CHEMICAL ABSTRACTS

Vol. 21.

NOVEMBER 10, 1927

No. 21

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Some additional refinements for precision balances. J. J. MANLEY. *Proc. Phys. Soc. (London)* 39, 444-8(1927). E. H.

Apparatus for micro-analysis. C. VAN ZIJP. *Pharm. Weekblad* 64, 916-9(1927).—Simple devices are described for filtration, detection of carbonates, sublimation, sepn. of immiscible liquids, extrn. and steam distn. of small quantities of material.

A. W. DOX

A continuous-reading electrotitration apparatus. STEPHEN POPOFF AND J. HILDEBRAND. *Proc. Iowa Acad. Sci.* 33, 172(1926).—An abstract. Goode's single radio-tube electrotitration set up was modified so as to give greater sensitivity. In place of the galvanometer a microammeter reading to 750 microamps is used in the circuit.

W. G. GAESSLER

Simple mercury cathode for arsenic determination. F. S. AUMONIER. *J. Soc. Chem. Ind.* 46, 311-5T(1927).—A describes in detail a porcelain porous cell in which Hg is the cathode and over which arsine is generated by the electrolytic reduction of the As compd. Uniform deposits of As were secured with the app. and it is recommended for pptg. small quantities of As as in foodstuffs. An abstract of Ramberg and Sjöström's wet combustion and HCl-distn. method for detg. As is given.

J. W. SHIPLEY

A convenient form of apparatus for the determination of melting temperature. GEORGE LYNN. *J. Phys. Chem.* 31, 1381-2(1927).—A modification of Washburn's app. (cf. *C. A.* 18, 2823), by the addn. of a heating coil wound upon a glass tube, and a removable sample tube which rests upon glass wool. The heating coil of No. 36 nichrome wire is wrapped about a glass tube in which are punched 3 holes, 2 at the top and 1 at the bottom. The wire is threaded several times through the lower hole to hold the free end in position, and then wrapped about the tube in turns about 2 mm. apart. At one of the upper holes it is attached to a Cu lead. The other free end is brought up inside the tube to the other hole where it is fastened to the second Cu lead.

ROBERT K. WERNER

Apparatus for the determination of thermal conductivities of high-temperature insulation. R. H. HEILMAN. *Trans. Am. Inst. Chem. Eng.* 18, 283-93(1926); cf. *C. A.* 21, 1319.—Data are given of an investigation on the development of a flat plate testing device for the accurate detn. of the thermal conductivities of high-temp. insulation and refractory materials. The app. is illus. and described. The cond. of a flat plate is expressed by $K = [W \times 3.415 \times \text{thickness (in.)}] / \text{area (ft.}^2\text{)} (t_1 - t_2)$.

W. H. BOYNTON

Recrystallization. H. DANNEEL. *Chem. App.* 14, 193-4(1927); 2 cuts.—The impure substance is placed in A and the app. filled with the satd. soln. through F. On heating the beaker contg. A and cooling B in ice H₂O, circulation takes place as indicated, the purified substance being crystd. out in B. The app. has a wide application.

J. H. MOORE

Device for detecting traces of mercury vapor (with selenium sulfide). ANON. *Gen. Elec. Rev.* 30, 442(1927).—One part of Hg vapor in 20,000,000 parts of the atm. may be measured accurately by an operation based on a reaction between a solid, Se sulfide, and the vapor, with the reaction product an easily observable colored substance. The darkening depends upon the concn. of Hg vapor, the time of exposure, and other controllable factors. The app. may afford a continuous and automatic record of the Hg content. The photoelec. cell circuit may be arranged to furnish a warning signal when the Hg concn. becomes dangerously high.

W. H. BOYNTON

A new differential dilatometer for the determination of volume changes during solidification. C. J. SMITH. *Proc. Roy. Soc. (London)* **A115**, 554 70(1927).—The Pb-Sn eutectic was found to contract 2.5% and the Bi-Sn eutectic to expand 0.8% on solidifying, by the use of a differential dilatometer so designed that the pressure on the two sides was kept equal by the removal of known amts. of Hg. F. O. A.

The T. C.-B. photo-colorimeter for measuring colors independently of the eye. RENÉ TOUSSAINT. *Bull. soc. encour. ind. nat.* **126**, 421-30(1927).—A given color can be characterized by a curve obtained by plotting the intensity of each shade present (blue, orange, red, yellow, etc.) as compared either with a pure white (e. g., plaster or MgO) or with a standard color. In the T. C.-B. photo-colorimeter the intensity is measured by means of a photo-elec. cell, consisting of a glass bulb filled with A under low pressure and coated inside with K (acting as cathode); inside the bulb is placed a W ring (as anode). Under the action of light, the K cathode emits electrons which make the current vary according to the intensity of the light, and the variations are measured by means of a galvanometer or ammeter. The intensity in the various parts of the spectrum is measured by interposing suitable color screens. The method of measuring and duplicating colors is described, and the chief applications of the instrument are enumerated. A. PAPINEAU-COUTURE

The T. C.-B. photo-colorimeter. J. PYTE. *Tiba* **5**, 955 73(1927); cf. preceding abstr.—A detailed description of the instrument and its operation. A. P.-C.

Machine devised by the Compagnie des Chemins de Fer de l'Est for testing lubricating oils, bronzes and anti-friction alloys. ANON. *Bull. soc. encour. ind. nat.* **126**, 444-9(1927). The machine described has been designed and constructed in such a manner that the material is tested under conditions practically identical with those to which it is subjected in service in rolling stock. A. PAPINEAU-COUTURE

Apparatus for carrying out physical or chemical experiments at all temperatures and under liquid pressures up to 15,000 kilograms per square centimeter. JAMES BASSET. *Compt. rend.* **185**, 343 5(1927).—An app. is described with diagram and photograph, by which regulable pressures up to 20,000 kg. per sq. cm. can be produced. The expt. chamber is provided with insulated electrodes to allow of heating the chamber or of electrolyzing under pressure. Special steels (compn. not given) are used and exceptional care is taken in machining, etc. A. P.-C.

The use of aluminum in the construction of apparatus. W. MEINECKE. *Metall-börse* **16**, 873 4, 929-31, 986 7, *Chem. Zentr.* **1926**, II, 282.—Expts. dealing with the attack of Al sheet by various substances are described. Aktivin has no action, MeOH and EtOH have a slight action when they are in 20% concn. in water; HCO₂H has a slight action; AcOAm has no action; sour beer has practically no action; AcOH acts slowly when cold but vigorously when boiling, KOH has a strong action; PhOH has a weak action which becomes more vigorous when it is heated, MgCl₂ has a slight action; mud-baths and chalybeate baths (Bad Elster) have no action, NaHCO₃ and NaCl solns. have a slight action; Na₂CO₃ soln. has a strong action, petroleum has no action; HNO₃ has the most vigorous action at 70% concn. but when warmed to 60-70° HNO₃ at 60% concn. has the max. action; the action of H₂SO₄ depends upon the concn. of its soln., cold tar has no action, but when hot the phenols which it contains attack the Al vigorously; CCl₄, cellulose pulp and onion juice have no action. C. C. DAVIS

Some mistakes in the construction of evaporators and their correction. BERTHOLD BRÖCK. *Chem. App.* **14**, 112 3, 170 2, 196 8(1927), 23 cuts.—The proper insertion of tube-sheets, arrangement of tubes, steam pipe and H₂O-drain connections, and various body types are shown. J. H. MOORE

Some modern developments in chemical plant. D. L. HOWARD. *Pharm. J.* **118**, 783-7(1927). An illustrated account of modern app. for evapn., sepn. and fine grinding on a mfg. scale. S. WALDBOTT

Experiments on the construction of a polariscope with photoelectric indication. VL. STANEK AND K. ŠANDERA. *Z. Zuckerind. czechoslov. Rep.* **51**, 245 8(1927).—The light is received on a sensitive cell consisting of a vacuum tube with a wire anode and a film of metallic K as cathode. The current so generated is amplified with an ordinary vacuum tube. The method offers possibilities, but as yet has not been made accurate to less than 1° Ventzke. ZD. VYTOPI. *Ibid* **51**, 335 6; VL. STANEK AND K. ŠANDERA. *Ibid* 336. Discussion W. L. BADGER

Stoneware exhaust fans and blowers. P. C. KINGSBURY AND F. E. MEHRHOF. *Trans. Am. Inst. Chem. Eng.* **18**, 103-29(1926).—Expts. were conducted on 4 stoneware exhausters. A brief review of the development of a satisfactory stoneware exhauster is given. Data and the method of calcg. results are tabulated and graphed.

The results for the larger fans are probably correct to within 5%, and those for the 10-cm fan within 10%. W. H. BOYNTON

- Acetylene generator. L. W. STETTNER. U. S. 1,642,467, Sept. 13.
 Heat-exchange apparatus. R. C. JONES. U. S. 1,641,975, Sept. 13.
 Heat-exchange apparatus. H. WEBSTER. U. S. 1,641,999, Sept. 13.
 Viscometer. C. M. LARSON and C. L. KNOPP. Brit. 262,652, May 17, 1926.
 Viscometer. KNOW MILL PRINTING CO., LTD., AND T. L. MORT. Brit. 262,539, Sept. 18, 1925.
 Manometer. W. LOMMEL. U. S. 1,642,615, Sept. 13.
 Filter. G. C. LEWIS. Brit. 262,328, May 11, 1926. A filter for liquids is prepd. by placing activated C or similar material in a ceramic container, burning to render the container porous and render the C more active, and, if desired, adding substances such as KMnO_4 or Cu salts.
 Filter for removing liquid particles and dust from gases. O. V. GREENE. Brit. 261,833, Aug. 24, 1925.
 Pressure filter for sirups or other liquids. J. N. S. WILLIAMS. U. S. 1,642,864, Sept. 20.
 Fabric filters for air or other gases. D. HALL, J. H. KAY and HALL & KAY, LTD. Brit. 261,897, Oct. 26, 1925.
 Funnel strainer for liquids. F. CHETHAM. Brit. 261,855, Aug. 31, 1925.
 Annealing furnaces. SIEMENS-SCHUCKERTWERKE GES. Brit. 262,444-5, Dec. 3, 1925.
 Gas-fired melting-pot furnace. L. F. TOOTH. Brit. 261,819, July 29, 1925.
 Device for supplying oxygen, oil, coal, ore or other substances to blast or melting furnaces through a blast nozzle. A. WAGNER and E. HILGERS. Brit. 261,776, Nov. 19, 1925.
 Recording device for gas-analyzing apparatus. SVENSKA AKTIEBOLAGET MONO. Brit. 261,803, Nov. 23, 1925.
 Apparatus for gas analysis. G. SOCOLOV-VISHNEVSKY. Brit. 262,316, March 23, 1926.
 Apparatus for sampling and analyzing gases flowing through pipes. R. EISENSCHUTZ. U. S. 1,643,155, Sept. 20.
 Apparatus for settling and thickening of mixtures of solids and liquids. W. C. WEBER. Brit. 262,179, Dec. 5, 1925.
 Column apparatus for distillation, rectification or treatment of liquids with gases. SOC. L'AIR LIQUIDE (SOC. ANON. POUR L'ETUDE ET L'EXPLOITATION DES PROCÉDÉS G. CLAUDE). Brit. 262,042, Nov. 28, 1925.
 Oven for distilling solid fuels or for drying materials. F. G. HOFFMANN. Brit. 261,740, Nov. 17, 1925.
 Double-walled vessel for carrying out reactions under high pressure and temperature conditions. J. TRAUTMANN. Brit. 261,767, Nov. 19, 1925.
 Recording device for wet- and dry-bulb humidity apparatus. E. B. WHEELER. U. S. 1,642,525, Sept. 13.
 Furnace for heating and unwinding rolls of wire. A. F. JACQUEMIN. U. S. 1,642,613, Sept. 13.
 Apparatus for subliming arsenic, antimony, lead, zinc or other substances. E. H. WEDEKIND. U. S. 1,642,756, Sept. 20.
 Apparatus and cabinet for testing hygroscopic substances. F. T. CARSON. U. S. 1,642,577, Sept. 13.
 Apparatus for treating acid sludge with salt solution, etc. L. BURGESS. U. S. 1,642,060, Sept. 13.
 Rotary kiln and heat recuperator. VICKERS, LTD., AND L. D. PARKER. Brit. 262,525, Sept. 12, 1925.
 Retort for distilling carbonaceous or other solid materials. F. D. MARSHALL. Brit. 261,919, June 5, 1925. Material is moved through an externally heated retort by Archimedeum screws the threads of which overlap but do not come into contact. Brit. 261,927 relates to similar app., as does also Brit. 261,975.
 Apparatus for fermentation and storage of fertilizer, foodstuffs and other materials. F. KRANTZ and H. KRANTZ. U. S. 1,643,018, Sept. 20.
 Strainer for gasoline or other liquids. R. D. FAGAN. U. S. 1,642,133, Sept. 13.
 Preheater and evaporator, for concentrating tanning liquors or other solutions. D. A. BLAIR AND BLAIR, CAMPBELL & MCLEAN, LTD. Brit. 262,608, Dec. 30, 1925.

Diffraction gratings with dichromated gelatin films. K. KONDO. Brit. 262,020, July 29, 1926.

Temperature-controlled alarm device. W. E. FOX. U. S. 1,642,649, Sept. 13.

Bimetallic element for thermostatic devices. W. M. CHACE. U. S. 1,642,485, Sept. 13. A Ni-steel alloy in which the Ni content is not greater than 42% is welded to a steel comprising C 0.50, Mn 0.70, Si 1.75, Cr 8, Ni 22, Cu 2, Co 1 and Fe 64.05 parts.

Thermostatic electric switch. O. G. MYERS. U. S. 1,642,742, Sept. 20.

Thermostatic control for electric circuits. F. W. WOOD. U. S. 1,642,284, Sept. 13.

Thermostatically controlled valve device. H. W. O'DOWD. U. S. 1,643,255, Sept. 20.

Thermionic valve. L. A. LEVY. Brit. 262,563, Oct. 27, 1925. A cathode is formed with an outer, electron-emitting surface of Ru or material contg. Ru. Ru chloride may be applied to a core such as W, Mo or fused SiO_2 and finely ground Bi or other metal more fusible than Ru may be added as a flux. A W core coated with Cu may be used for electrodeposition of Ru from its chloride soln. contg. Na phosphate and H_3PO_4 .

Bi-metallic strips for thermostats. F. W. MILLER. Brit. 262,644, April 21, 1926. A metal plate such as Ni-steel is covered with a flux such as powd fused borax and another metal such as brass, having a lower m. p. and in subdivided form, and the metals are caused to unite by heating and may be rolled and cut into strips.

Electron-emitting cathode. E. E. SCHUMACHER. Can. 272,015, June 28, 1927. A thermionic cathode comprises a W filament having a coating composed of a powdered metal of the Ce group.

Device for producing high vacuums with alkaline earth metal such as calcium. W. A. RUGGLES. Brit. 262,069, Nov. 27, 1925. A device is described applicable to evacuation of thermionic valves and similar app.

X-ray apparatus. M. B. ADRIAN. U. S. 1,642,915, Sept. 20.

Ultra-violet ray apparatus. HANOVIA CHEMICAL & MANUFACTURING CO. Brit. 262,703, May 1, 1926.

Raoul Lambert. F. M. *Ingénieur chimiste* 15, 93(1927).—An obituary with portrait. A. PAPINEAU-COUTURE

Kunkel and the early history of phosphorus. T. L. DAVIS. *J. Chem. Education* 4, 1105-13(1927). E. H.

A Russian physical chemist of the eighteenth century. B. N. MENSHUTKIN. *J. Chem. Education* 4, 1079-87(1927).—A biographical sketch of Michájlo Vasilievich Lomonosov. E. H.

Progress of chemistry in the first quarter of the twentieth century. S. C. LIND. *J. Chem. Education* 4, 1098-1104(1927). E. H.

A glance at the early organic chemistry of America. E. F. SMITH. *J. Chem. Education* 4, 1150-7(1927). E. H.

The solution of mathematical equations in chemical problems. S. K. TWREDDY. *Chemistry & Industry* 46, 824-5(1927). E. H.

Fundamental atomic weights. III. Revision of the atomic weight of silver. Analysis of silver nitrate. O. HÖNIGSCHMID, E. ZINTL AND P. THILO. *Z. anorg. allgem. Chem.* 163, 65-92(1927).—A method has been developed which makes it possible to reduce quant. molten AgNO_3 by means of H, insuring thus an analysis of the salt. In order to minimize the errors due to absorption of air, the weighing of both Ag and AgNO_3 has been performed *in vacuo*. Each analysis has been repeated 4 times. The av. of 14 detns. indicates that 168.92571 g. AgNO_3 yields 107.26868 g. Ag. Consequently the ratio $\text{AgNO}_3/\text{Ag} = 1.57479$ and the at. wt. of Ag = 107.879, on the assumption that $N = 14.008$. This is in agreement with the recent best values given for Ag. The value 107.872 obtained by Richards (*Chem. Rev.* 1, 17(1925)) was calcd. on the basis

N 14.004. The final paragraph discusses the results recently published by Baker and Riley (cf. *C. A.* 21, 1570, 2080, 2203). IV. The molecular weight of potassium. Analysis of potassium chloride. O. HÖNIGSCHMID AND J. GOUBEAU. *Ibid* 93-104.—Numerous analyses have been performed by the classical methods indicated by Richards. From the ratio $KCl/Ag = 0.691149$, the at. wt. of K is calcd. It equals 39.104. The same value is obtained when it is calcd. from the ratio $KCl/AgCl = 0.520180$. The ratio $AgCl/Ag = 1.328670$. V. The atomic weights of silver, chlorine and potassium. E. ZINTL AND J. GOUBEAU. *Ibid* 302-14(1927).—An exptl. detn. is made of the ratio KNO_3/KCl . The combination of this value with the ratios KCl/Ag and $AgCl/Ag$ already detd. in the second and third part of the work renders it possible to calc. the at. wt. of Ag, Cl and K. The at. wt. of N is taken as 14.008; the procedure has no new feature; every substance is weighed *in vacuo*. $KNO_3/KCl = 1.356111 \pm 0.000010$, $Ag = 107.879 \pm 0.0011$, $K = 39.104 \pm 0.0007$, $Cl = 35.456 \pm 0.0003$. VI. Revision of the atomic weight of chlorine. (1) A complete synthesis of silver chloride. (2) An incomplete synthesis of silver chloride. O. HÖNIGSCHMID, SAFFER BEDR CHAN AND L. BIRCKENBACH. *Ibid* 315-44.—In the first part, a known amt. of pure chlorine has been allowed to react on an equivalent amt. of pure silver, and the resulting $AgCl$ weighed. This method offers the possibility of checking the purity of the reagents. Nine detns. give $Cl/Ag = 0.328668$ within 1/100,000. Eight detns. of $Cl/AgCl$ give 0.247366. If Ag is taken as 107.880, the atomic weight of Cl in both cases = 35.457. In the second part, two different portions have been taken from a distn. of CCl_4 ; the two batches of HCl obtained therefrom have been compared with two batches of ordinary HCl , with the hope of detecting differences due to isotopes. The HCl was used in excess to ppt. a $AgNO_3$ soln. obtained by dissolving a known amt. of Ag in HNO_3 , and the ppt. weighed: $Cl/Ag = 0.32867$ and $Cl = 35.457$, on the basis $Ag = 107.880$. A. L. HENKE

Revision of the atomic weight of dysprosium. Analysis of dysprosium chloride. O. HÖNIGSCHMID AND H. FRH. AUER VON WELSCHACH. *Z. anorg. allgem. Chem.* 165, 289-96(1927).—Dy obtained from monazite was purified by fractional crystn. and converted into $Dy_2(SO_4)_3 \cdot 8H_2O$. The product contained traces of Th and Ho. The impurities amounted to less than 0.1%, which would affect the at. wt. by not more than 0.003 units. This lies within the exptl. error. The sulfate was converted to oxalate through hydroxide and nitrate. The oxalate was ignited and the oxide converted into $DyCl_3$ by HCl . The $DyCl_3$ was dehydrated and then melted and cooled in an atm. of dry HCl . At. wt. detns. from analyses yielding the ratios $DyCl_3:3Ag$ and $DyCl_3:3AgCl$ (total of 13 detns.) give the value $Dy = 162.459$. J. E. SNYDER

Revision of the atomic weight of yttrium. Analysis of yttrium chloride. O. HÖNIGSCHMID AND H. FRH. AUER VON WELSCHACH. *Z. anorg. allgem. Chem.* 165, 284-8(1927).—Previous detns. of the at. wt. of Yt gave for the purest sample, which still contained traces of Er, the value 88.950 (*C. A.* 19, 1212). This sample was further purified until no Er could be detected spectroscopically. Twenty detns. of the ratios $YtCl_3:3Ag$ and $YtCl_3:3AgCl$ give for the new at. wt. of Yt the value 88.925 ± 0.002 . J. E. S.

Modified micro-method for the determination of molecular weights. J. REILLY AND G. T. PYNE. *Sci. Proc. Roy. Dublin Soc.* 18, 489-93(1927).—The method depends on the alterations in the cooling curve of pure camphor produced by minute amts. of dissolved substances. The method is particularly useful for substances whose low soly. in camphor or high mol. wt. precludes the use of the ordinary Rast method. The app. and process are described in detail. L. W. RIGGS

Determination of molecular weights of organic substances in small quantities by means of freezing-point depression. BENNOSUKE KUBOTA AND TAKEO YAMANE. *Bull. Chem. Soc. Japan* 2, 209-12(1927).—A Ag-elec. resistance thermometer of high sensitivity was used to measure the depression in f. p. of a small amt. of dil. soln. in C_6H_6 , $PhNO_2$ or $C_2H_4Br_2$. A. W. FRANCIS

The variability of valency. PRAFULLA CHANDRA RAY. *Quart. J. Indian Chem. Soc.* 4, 89-95(1927).—The valency of an atom depends on: the nature of the atoms to which it unites; external conditions, temp., pressure, medium, presence of certain substances in the medium and relative concn. of reacting atoms. The Werner co-ordination number may have any value from 1 to 8 inclusive. Pt has valences of 1 to 4 and 6 in compds. with O and Cl. With mercaptanic radicals and org. sulfide Pt has all valences from 1 to 8 inclusive. The general formula is $Pt(SC_xH_4SH)_x$. Au forms the similar compds., $Au(SC_xH_4SH)_x$, where $x = 2$, or 3, or 4, or 5. Compds. of the formulas: $6A.Au_2Cl_3$, $5A.Au_2Cl_3$, $4A.Au_2Cl_3$, $4A.Au_2Cl_3$, $3A.Au_2Cl_3$ and $3A.Au_2Cl_3$ have been obtained when benzaldehyde trisulfide is treated with $AuCl_3$. The A of the formulas stands for 1,4-dithian. When dithioethyleneglycol and $AuCl_3$ are

allowed to react in acetone $[(CH_3)_2S_2]_nAu_2$ forms. Au is quinquevalent. By the action of NH_3 on $Au_2Cl_3 (C_2H_5)_2S_2$ a compd. of the compn. $Au_2Cl_3.6NH_3$ forms. No ordinarily accepted valency of Au explains this compn. F. E. BROWN

The dependence of the Avogadro number on the size of the particle. SATYENDRA RAY. *Z. physik. Chem.* **128**, 182-8(1927).—A mathematical discussion in which S. shows why the values for the Avogadro no. detd. by Millikan's method do not agree with those detd. by Perrin and why the no. can be independent of the size of the particle only when the latter is small. E. R. SCHIERZ

Molecular volumes at absolute zero. I. Density as a function of temperature. SAMUEL SUGDEN. *J. Chem. Soc.* **1927**, 1780-5.—The variation of d . with temp. from the f. p. to the crit. point is represented accurately in normal liquids, C_6H_6 , C_6H_5Cl , Et_2O , HCO_2Me , $AcOEt$ and CCl_4 by $D - d = D_0[(1 - T)/T_0]^{0.3}$, where D and d are the d . of the liquid and satd. vapor, resp., at T° abs. For associated liquids $AcOH$ and $EtOH$ it holds over the lower part of the temp. range. The "zero vol." V_0 obtained by dividing the mol. wt. by the const. D_0 is nearly proportional to the crit. vol. for H , Et_2O , CCl_4 , HCO_2Me , $AcOMe$, $C_2H_5CO_2Me$, $AcOEt$, HCO_2Pr , $C_3H_7CO_2Me$, methyl isobutyrate, $C_2H_5CO_2Et$, $AcOPr$, n -pentane, isopentane, diisopropyl, n - C_8H_{18} , n - C_8H_{18} , diisobutyl, C_6H_6 , fluoro- and bromobenzene. II. Zero volumes and chemical composition. *Ibid* 1786-98. S. shows the "zero vols." (cf. preceding abstr.) can be predicted by adding together certain characteristic consts for the atoms and structures in the mol. H 6.7, C 1.1, N 3.6, O 5.0, F 10.3, Cl 19.3, Br 22.1, I 28.3, P 12.7, S 14.3, O in alics. 3.0, N in amines 0.0 triple bond 15.5, double 8.0, 3-membered ring 4.8, 4-ring 3.2, 5-ring 1.8, 6-ring 0.6 and semi-polar double bond 0.0. Of the 284 compds. considered from the groups: hydrocarbons, halogen derivs., ethers, aldehydes and ketones, esters, nitro, P and S compds., and associated liquids, acids, alcs and amines 236 are within 2%, and 149 within 1% of the calcd. value. E. R. SCHIERZ

Volume laws of solid substances. WILHELM BILTZ. *Nach. Ges. Wiss. Göttingen. Math.-Physik. Klasse* **1926**, 45-80.—A statistical and crit. study of data taken from the literature shows a fairly const. relationship in the vols. occupied by the constituent radicals in solid substances at abs. zero. With a normal-zero vol. of NH_3 of 18.20 except in Hg salts, the zero vol. of NH_3 in the ammo fluorides and chlorides is normal, while in the bromides and iodides it runs high. It is concluded that in compds. of a higher order the lesser constituents occupy their zero vols., but that their simple additive properties are concealed by actions of a second order which are relatable to the individual characteristics of the component. This additive characteristic of the zero vols. is not so apparent in intermetallic compds. While the additive rule applies to chlorides and bromides fluorides and iodides generally show a vol. contraction and iodides a vol. dilation. La compds. also show strong vol. contraction. For the alkali halides the equation $v_1 = av_0 + b$ (where v_1 = vol. of the alk. halide, v_0 = vol. of K halides, $a = 1$, and b = the atomic vol. diff. between the metal and K) gives only a good approximation. Some compds. show half-values of their zero vol. for the metal constituent and others full values. The following general relations apply to these vol.-change phenomena: (1) the unstable metal isomers generally show a larger zero vol. than the corresponding stable isomer, and the ratios of the stable to unstable isomer vols. are expressible as small whole nos.; (2) borides and silicides give half-vol. values, sulfides $1/2$, $2/2$ and $3/2$ vols. for S , selenides give a double value, fluorides show values of $1/2$ -1, iodides $3/4$, and oxides $1/4$ - $1/2$, (3) in carbides, silicides, arsenides and borides the metal generally shows its full vol. as in intermetallic compds., while in sulfides, oxides, chlorides and fluorides the metal shows a "half vol."; (4) the constituent vols. of compds. contg. the same metal, which show equal vols. for diff. stages of oxidation of the metal are not additive, and the vols. of the acid radical vary between corresponding pairs of salts in the ratios of small whole nos.; (5) the zero vol. of O in compds. may assume a unit, half or quarter of its normal zero vol. and this is accountable for by the space lattice of the compds. in question. A parallel exists between the vol. ratios and the sp. heats of different modifications of the same substance. The data given show that in the limiting case the zero vol. of a compd. equals $\Sigma n/m \cdot v_0$, where v_0 is the zero vol. of the compd. constituents and n and m are small whole nos. whose quotient often equals 1. In many crystals the constituent does not enter according to the rational ratio called for by the limiting case, but with a more or less approx. partial vol. according to the particular substance.

C. D. INGERSOLL

The relationships governing the decrease in volume in the formation of solid compounds. I. ZASLAVSKIĬ. *J. Russ. Phys.-Chem. Soc.* **58**, 659-63(1926).—A discussion (cf. *C. A.* **19**, 3392). BASIL C. SOYENKOFF

The oscillation frequency in binary compounds. W. HERZ. *uZ. anorg. allgem. Chem.* **163**, 221-4 (1927).—In the Lindemann formula $\nu = 2.80 \cdot 10^{12} \sqrt{T_0/AV}$, ν = the oscillation frequency, T_0 = the m. p., A = the at. wt. and V = the at. vol. This formula is used for free elements. When 2 elements are combined in a binary compound, it is still possible to det. their ν by means of an analogous formula: the at. wt. and the at. vol. of each element are taken as the half of the mol. vol. and the mol. wt. of the combination. Therefore, $\nu/\nu' = \sqrt{T_0/T'_0}$, in which ν' = the oscillation frequency of the element when it is combined, and T'_0 = the m. p. of the compd. Taking data from the literature, H. shows that the last equation is correct, but he is unable to decide whether it is only a mathematical relation or a relation with a true physical meaning. A. L. HENNE

The hardness of inorganic compounds and of elements. ERNST FRIEDERICH. *Fortschritte Chem. Physik, physik. Chem.* **18**, 5-44 (1926).—The valence exerts a great influence upon the hardness of compds. and of elements. When the hardness is described as a function of at. concn. with the addn. of a valence factor the same order of hardness is obtained in the case of simple compds. as in Mohs' or Auerbach's scales. This equation permits the calcn. of the hardness of chem. compds. from the formula and the sp. gravity with a fair degree of accuracy. The hardness of solids which can be regarded as ionic or at. lattices is caused in a first approximation by electrostatic attraction according to Coulomb's law. The full validity of this law is impaired evidently by the action of rest affinities. In the case of elements which are conductors the idea is advanced that the hardness is owing to one part of the valence electrons, while the elec. cond. is due to the remaining valence electrons. This assumption is supported by the close relationship between hardness and elec. cond. particularly in the case of mixed crystals. EMIL KLARMANN

The preparation and some properties of pure metallic silicon. RUDOLF HOLBLING. *Z. angew. Chem.* **40**, 655-9 (1927).—A C filament was heated electrically at a temp. of about 1000° in a mixt. of SiCl₄ and specially purified H₂. In a few hrs. there was formed a bar of Si 4 mm. thick, with the undamaged C filament in the center. The Si could not be worked either cold or warm, even at 1400°. It appeared to be more brittle in the incandescent state than when cold. In this compact form it was very stable when heated in the air, and acquired only a slight tempering color. Its linear coeff. of expansion due to heat was measured röntgenographically. $\alpha_{18-950} = 3.55 \times 10^{-6}$. Its elec. cond. increased with rise in temp. A sketch of the app. used for the prepn. of the Si is given, also details of the method. LOUISE KELLEY

Tin-plague and museum sickness in Netherlands. ERNST COHEN. *Chem. Weekblad* **24**, 402-3 (1927).—Warning is given as to bringing sound tin into contact with infected articles. M. ACHTERHOF

The compressibility of tellurium. R. F. MEHL AND R. J. MAIR. *J. Am. Chem. Soc.* **49**, 1892-900 (1927).—The compressibility coeff. detn. and the piezometer standardization are made by Richards' methods (*C. A.* **9**, 2011). The approx. compressibility of H₂O, at 25°, is 41.54×10^{-6} . The av. of 6 detns., at 25° and 100-500 megabars, is 5.00×10^{-6} , accurate to 2 in the sec. decimal place. From the calcd. ds. for given values of h , the height of a unit prism, a curve is obtained, showing that the compressibility coeff. of Te is positive for values of h less than 5.55 A. U. and is negative above this. As the actual value of h is 5.91 A. U., the coeff. must be negative. In the same way it is shown that the coeff. must be positive for Se. It is predicted that other substances having a negative coeff. exist. J. BALCZIAN

Active sulfur. KARL STOCK. *Naturwissenschaften* **15**, 700 (1927).—Active S was prepd. in a way similar to the prepn. of active N. The band spectrum of its luminescence shows several characteristics, which will shortly be published. B. J. C. VAN DER HORVEN

The passivity of the metals. FRANCIS MEUNIER. *Bull. soc. chim. Belg.* **36**, 435-47 (1927).—A review. A. L. HENNE

X-ray method of determining coefficient of expansion at high temperatures. K. BECKER. *Z. Physik* **40**, 37-41 (1926).—The Debye-Scherrer method was used and the prepn. was heated by means of an elec. current through a W wire. For W, the linear coeff. from 18° to 2200° = 7.5×10^{-6} , from 18° to 1750° = 6.6×10^{-6} , from 18° to 1380° = 5.8×10^{-6} . For zircon, silicon, silicon carbide and the Nernst filament the values are 4.5, 3.55, 6.25 and 10.7×10^{-6} , resp., to the temps. 1300°, 950°, 1200° and 2000°. B. C. A.

The expansion of crystals from absolute zero to the melting point. W. P. DAVEY. *Phys. Rev.* **27**, 819 (1926).—Theoretical considerations of face-centered cubic crystals

indicate a linear expansion of at least 2.6% to be necessary between 0° K. and the m. p. There must be added the expansion while the atoms take up energy to overcome cohesion. Cu shows 2.9%. Body-centered cubic crystals require no expansion other than that to overcome cohesion.

R. L. HERSHEY

The temperature variation of the elasticity of Rochelle salt. R. MORGAN DAVIES. *Nature* 120, 332-3(1927).—The extension modulus of slabs of Rochelle salt has been detd. over a temp. range -30° to 40° .

C. H. GREENEWALT

Construction of crystals. V. M. GOLDSCHMIDT. *Z. tech. Physik* 8, 251-64(1927).—A lecture on the construction of crystals from at. building stones of known properties, radius and polarizability. The predicted macroproperties of the constructed crystals are discussed. Numerous references are given.

B. J. C. VAN DER HOEVEN

The symmetry of atoms in crystals. KARL HERRMANN. *Z. Physik* 42, 631-6(1927).—An examn. of the results of crystal analysis reveals that no crystal having unequivocally a purely hexagonal space group has yet been found; i. e., the atoms in all examd. structures appear only with the highest cubic symmetry or a lower symmetry derived from it.

R. L. HERSHEY

Lattice parameters and densities of copper, silver and tungsten. W. P. DAVEY AND T. A. WILSON. *Phys. Rev.* 27, 105(1926).—New expts. give for Cu, $a = 3.605$ A. U., corresponding to a d. of 8.95. A single crystal gave a d. of 8.953. A single crystal of Ag had a d. of 10.481, agreeing with earlier x-ray data indicating 10.49. W has $a = 3.155$ A. U., d. = 19.32.

R. L. HERSHEY

The crystal structure of α -manganese. A. J. BRADLEY AND J. THEWLIS. *Proc. Roy. Soc. (London)* A115, 456-71(1927).—Westgren and Phragmen's nomenclature is adopted and their powder data are used (cf. *C. A.* 19, 3181). The lattice is cubic, $a = 8.894$ A. U. New detns. of d. lead to 58 atoms per unit cell. Consideration of intensity data and space-group possibilities lead to the assignment of space group T_d^2 , with four sets of equivalent positions, contg. 2, 8, 24 and 24 atoms. Five parameters are needed and have been evaluated. The structure is based upon a single body-centered cubic lattice, each lattice point being replaced by a cluster of 29 atoms, the cluster having tetrahedral symmetry. The interat. distances range from 2.25 A. U. to 2.95 A. U. indicating an unequal distribution of electrons.

R. L. HERSHEY

Crystal structures of anatase and rutile, the tetragonal forms of titanium oxide. M. L. HUGGINS. *Phys. Rev.* 27, 638(1926).—Anatase has the dimensions, $a_0 = 3.78$ A. U., $c_0 = 9.50$ A. U. with Ti atoms at (000) $(0, \frac{1}{2}, \frac{1}{2})$ $(\frac{1}{2}, 0, \frac{1}{2})$ $(\frac{1}{2}, \frac{1}{2}, 0)$ and O atoms at (00u) $(0, \frac{1}{2}, u + \frac{1}{2})$ $(\frac{1}{2}, 0, u + \frac{1}{2})$ $(\frac{1}{2}, \frac{1}{2}, u + \frac{1}{2})$ (00 \bar{u}) $(0, \frac{1}{2}, \frac{1}{2} - u)$ $(\frac{1}{2}, 0, \frac{1}{2} - u)$ $(\frac{1}{2}, \frac{1}{2}, -u)$, where $u = 0.20 \pm 0.01$. The space group is D_{4h}^{19} . For rutile $a_0 = 4.58$ A. U., $c_0 = 2.95$ A. U. Ti atoms are at (000) $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2})$; O atoms at ($\bar{u}, u, 0$) $(\bar{u}, \bar{u}, 0)$ $(\frac{1}{2} - u, u + \frac{1}{2}, \frac{1}{2})$ $(u + \frac{1}{2}, \frac{1}{2} - u, \frac{1}{2})$, where $u = 0.30 \pm 0.01$. The space group is D_{4h}^{14} .

R. L. HERSHEY

Crystal structure of zirconium oxide. W. P. DAVEY. *Phys. Rev.* 27, 798(1926).— ZrO_2 appears to crystallize in several forms. Two have been studied by the powder method. One shows a face-centered cubic lattice, $a = 5.098$ A. U. The strong lines indicate that the Zr atoms and O atoms are situated like the Ca and F atoms, resp. in CaF_2 . The second type shows a triangular close packed lattice, $a = 3.598$ A. U., $c = 1.633$ A. U. Both structures give a d. of 6.13.

R. L. HERSHEY

The lattice constants of CaO , $CaSe$, CaS , $CaTe$. IVAR OFFEDAL. *Z. physik. Chem.* 128, 154-8(1927).—The powder method, with rock salt as a standard, was used. The lattice dimensions are: CaO , $a = 4.802 \pm 0.005$ A. U.; CaS , $a = 5.686 \pm 0.005$ A. U.; $CaSe$, $a = 5.912 \pm 0.003$ A. U.; $CaTe$, $a = 6.345 \pm 0.008$ A. U. CaO , CaS , $CaSe$ have previously been shown to be of the NaCl type. Intensity calcs. indicate $CaTe$ to be of the same type.

R. L. HERSHEY

Precision determinations of the lattice constants of the compounds MgO , $MgSe$, MgS , MnO and $MnSe$. LINAR BROCH. *Z. physik. Chem.* 127, 446-54(1927).—The Debye-Scherrer method was used. The compds. are all of the NaCl type. The dimensions are: MgO , $a = 4.208 \pm 0.001$ A. U.; MgS , $a = 5.190 \pm 0.002$ A. U.; $MgSe$, $a = 5.452 \pm 0.002$ A. U.; MnO , $a = 4.435 \pm 0.002$ A. U.; $MnSe$, $a = 5.448 \pm 0.002$ A. U.

R. L. HERSHEY

The crystal structure of $MoSi_2$ and WSi_2 . WM. ZACHARIASEN. *Z. physik. Chem.* 128, 39-48(1927).—The powder method was used. $MoSi_2$ and WSi_2 are tetragonal, the lattice dimensions being, resp.: $a = 3.200 \pm 0.005$ A. U., $c = 7.861 \pm 0.005$ A. U., $c/a = 2.457$; $a = 3.212 \pm 0.005$ A. U., $c = 7.880 \pm 0.005$ A. U., $c/a = 2.453$. There are two mols. per unit cell. The elementary cell is body-centered; the space group

appears to be D_{4h}^{17} , with R(W or Mo) at (000), $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2})$ and S atoms at $(00u)$, $(00 - u)$, $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2} + u)$, $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2} - u)$, where $u = 0.333 \pm 0.015$. R. L. H. HERSHEY

The space lattice of yellow lead oxide. F. HALLA AND F. PAWLEK. *Z. physik. Chem.* 128, 49-70(1927).—Powder rotation, Laue and oscillation x-ray photographs were taken of the yellow modification of PbO. The lattice is rhombic base-centered; the space group is either C_{2v}^{11} , V_6^6 or V_h^{19} , probably the last. The unit-cell dimensions are $a = 5.50 \pm 0.02$ A. U., $b = 4.72 \pm 0.03$ A. U., $c = 5.880 \pm 0.003$ A. U., there are 4 mols. per unit cell. The lattice is a mol. one, constructed of double mols., Pb_2O_2 . R. L. HERSHEY

Some crystal structures of the type NiAs. IVAR OFTEDAL. *Z. physik. Chem.* 128, 135-53(1927).—Powder examn. shows the following substances to be of the NiAs type (hexagonal lattice, 2 mols. per unit cell) and to have the dimensions recorded.

	a	c	c/a
CoSe	5.278	3.614	1.460
CrTe	6.211	3.981	1.560
MnTe	6.698	4.124	1.624
CoTe	5.360	3.886	1.380
NiTe	5.354	3.957	1.353
CrSb	5.468	4.107	1.331
MnSb	5.784	4.120	1.404
MnSb ₂	5.744	4.131	1.390
FeSb	5.130	4.064	1.262
FeSb ₂	5.168	4.123	1.253
CoSb	5.188	3.866	1.342
NiSb	5.133	3.907	1.314

The formulas for the Sb compds. of Fe and Mn are approx. empirical expressions of the compn.; these elements form solid solns. and the above dimensions probably vary with compn. R. L. HERSHEY

The crystal structure of ammonium fluoride. WILLIAM ZACHARIASEN. *Z. physik. Chem.* 127, 218-24(1927).—The structure of NH_4F , detd. by powder pictures and a Laue diagram is hexagonal closest packed, ZnO type, unit-cell dimensions: $a = 4.39 \pm 0.04$ A. U., $c = 7.02 \pm 0.06$ A. U.; there are two mols. per unit cell. The F atoms are at $(\frac{1}{2}, \frac{1}{2}, 0)$ and $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2})$; the N atoms at $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2})$ and $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2})$. An H atom arrangement with the atoms tetrahedrally disposed about the N atoms and with one H atom on the line between each pair of N and F atoms is suggested as plausible in view of the tendency of NH_4F to decompose into NH_3 and HF. The space group is either C_6^6 or C_6^{4v} . R. L. HERSHEY

Structure of anhydrite. Structure of the sulfate group. J. A. WASASTJERNA. *Soc. Sci. Fennica Commentationes Phys.-Math.* 2, No. 19-30, 46 pp.(1927). cf. C. A. 21, 841.—The sulfate group is assumed to remain intact in different crystals. Its structure is studied by x-rays. Anhydrite was chosen as the most suitable material for study. The powder and Bragg spectrographic methods were used. Space group analysis and comparison with theoretical intensity are used in the study. The results are: the structure of anhydrite has the symmetry of V_h^{17} ; the axial lengths are $a_0 = 6.24$ A. U., $b_0 = 6.98$ A. U., $c_0 = 6.98$ A. U.; the axial ratio is $a_0:b_0:c_0 = 0.894:1:1000$, compared with the crystallographically detd. ratio $a:b:c = 0.893:1:1.001$, the unit cell contains 4 mols. The Ca and S atoms lie upon the intersections of the reflection planes $(010)_1$, $(010)_2$ and $(001)_0$, $(001)_1$. The 16 O atoms belong to two sets of 8 atoms each. The one group lies upon the reflection planes $(010)_1$, $(010)_2$; the other upon $(001)_0$, $(001)_1$. The at. coordinates are given. W. concludes, from the discussion of the existence of definite, intact groups, that the lattice must sometimes be assumed as built of anisotropic units larger than atoms, i. e., mols. or radicals. The sulfate group of anhydrite consists of 4 O atoms at the corners of a regular tetrahedron (within the limits of exptl. error) with an edge length of 2.7 A. U., the S atom being at the tetrahedron center. A study of the symmetry of the group in sulfates crystg. in different systems, shows the tetrahedron defined by the free sulfate group to be regular. The structure of anhydrite is similar to that of $LiKSO_4$, in agreement with W.'s theory of ionic radii. R. L. HERSHEY

Zinc blende-wurtzite lattices and ionic lattices. G. v. HEVESY. *Z. physik. Chem.* 127, 401-14(1927).—The electrolytic cond. of crystals and their melts is used to det. whether the lattice units are charged (ionic) or uncharged (mol.). A high electrolytic

cond. argues for ions; the cond. compared to NaCl cond. indicates the percentage of ions. In most cases apparently both kinds of structural units exist, which is in agreement with quantum ideas on the extension of the electronic field. BeO (wurtzite type) appears to consist mainly of uncharged units, which agrees with Grimm and Sommerfeld's and Goldschmidt's conclusions regarding commensurability and the character of the binding forces in diamond and wurtzite type lattices. In the case of α - (high temp.) AgI an ionic lattice occurs; the β - (low temp.) AgI (wurtzite type) has an at. lattice. The appearance of a metallic cond. is related to the presence of an uncharged lattice ingredient. The relation between loosening of the lattice and the appearance of polymorphic change is discussed. R. L. HERSHEY

Preliminary note on the crystal structure of some compounds of the constitution $M_2G_2L_2R_4$. O. HASSEL. *Z. physik. Chem.* **126**, 118-26(1927).—X-ray examn. of $ZnSiF_6 \cdot 6H_2O$ and $MgSiF_6 \cdot 6H_2O$ show the unit rhombohedrons to contain one mol. per unit cell. The b axis for the Zn salt is 9.325 A. U. long; for the Mg salt, 9.47 A. U. Possible space groups are discussed. R. L. HERSHEY

The crystal structure of the hexamminecobaltic iodides. KARL MEISEL AND WALTER THEDJE. *Z. anorg. allgem. Chem.* **164**, 223-40(1927).—Rotation and Debye-Scherrer photographs were used to det. the structure of $Co(NH_3)_6I_3$. The unit cell is face-centered cubic, with 4 chem. mols.; the cube edge length is 10.9 A. U. The space group is O_h^h or O_c . The Co atoms are at the corners and face centers, surrounded by the corresponding N atoms in the octahedral configuration and at a distance of about $1/6$ the cube edge. The I atoms are of 2 kinds: those of the first kind form an inner cube with edge length of $1/2$ the unit cell edge length, those of the second kind are at the midpoints of the edges and in the cube center. The structure of $Co(NH_3)_6I_2$, detd. by Scherrer and Stoll, is lacking the I atoms of the second kind. The mol. vols. are the same since the addn. of the second kind of I atoms in $Co(NH_3)_6I_3$ requires no addnl. space in the lattice. R. L. HERSHEY

The crystal structure of $[N(CH_3)_4]_2PtCl_4$. M. L. HUGGINS. *Phys. Rev.* **27**, 638 (1926).—Laue and spectrum photographs are used. The structure is cubic with $a = 12.65$ A. U. Pt and N atoms are arranged as Ca and P in CaF_2 . Each Pt atom is surrounded by 6 Cl atoms octahedrally, each N atom by 4 C atoms tetrahedrally. The space group is either O_h^h or O_c . Assuming the N-C distance as 1.17 A. U., the Pt-Cl distance appears to be about 2.35 A. U. R. L. HERSHEY

Crystal structures of ammonium, potassium and rubidium cupric chloride dihydrates. S. B. HENDRICKS AND R. G. DICKINSON. *J. Am. Chem. Soc.* **49**, 2149-62 (1927). These compds. have been examd. by Laue and spectral photographs. They are tetragonal with 2 mols. per unit cell, the dimensions are: for the NH_4 salt, $a = 7.58$ A. U., $c = 7.96$ A. U.; the K salt, $a = 7.45$ A. U., $c = 7.88$ A. U.; the Rb salt, $a = 7.81$ A. U., $c = 8.00$ A. U. The space group is probably D_{4h}^{14} . R. L. HERSHEY

The crystal structure of quinone. II. W. A. CASPARI. *J. Chem. Soc.* **1927**, 1093-5; cf. *C. A.* **21**, 1211.—The modification of quinone deposited at ordinary temps. from a MeOH soln., β -quinone, has a d. of 1.31 and m. p. of 166°. Laue and rotation x-ray photographs show it to belong to the trigonal polar class, the unit cell dimensions being $a = 16.21$ A. U., $c = 5.53$ A. U. There are 9 mols. per unit cell, with 3 lattice units per unit cell, each contg. 3 mols. The 3 mols. per unit have no symmetry, either separately or as a group. The space group appears to be C_3 . γ -Quinone, formed by sublimation has a d. of 1.35, m. p. of 169°. Rotation photographs give the dimensions, $a = 13.24$ A. U., $b = 5.20$ A. U., $c = 8.11$ A. U. The space group appears to be C_{2h}^b , built up on the lattice Γ_m ; γ -quinone is less stable than the other forms. Quinone tends to crystallize in the trigonal system and to associate in termol. units. The c axes of the trigonal modifications, α - and β -quinone, are nearly equal; the a axes are nearly in the ratio 4 to 3. R. L. HERSHEY

Variability of long diffraction spacings in paraffin waxes. G. L. CLARK. *Nature* **120**, 12; *Science* **66**, 136-7(1927).—The examn. of 4 commercial paraffin waxes having m. ps. of 135°, 130°, 125° and 120° F. on an oscillating spectrograph with $CuK\alpha$ radiation reveals an increase in the long spacing with m. p. increase when the samples are prepd. identically. The 135° wax, cooled upon a glass plate with varying rapidity shows an increase from 36.64 A. U. for instantaneous cooling to 40.20 A. U. when cooling from just above to just below the m. p. took 60 min., intermediate cooling times giving intermediate values. The presence of addn. agents affects the spacing, 1% of Pb oleate impressing its own spacing 37.5 A. U. upon the whole mixt. R. L. HERSHEY

The resemblance of the fluorosulfonates to the perchlorates in chemical and crystallographic relationships, and a fluorophosphate. WILLY LANGE. *Ber.* **60B**, 962-70

(1927).—By the addn. of an aq. soln. of NH_4 fluorosulfonate to solns. of the chloride or acetate of the proper bases, L. has prepared tetramethylammonium fluorosulfonate, the *o*-toluenediazonium salt, and some alkaloid fluorosulfonates. Mixed crystals of the fluorosulfonates and perchlorates of Cs, K, Li, tetramethylammonium and the Cu-4-pyridine complex were obtained, as were mixed crystals of the corresponding permanganates and fluorosulfonates. The crystallographic examn., only begun, indicates that the simple fluorosulfonates at least resemble the perchlorates. The crystallographic and chem. examns. of the known and new fluorosulfonates and the comparison with the corresponding perchlorates and permanganates show a considerable similarity of the salts. The properties of these anions, ClO_4^- , SO_3F^- , etc. are independent of the atonicity and position in the periodic table of the central atom. Ion vol. appears important, the aq. soly. appearing to increase with increasing ion vol. Phosphoroxo fluoride, POF_3 , in cold H_2O gives POF_2OH , difluorophosphoric acid. The nitron salts may be pptd. by adding nitron acetate. The detailed description of the prepn. of the fluorosulfonates and the fluorophosphate is given. R. L. H.

The isodimorphy of the alkaline earth sulfates and the alkali perchlorates. D. VORLANDER AND HERBERT HEMPEL. *Ber.* 60B, 845-8(1927).—The alkali perchlorates undergo a transition and become optically isotropic upon heating. V. and H. investigate this property with the polarization microscope in the isomorphous alkaline earth sulfates and chromates. No transition was observed for the chromates, which are unusually luminescent when heated. BaSO_4 , CaSO_4 and SrSO_4 showed the transition, as did PbSO_4 . The alkaline earth selenates showed no transition, nor did Ca tungstate, Pb tungstate and Pb molybdate. These last three are not isomorphous with the others, being tetragonal.

The theory of crystal growth. HERBERT BRANDES. *Z. physik. Chem.* 126, 196-210 (1927).—The crystal form is detd. by the most slowly growing faces. The growth is considered to be discontinuous and to take place plane by plane. If, upon an already complete crystal plane, a nucleus of a new plane forms, energy is used to construct the nucleus boundary, thus increasing the vapor pressure of the nucleus and tending to send it back into soln. By a consideration of the energies of formation of such nuclei upon different crystal faces of NaCl, it is shown that these energies are greatest for the cubic face, less for the rhombododecahedral face, and least for the octahedral face. Hence, the rates of growth of the different faces decrease in the above order. The theory also explains the occurrence of imperfections in crystals. R. L. HERSHEY

Rate of growth of crystals in aqueous solution. G. H. MONTILLON AND W. L. BADGER. *Ind. Eng. Chem.* 19, 809-16(1927).—The rates of crystn. of Na_2SO_4 and MgSO_4 in a new continuous crystallizer were detd. over a temp. range of 27° to 31° . A definite relation exists between wt. of material crystd. and the new surface generated during crystn. under definite conditions of concn. changes. The probable effects of temp. and viscosity changes are discussed. A method of predicting probable size of the crystals produced is given.

R. L. HERSHEY

Investigation of the rate of growth of crystals in different directions. MARIE BENTIVOGLIO. *Proc. Roy. Soc. (London)* A115, 59-87(1927).—The rates of growth of the various faces of crystals of the three isomorphous salts, $\text{Mg}(\text{NH}_4)_2(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$, $\text{Fe}(\text{NH}_4)_2(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$ and $\text{MgK}_2(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$ and the polar K and NH_4 tartrates have been measured. The crystal under examn. was suspended by a horizontal pin lying in the horizontal axis of rotation of a slowly revolving flask contg. the soln. This arrangement removed the inequalities due to convection currents, and enabled the faces of the zone parallel to the axis to be studied. For measurement the crystal holder was removed from the soln. and mounted on a microscope stage, the position of the graduated head, when sharply focused, being noticed, the change in this position, after addn. growth, being the measure of the growth. The measurements show that similar faces of a simple form grow at the same rate, even when of different size; hence a misshapen crystal, grown under uniform conditions, tends towards but does not reach the ideal form with equal faces. On a combination, unlike faces grow at different rates, while like faces grow at the same rate unless certain of them are adjacent to a large face of another faster growing form, which apparently causes impoverishment of the soln. in its neighborhood and destroys the uniformity of the conditions. Except in this case there is a const. ratio between the rates of growth of any two different forms. In the case of polar crystals the rates of growth of parallel faces may be widely different. In an isomorphous series of salts the orders of increasing rates of growth of different forms are not const. throughout the series. These last two facts seem to prove that the rate of growth cannot be simply related to reticular density. Ideal forms for the crystals studied are developed from the normal rate of growth ratios. R. L. H.

The effect of gelatin on the size and distribution of macroscopic crystals grown from aqueous solutions. T. S. ECKERT AND W. G. FRANCE. *J. Phys. Chem.* **31**, 877-81 (1927).—Crystals of CuSO_4 and $\text{Pb}(\text{NO}_3)_2$ were grown by evapn. from solns. contg. gelatin, the dishes contg. the crystals photographed and the negatives projected upon a calibrated screen, allowing size and distribution to be detd. The presence of gelatin produces a marked decrease in av. size; increasing the concn. of gelatin increases the uniformity of the crystals. No differences were noticed in the effects of two grades of gelatin. The results indicate a similarity in the action of gelatin as affecting microscopic crystals formed either by electro- or chem. pptn. on the one hand and macroscopic crystals grown by evapn. from aq. soln. on the other hand. R. L. H.

Lattice variations in the formation of mixed crystals by precipitation from solutions. L. VEGARD. *Z. Physik* **43**, 299-308(1927).—Mixed crystals of $\text{HgCl}_2\text{-HgBr}_2$ of various compns. and formed by the addn. of a mixed soln. of KCl and KBr to a soln. of HgNO_3 were examd. by the x-ray powder method. The lattice dimensions depend not only upon the compn., but also upon the method of pptn. A ppt. formed by rapid addn. of the KCl-KBr soln. has dimensions varying widely from those predicted by V.'s additive law, the variation being much greater in a than in c (the lattice is tetragonal). Ppts. formed by addn. of the soln. drop by drop have dimensions much nearer the additive law values, which are apparently limiting values. The variations are shown not to be due to inhomogeneity. The width of line shows the rapidly pptd. crystals to have the smaller particle size, hence a larger proportion of "uncompensated" surface atoms, which exert a deforming influence upon the possibly deformable mercurous ion. The additive law represents the case of large crystals, i. e., very slow pptn. R. L. HERSHEY

New kinds of mixed crystals. II. D. BALAREFF AND G. KANDILAROV. *Z. anorg. allgem. Chem.* **162**, 344-8(1927); cf. *C. A.* **21**, 517.—Four forms of BaSO_4 were prepd.: (1) a cross-form, by pptn. of 0.05 N H_2SO_4 with 0.5 N BaCl_2 ; (2) by slow diffusion of 0.5 N BaCl_2 into 0.5 N H_2SO_4 ; (3) an x-form pptd. as in (1); (4) large crystals by simultaneously dropping 0.5 N BaCl_2 and 0.5 N H_2SO_4 into boiling H_2O , acidified with HCl . The loss of wt. was detd. upon heating after drying. All showed some water content, (2) being highest with 0.46 mol. H_2O per mol. BaSO_4 , and (4) lowest with only 0.07% H_2O . Form (2), upon rubbing in a mortar, drying and heating showed a decrease in loss in wt. with increased rubbing, indicating mechanical enclosure of the H_2O . Form (1), unfiltered, becomes violet colored upon standing 2 or 3 days in KMnO_4 soln. without any other change in external appearance, the phenomenon being apparently a capillary one. When filtered and calcined, or dried over H_2SO_4 , (1) does not become colored; the H_2SO_4 -dried sample when ground to a powder again becomes colored when placed in KMnO_4 . (1) changes from violet to a bright red upon standing 9 months in the same soln. This appears to be due to recrystn. III. *Ibid* **163**, 141-4.—A detn. of the sp. gr. of forms (2) and (4), (4) being considered pure, shows that the entire H_2O content of (2) was mechanically enclosed in the crystals. Detns. of the effect of BaSO_4 suspensions upon the reaction velocity of permanganate and HCl shows that the suspension diminishes the velocity, but by different amts for different permanganates. The effect cannot be that of a chem. inert suspension, since sand used instead of BaSO_4 , has no influence. The different effect upon different permanganates can be thought of as due to different adsorption by the BaSO_4 (cf. following abstr.) R. L. HERSHEY

New kinds of mixed crystals. IV. D. BALAREFF, N. GANTSCHW AND B. SREBROW. *Z. anorg. allgem. Chem.* **165**, 192-4(1927); cf. preceding abstr.—In the presence of Cu^{++} , Zn^{++} was pptd. completely by H_2S in a soln. contg. sufficient HCl to prevent pptn. of Zn^{++} when present alone. No Zn was dissolved from the mixed ppt. by treating it with HCl at 95° for 4 days. In other expts., Zn^{++} was added to pptd. CuS in HCl soln. the soln. was neutralized with $(\text{NH}_4)_2\text{S}$ or Na_2S and then concd. HCl was added. The resulting ppt. contained Zn as well as Cu . When AcONa was substituted for $(\text{NH}_4)_2\text{S}$, however, the product contained no Zn . B. considers the ppt. to be composed of ZnS adsorbed on CuS rather than a Zn-Cu complex. J. E. SNYDER

Relation between composition and solubility of mixed crystals. B. HABER-CHUWIS. *Rocz. Chem.* **6**, 700-4(1926).—Data representing the soly. of mixed crystals of copper and ferrous ammonium sulfates at 0° and at 8.2° and of ferrous and zinc potassium sulfates at 6.8° are recorded. Thiel's law is followed in both cases. Nernst's distribution law is, however, true only for the former pair of salts, where the solubilities of the constituent salts are low and close to one another, but not for the second pair, where the solubility difference is greater. B. C. A.

What are mixed crystals? E. HALPERN. *Rocz. Chem.* **6**, 661-78(1926).—Data for the soly. of mixed crystals of Mn and Cu NH_4 sulfates at 6.8° and of Ni and Cu NH_4 sulfates at 0° and 8.5° are recorded. The results are in agreement with Retgers' (*Z. physik. Chem.* **3**, 497-561) and Thiel's laws (*Z. physik. Chem.* **43**, 641-70(1903)) Nernst's distribution law is, however, only approx. satisfied, applying more closely when the solubilities of the constituent salts of a mixed crystal are close to one another.

B. C. A.

Nature of mixed crystals. A. PLOIN. *Rocz. Chem.* **6**, 690-9(1926).—The solubilities of mixed crystals of Cu and Co K sulfates at 0° and 7.8° and Cu and Zn K sulfates at 6.8° are recorded. The results confirm the conclusions of Halpern (cf. preceding abstr.).

B. C. A.

Solubility of mixed crystals. B. BERTSCH. *Rocz. Chem.* **6**, 705-10(1926).—The solubilities of mixed crystals of Cu and Co NH_4 sulfates at 0° and at 8° and of Cu and Mn NH_4 sulfates at 7° confirm the conclusions of Halpern (cf. preceding abstracts).

B. C. A.

Additive qualities of mixed crystals. D. OSTERSETZER. *Rocz. Chem.* **6**, 679-88(1926).—The solubilities of mixed crystals of ferrous and Zn NH_4 sulfates at 7° and of Cu and Ni NH_4 sulfates at 0° and 8° have been detd. Temp. differences do not appear to affect the relative solubilities of the constituent salts in the latter case. The results confirm the conclusions of Halpern (above).

B. C. A.

Nickel-chromium solid solutions. F. C. BLAKE AND A. E. FOCKE. *Phys. Rev.* **27**, 798(1926).—A complete series of nichrome alloys has been studied by the x-ray powder method.

R. L. HERSHEY

Banded structure in aluminum and copper. C. F. ELAM. *Nature* **120**, 259(1927).—X-ray examn. of the banded structure in Al and Cu showed that twinning in the octahedral plane is not always the case. Both parts of the Al twin appeared to have one dodecahedral plane in common, but the plane of junction had no relation to the crystal structure of either twin. This latter was also true of Cu, no important plane or direction appeared common to both parts.

R. L. HERSHEY

Etch planes in metallic single crystals. H. H. POTTER AND W. SUCKSMITH. *Nature* **119**, 924(1927).—The examn. of the etch planes of Fe, Ni and Al by optical reflection show Fe to give {100} planes as etch planes, Al to give {100} and occasionally {110}, and Ni to give {111} and {100}. X-ray examn. of Ni agrees with the optical data.

R. L. HERSHEY

Recrystallization phenomena in aluminum. A. E. V. ARKEL AND M. G. V. BRUGGEN. *Z. Physik* **42**, 795-806(1927).—The no. of recrystallization nuclei in Al is detd. by the increase in tensile strength caused by deformation, the recrystallization being always at the same temp. The deformation must have a certain threshold value to cause any recrystallization, this value being smaller for smaller crystals. The rate of growth in recrystn. decreases with decreasing deformation to practically zero at the threshold value. Hence recrystn. may not occur after smaller deformation, in consequence of the slow rate of growth. A crystal deformed below the threshold value cannot grow at the expense of more strongly deformed crystals at its boundaries.

R. L. HERSHEY

Increase of tensile strength of single crystals by plastic deformation. F. SCHMID. *Z. Physik* **40**, 54-74(1926).—The increase of strength of the main faces of slip in Zn crystals caused by plastic extension has been investigated; after passing the elastic limit, the strength increases linearly with the extension. The shape of the extension curve for single crystals depends on the angle between the slip and the direction of the applied force. The group of curves relating the force in the main plane of slip to the extension can be represented by a single line almost straight. A comparison is obtained for the increase in strength along the actual planes of slip and the latent planes (which cut the former) for crystals of Zn and Sn; if the 2 planes are crystallographically identical, the increase of strength is less in the actual than in the latent planes; for Zn, in which the planes are not the same, the increase is greater in the main actual plane of slip.

B. C. A.

The distortion of crystals of aluminum under compression. II. Distortion by double slipping and changes in orientation of crystal axes during compression. G. I. TAYLOR. *Proc. Roy. Soc. (London)* **A116**, 16-38(1927); cf. *C. A.* **20**, 3107.—During compression of a disk cut from a single crystal of Al, the crystal axes take a position in which 2 possible planes of slip are symmetrically disposed in relation to the stress. The orientation of the crystal axes relative to the normal to the flat surface of the specimen is different from their orientation relative to the axis of a tensile test piece. After the axes have taken the symmetrical position, Laue photographs show that they remain in such a position even when compression continues until thickness of specimen is only

0.28 of its original thickness. **III. Measurements of stress.** *Ibid* 39-60.—With expl. conditions adjusted so that the effect of friction on the surface of a specimen under compression is negligible, it is possible to measure internal shearing stresses. Identical relationships hold between shear stress and amt. of shear in both tension and compression. During slipping on two planes, resistance to shear increases more rapidly for a given total amt. of slipping than when all slip is confined to one plane.

R. J. HAVIGHURST

Application of Fourier's series to crystal analysis. R. T. HAVIGHURST. *Phys. Rev.* 55, 881 (1925).—H. describes an application of the quantum theory and the correspondence principle to the problem of electron distribution in crystals. The relative reflecting powers of the crystal planes of certain salts are obtained from x-ray measurements by the powder method. The square roots of these relative reflecting powers are used as coeffs. in a Fourier series. The distribution of electron intensity is obtained for different directions through the crystal, and comparisons are made between different salts of the same general structure

R. L. HERSHEY

The reflection of electrons from crystal lattices. F. ZWICKY. *Proc. Nat. Acad. Sci.* 13, 518-25 (1927).—The analogy between the reflection patterns for slow electrons observed by Davison and Germer (*C. A.* 21, 1927) and the diffraction of x rays is not complete in that the whole effect in the case of electrons is produced by the first few layers on the crystal surface. A derivation is given in terms of the wave mechanics for the diffraction of an electron beam by a single-lattice plane. A pattern is obtained similar to that for the reflection of light by a ruled crossed grating. The resolving power for a finite lattice is calcd. The reflecting power of a single plane is so large that it is not possible to treat this case by analogy with x rays. The interference pattern cannot be computed by assuming that the rays penetrate a great no. of layers.

F. A. JENKINS

The compressibility isotherms of hydrogen, nitrogen and mixtures of these gases at 0° and pressures to 1000 atmospheres. (A correction.) E. P. BARTLETT. *J. Am. Chem. Soc.* 49, 1955-7 (1927); cf. *C. A.* 21, 1387.—A calibration, with more exact instruments, of the pressure gage used in the recently published work shows it to be accurate to within 0.1% at pressures up to 100 atms. and 0.62% at 200 atms., the error becoming less at higher pressures. At 100 atms. the corrected results agree to within 0.26% for H_2 and 0.11% for N_2 with Holborn and Verschoyle, almost exactly at 200 atms. and above by 0.34% with Amagat, and, at pressures to 100 atms., for 3 gas mixts., to within 0.1% and at 200 atms. to within 0.4% with Verschoyle. Tables of corrected compressibility factors, ds. and const. are given

J. BALOZIAN

A transformation of theoretical chemical constants. E. WERTHEIMER. *Physik. Z.* 27, 771-4 (1926); cf. *C. A.* 15, 2770.—Herzfeld has shown that a simple derivation of the theoretical chem. const. can be given by combination of the gas equation with the equation for the number of particles in an ideal monoat. gas coexisting with a solid phase at sufficiently low temps. In contrast to Planck, who assumes that the const. h depends directly upon the gaseous and not at all upon the solid phase, H. states that h (which occurs in his equation) is detd. by the properties of the solid and has nothing to do with the gas; actually the classical theory only is used for the description of the state of the gas. W. finds that both conceptions can be combined based on the premise that the contemplated monoat. substance consists of Bohr's atoms; this permits the application of Bohr's laws regarding the structure of matter to this problem. E. K.

The chemical constant of the diatomic molecules. F. J. v. WISNIEWSKY. *Z. Physik* 44, 392-5 (1927).—Using his model of the diat. mols., W. calcs. the const. of the chem. equil. between diat. mols. The values thus obtained for Cl_2 , Br_2 , I_2 and H_2 check the ones given in the literature (*Z. Physik* 29, 1-36 (1924)). These values are also calcd. for O_2 , N_2 , CO , CO_2 and NH_3 .

A. L. HENNE

Characteristic equation of gases. K. SHIRA. *Proc. Imp. Acad. (Japan)* 2, 398-400 (1926).—A discussion of the equation of state advanced by S., in which it is concluded that the equation of Clausius cannot be considered as a corrected form of that of van der Waals. The limitations of Goebel's equation are discussed and the law of intermol. force is deduced to be of the inverse 8th or 9th power for CO_2 , in approx. agreement with Debye's theory.

B. C. A.

Mobilities of ions in acetylene-hydrogen mixtures. L. B. LOEB and L. DU SAULT. *Proc. Nat. Acad. Sci.* 13, 510-6 (1927); cf. *C. A.* 21, 1221, 1222.—New measurements are reported of the mobilities of gaseous ions in C_2H_2 and mixts. of C_2H_2 with H_2 in varying proportions. For C_2H_2 alone, in agreement with Erickson (*C. A.* 21, 701) the negative ions are found to have a slightly higher mobility than the positive ions, although the difference is probably illusory, due to the probable presence of free electrons

which was indicated by the expts. It is concluded that both ions have the same initial mobility, viz., 0.708 cm./sec. per \sqrt{v} /cm. In the presence of H_2 the mobilities follow the law of mixts. for non-reactive gases, with no indications of clustering on either ion. Contrary to Frickson's interpretation of the abnormal mobilities in C_2H_2 in terms of bimol. ion formation, it is supposed that the effects are due to the free electrons, as is also probably true in the case of H_2 . F. A. JENKINS

Methods of determining distillation factors. E. ÖMAN. *Teknisk Tidskrift, Upp-
laga C (Kemi)* 57, 27-30(1927).—The distn. factor is defined as the ratio between the content of the more volatile component in the vapor and in the liquid during distn. of a mixt. of liquid substances. Various methods of detg. this ratio are described and the disadvantages are outlined. In a newly designed app. shown diagrammatically, the vapor is sampled from the tube B where it is completely homogeneous. When the factor is to be detd. at increased or reduced pressure the arrangement shown by C is used. The points a and b then have to be connected by a rubber tube. Corrections are introduced for the amts. of liquid and vapor in circulation in the app. If the compn. of liquid and vapor is difficult to det. by analysis the compn. of the phases can be estd. by making a series of very accurate b. p. detns. This procedure has been employed with mixts. of water and methanol. C. A. ROBAK

Determining the distillation curve of benzene-toluene. E. ÖMAN. *Teknisk Tidskrift, Upplaga C (Kemi)* 57, 35-8(1927); cf. preceding abstr.—The distn. curve of the mixt. benzene-toluene has been detd. The method of analysis employed is similar to that for carbohydrates (C. 1 21, 1077). A suitable quantity of 70% alc. is added, the mixt. cooled and the temp. observed at which the mixt. begins to pale, the "paling point." The cooling was at the rate of 0.4° per min. The amt. of alc. added must be measured exactly: 820 cc. alc. to 200 cc. of the mixt. to be analyzed having been found a suitable ratio. Since the concn. of the alc. has a great influence upon the paling point, the same alc. must be used for all detns. or, if it is preferred, the exact concn. of the alc. can be detd. by measuring its paling point with pure toluene. Detns. of the distn. factors were made with mixts. of pure benzene and toluene in 6 different proportions and the distn. curve was set up. In mixts. contg. 1, 2, 3, 4, 5, 10, 20 and 30% of benzene the factors were, resp. 3.6, 3.2, 3.0, 3.0, 2.8, 2.4, 1.9 and 1.7. In the mixts. contg. more benzene the found values are considered less accurate. C. A. ROBAK

Separating benzene and toluene in fractionating columns. E. ÖMAN. *Teknisk Tidskrift, Upplaga C (Kemi)* 57, 38-41(1927)—By means of the distn. curve (cf. preceding abstr.), calcns. are made of the chief conditions governing the fractionating process, such as the no. of floors, the quantity of heat applied, etc., with a special view to mixts. contg. about 5% of benzene and 95% of toluene. C. A. ROBAK

Density and temperature. VI. W. HERZ. *Z. Elektrochem. angew. phys. Chem.* 33, 348-9(1927); cf. C. A. 20, 320.—The relationship $(d - d_0)/a(t - t_0)^b = 1$ holds, in which d is the density of any liquid at the temp. t , d_0 and t_0 are the crit. values and a and b consts. characteristic of the material. Calcns. are given for $MeOOCII$ at temps. 30° to 190° , for $HOAc$ at temps. 20° to 310° , Cl_2 from -100° to 120° , A from -182° to -125° and N_2 from -208° to -150° . There is no progressive change in the value of the quotient, which is const. within 2 or 3%. Other cases have been calcd. with equal success, but the results are not given. A. W. KENNEY

A new method for measuring vapor densities. PHILIP BLACKMAN. *Chem. News* 135, 97-100(1927).—The method consists in enclosing the liquid whose vapor density is to be measured in a double U shaped glass app. over Hg. The app. is so constructed that the vol. of inclosed air, vapor of the substance being measured and the displaced Hg can readily be detd. The v. p. may be detd. either above or below atm. pressure, by slightly altering the form of the app. The d. of 35 org. compds. detd. with this app. is given. Substances reacting with Hg cannot be detd. J. W. SHIPLEY

The volumetric determination of the density of liquid substances. B. LYASKO. *Nauchnue Zapiski* (Russian) 4, 308-14(1927).—According to a phys. law the height of a liquid column is inversely proportional to its sp. gr. at the same diln., that is, if one designates by a the height of the column of the liquid in mm. b the diln. in mm. of the height of the column of water, x the sp. gr. of the liquid, then $a = b/x$ and $x = b/a$.

In constructing a new app. for the detn. of the d. of sugar products use has been made of the above formula. The value of a is a const. equal to 1, and x is therefore equal to $b/1 = b$. The value for b is found by reading a scale. From practical considerations the unit a is 650 mm., and a scale is made up to read the sp. gr. of liquids ranging between 0.65 and 1.5, to 0.001. The app. is described (illus.) with directions for its use. A table for the direct reading of the content of dry matter calcd. from the sp. gr. of sugar solns. accompanies the article. J. S. JOFFE

Graphical method for the construction of the viscosity-shear gradient curve. E. HATSCHKE. *Kolloid-Z.* 41, 11-4(1927).—A purely graphical method of constructing the viscosity-shear gradient curve is developed from an equation derived in a previous paper (*C. A.* 20, 3607). B. C. A.

Viscometry by variation in velocity of flow, and a new viscometer. W. O. OSTWALD AND R. AUERBACH. *Kolloid-Z.* 41, 56-62(1927).—Existing forms of viscometer are described and critically discussed. A new type of viscometer (the "over-flow" viscometer) is described. In this form, the liquid is contained in a vertical, graduated tube, falls through hydrostatic pressure through a capillary tube, and overflows by means of a U-tube into a receptacle. The methods of measurement and calcn. of results are demonstrated. B. C. A.

H. LeChatelier's viscosity law. P. LAZAREV. *Compt. rend.* 185, 106-7(1927); cf. *C. A.* 19, 878.—LeChatelier's law for the viscosity (η) of glass as a function of the temp. can be written $\log \eta/\eta_0 = N - M/t$, or $\log \eta = \log \eta_0 + 10^N - M/t$, or $\eta = \eta_0 10^{10N - M/t}$, in which η_0 , M and N are consts. The formula is also accurate in the case of viscous liquids, calcd. values agreeing very closely with the exptl. values of Thorpe and Rotgen (Landolt-Bernstein, *Physik. Tabellen* 1, 5 Aufl., 1923, p. 151) for AmOH. Numerous viscosity detns. by the falling-sphere method have shown the formula to be applicable also to molasses and solns. of sugar in glycerol, the av. differences between calcd. and exptl. values being 1.21-1.51% and max. difference 4%. A. PAPINEAU-COUTURE

The viscosity of liquids above their boiling points. III. TOSHIKO TITANI. *Bull. Chem. Soc. Japan* 2, 196-201(1927); cf. *C. A.* 21, 3291.—The sp. fluidity, ϕ_1 , of CO_2 plotted against the sp. surface, $V_1^{2/3}$, gave a nearly straight line. The values of ϕ_1 from known data were compared with those calcd. from the equation $\phi_1 = K_1 (V_1^{2/3} - B_1)^{1/2}$, where $K_1 = 3060$ and $B_1 = 0.669$ and found to be in fair agreement. The relation between mol. fluidity ϕ and temp. is $\phi = \phi_k - C(T_k - T)^{1/2}$, where ϕ_k is the value of ϕ at the crit. temp. T_k and C is a const. When $\phi = 0$, the viscosity is infinity and the temp. obtained from the equation was found to be very near to the f. p. for many substances. Also, this temp. is about $7/20$ of T_k . The relation $V^{2/3} = V_k^{2/3} - A(T_k - T)^{1/2}$ was obtained between the orthobaric vol. and temp. and found to agree well with exptl. data. E. R. SMITH

The measurement of small vapor and partial pressures. H. v. HALBAN AND K. SIEDENTOPF. *Z. angew. Chem.* 40, 661-6(1927).—A brass rod is mounted vertically in a glass tube through which the gas passes, the upper end of the rod being held at 0° in an ice bath and the lower end at -76° in a bath of ether and solid CO_2 . The point at which dew or solid is deposited on the rod is an index to the concn. of the vapor in the gas used. This app. must be calibrated by the use of known mixts. and is said to be accurate for the measurement of partial pressures of H_2O in air of less than 1 g. per cu. m. Very small amts. of the gas sample suffice for a detn. J. H. PERRY

Solution of the ammonium chloride problem. A. SMITS. *Rec. trav. chim.* 46, 445-52(1927).—An app. for the simultaneous measurement of the vapor pressure and vapor density of dry and moist NH_4Cl at temps. between 280° and 310° is described. The app. is called a densi-tensimeter. A Jena-glass bulb of 10 cm. diam. contains a quartz knife edge and a graduated glass scale. From measurements with this app. it is concluded that the vapor pressure of NH_4Cl is lowered by intensive drying. The inner transformations of NH_4Cl by heating are not stopped by intensive drying, but a marked shifting of the inner equil. is observed. This shifting of the equil. diminishes as the temp. is increased and completely disappears at 310° . The vapor d. of 26.75 was found at 286° . This is explained by assuming that larger mols., as well as NH_4Cl , NH_3 and HCl mols. are present. The association increases with decreasing temp. The calcd. mol. heat of vaporization decreases from approx. 64,000 cal. at 280° to approx. 20,000 cal. at 325° . The results are interpreted on the basis of the previously published theory of the internal equil. between NH_4Cl and $(\text{NH}_4\text{Cl})_n$ mols. (cf. *C. A.* 17, 3815). R. L. DODGE

Polishing of surfaces. N. K. ADAM. *Nature* 119, 162-3(1927).—It appears unnecessary to suppose that actual liquefaction occurs, an amorphous layer indistin-

guishable from a supercooled liquid being formed by any mechanism which rearranges the surface mols. at random. Moreover, the resolidification of a liquefied surface layer might result in crystn. B. C. A.

A new capillary phenomenon. A. JANEK. *Kolloidchem. Beihefte* 24, 418-48 (1927).—If a reaction resulting in a ppt. takes place between 2 components, one of which is dissolved in a jelly that is spread out in a thin layer on a glass plate, and the other is dissolved in a liquid drop placed beside the jelly, a banded, jelly-like membrane holding the ppt. sometimes forms over the surface of the drop. The membrane bands exhibit a structure typical of the system and in no way connected with rhythmic pptn. within the jelly. It takes place in cases where rhythmic pptn. within the jelly is absent. The phenomenon results from a rhythmic extension of the drop in projections between jelly layer and glass surface. Reaction between components in jelly and drop on contact forms a fringe of ppt. in the jelly touching the drop. When the fringe reaches a certain thickness, the drop pushes under the fringe and lifts it to the surface of the liquid. Repetition of the process forms the banded membrane. The jelly contg. the ppt. is more easily torn away from the glass than the jelly contg. no ppt.

F. L. BROWNE

The surface tension of molten metals. I. Copper. E. F. LIBMAN. *Proc. Nat. Acad. Sci.* 13, 588-92 (1927).—The "capillary const." of Cu with total impurities amounting to 0.019% varies from 0.308 to 0.297 in a temp. range from 1083-1318° and for impure Cu with impurities amounting to 0.11% the values vary from 0.301 to 0.275 in the same temp. range. These values are calcd. from the depression of molten Cu in contact with a vertical plane and in a capillary tube. M. F.

Capillarity and displacement. K. SCHULTZE. *Kolloid-Z.* 41, 6-11 (1927); cf. C. A. 21, 6, 1388.—Expts. are described on the behavior of pairs of non-miscible liquids in capillary spaces. When light petroleum is contained in a capillary tube, and water, colored with ammoniacal cupric oxide, is drawn up into the tube, the water begins to spread from the meniscus sepg. the two liquid phases, and along the sides of the glass tube, displacing therefrom the petroleum. Finally, the petroleum-glass interface becomes entirely a water-glass interface, irrespective of which liquid is placed on top. B. C. A.

Surface tension of sodium. F. E. POINDEXTER. *Phys. Rev.* 27, 820 (1926).—Detns. of the surface tension of Na were made, by a modified flat-drop method in a high vacuum, over a temp. range from 105° to 245°. Values at 100° and 250° are 222 dynes/cm. and 211 dynes/cm., giving a temp. gradient of 0.072 dyne/cm. per degree; k in the Eötvös relation is 0.62, which is interpreted to mean the mols. in liquid Na are polyat. R. L. HERSHEY

Determination of the surface tension by means of capillary rise. **Surface tension of water, ethyl alcohol, boron trichloride and silicon tetrachloride.** HERBERT MILLS AND P. L. ROBINSON. *J. Chem. Soc.* 1927, 1823-32.—Using glass tubes of much smaller bore ($r = 0.07325, 0.20168, 0.25287, 0.27165, 0.41354, 0.49920$ mm.) than have been previously used, the authors have detd. at 25° ± 0.01 the surface tension γ of H₂O (I), EtOH (II), BCl₃ (III) and SiCl₄ (IV). At 20° $\gamma =$ (I) 72.90 ± 0.04 , (II) 22.05 ± 0.01 , (III) 16.70 ± 0.01 , (IV) 19.71 ± 0.01 provisional. The change of γ per degree is 0.15, 0.09, 0.11 and 0.12, resp. It was found that several hrs. were required for the meniscus to attain a const. level. F. R. SCHIERZ

Capillary activity of filter paper. L. JENDRASSIK AND A. CZIKE. *Biochem. Z.* 185, 470-6 (1927).—The surface tension of an aq. soln. is usually raised when its surface is quickly wiped by a strip of filter paper. If the paper remains in contact with the surface for a while there is a lowering of the surface tension either due to the spread of surface-tension-lowering impurities present in filter paper which are removable by extraction with alc., or in the case of solns. of alkaloid salts this is occasioned by a rise in the p_H due to the binding of acid. S. MORGULIS

Studies on permeability. Surface activity of the dye trypan blue on different surfaces. N. OKUNEFF. *Biochem. Z.* 187, 37-50 (1927).—Trypan blue is capillary inactive at the H₂O/air boundary, but strongly active at H₂O/C₆H₆, H₂O/petroleum ether or H₂O/olive oil. The surface tension at these boundaries is reduced to $\frac{1}{2}$ by the addn. of trypan blue to the H₂O. The lowering of the surface tension shows definite and typical dependence upon the dye concn., age of the surface of contact or of the dye soln. itself. Trypan blue shows the greatest surface activity at the H₂O/petroleum ether interface and the least at the H₂O/olive oil interface. S. MORGULIS

Measurement of the temperature effect on surface energy of solutions and biological fluids as a means of determining the surface tension of dissolved substances. P. REHBINDER. *Biochem. Z.* 187, 32-6 (1927).—The total surface energy σ of chemically

pure liquids is almost independent of T , but this is not the case where solns. instead of pure liquids are examd., the value of σ diminishing because one of the 2 soln. components is adsorbed on the surface boundary. S. MORGULIS

Spheroidal state of liquids on heated metallic surfaces. I. MÔSCICKI AND J. BRODER. *Rocz. Chem.* 6, 321-54(1926).—App. is described for the concn. of HNO_3 in iron vessels, corrosion being avoided by heating the iron to such a temp. that no wetting of the surface takes place. Expts. were made to det. the limiting temps. at which the wetting of wires immersed in various liquids comes to an end. The conception of "adsorption pressure" is introduced, this being the pressure exerted on the metal surface by the mols. of the layer of liquid wetting it; the actual pressure exceeds this by the pressure of the atm. Hence the b. p. of this layer is higher than that of the rest of the liquid, and is identical with the limiting temp. at which wetting ceases. It is shown that this temp. is a const. for a given liquid and metal, invariably higher than the b. p. of the former, and independent of its temp. The limiting wetting temp. for aq. solns. of non-electrolytes at a Pt surface is higher than for pure water (130°) pointing to a greater concn. of solute in the surface layer. It increases according to the series Pt, Fe, Ag, Ni, Cu and Pb. B. C. A.

Adsorption at crystal faces. I. The growth and solution of single copper sulfate crystals in the presence of gelatin and dyes. T. S. ECKERT AND W. G. FRANCE. *J. Am. Ceram. Soc.* 10, 579-91(1927).—Crystal growth and soln. were studied by means of a moving-picture camera. Gelatin decreases the rate of growth of CuSO_4 crystals and changes the growth velocity at a nonuniform rate in different directions. Quinoline yellow, bismark brown and methylene blue greatly change crystal habit and decrease rate of growth. Naphthol yellow, ponceau 2R and methyl violet have no effect. Viscosity and convection currents are the important factors in detg. the rate of soln. in gelatin or dye. Sp. adsorption is believed largely responsible for changes in crystal form produced by gelatin or dye. C. H. KERR

Adsorption by carbon in viscous media. G. WEISSENBERGER AND S. FRANKEL. *Kolloid-Z.* 41, 14-27(1927).—The amount of I adsorbed by various charcoals from glycerol solns. was detd. by titration after equil. was attained. Measurements of the viscosity of the solns. were also made. Expts. were carried out on the adsorption of I from aq. soln. by carbon, kaolin and ruddle. The results show that the formula of Lockemann and Paucke (*C. A.* 5, 3531) holds in highly viscous solns., and that the relation between total adsorption and the viscosity of the medium is given by the formula $m_T = \Gamma \cdot \eta^{1/r}$, where Γ and $1/r$ are consts. The formula $m_T = K \cdot \eta^p$, where η is the initial concn. and K and p are consts., was found to hold in the cases examd., but is of only empirical significance. It is shown that coloring matters can be detd. in boiling soln. contg. strong H_2SO_4 by means of permanganate titration. The max. error observed was $\pm 1.2\%$. B. C. A.

Adsorption. ALBERT AUBRY. *Bull. soc. ind. Mulhouse* 93, 284-304(1927).—An address dealing with its theory, general laws and industrial applications. A. P.-C.

The activation of wood charcoal by progressive oxidation in relation to bulk density and iodine adsorption. A. B. P. PAGE. *J. Chem. Soc.* 1927, 1476-94. Samples of wood charcoal taken from a large standard stock supply were oxidized at various temps. between 500° and 900° , and at atm. pressure by a slow stream of air or of O-N mixts. rich in N. The appearance, apparent d., % yield, sorptive capacity for I in C_6H_6 soln., and rate of I sorption of the treated samples were compared. The sorption isotherms were detd. for 22 and for 150 hrs.' shaking for each sample over a range of concn. from 0.01 N to 0.2 N I in C_6H_6 . The isotherms were mostly parabolic. The Freundlich consts. were plotted against the degree of oxidation of the charcoal. The k and $1/n$ curves can be built up from simple curves of 2 quantities, one of which decreases, while the other increases with oxidation. The available surface is considered to be the quantity that increases, and the effective no. of attracting centers per unit surface, the quantity that decreases. R. L. DODGE

Swelling of activated charcoal. P. N. PAVLOV. *Kolloid-Z.* 42, 112-9(1927).—Both animal and sugar charcoal were tested with solns. of acid and base for swelling. The concn. of the solns. is a function of the swelling and in some cases a max. or min. point is found. Cane-sugar charcoal swells much less than animal charcoal and appears to have 2 min. points. The iso-elec. point of the charcoal was also detd. at $p_H = 8.3$. Graphite swells in many liquids and some values are recorded of these, together with the charcoals previously described for the same liquids. Swelling and absorption are closely related. R. H. LAMBERT

Active charcoal. Charcoal activated by mineral substances. M. SWIDEREK. *Rocz. Chem.* 6, 603-32(1926).—Charcoal activated by carbonization in presence of

mineral substances such as ZnCl_2 or asbestos owes its activity to the extension of its surface by the fine division of the charred mass on the mineral bases. Its adsorptive power is detd. by the dimensions of the pores, and these, again, depend on the rapidity of carbonization. Such charcoal-covered granules adsorb gases and decolorize liquids at about the same rate as ordinary charcoal. The activity of such activated charcoal varies with the proportion of the charcoal in the prepn. B. C. A.

The so-called adsorption of ferric oxide hydrosol by charcoal. A. W. THOMAS AND T. R. LE COMPTE. *Fourth Colloid Symposium 1926*, 328–54 (Chem. Catalog Co.).—The charcoals used were: tech. Norite; com. blood charcoal; cane-sugar charcoal; Norite purified by 6 M HCl and 10 weeks' washing; bone charcoal similarly purified. The iron oxide sols were made by adding 10 M NH_4OH to 27 M FeCl_3 soln. which had been first mixed with an equal vol. of H_2O . The NH_4OH was added dropwise until the ppt. dissolved with difficulty, and prolonged dialysis reduced the Fe/Cl ratio from 17.9 to 48.6. From the exptl. data educed, the following conclusions are drawn: Purified charcoals do not adsorb Graham iron oxide sols; the high removal powers of tech. charcoals are essentially due to the pptg. action of their electrolyte impurities; the operation of the "liminal value" principle being evident; the principle of "exchange adsorption" satisfactorily accounts for the phenomena observed; purified charcoals have negligible adsorption on FeCl_3 solns., at least up to 0.02 M ; tech. Norite has high, but purified Norite slight, removal power toward HCl , and up to 0.004 M HCl a comparison of titration and gravimetric detus. shows that only about $1/4$ as many mols. of Cl ion are removed as of H ion. Sufficiently purified charcoal does not ppt. Au sols. JEROME ALEXANDER

Adhesion forces in solutions. IX. The adsorption of substances from dilute aqueous solutions in the presence of nonelectrolytes. MICHAEL DUBININ. *Z. physik. Chem.* 128, 266–84 (1927); cf. *C. A.* 20, 3605.—The adsorption of HCl by activated charcoal from $\text{MeOH}-\text{H}_2\text{O}$, ether- H_2O , and acetone- H_2O soln. was measured. The presence of the org. compds. decreased the HCl adsorption and changed the shape of the isotherm. The effect is attributed to adsorption of the org. substance, being most pronounced with ether, and least with MeOH . Measurements of ether, acetone and MeOH adsorption from aq. solns. substantiate this explanation. Measurements of the adsorption of grape sugar and AcOH from aq. solns. contg. ether, acetone and MeOH show a similar decrease in adsorption, but a less pronounced change in shape of the adsorption isotherms. R. L. DODGE

Adsorption and diffusion phenomena in the electrical field—theoretical remarks on a paper of the same name. REINHOLD FURTH. *Z. physik. Chem.* 126, 238–46 (1927).—A discussion of earlier papers (cf. *C. A.* 21, 200 and *C. A.* 21, 2005). The phenomenon under these conditions is not truly electrolysis nor cataphoresis, but a coöperation of field effect and diffusion. On one electrode both kinds of ions are absorbed. This electrode is that one to which the ion of less mobility is drawn by the field. The amt. of the common ion absorption is detd. by the rule that on the cathode the deposition of both kinds is greater the higher the atomicity of the cation against that of the anion, and *vice versa* at the anode. R. L. HERSHEY

The interfacial activity and energy on different surfaces and their specific adsorption capacity. P. REHBINDER. *Biochem. Z.* 187, 19–31 (1927).—The interfacial activity of a capillary-active substance at the boundary of 2 phases increases as the difference in polarity of the 2 phases increases. This accounts for the fact that many biologically important substances like dyes, adrenaline and fatty acids are much more active (*i. e.*, are more adsorbed) on a $\text{H}_2\text{O}/\text{hydrocarbon}$ (petroleum ether, benzene) than on a $\text{H}_2\text{O}/\text{air}$ boundary. It is further shown that the difference in polarity of 2 fluid phases can be detd. from the difference in soly. of the substance in the 2 phases as well as the surface tension $(\sigma_{12})_0$ of the 2 phases in pure condition. The activity $G = \Delta\sigma/\Delta c$ at the boundary of 2 fluid phases varies directly as the σ_0 value. If H_2O is in contact with another phase of varying polarity (hexane, C_6H_6 , olive oil) or is itself replaced by a less polar fluid contg. OH groups, the value of G increases regularly with the increasing change in polarity. The distribution of a capillary-active substance between 2 phases is demonstrated to depend upon the surface action on each side of the boundary. The surface activity is a means of measuring the purity of a substance. Thus, for instance, natural adrenaline is much more active than the synthetic product at a $\text{H}_2\text{O}/\text{C}_6\text{H}_6$ surface boundary, *i. e.*, the adrenaline base is much more adsorbed than the salt. S. MORGULIS

Adsorption of ions and of sols at interfaces and its application to certain problems of colloid chemistry. N. R. DHAR. *Quart. J. Indian Chem. Soc.* 4, 173–81 (1927).—A review is given of 10 years of work at Allahabad. The greater the valency of an

ion, the less it is adsorbed. The amt. of adsorption is increased by chem. affinity. Sols may adsorb ions carrying the same charge as the sol. ° The abnormal behavior of sols with regard to general diln. rule, mixts. of electrolytes, positive acclimatization, and decrease of viscosity on the addn. of small concns. of electrolytes is mainly due to the adsorption of similarly charged ions. Increase in charge of a sol decreases its viscosity and hydration. Some sols are adsorbed strongly by their freshly pptd. unpeptized solids. These form Liesegang rings in which a layer of ppt. follows a clear space. Other sols are not adsorbed by their freshly formed unpeptized ppt. They form Liesegang rings of alternating colors with no clear spaces. The first type of behavior is exhibited by Ag_3CrO_4 , PbCrO_4 , $\text{Fe}(\text{OH})_3$, etc. The second type of behavior is exhibited by Sb_2S_3 , CdS , MnO_2 , etc. References are given to previously published articles.

F. E. BROWN

An experimental test of the Gibbs adsorption theorem: a study of the structure of the surface of ordinary solutions. J. W. MCBAIN AND GEO. P. DAVIES. *J. Am. Chem. Soc.* **49**, 2230-54(1927).—A simple method is described for accurately measuring the abs. adsorption at an air-liquid interface. Aq. solns. of *p*-toluidine, amyl alc. and camphor were studied by this method. In every case, the amts. actually adsorbed were several times greater than that corresponding to a monomol. film. It is concluded that over a wide range of concn. a surface of these solns. consists of a satd. monomol. film of solute resting upon a comparatively thick layer of concd. soln., gradually decreasing in concn. with depth to the bulk concn. of the soln. The structure is that of chains of oriented mols. of solute extending downward into the soln. from the outermost monomol. film. The so-called concn. formula of Gibbs is shown to give erroneous values for adsorption. The true thermodynamic formula of Gibbs must be used, and all the components, including the elec. effects, must be taken into account. R. L. DODGE

Influence of adsorbed substances on chemical equilibrium in solution. RENÉ DUBRISAY AND JEAN BRAVARD. *Compt. rend.* **185**, 385-6(1927).—The concn. of dissolved Ca in equil. with CaCO_3 and various amts. of NH_4Cl was measured in the presence and in the absence of diatomaceous earth. In every case the concn. of sol. Ca was increased by the presence of the earth, the influence of which was greater the lower the temp. The importance of this displacement of equil. in the fixation of fertilizers by soil is indicated.

R. L. DODGE

The diffusion of small particles in a liquid. WARREN WEAVER. *Z. Physik* **43**, 296-8(1927).—A mathematical discussion of the time required for the establishment of a stationary equil.

A. L. HENNE

Visible and latent differentiated zones in macroscopic homogeneous suspensions. A. STEIGMANN. *Kolloid-Z.* **41**, 18(1927); cf. *C. A.* **15**, 638; **16**, 690.—A description is given of the differentiated zones formed by colloidal pptd. Ag salts. These have in some cases a cellular structure and resemble anatomical preps. The differentiation is more apparent when the system is exposed to bright daylight than in diffused light.

B. C. A.

Rhythmical precipitation of calcium hydroxide. W. M. FISCHER AND A. SCHMIDT. *Rocz. Chem.* **6**, 404-14(1926).—Periodic variation in light intensity may cause rhythmical pptn. of $\text{Ca}(\text{OH})_2$. True rhythmical pptn., due to chem. factors alone may be observed when CaCl_2 soln. diffuses into a NaOH soln. under a cover-glass. The $\text{Ca}(\text{OH})_2$ which is at first pptd. soon disappears, being replaced by an unstable hydrate, $2\text{Ca}(\text{OH})_2 \cdot \text{H}_2\text{O}$, which then rapidly changes back to the stable normal hydroxide. The optical and crystallographic constns. of these two hydroxides are detd. and compared.

B. C. A.

***Solubility and grain size. IV.** D. BALAREFF. *Z. anorg. allgem. Chem.* **163**, 213-6(1927).—An alcoholic aq. soln. of H_2SO_4 has been used to ppt. alcoholic BaCl_2 and alcoholic Ba acetate. The first colloid has been washed 37 times, the second 17 times. The sizes of the smallest particles were 0.1μ and less than 0.1μ , resp. A suspension of these colloids in water has a cond. at 25° of $3.3-3.9 \times 10^{-6}$, against 2.86×10^{-6} for a normally satd. soln. After two weeks, the cloudiness had not yet vanished. A finely cryst. ppt. of BaSO_4 has been obtained by adding $0.5 N \text{H}_2\text{SO}_4$ drop by drop to a boiling $0.5 N \text{BaCl}_2$ slightly acidified with HCl . The size of the smallest particles was 0.2μ . The cond. at 25° was 3×10^{-7} , and after a very long washing dropped to 2.89×10^{-6} . If water containing a BaSO_4 suspension is submitted to temp. fluctuations, and constantly shaken, 6 fluctuations between 12° and 28° are sufficient to cause the disappearance of the small 0.2μ particles. By fluctuation between 24° and 53° , no effect can be detected after one hr. It takes 12 hrs. for a supersatd. gypsum soln. to come in equil. with a gypsum plate, whereas it takes only $1\frac{1}{2}$ hrs. for the plate to reach the satn. point when it is put into water. The ratio of the 2 processes is thus

$\frac{1}{4}$. When a suspension of BaSO_4 in H_2O is stirred for $2\frac{1}{2}$ hrs., the no. of smaller particles increases, but when the stirring is continued for 30 hrs. the smaller particles disappear completely. This will explain the fact that it takes a longer time for pulverized and stirred gypsum to reach equil. than it does for a gypsum plate. It has never been definitely proved that smaller BaSO_4 particles are more sol. than larger ones.

A. L. HENNE

Colloidal syntheses with the aid of titanium trichloride. I. Hydrolysis and oxidation products of titanium trichloride. A. GUTBIER, BERTA OTTENSTEIN, EDITH LEUTHEUSSER, K. LOSSEN AND F. ALLAM. *Z. anorg. allgem. Chem.* **162**, 87–100 (1927).—An aq. soln. of TiCl_3 yields colloidal TiO_2 by dñ., heating and action of the air. The reaction can be controlled by measuring the variation of the p_{H} . The steps are: $\text{TiCl}_3 \rightarrow \text{TiCl}_2 \rightarrow \text{TiClO}_2\text{H} \rightarrow \text{TiO}_2\text{H}_2$. The formula of the colloidal titanic acid must be represented by $\text{TiO}_2 + x\text{H}_2\text{O}$, x being very variable and depending on the method of prepn. No definite hydrate can be traced. The x -ray analysis shows the TiO_2 lattice to be analogous to that of anatase or rutile, depending on the sample of titanic acid. **II. Colloidal gold and colloidal selenium.** A. GUTBIER, BERTA OTTENSTEIN AND K. LOSSEN. *Ibid* 101–9.—The hydrolysis and oxidation of TiCl_3 renders it easy to obtain colloidal Au or Se from AuCl_3 or SeO_2 . TiO_2 is a strongly protective colloid.

A. L. HENNE

Colloid syntheses with the aid of titanium trichloride. III. Colloidal copper. A. GUTBIER AND BERTA OTTENSTEIN. *Z. anorg. allgem. Chem.* **164**, 274–80 (1927); cf. C. A. **21**, 351; cf. preceding abstract.—Cu-Ti-“purple” was prepd. as follows: 0.42% TiCl_3 soln. was heated to boiling, converting it in part to $\text{TiO}_2 \cdot x\text{H}_2\text{O}$, which acts as protecting colloid. The soln. was cooled rapidly to room temp. and to 5 cc. of it was added 5 cc. of 0.025% CuSO_4 or CuO . Within 5 or 10 min. the Cu was reduced to deep-red, colloidal Cu. The sols made with CuO were very stable, especially when not dialyzed. Sols containing more than 0.04% Cu even if dialyzed remained undecomposed for several weeks when kept in stoppered containers, but more dil. sols oxidized readily. Dry colloids could not be prepd. because they oxidize too easily. The fresh, unwashed ultrafiltrate from the sols could be redispersed in H_2O . Sols prepd. from CuO were more stable than those made from CuSO_4 , because SO_4^{--} has a pptg. action. The sols made with CuO were stable on boiling and on freezing. The sols were exceptionally sensitive to electrolytes, had a viscosity close to that of H_2O , were polydispersed according to ultramicroscopic observation, and were positively charged as detd. by cataphoresis. **IV. Colloidal rhodium.** A. GUTBIER AND E. LEUTHEUSSER. *Ibid* 281–6.—Colloidal Rh protected by $\text{TiO}_2 \cdot x\text{H}_2\text{O}$ was prepd. by the same method used for colloidal Cu except that Na_3RhCl_6 replaced the CuO . The reaction was quant., requiring 3 mols. of TiCl_3 per mol. of Na_3RhCl_6 . The sol could be dialyzed until it contained 0.4% Cl^- and still remain stable, but on longer dialysis it formed a jelly and finally coagulated. The coagulum could be peptized with HCl or NH_3 . The sol with NH_3 was stable for only a few days. The residue obtained by evaporating Rh sol to dryness remains sol. in H_2O for several days, but the soly. gradually diminishes until it becomes insol. The sol was found to be polydispersed; its viscosity was similar to that of H_2O ; it was relatively resistant to electrolytes, catalytically decomposed hydrazine hydrate, and was positively charged. **V. Colloidal bismuth and antimony.** A. GUTBIER, BERTA OTTENSTEIN AND F. ALLAM. *Ibid* 287–96.—Bi-Ti-“purple” was prepd. in analogous manner to the Cu-“purple” by using $\text{Bi}(\text{OH})_3$ in place of CuO and using NaOOCCH_3 to regulate the p_{H} of the TiCl_3 soln. The Bi sol must be kept sealed from air to protect it from oxidation. The dry colloid also oxidizes readily. The sol was found to be stable on boiling or on freezing. It had a viscosity similar to that of H_2O ; it was positively charged and polydispersed. Sb-Ti-“purple” was prepd. by adding a suspension of $\text{SbOCl} \cdot x\text{H}_2\text{O}$ to hot TiCl_3 soln. and dialyzing. The sol oxidized very easily. It was positively charged, stable on freezing, polydispersed, and had the viscosity of H_2O .

F. L. BROWNE

Synthesis of red dispersoidal solutions of gold by means of aqueous extracts from fresh leaves of plants. EIICHI IWASAKI. *Bull. Chem. Soc. Japan* **2**, 187–91 (1927).—Exts. were prepd. by boiling fresh leaves in H_2O 10 min. and filtering. Ten cc. of ext. and 10 cc. of 0.1% $\text{HAuCl}_4 \cdot 4\text{H}_2\text{O}$ soln. were added simultaneously to 500 cc. boiling distd. H_2O , and boiling was continued until the soln. was 260 cc. (25 min.). The red colloidal sols. thus formed were perfectly stable. Maple and cherry-leaf exts. gave reddish violet sols; pine needles, bamboo leaves and camellia leaves gave bright red sols.

A. W. FRANCIS

The synthesis and properties of colloidal molybdic acid. S. I. D'YACHOVSKII AND A. V. DUMANSKIY. *J. Russ. Phys.-Chem. Soc.* **58**, 630–8 (1926).—Molybdic acid

sol was prepd. by adding HCl to dil. solns. of Na_2MoO_4 . Cond. measurements showed a min. at the neutral point corresponding to 7 equiv. of HCl per 10 of Na_2MoO_4 . F.-p. measurements and tests with $\text{K}_4\text{Fe}(\text{CN})_6$ prove the formation of the complex $\text{Na}_2\text{O}(\text{MoO}_3)_4$, crystals of which were obtained from solu. of the above compn. With 12 equivs. of HCl, the complex $\text{Na}_2\text{O}(\text{MoO}_3)_8$ was isolated (mol. wt. by f. p. 1139, max. intensity of Tyndall conc); this sol does not coagulate at 100° nor on addn. of electrolytes. No particles were visible under the slit ultramicroscope. Further addn. of HCl breaks up the complex salts. An analogous phenomenon was observed with a negatively charged suspension of freshly pptd. MoO_3 whose equiv. cond. increased on diln. Another method of prepn. was by satg. 1 N Na_2MoO_4 with MoO_3 ; these sols exhibited no Tyndall cone. The authors conclude that the "semicolloid" is formed by the addn. of MoO_3 to the neutral salt in steps, and its micelle has an indefinite chem. compn. although the nucleus closely corresponds to $\text{Na}_2\text{O}(\text{MoO}_3)_8$. B. C. S.

The preparation of monodispersed silver hydrosol free from protecting colloids. I. J. VOIGT AND J. HEUMANN. *Z. anorg. allgem. Chem.* **164**, 409-19(1927).—The usual Ag hydrosols are polydispersed and contain varicolored submicrons. Sols with uniformly colored particles can be prepd. It is necessary to have materials of the utmost purity and to use very dil. Ag solns. As starting material, a soln. of Ag_2O contg. 0.001% Ag was used. The method of seeding with Ag or Au nuclei was employed. The Au proved more favorable. Hydrazine sulfate or hydrate, formol and H_2O_2 were found suitable reducing agents. Solns. of P in ether were unsuitable because spontaneous nucleus formation takes place too readily. F. L. BROWNE

Platinum hydride hydrosol and its dehydration by metallic mercury. C. PAAL AND CHARLOTTE AUERSWALD. *Ber.* **60B**, 1648 54(1927).—Expts. were made with a Pt colloid protected with Na lysallinate, contg. 33.88% Pt which was readily sol. in H_2O . Hydrosols made with freshly prepd. colloid adsorbed 305 vols. of H_2 per vol. of Pt. On standing in contact with air their adsorptive capacity for H_2 diminished. On shaking a Pt hydrosol satd. with H_2 with 11g. 88 volumes of H_2 per vol. of Pt were given off and a Pt amalgam hydrosol was formed. F. L. BROWNE

A general electrical method for the preparation of organo-metallic hydrosols. EUGÈNE FOUARD. *Colloïdes biol. clin. therap.* **1**, 101-9(1927); cf. *C. A.* **21**, 1577.—An enzyme may be conceived as consisting of a material system adsorbed at the surface of the org. colloid, in the midst of which it exerts its action, and condensed in its perigranular zone, which is the true seat of its activity. Since all chem. transformations in aq. soln. take place exclusively through the action of ions, enzymic reactions are max. for a max. concn. of adsorbed active ions in contact with the colloid. The latter thus acts as ionizer, or condensing agent for ions, and consequently multiplies the rate of the reaction, which could take place in a non-colloidal medium, but at a much lower rate. Beyond a given state of chem. equil. addn. of mol. which can be transformed by the enzyme causes a fresh adsorption by the micelles and upsets the equil., resulting in a reaction in the perigranular zone, with liberation or elimination of the excess of the transformed mol. into the intermicellar liquid. It follows from this conception that a proper understanding of enzymic phenomena is intimately bound up with a thorough knowledge of the mechanism of adsorption by colloids. Investigations along this line led to the development of a method of prepn. previously outlined (*loc. cit.*), which is now described and discussed at greater length. Highly purified amylose was selected as org. colloidal substratum, preferable to an albuminoid, because of greater ease of purification and because the use of the organo-metallic colloids obtained for physiol. and therapeutic investigations does not give rise to colloidoclastic shock experienced with injections of albuminoids. Conditions under which electrolysis must be carried out are discussed, and comprise, among others, as thorough purification as possible of the colloid, which must be perfectly neutral, elimination of the products of electrolysis other than the metal which tend to diffuse throughout the whole of the medium, and reduction of the rate at which the ions are brought to the cathode. The amylo-metallic complex obtained is dispersed as a colored cloud, which is repelled by the cathode and attracted by the anode. Each granule of pure, iso-elec. amylose is, therefore, converted into an amylo-metallic micelle, which behaves as a large negative ion whose charge is balanced by free positive ions, presumably metal ions. The metallo-org. hydrosol micelle would therefore consist of an amylose complex, mol. metallic granules slowly discharged on the amylose and acquiring a characteristic color for each metal, and metallic ions which have retained their elec. charges. With organo-metalloid hydrosols, the elec. charges are reversed. Contrary to the hydrosols obtained by the Bredig method, the products thus obtained can be subjected to thorough purification without danger of changing the initial micellar structure. Use of these hydro-

sols in physiological and therapeutic investigations showed that, when injected intravenously, they do not cause any colloidal shock, the latter being produced with unpurified colloidal substratum and decreasing as the degree of purification increases. This shows that colloidal shock on the one hand and therapeutic and physiological effects on the other are distinct and independent phenomena, and that the latter can be obtained without the former. A PAPINEAU-COUTURE

Colloidal gold in alkali halide crystals. F. BLANK AND F. URBACH. *Naturwissenschaften* 15, 700(1927).—On adding AuCl_3 to fused KCl or other halides colored crystals were obtained. The color appears after solidification and changes on cooling, the final result being dependent upon the rate of cooling and the nature of the salt (KCl red-violet, KBr blue and green, KI yellow). Most intensive coloration appeared at points of strongly disturbed crystal structure. The gold coagulates on dissolving of the salt. The crystals show Tyndall effect and ultramicroscopic particles. B. J. C. v. d. H.

The physical chemistry of dyestuffs. III. Theoretical note concerning my method for determining the charge in dye solutions. REINHOLD FURTH. *Kolloid-Z.* 41, 297-9(1927); cf. *C. A.* 20, 865.—The significance of the studies by Blüh (*C. A.* 21, 2005) of the potential drop along the special electrodes employed in F.'s previously described method is discussed. The optimum length of the electrodes is a compromise between the necessity of keeping them short enough to avoid too great loss of potential and long enough to avoid contamination by electrolytic decomposition products during the expt. IV. A new method for the exact determination of the degree of dispersity of dye solutions. *Ibid* 300-4.

Since charge and degree of dispersity det. the usefulness of dyes for biol. staining (Gieckhorn and Keller, *C. A.* 19, 2217; *Z. wis. Zool.* 127, 244 (1926)), routine methods of measuring both properties are needed. The method for measuring degree of dispersity through observation of diffusion velocity and calcul. on the basis of the Einstein formula is adapted to the purpose within the limits of precision required for biol. work by making the examn. with the microscope over distances of the order of 0.1 mm. instead of several cm. In that way a detn. in quadruplicate can be made in 10 to 20 min. with an accuracy of 3 to 6%. The method requires no elaborate app., technic or precautions against vibration and temp. changes. A detailed description is given of the special *microscope object glass*, easily made from ordinary laboratory equipment, with which observation of the diffusion can be made. Further improvements in the method and a crit. examn. of the technic are reported by E. Ullmann (*C. A.* 21, 1579). V. The degree of dispersity of dyes. REINHOLD FURTH AND ERNST ULLMANN. *Ibid* 304-10.—An acid dye, trypan red, and a basic dye, neutral red, in concns., c , varying from 0.031 to 0.125% were examd. for velocity of diffusion, D , by the method of the preceding abstract. D varied with c , increasing ever more rapidly as c decreased. At infinite diln., D was 4.3×10^{-6} sq. cm./sec. for neutral red (mol. wt. 275) and 3.5 for trypan red (mol. wt. 980). Application of the Einstein formula indicates that for neutral red the radius of the particles, a , is 4.6×10^{-7} cm. at infinite diln. and increases as a linear function of c . For trypan red, a is 5.8 at infinite diln. and increases at higher concn., but the a - c curve is concave downward. The change in a with c must be kept in mind in using dyes for staining biological preps. It is suggested that the dyes are dispersed in the form of single mols. at infinite diln. and polymerize rapidly as c increases. On that basis the particles in concd. solns. of neutral red consist of about 40 mols. For Congo red, D was found to be 1.56×10^{-6} at $c = 0.125\%$, giving $a = 1.26 \times 10^{-7}$. An examn. of aq. soln. of KMnO_4 showed that D varies 3 fold between infinite diln. and 0.5% concn.; the value of D for infinite diln. agrees with the prediction on the basis of Nernst's formula. The influence of electrolytes on D and a can also be investigated by the method employed. F. L. B.

The determination of average size of particles in colloidal solutions by means of v. Smoluchowski's formula. H. J. C. TENDELOO. *Kolloid-Z.* 41, 290-3(1927).—The addn. of KCl to an As_2S_3 hydrosol increased the viscosity to a max., after which it fell off again on further addn. It is suggested that the influence of electrolytes on As_2S_3 sol is of an electrocapillary nature, in accordance with v. Smoluchowski's theory of the quasi-viscous effect. It is possible to compute the av. particle size with the aid of v. S.'s formula provided that the viscosity, the cond., the electrokinetic potential, and the relative vol. are known. F. L. BROWNE

Estimation of the efficiency and dispersive power of emulsifying agents. R. C. SMITH. *J. Soc. Chem. Ind.* 46, 345-6(1927).—Three methods for standardizing the emulsifying power of agents are given. After emulsifying equal quantities of the dispersion medium and disperse phase the quantities of (1) disperse phase remaining undispersed, (2) dispersion medium remaining unused, and (3) the emulsion, are compared. "Emulsifying power" and "dispersion factor" are calcd. from these relative vols. A

third method described¹ depends upon measuring the average radius of the emulsified particle. An appeal is made for the standardization of methods by all experimenters in this field.

J. W. SHIPLEY

Studies in "photo-sols." I. S. S. BHATNAGAR, N. A. YAJNIK AND VASU DEV ZADOO. *Quart. J. Indian Chem. Soc.* **4**, 209-16(1927); cf. *C. A.* **19**, 1647.—Sols of Au and Ag prepd. by Zsigmondy's method and Bredig's method were treated with sols of As_2S_3 and Sb_2S_3 . All sols were negatively charged. The concns. of the sols varied greatly. Sep. tests were made to det. the effects of air and of light on the changes which occur. No changes except coagulation occurred in the dark. Very little change occurred in diffused light. Profound changes of color and composition occurred in direct sunlight. Exposure to air modified some of the changes occurring in sunlight. When the changes are completed, the mixts. contain sulfides of Au or Ag, free sulfur and H_2AsO_3 or H_2SbO_3 . These results are due to the hydrolysis of the sulfides, As_2S_3 and Sb_2S_3 to form H_2S . The action of air and light on H_2S produces H_2O and S. The Au sol or Ag sol reacts with H_2S to form sulfides of Au or Ag. Color changes are due to successive stages in these chem. changes. Probably small quantities of the metal sulfide formed initially in the mixts. form centers of photochem. sensitivity similar to such centers on a photographic film.

F. E. BROWN

Peptization of metallic hydroxides in presence of sugars. M. R. MEHROTRA AND K. C. SEN. *Quart. J. Indian Chem. Soc.* **4**, 117-29(1927); cf. *C. A.* **18**, 490.—The peptization of the hydroxides of Cu, Hg , Fe and Ce in the presence of sucrose, dextrose, levulose and lactose was studied. In one set of expts. the vols. were all 15 cc. and the amt. of NaOH was 3 millimols. Under these conditions the amt. of sugar in millimols, C_s , is represented by the equation, $C_s = AC_m + B$, where A and B are consts. and C_m is the amt. of metallic hydroxide in millimols. The consts. are different for each sugar with each metallic hydroxide, and the concns. of the hydroxides have a lower and an upper limit for each sugar-metallic hydroxide pair outside of which the equation is inapplicable. For dextrose and levulose, the order of peptizability of the hydroxides expressed in mols is $Cu > Fe > Hg > Ce$; for sucrose $Cu > Ce > Fe > Hg$; for lactose $Cu > Fe > Ce > Hg$. With increasing vol. the amt. of sugar necessary to peptize a fixed amt. of a hydroxide decreases until low concns. of metallic hydroxide are reached. A min. excess of alkali is necessary to aid peptization. In one case, Cu, a larger excess of alkali decreases the amt. of sugar required for peptization; in another case, Hg, higher concns. of alkali increased the concn. of sugar required. The excess of alkali is at least as important as the presence of the sugar in inhibiting the pptn. of the metallic hydroxides. However, $Fe(OH)_3$ can be peptized in an acid soln. but not in a neutral soln. F. E. B.

Peptization of iron and chromium hydroxides in presence of nonelectrolytes and the influences of acid and alkali on the peptization. K. C. SEN. *Indian Chem. Soc.* **4**, 131-5(1927); cf. preceding abstr.—The hydroxides of Fe and Cr are peptized by means of glycerol. "The peptization of metallic hydroxides, in general, cannot be obtained unless an excess of alkali is present in the soln." "The nonelectrolytes are not functioning as the peptizing agents in the usual sense of the term and we have to consider the hydroxyl ions as the real peptizing agents in those cases where excess of hydroxyl ions are present." The peptized $Fe(OH)_3$ sol. is positively charged when there is a deficiency of NaOH, and negatively charged when there is an excess of NaOH. The sugar does have some sp. function in the peptization and each sugar has its own sp. power on each metallic hydroxide. F. E. BROWN

• Solution of colloids of large molecular compounds by a very easily soluble strongly hydrolyzed materiál. P. P. V. VEIMARN. *Kolloid-Z.* **42**, 134-40(1927).—Colloids may be divided into 2 classes, one thermodynamically unstable called dispersoids and the other stable called solutoids. A very great difference may be seen between the two for substances of high mol. wt. The dispersion theory, which rests on the assumption that mols. of high mol. wt. are solvated dynamically, is discussed. A general basis is given for the stability of extremely stable dispersoid solns. A review is given of previous work on dispersion of cellulose, fibrin, casein, chitin, keratin, etc., and in order to test further the theory of dynamic hydration V. has studied dispersion and aggregation of casein, silk and cellulose, in pyrogallol and resorcinol. The properties of these colloids are then discussed. R. H. LAMBERT

Aging phenomena of viscosity and conductivity of a sol and an electrolyte. N. R. DHAR AND D. N. CHAKRAVARTI. *Kolloid-Z.* **42**, 120-4(1927).—Sols of $Fe(OH)_3$, Berlin blue, Cu ferrocyanide, stannic acid, As_2O_3 and crystal violet show an increase in cond. and a decrease in viscosity with age, indicating a hydrophobic nature. K soaps are also hydrophobic. Congo red and molybdic acid show an intermediate

state between hydrophobic and hydrophilic sols. Ce nitrate and Ni sulfate show slight increases in cond. with time while stannic acid and $\text{Fe}(\text{OH})_3$ show a great change in viscosity and cond. with age which is greatly accelerated by heating. A study of aging gives a sensitive test for the constitution of colloids. R. H. LAMBERT

The viscosity of a hydrophobic sol and its change on addition of electrolytes. D. N. CHAKRAVARTI AND N. R. DHAR. *Kolloid-Z.* **42**, 124-34 (1927).—The influence of addn. of electrolyte to a hydrophobic sol has been treated by measuring viscosity of a great many sols. Addn. of a common ion is included in the data. In most cases the viscosity passes through a min with concn. of electrolyte. Fe and Al hydroxides are more strongly hydrated than As sulfide sols. Common-ion electrolytes lower viscosity much more than others. Viscosity begins to increase rapidly at concns. of electrolytes far below that necessary for flocculation in consequence of a decrease in the charge and increase in hydration of the sol. R. H. LAMBERT

The action of colloidal and semi-colloidal ferric oxide sol on a gelatin solution in water. R. WINTGEN AND M. VÖHL. *Kolloid-Z.* **42**, 140-9 (1927).—A method is described for prepg. colloidal ferric oxide by an ultrafiltration. Addn. of gelatin causes an increase in amt. of pptn. of chromic oxide sol, passing through a max. at sufficiently high concn. of gelatin. For Fe_2O_3 sols this depends on amt. of HCl present and the concn. of gelatin soln. added. If the sols are added to gelatin soln. a max. pptn. occurs with either a dild. or a concd. sol. The equiv. aggregate wt. of gelatin averages 32,600 as compared to 32,200 for Cr_2O_3 sols. The equiv. aggregate wt. depends on the method of prepn. of the gelatin and may vary as much as 4-fold for different samples of gelatin. R. H. LAMBERT

Effects of colloids on the reaction of media. JEAN LOISELEUR. *Colloides biol. clin. therap.* **1**, 110-22 (1927); cf. *C. A.* **21**, 2588.—Animal parchment which has been placed in contact with a soln. of a neutral electrolyte causes partial hydrolysis of sucrose, the intensity of the phenomenon depending on the nature of the electrolyte (increasing as the soly. of the cation-membrane combination decreases) and increasing with the concn. of the sucrose soln., time (apparently to a limiting value), temp. (expts. carried out at 10-37°) and surface of parchment. Similar expts. in which the parchment was used as a dialyzing membrane gave more marked hydrolysis of the sucrose: max. effect was obtained with the most sol. salts (e. g., NaCl); the degree of hydrolysis decreases with increase in concn. of the electrolyte; and temp. exerts a similar but less marked effect than with immersed parchments. No such effects are obtained with vegetable parchment or collodion membranes. From a discussion of the mechanism of the phenomenon, L. concludes that the hydrolysis is the manifestation of a variation in p_H resulting from selective adsorption of the ions of the electrolyte. Such a phenomenon can come into play in establishing the intracellular p_H of tissues. A. PAPINEAU-COUTURE

The opalescence of certain jellies. PAUL BARY. *Colloides biol. clin. therap.* **1**, 51-3 (1927).—A jelly consists of a single phase, whereas a gel consists of 2 phases. The opalescence observed in demineralized-gelatin jellies under certain conditions is due to the fact that the body is not a simple jelly but must contain a dispersed phase. This may be due to an impurity in the gelatin, or may be explained by assuming that the gelatin is not completely homogeneous but consists of 2 substances having similar chem. properties, but unequal swelling capacities in the solvent used. A. P.-C.

The increase of Brownian movement by means of light. W. POSPISIL. *Ann. Physik* **83**, 735-52 (1927).—It was shown by quant. expts. that the Brownian movement of substances that do not absorb the light employed, such as mastic, remains unchanged regardless of the intensity of the illumination and that it continues in the absence of light. Substances that absorb the light employed, such as carbon and gamboge, under the influence of strong illumination exhibit a greater acceleration of Brownian movement than can be accounted for by the rise in temp. of the liquid and the decrease in its viscosity. The phenomenon is related to photophoresis and radiometry and cannot be explained on the basis of kinetic theory. It can be accounted for either by means of photoelectricity or better on the assumption that mol. motion is a consequence of black-body radiation. F. L. BROWNE

The Hofmeister series. E. H. BUCHNER. *Rec. trav. chim.* **46**, 439-44 (1927).—No really conclusive explanation has as yet been given as to the cause of the Hofmeister or lyotropic series. It is known only that a no. of salts, when arranged according to their influence on different phenomena in colloid. chem., always appear in the same order, which, however, may be reversed as a whole. Expts. were made on the influence of temp. and sol concn. on the concn. of salt which ppts. gelatin from its sol. The detns. were made at 40°, 60° and 80°. The salts investigated, listed in the order of their

decreasing salting-out power, were $K_4Fe(CN)_6$, Na citrate, Na_2HPO_4 , NaF, Na_2SO_4 , Na tartrate, $Na_2S_2O_4$, $Na_2S_2O_8$, $Na_2S_2O_3$, NaOAc, Na formate. The influence of the concn. of the gelatin was in most cases very small, though the tendency was for the more concd. gelatin solns. to be salted out more easily. Except in the case of the acetate the influence of temp. was not very important. The influence of the same and other salts on the swelling of gelatin was measured. It is concluded that the polyhydrol mols. of H_2O have a greater peptizing influence (*i. e.*, greater affinity for) the gelatin micelles than the single H_2O mols.

R. L. DODGE

Mechanical and electrical coagulation. WO. OSTWALD. *Kolloid-Z.* **41**, 71-80 (1927).—The effect observed by Freundlich and Kroch (*C. A.* **21**, 845) that certain colloid systems are coagulated by mechanical stirring is discussed, and their conclusions are criticized. It is considered more likely that the coagulation is due to elec. charges set up by differences of potential between the stirrer and the colloid system. The observations of Freundlich and Kroch can be explained quant. on this basis. B. C. A.

Influence of alcohols on the coagulation of dispersoid solutions. A. JANEK AND B. JIRGENSONS. *Kolloid-Z.* **41**, 40-46 (1927).—A study was made of the effect of methyl, ethyl, propyl and *i*-butyl alcs. on the coagulation of dialyzed sols of $Fe(OH)_3$, Ag and As_2S_3 by electrolytes. When coagulation was carried out by means of NaCl, small amts. of the alcs. sensitized the sols (*i. e.*, rendered coagulation easier), the effect increasing with increasing mol. wt. of the alc. Higher concns. of alcs. stabilized the sols. This effect, although not very noticeable with $Fe(OH)_3$, was easily recognizable with Ag sol and quite pronounced with As_2S_3 . In the case of As_2S_3 , a max. stabilizing concn. was reached, further increase of alc. causing sensitization again. In this case also, MeOH differed from the others in sensitizing throughout. The best stabilizing effect was found in the coagulation of As_2S_3 by $BaCl_2$, with small quantities of alc. In this case also, MeOH exerted a sensitizing effect, and at higher concns. EtOH did likewise.

B. C. A.

Lyotropic properties of the fluoride ion. H. FREUNDLICH AND M. ASCHENBRENNER. *Kolloid-Z.* **41**, 35-40 (1927).—The F^- ion is regarded as the extreme end of the Hofmeister series. The exptl. data on which this conclusion rests are the following effects, due to the presence of fluorine ions: (1) the lowering of the soly. of highly sol. substances, (2) the large increase of surface tension at a water-air interface, (3) the change in the electropotential at a water-air interface, (4) the favorable influence on the sol-gel transformation of a gelatin soln. F^- ions have a strong coagulative effect on the weakly hydrophilic colloid $Fe(OH)_3$, but a weaker effect than the Cl^- ion on the hydrophobic CuO sol.

B. C. A.

Effect of acids on hydrophobic colloids, particularly gold. W. PROSCH. *Kolloid-Z.* **40**, 318-21 (1926).—A lecture on the influence of H^+ -ion concn. on the pptn. of colloidal Au and on the inhibitive effect of protective colloids.

B. C. A.

Flocculation and deflocculation of the silver halides. S. E. SHEPPARD AND R. H. LAMBERT. *Fourth Colloid Symposium Monograph* 1926, pp. 281-301 (Chem. Catalog Co.).—Following discussion of coagulation and recrystn. in the grain growth of Ag halide ppts. (partly polemical against F. F. Renwick), evidence is given to show that coagulation by electroadsorption is a phase of Ag halide pptn., in agreement with Lottermoser. The process is not purely a recrystn., as suggested by Jabczyński. Gelatin inhibits coagulation as a result of electroadsorption, its higher concn. increasing the total reactant concn. at which flocculation is possible. Electrocoagulation and recrystn. follow initially the same law for the diminution of number of particles. Electrocoagulation and recrystallization play only a subordinate role in grain growth in Ag-Br emulsions.

JEROME ALEXANDER

Charge on the particles in colloids. R. WINTGEN. *Kolloid-Z.* **40**, 300-2 (1926).—The amt. of colloidal substance deposited by one Faraday of electricity may be regarded as the electrochem. equiv. of the colloid, and colloids may therefore be expressed in terms of normality, according to the no. of electrochem. equivs. of colloid per l. This value may be detd. by measuring the elec. cond. of the system before and after ultrafiltration, the difference representing the cond. due to the charged colloid particles. Results are given for sols of Fe_2O_3 and for dialyzed and undialyzed Au sols.

B. C. A.

Changes in electrical conductivity of electrolytes and sols with age. N. R. DHAR. *Z. anorg. allgem. Chem.* **162**, 237-42 (1927).—The speed of hydrolysis of salts of difficultly sol. acids or bases depends upon the speed of formation of nuclei and of coagulation of the latter to colloid particles. Such colloids gradually lose their activity, absorptive capacity and H_2O , so that absorbed electrolyte is given up and cond. is increased. Hydrophilic colloids such as gelatin and egg albumin, with age increase

in stability, degree of hydration, viscosity and absorptive capacity, and decrease in elec. cond. and surface tension. Age has the opposite effect upon hydrophobic colloids.

A. W. FRANCIS

Diffusion-potential measurements applied to hydrochloric acid-gelatin systems. I. The equivalent weight of gelatin. A. L. FERGUSON AND E. K. BACON. *J. Am. Chem. Soc.* **49**, 1921-34 (1927).—An app. is devised for detg. the liq./liq. junction potentials of 0.1 N HCl/0.01 N HCl, and HCl/NaCl and HCl/gelatin at various concns. The results are reliable and accurately reproducible. Curves of the relations between changes in diffusion potential at the boundaries of HCl/gelatin with varying gelatin concns. are similar to the corresponding curves for HCl/NaCl. From the 4 points of inflection in the gelatin curves the equiv. wt. is detd. to be 1090. These show that the combinations between gelatin and 0.01-0.10 N HCl are in stoichiometric proportion.

II. The components of hydrochloric acid-gelatin solutions. EGBERT K. BACON AND ALFRED L. FERGUSON. *Ibid* 1934-9.—Dissimilarities, in the previous expts., in the potential curves of HCl/gelatin and HCl/NaCl are due to the addn. of gelatin irrespective of the amt. needed for complete combination with HCl. A largely indeterminate source of e. in. f. is thus formed at the boundary. The solns. should be defined in terms of the free acid and combined and uncombined gelatin. An excess of this has no effect. To explain the results satisfactorily the neutral iso-electric gelatin is assumed to form the highly ionized gelatin chloride, giving Cl anions and gelatin cations.

J. BALOZIAN

Cataphoresis, electrical charge, critical potential and stability of colloids. H. R. KRUYT, A. C. W. ROODVOETS AND P. C. VAN DER WILLIGEN. *Fourth Colloid Symposium Monograph* 1926, pp. 304-10.—Cataphoresis measurements with Burton's app. with an As_2S_3 sol, using intermicellar fluid, show that the rate of cataphoresis increases with addn. of KCl in all concns. nearly to flocculation. Recent investigations in dielec. potential show that addn. of electrolyte causes fall in potential and that the rate of cataphoresis ζ does not necessarily vary in the same sense as fall of potential ζ . Since the crit. potential does not depend on a definite u value, but on u/D , there is no reason to reject the theory of crit. potentials.

JEROME ALEXANDER

Electrocapillary phenomena and ions. W. KOPACZEWSKI AND M. ROSNOWSKI. *Compt. rend.* **185**, 450-3 (1927).—Different ions, anions or cations, can effect a reversal of the direction of electrocapillary penetration of colloids or at least increase or decrease the rise. Ferric ion has such a marked effect that at a concn. of only 10^{-6} molal it will cause a positive colloid whose penetration is feeble to rise in filter paper as high as a negative colloid. Anions act especially on positive colloids. H ion has a marked influence on the rise but the anion of the acid also has a simultaneous effect.

E. R. SMITH

The physical chemistry of dyes. II. The technical presentation of the Furth method of determining the electric charge of a dye solution together with a collection of demonstration experiments. JOSEF GLICKLHORN. *Kolloid-Z.* **42**, 9-18 (1927).—An outline is given for the qualification necessary for the porous material used in the Furth method for detg. the elec. charge on dyes in soln. The method is especially applicable to biological expts. Expts. were made by using both paper and sintered-glass filters. Gypsum, wood and many other materials are considered for the same purpose. The efficiency and advantage of the procedure are illustrated by a demonstration expt. that is recommended. This expt. affords an easy method for studying elec. relations of colloid and soln.

R. H. LAMBERT

The macroscopic method of measuring the velocity of migration of colloid particles. A. F. GERASIMOV. *J. Russ. Phys.-Chem. Soc.* **58**, 601-9 (1926).—The migration velocity of dialyzed collargol was measured according to Burton; solns. of Na_2SO_4 , Na_2CO_3 and NaOH of cond. approaching that of the sol served as the electrolytes. The tube was 2.6 cm. wide and at the p. d. of 0.5 v. per cm. and current of 0.8 milliamp., the distortion of the meniscus was negligible. Readings were made with the aid of a cathetometer or a microscope and a suitable light filter (a soln. of Me green). The speed of migration increases during the first 15-20 min., then remains const.; it varies widely with the nature of the electrolyte used, and subsequent measurements with the same electrolyte deviate by 7.4%. A correction for the diffusion of the sol did not improve the results. The method is theoretically sound only when applied to very dil. sols and a large excess of the electrolyte, its concn. being the same inside and outside of the sol. It is not in general capable of quant. precision.

BASIL C. SOVENKOFF

The velocity of cataphoretic migration of coarser particles in sols and gels. H. FREUNDLICH AND H. A. ABRAMSON. *Z. physik. Chem.* **128**, 25-38 (1927).—On measuring the velocity of cataphoretic migration of Zn dust particles suspended in 1%

gelatin sol during the change from sol to gel (requiring several hours) it was found that the velocity remains const. within exptl. error. The velocity increases in proportion to the potential gradient, in accordance with the assumption of a const. and relatively small coeff. of viscosity. The gel became sufficiently solid, however, to prevent settling of the particles under the influence of gravity. The metal particles in the sol do not seem to move independently but appear to be attached to gelatin particles and to serve as indicators of the motion of the otherwise invisible gelatin particles. That condition was evidenced by the facts that other suspended particles, such as air bubbles, moved with the same velocity and that the movement became zero and reversed direction on passing through the isoelec. point. The gelatin particles then migrate with the same velocity in the solid gel as in the fluid sol. It is suggested that the elasticity of the gel may be due to the binding together of part of the gelatin particles to threads, disks, etc., which govern the macroscopically observed mechanical properties of the gel. Microscopic observation of cataphoresis, on the other hand, reveals other particles, not so bound into threads, which move with the same freedom in gel as in sol. The erythrocytes of horse blood are always negatively charged and move in the blood serum at room temp. with a velocity of 1.01μ per sec. per v. per cm. Erythrocytes that have clumped together move with the same velocity. The white corpuscles are also negatively charged. The leucocytes migrate 50% more slowly, the lymphocytes 30% more slowly than the erythrocytes. Again, clumping of the corpuscles failed to alter the migration velocity. The apparent contradiction between these observations and the theory of Debye and Hückel may be due to distortion of the elec. double layer about the particles under the influence of the applied potential. F. L. B.

The distribution of hydrogen ions between gelatin and water. I. I. ZHUKOV, S. A. SHCHUKAREV AND I. N. BUSHMAKIN. *J. Russ. Phys.-Chem. Soc.* **58**, 639-58 (1926).—Numerous electrometric titrations of acids were made in presence of varying amts. of gelatin of 1.3% ash content. The curves intersect at p_H 5.6 (isoelec. point). For a given p_H , the amts. of H and OH ion combined with a g. of gelatin were independent of the concn. of the protein. At p_H 2, 1 g. of gelatin combined with 9.2×10^{-4} g. of H ion (9.1×10^{-4} according to Loeb) and at p_H 3, 7.8×10^{-4} g., while at p_{OH} 3 only 4.9×10^{-4} g. of OH ion is absorbed. Expts. with a different batch of gelatin showed its isoelectric point to lie at p_H 5.25 irrespective of the nature of the electrolytes present or their ionization const. The above observations contradict the view of gelatin as an ampholyte forming easily hydrolyzable salts. BASIL C. SOYENKOFF

Collodion membranes. I. Preparation of uniform membranes and their characterization. NIELS BJERRUM AND ERICH MANEGOLD. *Kolloid-Z.* **42**, 97-112 (1927).—A description is given for prepg. both cylindrical and flat sheets of collodion membranes that are surprisingly uniform in thickness and porosity. They are readily reproducible as to thickness, water content per cc. of membrane and porosity to water. The product of porosity and thickness of membrane of const. vol. is const. if evapn. of collodion soln. takes place in a dry air atm. If the collodion infusion is exposed to air satd. with water or even better to acetone, a membrane will be obtained whose porosity is much greater even though its thickness is the same as that of the other. R. H. L.

The function of carbon membranes in osmosis. F. E. BARTELL AND H. J. OSTERHOFF. *Fourth Colloid Symposium Monograph* 1926, 234-45 (Chem. Catalog Co.).—The function of membranes in osmosis is not elucidated by thermodynamic treatment. Following a discussion of semipermeability and past work on it, expts. are described with membranes made by compressing finely divided silica and C to 2500-20,000 lbs. per sq. in. With silica the flow was from water to org. liquid; with C eventually the reverse. Though the thermodynamic tendency is for a flow from water to org. liquid, in some cases the membrane properties may alter or reverse this. A displacement cell is described, wherein 2 liquids are sepd. by a membrane (SiO_2 or C), with a manometer to indicate the pressure resulting when one displaces the other. The following liquids drove out water from a C membrane, giving the pressures mentioned: Toluene, 2670 mm. Hg; CCl_4 , 2840; pyridine, 750 mm. H_2O ; acetone, 295; propyl alc., 1.92; EtOH, 180. With a SiO_2 membrane, water drove out the following: Toluene, 1360 mm. H_2O ; CCl_4 , 2210; pyridine, 15; propyl alc., 16. With a C membrane, CCl_4 drove out toluene (pressure of 190 mm. H_2O), pyridine, and propyl alc. (pressure 386 mm. H_2O); toluene drove out PrOH (pressure 139); and pyridine drove out PrOH (pressure 556). It is concluded, in conformity with generally accepted views, that in a strictly semipermeable membrane, one component is adsorbed to the practical exclusion of the other. Where the membrane has greater permeability, i. e., with fine pores, the initial osmotic force and direction of flow are mainly detd. by relative adsorption of the liquids, the membrane playing an active part. If the membrane is fairly permeable and thin

enough, osmotic flow is governed by properties of the liquid system, and the membrane may not direct its direction. JEROME ALEXANDER

Observations on anomalous osmosis through collodion membranes. P. J. JURISIC. *Physik. Z.* 27, 774-8(1926); cf. *C. A.* 15, 2041, 2686; 14, 187, 1246, 2285, 2573.—J. Loeb has demonstrated in a number of papers published in 1919 and 1920 that solns. of salts with univalent cations such as $\text{Na}_4\text{Fe}(\text{CN})_6$, Na_2SO_4 , KCl , etc., show a characteristic anomalous behavior, since the quantity of water transported through the collodion membrane in a definite time does not depend only upon the concn. of salt (within certain concns.) in disagreement with osmotic laws. Different conditions have been observed by Loeb when salts with cations possessing a higher valency were used. Loeb's findings have been corroborated by Preuner (cf. *C. A.* 17, 2072). In contrast to L.'s and P.'s observations it has been found by J. that the anomaly in the osmotic behavior is of an altogether different nature from the one observed by L. and P. The osmotic pressures are higher than those observed on isotonic solns. of glucose. J. has found in contrast to P. that there is no regular relation between the potential and the salt concn. Varying results have been obtained with various collodion membranes. Addn. of acid retards the transference of water, alkali accelerates it at concns. of from $M/32$ down. Between $M/32$ and $M/64$ a retardation takes place. E. K.

The electroendosmosis of aqueous solutions through a diaphragm of sintered glass powder. FRED FAIRBROTHER AND HAROLD VARLEY. *J. Chem. Soc.* 1927, 1584-9.—Electroendosmosis expts. were carried out with a diaphragm of sintered Jena glass powder in H_2O and dil. HCl . The app. was essentially that described by Fairbrother and Mastin (cf. *C. A.* 19, 771). The amt. of electroendosmosis decreased after a time, and in 0.01 N HCl it reversed in direction. Expts. were also carried out on the permeability of the diaphragm to H_2O . This also decreased with time. The results indicate that the glass surface undergoes a swelling process. The distribution of potential within the swollen layer may account for the reversal of direction. R. L. D.

The osmotic pressure of solutions. M. K. LEVANT-EZERSKII. *J. Russ. Phys.-Chem. Soc.* 57, 151-60(1925); *Chem. Zentr.* I, 1926, 2656; cf. *C. A.* 19, 2155.—From a study of the literature it is concluded that the osmotic pressure, the vapor pressure and the lowering of the f. p. are actually proportional to one another, and the hypothesis is accepted that these values are proportional to the concn. of the soln. C. C. D.

Behavior of difficultly soluble metal oxides in solutions of their salts. Magnesium oxide cements. W. FEITKNECHT. *Helv. Chem. Acta* 10, 140-67(1927); cf. *C. A.* 21, 3169.—The formation of solid masses or cements from mixts. of MgO and MgCl_2 soln. was studied. There is a sharp break in the dehydration curve at 6 mols. of H_2O to one of MgCl_2 . When kept under a concd. soln. of MgCl_2 the cement sample takes up MgCl_2 slowly and the final product contains more than 1 mol. MgCl_2 to 1 mol. MgO . The strength of the cement increases with increased concn. of MgCl_2 . The strength is in a complex manner dependent on the subdivision of the materials; fine-grained oxide gives a hard mass. With other Mg salts the order of decreasing hardness is: chloride, bromide, sulfate and nitrate. On drying the cement the strength does not vary much with progressive loss of H_2O . Dehydration quickly decreases its strength below its original value. Drying at a high temp. increases the strength up to a certain point. The beginning of the decrease in strength is in no stoichiometric relation to the H_2O content of the cement, but is rather limited to a morphological relationship. Microscopic investigation shows that in the normal setting of the cement no crystd. oxychloride is formed, but the strength arises from the penetration of the soln. into the inner MgO grains, where a chem. reaction occurs, whereby the grains expand until they touch one another and are then knitted together. M. FENSKE

Solubility of the silver halides in concentrated halide solutions. L. DRBE AND TH. WALTHER. *Z. anorg. allgem. Chem.* 163, 185-94(1927).—The soly. of AgCl and AgBr in one equiv. of solvent was detd. In the following, the soly. is given in millimols. of AgCl or AgBr . The solvent is indicated first; the four following figures refer to the soly. at 20, 40, 60 and 80° resp. (1) *Soly. of AgCl :* $\frac{1}{2} \text{CaCl}_2 + 5\text{H}_2\text{O}$, 4.52, 5.96, 7.57, 9.81; $\text{LiCl} + 5\text{H}_2\text{O}$, 2.85, 4.19, 5.77, 7.91; $\text{NH}_4\text{Cl} + 10\text{H}_2\text{O}$, 1.978, 2.91, 4.22, 6.10; $\text{NaCl} + 10\text{H}_2\text{O}$, 1.271, 1.913, 2.88, 4.41; $\frac{1}{2} \text{CaCl}_2 + 10\text{H}_2\text{O}$, 1.096, 1.607, 2.41, 3.55; $\text{LiCl} + 10\text{H}_2\text{O}$, 0.636, 1.087, 1.775, 2.83; $\text{HCl} + 10\text{H}_2\text{O}$, 0.599, 0.959, 1.514, 2.285; $\text{KCl} + 20\text{H}_2\text{O}$, 0.416, 0.733, 1.309, 2.25; $\text{NH}_4\text{Cl} + 20\text{H}_2\text{O}$, 0.386, 0.683, 1.185, 2.075; $\text{NaCl} + 20\text{H}_2\text{O}$, 0.269, 0.504, 0.938, 1.668; $\frac{1}{2} \text{CaCl}_2 + 20\text{H}_2\text{O}$, 0.248, 0.457, 0.841, 1.449; $\text{LiCl} + 20\text{H}_2\text{O}$, 0.171, 0.360, 0.712, 1.304; $\text{HCl} + 20\text{H}_2\text{O}$, 0.175, 0.349, 0.663, 1.200; $\text{KCl} + 30\text{H}_2\text{O}$, 0.176, 0.368, 0.721, 1.365; $\text{NH}_4\text{Cl} + 30\text{H}_2\text{O}$, 0.183, 0.367, 0.709, 1.321; $\text{NaCl} + 30\text{H}_2\text{O}$, 0.139, 0.291, 0.593, 1.119; $\frac{1}{2} \text{CaCl}_2 + 30\text{H}_2\text{O}$, 0.133, 0.273, 0.548, 1.042; $\text{LiCl} + 30\text{H}_2\text{O}$, 0.100, 0.228, 0.481, 0.955; $\text{HCl} +$

A. L. HENNE

Solubility of solids at low temperatures. W. JACEK. *Rocz. Chem.* **6**, 501-9 (1926).—The soly. of I in pentane, isopentane, and CCl₄ is very small at temp. of about -100° (0.018% in pentane at -71°, 0.017% in isopentane at -79°, and 0.148% in CCl₄ at -24°). At these low temps., the I solns. are colorless, probably because of the formation of an unstable compd. between I and the solvent. The soly. of S in CCl₄ and in toluene was also detd. In all cases, the soly. s agrees with $d \log s = \theta dt$, where θ is const. for the given solvent and solute.

B. C. A.

The velocity of solution. A. E. MAKOVETZKIĬ. *J. Russ. Phys.-Chem. Soc.* **58**, 726-8 (1926).—Expts. with NaCl and CuSO₄ · H₂O in water show the velocity to be proportional to the active mass of free water a and surface of the solid O , or $dx/dt = KOa$.

BASIL C. SOYENKOFF

Viscosities, electrical conductivities and specific volumes of acetic acid-stannic chloride solutions. J. D. STRANATHAN AND JOHN STRONG. *J. Phys. Chem.* **31**, 1420-8 (1927).—Data were taken at 25.2°. The sp. cond. of the AcOH was about 4×10^{-8} and the sp. cond. of the SnCl₄ was about 2×10^{-9} . Both pure substances and 12 solns. whose molal fraction of SnCl₄ varied from 0.0244 to 0.411 were used. The abs. viscosity of AcOH is 0.01155, and of pure SnCl₄ is 0.0084. The viscosity increased with increasing concn. of SnCl₄ until its molal fraction was 0.2527 when the max. was reached. The abs. viscosity at this concn. was 3.034. The abs. viscosity then decreased to 0.4234 when the molal fraction of SnCl₄ was 0.411. The sp. vol. varied continuously from 0.9486 for pure AcOH to 0.4436 for pure SnCl₄. The sp. elec. cond. decreased from 11.85×10^{-4} for the soln. whose molal fraction of SnCl₄ was 0.0244 to 2.510×10^{-4} for the soln. whose molal fraction of SnCl₄ was 0.4111. The mixing of SnCl₄ and AcOH is accompanied by large evolution of heat and a contraction of as much as 32.10% of the additive vol. The max. viscosity is 282 times that calcd. from the additive law, and 263 times that of the most viscous component. The max. is at the compn. represented by SnCl₄·3AcOH, and indicates the existence of this compd.

F. E. B.

The density of solutions of sodium in liquid ammonia. C. A. KRAUS, E. S. CARNEY AND W. C. JOHNSON. *J. Am. Chem. Soc.* **49**, 2206-13 (1927).—The ds. of solns., ranging in concns. from 32.6 mols. of NH₃ per atom of Na to satn., are detd. at -33.8° with a modified Westphal balance in a II atm. They are found to vary from 0.5782 for a satd. soln. to 0.6582 and are less, in any case, than that of either constituent. The vol. change is calcd. by a formula from the data. For a satd. soln. the change is 40.96 cc.; on dilg. to 16.2 mols. NH₃ per atom of Na it has a max. value of 43.14 cc., and on further diln. approaches 40 cc. From a plot of equl. pressures of solns. of Na in liquid NH₃, in mm. of Hg, against concns. in mols. of NH₃ per atom of Na, the satd. soln. is found to contain 5.18 mols. of NH₃ per atom of Na.

J. BALOZIAN

Bromine as a solvent in the electrochemistry of non-aqueous solutions. V. FINKELSTEIN. *J. Russ. Phys.-Chem. Soc.* **58**, 565-86 (1926). (cf. C. A. **20**, 3377. B. C. S.)

The influence of temperature on the neutral salt effect. A. WEISSBERGER. *Z. physik. Chem.* **126**, 127-32 (1927).—W. replies to objections of Schmid and Olsen (cf. C. A. **21**, 519) that the non-dependence of the neutral salt effect upon temp. and the explanation of this effect as a dehydration of the acid are incompatible, by a short discussion of the dehydration theory in general and in the special form given by Bjerrum.

R. L. HERSCHEY

Influence of electrolytes on the solubility of other electrolytes in non-aqueous solvents. C. A. KRAUS AND R. P. SEWARD. *Trans. Faraday Soc.* **23**, 488-91 (1927).—The soly. of a salt (NaCl or NaBr) in a non-aq. solvent (Me₂CHOH or MeAc) is depressed by a 2nd salt with a common ion, and increased by a salt without a common ion. These effects are less than those in H₂O, but much greater than would be predicted by the Debye-Huckel theory. To apply the latter to solns. of lower dielectric const. the assumption must be dropped that the only mol. species are the simple ions.

A. W. FRANCIS

Mixed solutions of electrolytes and nonelectrolytes. GEORGE SCATHARD. *Trans. Faraday Soc.* **23**, 454-62 (1927); cf. C. A. **21**, 1216, 1913.—By rigorous math. calcs. a complex formula for $\partial F/\partial n_i$ based on the radii and nearest approach of ions and mols. and the dielec. const. of medium was derived. This was compared with observed results in various solns. Agreement is evidence for no solvation of NaCl or KCl in

H₂O-EtOH; but H⁺ and sucrose are evidently hydrated. The generality of the formula is shown by the agreement with observations on such dissimilar solutes as O₂ and egg albumin. Reciprocals of ionic radii are nearly additive. A. W. FRANCIS

The influence of hydrogen and hydroxyl ions on the movement of water through collodion membranes. P. J. JURGIĆ. *Biochem. Z.* **185**, 423-6(1927).—Expts. are cited showing that there is no direct relationship between the H- and OH-ion influence and the p. d. S. MORGULIS

The effect of pressure on chemical reaction. F. E. BROWN. *Proc. Iowa Acad. Sci.* **33**, 145-50(1926); cf. *C. A.* **20**, 2271.—A review and discussion of the work and theories of P. W. Bridgman (*C. A.* **6**, 1084; **8**, 3160; **17**, 3815; **18**, 1219); G. Tammann (*C. A.* **4**, 2059); G. Tammann and H. Diekmann (*C. A.* **20**, 1169); Wm. R. Hainsworth and Duncan A. MacInnes (*C. A.* **16**, 1901); Wm. R. Hainsworth, H. J. Rowley and D. A. MacInnes (*C. A.* **18**, 2628); and B. H. Hite, West Va. Agr. Expt. Sta., J. A. Burrows and the author (*C. A.* **20**, 2627) have shown that suitable mixts. of KClO₃ decompose almost explosively at temps. below 300°. H. M. McLaughlin with the author has shown similar mixts. under 300 atm. pressure may be heated for several hrs. at 320° with less than 10% decompn. The calcd. equil. pressure in this case is 10¹⁵ atm. Increased pressure does not reverse the reaction so that 300 atm. is not an equil. pressure. W. G. GAESSLER

Regions of reaction. X. Fe-S-SiO₂, Fe-Mg-S and Fe-Al-S. W. P. JORISSEN AND B. L. ONGKIEHONG. *Rec. trav. chim.* **45**, 540-4(1926); cf. *C. A.* **21**, 1215.—Reaction regions have been observed for mixts. of solid substances resembling those obtained with gaseous mixts. (cf. *C. A.* **20**, 1549). Data are given, and expressed graphically for the limits of compn. within which reaction takes place for the following mixts.: Fe and S; Fe, S and silica; Mg and S; Fe, Mg and S; Fe, Al and S. B. C. A.

Regions of reaction. XIII. The influence of the size of particles of the reacting substance and of the nature of the igniter. W. P. JORISSEN AND C. GROENEVELD. *Rec. trav. chim.* **46**, 47-53(1927)(In English).—The authors in continuing their work (cf. preceding abstr.) on the regions of reaction of solids (I) Fe-S, (II) Al-S, (III) Al-Fe-S, have substituted a powerful igniter consisting of fine Al (*pulv. subtil*) and flowers of S in the ratio 2.3 g. atoms. This is ignited by Mg ribbon. A larger region of reaction is obtained. The limits in (I) Fe 45.4%-S 54.6%, Fe 86.7%-S 13.3% (all ratios in %); (II) no reaction; (III) Al 5-Fe 36.3-S 58.7, Al 5-Fe 81.3-S 13.7; Al 50-Fe 1.9-S 48.1, Al 50-Fe 9.6-S 40.4 (mixts. in (III) with Al content 5-50% varying by 5% were investigated). When Al (*pulv. subtil*) was substituted in the reaction mixt. for the coarse variety—ignition by Mg ribbon only—both the upper and lower limits with respect to Fe were usually extended. The limits in (II) Al 22.1-S 77.9, Al 74.6-S 25.4; (III) Al 5-Fe 33.8-S 61.2, Al 5-Fe 80.4-S 14.6; Al 50-Fe 34-S 16. Mixts up to 70% Al were studied. In the region 5-20% Al irregularities occur which may be due to the distribution of the component occurring in smallest amt. over the other two. E. R. SCHIERZ

Regions of reaction. XIV. A closed reaction region. W. P. JORISSEN AND C. GROENEVELD. *Rec. trav. chim.* **46**, 369-72(1927); cf. preceding abstr.—Reaction is propagated in mixts. of Al, SiO₂ and S when the comps. lie within the area between 10-54% SiO₂, 13-35% S and 17-66% Al. XV. The influence of carbon dioxide and carbon tetrachloride vapor on the inflammability of a methane-air mixture. W. P. JORISSEN AND G. M. A. KAYSER. *Ibid* 373-7.—A lower concn. of inhibitor is required to prevent explosion of CH₄-air mixts. when the inhibitor is a mixt. of CO₂ and CCl₄ than when it is either CO₂ or CCl₄ alone. With exptl. conditions such that the explosive region of CH₄-air mixts. lay between 6.3 and 12.2% CH₄, 9% CO₂ or 6.4% CCl₄ was necessary to prevent explosion in a 9% CH₄-air mixt. In a mixt. of CO₂ and CCl₄ contg., for example, 40% CCl₄, only 4.5% was required. J. E. SNYDER

Some investigations of the ethyl alcohol-carbon tetrachloride system. S. F. CALHOUN AND THOS. C. POULTER. *Proc. Iowa Acad. Sci.* **33**, 169(1926). An abstract.—The EtOH-CCl₄ system has been investigated with respect to the total vapor pressure, and the partial vapor pressures of the constituents at 25 and 60°. The total pressure of different mixts. of EtOH and CCl₄ were detd. at 25° by means of a bulb to which was sealed a manometer. The total pressure at 60° was measured by means of an app. designed by the authors for the rapid and accurate detn. of the vapor pressures of liquids that do not readily react with Hg. The partial pressures were detd. from the mol. fraction of each constituent in the vapor. The mol. fractions of each constituent in the vapor were detd. by condensing a small amt. of vapor and detg. its d. Curves were plotted for each temp. representing the total and partial pressures. W. G. GAESSLER

Balancing of oxidation-reduction equations. II. E. R. GETTE AND V. K. LAMER. *J. Chem. Education* **4**, 1158-67(1927); cf. *C. A.* **21**, 13145. E. H.

The computation of partial molal quantities of binary solutions. BENJAMIN SORNICK. *J. Am. Chem. Soc.* **49**, 2255-7(1927).—A method is developed that is particularly useful where great accuracy is desired. J. H. PERRY

Amphoteric hydroxides, their aqueous solutions and crystallized salts. V. Relation between the diffusion coefficients and optical absorption in tungstate solutions of various hydrogen-ion concentrations. HERMANN SCHULZ AND GERHARD JANDER. *Z. anorg. allgem. Chem.* **162**, 141-8(1927).—The diffusion coeff. of 0.1 *N* Na_2WO_4 was observed in various aq. solns. at temps. near 10° and corrected to 10° and 25° and also for viscosity. The coeff. was nearly the same for dil. and *N* NaOH and NaNO_3 and NaCl as for pure H_2O , but was decreased to about 0.4 its value in 0.1 *N* HCl or HNO_3 either alone or with *N* neutral salt. This was ascribed to aggregation of ions, e. g., to $\text{W}(\text{WO}_4)_6^{4-}$, just as CrO_4^{2-} goes to $\text{Cr}_2\text{O}_7^{2-}$ in acid soln. It was proposed to prepare complex polytungstates in this way. An 0.1 *N* Na_2WO_4 soln. in 0.1 *N* NaOH showed practically no absorption even in the extreme ultra-violet. A neutral soln. showed ultra-violet absorption, and in 0.1 *N* HCl soln., the absorption was in the visible field. The increase in wave length of absorbed light is analogous to that in chromate solns. A. W. FRANCIS

The mechanism of the electrolytic conductivity in crystals. A. REIS. *Z. Physik* **44**, 353-8(1927).—Ions of only one kind possess an appreciable mobility in electrolytically conducting crystals. This exptl. fact is to be assigned to a deformation of the ions. It is not necessary to consider a deformation of the ideal cryst. lattice. The ions are able to change their position, when they are not stopped by the unilateral attraction of a neighbor. Strongly deforming ions can fasten easily deformed ions. The reverse is not true. A. L. HENNE

The conductivity of acids and salts in liquid ammonia. F. A. SMITH. *J. Am. Chem. Soc.* **49**, 2162-7(1927).—Expts. at -33.5° to det. whether or not certain metallic acid salts derived from the NH_3 system ionize more than the respective acids in liquid NH_3 solns. The cells used are described by Elsey (*C. A.* **15**, 458). The results are accurate to at least 5%. From exptl. data, curves of Λ , the mol. cond., against $\log \Lambda$, the diln. in l. per mol., are made for the compds. Those of the acid amides, the polymers of cyanamides and triphenylguanidine are not plotted because of their small cond. In every case, but one, the alkali metal salt is a better conductor than the corresponding acid. The cond. of the ammonio-carbonic acids and their alkali salts increases with deammonation of the acids and decreases with their polymerization. J. BALOZIAN

The neutral salt effect in ionic reactions. I. The specific ionic effect. A. v. KISS AND V. BRUCKNER. *Z. physik. Chem.* **128**, 71-86(1927).—The effects of the chlorides of K, Na, Li, NH_4 , Mg and Ca, the sulfates of K, Na, Li, NH_4 , Co, Cd, Mn, Mg and Zn, $\text{Mg}(\text{NO}_3)_2$ and HCl , HNO_3 and H_2SO_4 on the ionic reaction between $\text{S}_2\text{O}_8^{2-}$ and I^- were studied in order to test the theory of neutral salt effect proposed by Brönsted (*C. A.* **19**, 2401). The theory was confirmed except for bivalent cations, which do not follow Brönsted's rule. Of the univalent cations K ion has the greatest effect and Li ion has the smallest. With the univalent metals chloride has the greatest and sulfate the smallest salt effect. With univalent ions the effect is greater the greater the ionic vol. With the salts of K, Na and Li there was found to be a qual. dependence between ion effect and viscosity, the more viscous solns. having smaller effects. E. R. SMITH

Contribution to the knowledge of electrolytic solution forces and of the electrolytic ionic condition. P. KARL FREDENHAGEN. *Z. physik. Chem.* **128**, 1-24(1927).—The soln. tension order of the halogens toward NH_3 is the reverse of their order toward H_2O . The NO_3 group has about the same soln. tension toward NH_3 and H_2O . The OH group has only a very small soln. tension toward NH_3 . All metals have a much smaller soln. tension toward NH_3 than toward H_2O . Toward HF the metals and the majority of anion forming elements and groups have greater soln. tensions than toward H_2O . MeOH conducts in HF like a moderately strong acid. The cause of this cond. was shown to be due to an electrolytic dissociation of MeOH. The halides liberate the corresponding halogen acid when added to HF. Dry HCl , CO_2 and CO do not increase the cond. of pure HF. For solns. of H_2O and MeOH in HF the change in cond. with concn. was detd. Pure HF was dried until its sp. cond. was reduced to 0.4×10^{-4} in contrast with the previously accepted value of 269.9×10^{-4} . The dielec. const. of this pure acid was 174.8 at -73° and 83.6 at 0°. Although HCN has the greatest dielec. const. it has only a very slight ionizing power to form electrolytic solns. KCN, KCl and KNO_3 are but slightly sol. in HCN and their relatively large cond. in HCN

is due to large migration velocities. Soln. tensions toward HCN are much smaller than toward alcohols and NH_3 . The dielec. const. does not det. the dissolving and ionizing power of a solvent. Whether or not a solvent can form an electrolytic soln. with a given compd. depends on sp. interactions between solvent and dissolved compd. II. *Ibid* 239-65.—From thermodynamic considerations the conclusion is drawn that electrolytic soln. tensions are functions of the affinities of the solutes for the solvent and of the internal forces acting in the solvent. The equation $k' = kP_B P_S / L_{BS}$ is proposed, according to which the electrolytic dissocn. const. k' in the liquid phase can be calcd. from the dissocn. const. k in the gas phase, the electrolytic distribution ratios P_B and P_S of the elements and the distribution ratio of the undissocd. compd. Explanations are given for the practically complete dissocn. of neutral salts, for the small change of electrolytic dissocn. with temp. and for deviations from the diln. law.

E. R. SMITH

The transference numbers and the degree of solvation of the ions of lithium chloride in certain alcohols. J. N. PEARCE AND W. G. EVERSOLE. *Proc. Iowa Acad. Sci.* 33, 151-64(1926).—The true and ordinary transference nos. of the Li ion in solns. of LiCl in Me, Et and *n*-Pr alcs. have been detd. Camphor was used as the reference substance. When these solns. are electrolyzed there is an increase in the concn. of the camphor at the anode and a decrease at the cathode. This change in the concn. of the camphor is produced by the migration of the solvent with the Li ion from the anode to the cathode. In a given solvent the values for the transference nos. and the degree of solvation of the Li ion decrease as the concn. of the LiCl is increased. For a fixed concn. of LiCl the observed values of the degree of solvation of the Li ion decrease as the complexity of the solvent mol. increases.

W. G. GAESSLER

Conductivity of organic compounds and certain elements in the solid and liquid state. M. A. RABINOVICH. *J. Russ. Phys.-Chem. Soc.* 58, 229-39(1926).—The cond. of org. compds. and halogens was investigated under a const. e. m. f. of 125 v. to det. the coeff. of loosening (α) of the crystal lattice, i. e., the ratio of the conductivities of the solid and liquid at the m. p., with the view of elucidating the mechanism of elec. dissocn. The individual conductivities of the halogen-substituted acetic acids and the nitroparaffins are not in the same order as their conductivities in aq. soln. The results show that symmetrical mols. with small dipole moments have little tendency to dissociate. This is confirmed by the values of α for the chloromethanes. The values of α for benzene, naphthalene, anthracene and substituted hydrocarbons are in the order of their polarity. The behavior of such substances in a non-polar solvent, such as ether, is analogous to the behavior in it of acids (palmitic, stearic) of the same individual solid and liquid cond. Finally, the halogens were investigated by themselves and in soln., and a dynamic theory of the internal ionization of the halogen mol. is discussed.

B. C. A.

Electrical resistance of concentrated sulfuric acid and theory of hydration. M. H. FISCHER AND M. O. HOOKER. *Kolloid-Z.* 40, 303-7(1926).—The elec. resistance of H_2SO_4 -water mixts. decreases with rise of temp. For a given temp. the resistance decreases with increasing concn. of H_2SO_4 , there being a min. when the mixt. contains 50 cc. of concd. H_2SO_4 (d. 1.84) and 200 cc. of water. Above this concn., the resistance increases rapidly, a second inflection indicating the presence of excess of SO_3 . The mode of variation of properties with compn. indicates a change from a soln. of H_2SO_4 in water to a soln. of water in H_2SO_4 , and the analogy with solvated colloids is discussed.

B. C. A.

On the diffusion of electrolytes. M. M. DUBININ. *J. Russ. Phys.-Chem. Soc.* 58, 623-9(1926).—The app. consisted of a cylindrical glass tube sealed at one end and provided with pairs of Pt electrodes at various distances from the bottom end closed by a glass plate. This tube was contained within a larger vessel through which passed the elec. connections, a rod on which the glass plate rotated and a rubber tube. The diffusometer, supported from a wall, was completely immersed in a thermostat regulated to within 0.1° . The inner vessel was filled with cond. water, the outer with the soln., and cond. measurements were taken at 12-hr. intervals. The concn. of the diffusing soln. changed by not more than 0.2% during the expt. The diffusion coeff. of 0.1-0.5 *N* KCl at 25° was $1.594 \pm .009 \text{ cm}^2 \text{ t./g.}$ calcd. from $dg = -D_0(1 + \beta c)(\partial c/\partial x)sd t$. With 0.1-1 *N* CaCl_2 , Wiedeburg's (*Ann. Phys.* 45, 675(1890)) relationship was found to hold; values of D_0 agreed within 1.5%, while D from Fick's equation varied by up to 10%. Fick's law represents the limiting case of a very dil. soln.

B. C. S.

Conductivity and molecular weight of halogen acids in dry and moist nitrobenzene. M. HLASKO AND E. MICHALSKI. *Rocz. Chem.* 6, 534-55(1926).—The conductivities of HCl and HBr in dry nitrobenzene and nitromethane are, in spite of the high dielec. consts. of the solvents, very small. Thus for dry nitrobenzene, α is 4.0×10^{-4} for

0.6 N HCl and 6.7×10^{-4} for 0.6 N HBr, while in nitromethane α is 9.4×10^{-4} for 8.7 N HCl. The presence of 0.1% of moisture increases the cond. tenfold. HBr is in all cases more dissociated than the chloride. Cryoscopic measurements show that H₂O, HBr and HCl, dissolved in nitrobenzene or in formic acid, are present as simple mols., but that the addn of HBr or HCl to wet nitrobenzene produces little depression of f. p., because of the formation of hydrates of the type HCl.H₂O, provided that it is added in quantities not greater than the water content. It follows that conclusions relative to the association of dissolved substances in the above solvents are not valid unless precautions are taken to eliminate water, and for this reason the results of Zanninovich-Tessarini (*Z. physik. Chem.* 19, 251-60(1896)) and of Beckmann and Lockemann (*C. A.* 2, 77), which indicated polymerization of hydrogen halides in the above solvents, are not acceptable. B. C. A.

Dilution law for strong electrolytes. B. SZYSZKOWSKI. *Rocz. Chem.* 6, 510-34 (1926).—The equiv. conds of strong electrolytes (univalent anion and cation) satisfy the following law from 0.0001 to 0.1 M solutions $1 - (\lambda/\lambda_0) = 0.5\beta C^{1/2} - \gamma C + 1.5\delta C^{3/2}$, where β , γ and δ are consts. This expression agrees fairly well with Kohlrausch's exptl. values and affords a confirmation of Debye and Hückel's theory for solns. of completely dissociated electrolytes. B. C. A.

Some anomalies in the theory of solution of strong electrolytes and their explanation. NIELS BJERRUM. *Trans. Faraday Soc.* 23, 445-54(1927).—(1) The heat of diln. of electrolytes varies with the size, a , of the ions in a direction opposite to that predicted by the equation, $U_r = 418\sqrt{C}/(1 + 0.327 a\sqrt{C})$, where U_r is the heat developed on adding a large amt. of water to a C molar soln. contg. 1 mol. of electrolyte. (2) The effect of the elec. charge on the partition coeff. of ions between water and alc. is always greater than is to be expected from the formula $P = 3.15/r$, where $P = \log_{10}$ of the partition coeff. and r is the radius of a spherical ion. (3) Many electrolytes show a remarkably small Soret effect. (4) A contraction occurs on soln. of a salt in water. (5) Some ions have a negative heat capacity in aq. soln. These anomalies are explicable by the assumption that the effective dielec. const. decreases in the immediate neighborhood of ions. E. R. SMITH

Strong electrolytes in relation to statistical theory, in particular the phase integral of Gibbs. R. H. FOWLER. *Trans. Faraday Soc.* 23, 431-43(1927).—The theory of Debye and Hückel is developed from the fundamental principles of statistical mechanics, by the method of Gibbs. The equations of Poisson and Boltzmann can be legitimately used together provided a certain fluctuation term can be ignored as small. This is legitimate for dil. solns. but it remains doubtful whether the more elaborate formulas can be quant. correct. The introduction of the dielec. const. makes use of a process of averaging in steps which is illegitimate though probably not seriously in error. It is shown directly from statistical theory that the thermodynamic function determinable from the analysis of Debye and Hückel is the characteristic function for this function by Debye and Hückel is correct and other thermodynamic properties must be deduced from it by the standard processes of thermodynamics. E. R. SMITH

Electrolytic transference of water, true transference numbers, ionic mobilities and water sheaths of the ions. H. REMY. *Trans. Faraday Soc.* 23, 381-8(1927).—The available data upon the electrolytic transference of water in 1 N aq. solns. of inorg. electrolytes are tabulated and used for the calcn. of the true transference nos. The mobility of an ion in a soln. is defined as the product of its true transference no. and the cond. of the soln. The product of true mobility and viscosity changes much less than that of apparent mobility and viscosity on passing from one soln. to another of homologous type. Abs. values for the water sheaths of ions are obtained from water transference in solns. of org. electrolytes with large cations not carrying water envelopes. E. R. SMITH

The activity of electrolytes. J. N. BRONSTED. *Trans. Faraday Soc.* 23, 416-34 (1927).—A review with references. E. R. SMITH

The influence of neutral salts on acid-salt equilibria. I. A contribution to the knowledge of the standard value used for calculating the activity exponent p_{aH} of the hydrogen-ion concentration. I. M. KOLTHOFF and WOUTER BOSCH. *Rec. trav. chim.* 46, 430-8(1927).—The calcn. of the H-ion concn., p_{H} , from potentiometric measurements is generally based on the standard value proposed by Sørensen. It is generally recognized that in the light of the Debye and Hückel theory, the calcn. of Sørensen's standard value is no longer correct. Since the potential of an electrode is a function of the activity of the H ions in the soln., it is of greatest importance that the activity

of the H ions in the standard H-electrode* acid mixt. (0.01 *N* HCl + 0.09 *N* KCl) be known. A standard value can then be obtained with which the activity exponent, p_{H} , in all kinds of solns. can be calcd. from the results of H-electrode measurements. Based on the data of G. Scatchard (cf. *C. A.* 19, 1366, 1520, 2156) for pure HCl, and on potential measurements using a quinhydrone electrode in the standard acid mixt. against a H electrode in the standard acid mixt. and in 0.001 *N* HCl + 0.099 *N* KCl, the suggestion is made that a value of 2.075 be accepted for the p_{H} in the standard acid mixt. If the p_{H} is calcd. on the basis of the classical formula of Sorensen, the following relation is obtained: $p_{\text{H}} = p_{\text{H}}^0 + 0.037$. Neutral salts first decrease the activity of the H ions in dil. HCl solns., and then tend to increase it at higher concns. A pronounced sp. cation effect of neutral salt influence was observed. R. L. D.

The activation of chemical reactions by neutral salts. I. The activation of the solution of marble by neutral salts. N. IZGARUISHEV AND FR. S. SCHAPIRO. *Z. physik. Chem.* 128, 230–8 (1927).—The authors have studied the effect of *N* solns. of MnCl₂, CoCl₂, (AcOH), KCl, SrCl₂, CaCl₂, NaCl, NiCl₂, BaCl₂, MgCl₂, AlCl₃, and NH₄Cl on the soly. of marble tablets (0.5 cc.-lg.) in 0.1 *N* AcOH and found that in general the velocity const. increases in the order in which they are given (*k* 108–276) and a general correspondence exists between the velocity and the p_{H} . MnCl₂ and NiCl₂ are irregular, and cases of similar p_{H} like NiCl₂ and CoCl₂, SrCl₂, and CaCl₂ give markedly different constns. Ionic vols. and velocity constns. show no simple relationship. The anion is almost without effect, as is shown by the similarity of constns. obtained with *M* solns. of KCl, KI (162) KBr, KClO₃, KBrO₃, KIO₃, KNO₃ (106–110) and 0.1 *N* AcOH. With 0.1 *N* HNO₃ the order is MnCl₂, ZnCl₂, CoCl₂, NiCl₂, (HNO₃) SrCl₂, LiCl, NH₄Cl, MgCl₂, KCl, CuCl, CuCl₂, BaCl₂, AlCl₃, NaCl (*k* = 215–976). The constns. were calcd. from the formula $k = (2.303/TF) \log (c/c - x)$, where *F* = surface. E. R. S.

Kinetics of dissolution of aluminum in acids and alkalis. K. JABLONCZYNSKI AND E. HERMANOWICZ. *Rocz. Chem.* 6, 466–82 (1926).—The velocity of dissoln. of Al in 0.1 *N* HCl or NaOH is independent of the rate of stirring, and increases by 126 and 137%, resp. per 10° rise in temp., showing that this is a purely chem. reaction. The velocity is proportional to the concn. of the acid, whence it follows that this is a unimolecular reaction. The metal may be rendered passive by immersion in oxidizing solns., the effect being greatest with H₂O₂, less with KMnO₄, and least with Br water. It may then be activated by contact with a Pt wire, but more vigorously by the addn. of HgCl₂, which so accelerates the rate of dissoln. that the process becomes one of diffusion, in this case, the temp. coeff. is small and the velocity depends on the rate of stirring. The velocity of dissoln. in 0.1 *N* NaOH is 18.5 times as great as that in acid. B. C. A.

The significance of the law for the speed of formation of hydrogen bromide from its elements. ANTON SKRAHAL. *Ann. Physik* 82, 138–42 (1927).—Herzfeld's derivation (*C. A.* 15, 1440) of the kinetic equation for the reaction $\text{H}_2 + \text{Br}_2 = 2\text{HBr}$ is claimed to be imperfect. S. proposes a new derivation based on the assumption that the concn. of monatomic Br is proportional to the sq. root of the Br₂ concn. F. R. B.

The influence of hydrogen on two homogeneous reactions. C. N. HINSHELWOOD AND P. J. ASKEY. *Proc. Roy. Soc. (London)* A116, 163–70 (1927).—The quasi-unimol. decompn. of CH₃CH₂CHO, which becomes bimol. at low pressures, in the presence of H retains its unimol. character for low pressures. This decompn. is analogous to that of Et₂O and of Me₂O (*C. A.* 21, 1581). The bimol. decompn. of CH₃CHO is only slightly influenced by the pres. of H, and not in such a manner as to make the reaction appear unimol. These expts. are consistent with the Lindemann theory (*Trans. Faraday Soc.* 17, 598 (1922)) that in the case of simple mols. like CH₃CHO there is no time lag between activation and transformation, while in the decompn. of a more complex mol., as CH₃CH₂CHO, such a time lag exists. R. J. HAVIGHURST

Oxidation of mixtures of stannous chloride and sodium sulfite in alkaline solution with air. SUSUMU MIYAMOTO. *Bull. Chem. Soc. Japan* 2, 191–6 (1927).—The velocity of oxidation of mixts. of SnCl₂ and Na₂SO₃ in 0.525, 0.752 and 1.092 *N* NaOH was found to be a little less than that of either alone (previously shown to be identical (*C. A.* 21, 2089, 3:99)), except when the concn. of SnCl₂ is low. Then the velocity is much smaller at first but increases with time. A. W. FRANCIS

The thermal decomposition of hydrogen peroxide. F. O. RICE AND O. M. REIFF. *J. Phys. Chem.* 31, 1352–6 (1927).—When H₂O₂ decomposes in the presence of inhibitors, dust, etc., there is an initial period of inhibition followed by decompn. at a rate similar to that of a unimol. reaction. When dust only is present the rate is that of a unimol. reaction. When the inter. of the reaction flask is freshly fused and all impurities including dust are removed (cf. *C. A.* 20, 3374), the decompn. is a zero-order decompn., and the rate is exceedingly slow. The ordinary decompn. of H₂O₂ occurs on the walls

of the vessel and on dust particles. The decompn. of H_2O_2 by the I-HIO_3 couples seems to occur on dust particles and the walls of the reaction vessel. F. E. BROWN

The unimolecular decomposition of azomethane; the adequacy of activation by collision. BERNARD LEWIS. *Proc. Nat. Acad. Sci.* 13, 546-9 (1927).—With a conservative estimate of the no. of effective internal degrees of freedom in the azomethane mol. $\text{CH}_3\text{N}:\text{NCH}_3$, it is shown that according to the equations of Fowler and Rideal (C. A. 21, 1047) collisions may account for the activation of 1.07×10^{20} mols. per cc. per second. The rate of decompn. exptly. detd. by Ramsperger (C. A. 21, 1742) was 1.67×10^{15} mols. per cc. per sec., so that collisions are adequate to account for the activation in this unimol. decompn. F. A. JENKINS

The rate of transformation of acetylchloroaminobenzene into *o*- and *p*-chloroanilides as a measure of the catalytic power of hydrochloric acid. F. G. SOPER. *J. Phys. Chem.* 31, 1192-6 (1927).—The catalytic activity of HCl given by the rate of formation of Cl is not proportional to the velocity coeff. of the transformation of acetylchloroaminobenzene into *o*- and *p*-chloroanilides as ordinarily measured. Such measurements contain a varying error which is, e. g., 0.915 of the true value in 0.2 *M* HCl and 0.970 of the true value in 0.8 *M* HCl. Deductions based on such measurements lead to a relative catalytic activity of the 0.8 *M* HCl which is about 6% too high in comparison with that of the 0.2 *M* HCl. The observed speed of transformation is found to be in satisfactory agreement with that calcd. on the assumption that the interaction of chloroamine and HCl is the slow stage, whereas no agreement is found with the value calcd. on the alternative assumption that the interaction between acetanilide and Cl is the slower. J. H. PERRY

The coefficient of saponification of ethyl acetate by sodium hydroxide. ETHEL M. TERRY AND JULIUS STIEGLITZ. *J. Am. Chem. Soc.* 49, 2216-22 (1927).—The reaction coeff. is detd. for 1/100 *M* mixts., in an improved Reicher app. Care is taken to exclude CO_2 at all times. The coeff. is calcd. from exptl. data, with the aid of the integrated form of the bi-mol. reaction equation, and is 6.75 at 25.00°, accurate to 0.75%. For each temp. rise of 0.01° the coeff. is increased 0.0045. J. BALOZIAN

The saponification of ethyl acetate. W. T. GOOCH. *J. Am. Chem. Soc.* 49, 2257 (1927).—It is established that variations of intensity of diffuse daylight such as may occur under varying lab. conditions have no effect on the rate of sapon. of Et acetate. With consns. of ester and NaOH of 0.008 and 0.01, resp., the av. coeff. in darkness and that in diffuse daylight was 6.77 at 25°.

Studies on the monoalkyl carbonates. IV. Solutions of carbon dioxide in anhydrous methyl and ethyl alcohol and monomethyl and monoethyl carbonate in anhydrous alcoholic solution and in the solid state. CARL FAURHOLT. *Z. physik. Chem.* 126, 227-37 (1927); cf. C. A. 21, 2413.—The apparent ionization consts. of monomethyl

and monoethyl carbonates, $K_{\text{HCH}_3\text{CO}_3 + \text{CO}_2} = \frac{a_{\text{H}^+} \cdot a_{\text{HCH}_3\text{CO}_3^-}}{a_{\text{HCH}_3\text{CO}_3} + a_{\text{CO}_2}}$ and $K_{\text{HC}_2\text{H}_5\text{CO}_3 + \text{CO}_2} = \frac{a_{\text{H}^+} \cdot a_{\text{C}_2\text{H}_5\text{CO}_3^-}}{a_{\text{HC}_2\text{H}_5\text{CO}_3} + a_{\text{CO}_2}}$, are calcd. from the ionization consts. of the 2 alcs., and the

equil. consts. for the reactions $\text{CH}_3\text{CO}_3^- = \text{CH}_3\text{O}^- + \text{CO}_2$ and $\text{C}_2\text{H}_5\text{CO}_3^- = \text{C}_2\text{H}_5\text{O}^- + \text{CO}_2$, to be $10^{-10.7}$ and $10^{-12.3}$, resp., at 18°. The equil. consts. were detd. by electro-metric measurements of the Me-ion concn. in a MeOH soln. of Na monomethyl carbonate of known concn. and known CO_2 concn., similar measurements being made for the monoethyl carbonate. The assumption that the true ionization const. of monomethyl carbonic acid in MeOH is 10^{-6} times that in H_2O gives $K_{\text{HCH}_3\text{CO}_3} =$

$a_{\text{H}^+} \cdot a_{\text{HCH}_3\text{CO}_3^-} = 10^{-8.7}$ and hence $\frac{a_{\text{HCH}_3\text{CO}_3}}{a_{\text{CO}_2}} = 10^{-2}$. The kinetics of the reactions are still undetd.; the reactions are fast, however. Expts. on the vapor pressure of CO_2 above solid Na monomethyl carbonate show the CO_2 to be firmly bound, no gas evolution taking place up to about 200°, when not CO_2 but ethylene is weakly evolved. The Na monomethyl carbonate was prepd. by saturating an anhydrous methyl alc. soln. of Na methylate. Na and K monoethyl carbonates were similarly produced.

R. L. HERSHEY

The kinetics of the intramolecular transformation of ammonium thiocyanate to thiourea and thiourea to ammonium thiocyanate. A. N. KAPPANNA. *Quart. J. Indian Chem. Soc.* 4, 217-28 (1927).—The NH_4CNS and $\text{CS}(\text{NH}_2)_2$ were recrystd. from EtOH and carefully dried. The $\text{CS}(\text{NH}_2)_2$ melted at 179°. Observations were made at 10° intervals from 140° to 180°. Two series of expts. were made. In the first series equal quantities of $\text{CS}(\text{NH}_2)_2$ and NH_4CNS were sealed in each of a dozen bulbs. The bulbs were immersed in a thermostat. At intervals a bulb was removed, cooled quickly

and the contents were analyzed. In the second series, tubes were used and samples were pipetted out at intervals. The results of the 2 series were concordant. Thiourea was std. iodometrically, as recommended by Reynolds and Werner (*J. Chem. Soc.* **83**, 1(1903)) and Werner (*C. A.* **7**, 946); and $\text{NH}_4\text{CNS} + \text{CS}(\text{NH}_2)_2$ by $\text{Hg}(\text{NO}_3)_2$ in dil. HNO_3 with ferric nitrate as an indicator (Williams Lunge's Technical Methods of Chem. Analysis, p. 656). The % $\text{CS}(\text{NH}_2)_2$ at equil. and heat of reaction, resp., for each temp. are: 140° , 28.10%, 3271 cal.; 150° , 26.24%, 3235 cal.; 160° , 24.56%, 3117 cal.; 170° , 23.09%, 3074 cal.; 180° , 21.76%. dx/dt for the direct reaction = $k_1 + k_2(\epsilon - x)$, where ϵ is the equil. value of x . $dx/dt = k_1 + k_2(a - \epsilon - x)$ is the equation for the reverse reaction. Integrating, one gets the same integration const. for both reactions. This is Waddell's test for a reversible reaction of the first order. (*J. Phys. Chem.* **2**, 538(1898)). The data taken when glass wool and Pt strips were put into the heated mixt. differed but little from those taken when the mixts. were not so treated. The mean heat of activation of NH_4CNS over the range 140 – 180° is 31,935 cal.; for $\text{CS}(\text{NH}_2)_2$ over the same range is 35,016. The heat of reaction, 3174 cal., is almost equal to the difference between these heats of activation, 3081 cal. The Dushman-Rideal equation gives values in good agreement with that observed for the velocity const. of the reaction $\text{CS}(\text{NH}_2)_2 \longrightarrow \text{NH}_4\text{CNS}$ but not for the reverse reaction. The active lives of the mol. have been calcd. to be 7.24×10^{-12} sec. for NH_4CNS and 8×10^{-14} sec. for $\text{SC}(\text{NH}_2)_2$. F. E. BROWN

The reaction of chlorine, hydrogen and oxygen when insulated. E. CREMER. *Z. physik. Chem.* **128**, 285–317(1927).—C. has studied the reaction of mixts. of dry Cl from cylinders (27.5–258-mm. pressure), O (18.7–166.4 mm.) and H (67–342 mm.) prep'd. by electrolysis of KOH soln. over P_2O_5 in Thuringia glass vessels at 12.5° when insulated by a 1000 c. p. lamp at a distance of 20 cm. The short wave lengths were removed by a screen of lead glass. The residual gases were analyzed by absorption in 10% KI soln. followed by titration of the liberated I with $\text{Na}_2\text{S}_2\text{O}_3$ and the H ion with barite after removal of CO_2 by heat. The velocity of formation of HCl is expressed by $d[\text{HCl}]/dt = kc[\text{Cl}_2]^2[\text{H}_2]/([\text{Cl}_2] + k'[\text{H}_2][\text{O}_2])$, that of H_2O by $d[2\text{H}_2\text{O}]/dt = k_w[\text{Cl}_2]$. A chain of 18 components is theoretically possible and is indicated by expt. The lack of agreement among previous workers is attributed to the catalytic effect of the walls and on the varying proportions of O which at low pressures permits one of the intermediate reactions to go to completion. Values for 41 expts. and drawing and description of the app. are given. F. R. S

The thermal dissociation of the alkali fluoborates. J. H. DE BOER AND J. A. M. VAN LIEMPT. *Rec. trav. chim.* **46**, 124–32(1927).—The fluoborates of K, Rb, Cs have been prep'd. by pptn. from H_2O by addn. of the chlorides to solns. of HBF_4 . The prep'n. is described in detail. The solubilities in H_2O are in the order Li, Na, K, Rb, Cs. Thermal studies show the m. ps. to be: KBF_4 , 530° ; RbBF_4 , 590° ; CsBF_4 , 550° . Though the alkali fluorides take up BF_3 readily to give the fluoborates, CaF_2 does not. Calcn. of thermal data shows the heat of reaction for this case would be neg. The η s of these salts are very near those of the sat'd. solns. These indices have been det'd. for the Na D line. R. L. HERSHEY

Reactions in solid crystallized organic substances on heating. BERNWARD GARRE. *Z. anorg. allgem. Chem.* **164**, 81–5(1927).—Unstable org. substances, when heated below the m. p., are capable of being transformed into stable forms with the evolution of heat. A mixt. of org. substances whose interaction liberates heat can react to form the stable substance upon being heated below the eutectic point. These rules are illustrated by the conversion of NH_4 cyanate to urea, maleic to fumaric acid, and the interaction of the following mixts.: hydroquinone-*m*-phenylenediamine, pyrocatechol-*o*-phenylenediamine, hydroquinone-*p*-phenylenediamine, and resorcinol-*p*-phenylenediamine. DAVID DAVIDSON

The action of oxalic acid on some soluble salts of lead. N. DEMASSIEUX. *Compt. rend.* **185**, 460–1(1927).—When $\text{H}_2\text{C}_2\text{O}_4$ reacts with PbCl_2 in soln. a white ppt. of $(\text{Pb}_2\text{C}_2\text{O}_4)\text{Cl}_2$ (I) is obtained which, by further addn. of the acid, is converted into PbC_2O_4 (II). The reactions were studied by means of cond. measurements and plotting the cond. values against the amts. of acid used. Each curve shows 2 points where an abrupt change in direction occurs, the first corresponding to the formation of (I) and the second to that of (II). Analogous results are obtained with PbBr_2 when $(\text{Pb}_2\text{C}_2\text{O}_4)\text{Br}_2$ is formed. With PbI_2 only one break in the curve is observed. E. O. ELLINGSON

The mutual replacement of sodium and potassium in their chlorides. L. HACKSPILL AND E. RINCK. *Compt. rend.* **185**, 463–5(1927).—The equil. const. of the system Na-KCl or K-NaCl in which variable amts. of the components are placed in direct contact without any solvent has been det'd. at 900° . The av. value from a large

no. of expts. is 11, expressed as $[KCl][Na]/[NaCl][K] = 11$. The materials are kept in a sealed iron tube which is heated electrically and shaken vigorously in a horizontal position by a mech. shaking device. Although equil. is attained in a short time the mixt. is heated and shaken for $1/2$ hr. after which the tube is placed in a vertical position for another $1/2$ hr. to assure sepn. of the 2 phases before solidification. No precise detn. was made to find the equil. const. at a lower temp. than 900° but 2 expts. at 800° gave values of 14 and 16 which shows that the const. increases when the temp. is lowered. Reference is made to the work of Jellinek and Tomoff in *C. A.* 19, (1084), who give 12.2 as the av. value at 860° , but in their case one of the phases consisted of an alloy of Pb, K and Na and the other the chlorides of the metals.

E. O. E.

The ternary system sodium chloride-platinum chloride-water at 25° . T. A. GENKE. *J. Russ. Phys.-Chem. Soc.* 58, 596-600 (1926).—The soly. isotherm at 25° is composed of 3 branches corresponding to NaCl, Na_2PtCl_6 and $PtCl_4$, resp.; as the sep. phases. The soly. curve of Na_2PtCl_6 is continuous, showing this compd. to be at the same time a complex of NaCl and $PtCl_4$, and a Na salt of H_2PtCl_4 . (Where NaCl was present in soln. the system reached equil. in 6-8 hrs.; in the presence of $PtCl_4$, on the other hand, over a day was required for complete equil., and individual measurements deviated to either side of the curve. The d. isotherm shows an analogous behavior, which is explained by the greater viscosity of soln. contg. $PtCl_4$ retarding the crystn. of Na_2PtCl_6 .)

BASIL C. SOVENKOFF

The ternary system formic acid-sodium formate-water. E. ELÖD AND K. TREMMEL. *Z. anorg. allgem. Chem.* 165, 161-70 (1927).—The soly. isotherms for the system $HCOOH-HCOONa-H_2O$ were detd. at 13.0° , 23.4° and 45.0° . The identity of the solid phase was detd. by means of a polarization microscope. The soln. was analyzed for total formate by oxidation, and for free formic acid by titration. Gravimetric analysis of the solid phase was carried out. The results are shown by the accompanying triangular coordinate diagram.

R. L. DODGE

Some observations on the system phenol-water. F. R. JONES. *J. Phys. Chem.* 31, 1316-21 (1927).—The expts. were carried out between -2° and 13° . The hydrate $(C_6H_5OH)_2 \cdot H_2O$ formed spontaneously above -1° , and by seeding, large amts. were easily prepd. The concns. of phenol were detd. by the method of Redman, Weith and Brock (cf. *C. A.* 8, 1554). When g. of phenol per 100 g. of soln. is plotted against temp., there are 2 eutectic points. At -0.843° , 4.607 g. of phenol per 100 g. of soln. is in equil. with $(C_6H_5OH)_2 \cdot H_2O$ and ice. At -1.174° , ice and $(C_6H_5OH)_2$ are in equil. with phenol soln. contg. 6.839 g. per 100 g. soln. There are 5 invariant points and a doubly unstable region. The m. p. of pure C_6H_5OH is 40.71° ; of C_6H_5OH under H_2O is 1.80° ; of $(C_6H_5OH)_2 \cdot H_2O$ under H_2O is 12.17° .

F. E. BROWN

The new singular elements: an isothermal plane and a singular solid angle. V. I. NIKOLAEV. *Ann. inst. anal. phys. chim.* 3, 473-4; *J. Russ. Phys.-Chem. Soc.* 58, 553 (1926).—Soly. isotherms of $Na_2O-N_2O_5-H_2O$ at 25° in presence of 5, 15 and 30% of EtOH were detd. The singular points of intersection form a singular curve (using a triangular prism to represent the system) which represents the change of soly. of $NaNO_3$ in function of the concn. of EtOH. A singular plane passing through the bisecting lines $H_2O-NaNO_3$ divides the prism into an alk and an acid half. With increasing concn., the angle of intersection of the isotherms approaches 180° .

B. C. S.

Cryohydric lines of the ternary system Na-O-Na₂O₂-H₂O. V. I. NIKOLAEV. *J. Russ. Phys.-Chem. Soc.* 58, 557-64 (1926).—The lowering of the eutectic temp. of $NaNO_3$ by HNO_3 and NaOH obeys Raoult's law until about 4% by wt. Two triple eutectics were found: $-46.4^\circ (NaNO_3 + H_2O + HNO_3 + 3H_2O)$ and $-39.1^\circ (NaNO_3 + H_2O + NaOH \cdot 7H_2O)$. The binary eutectic $H_2O-NaNO_3$ lies at -18.1° .

B. C. S.

The system ferric oxide-arsenic acid-water at low concentrations of arsenic acid. N. H. HARTHORNE. *J. Chem. Soc.* 1927, 1759-68.—Using an app. previously described (cf. *C. A.* 19, 193), H. has studied the system $Fe_2O_3-As_2O_5-H_2O$ at 25° at the concns. 2.6 23.3% As_2O_5 and found 2 solid phases: the neutral salt $Fe_2O_3 \cdot As_2O_5 \cdot xH_2O$ (x probably near 6), amorphous, which adsorbs H_2AsO_4 and the new acid salt $Fe_2O_3 \cdot 2As_2O_5 \cdot 8H_2O$, which is isomorphous with $Fe_2O_3 \cdot 2P_2O_5 \cdot 8H_2O$. The system attained equil. very sluggishly. The phase samples were analyzed for As by converting this element into $AsCl_3$ by the method of Jannasch and Seidel and then titrating with KIO_3 ; for Fe by $K_2Cr_2O_7$ after reduction with $SnCl_2$. In the liquid phase Fe was detd. colorimetrically with NH_4CNS .

E. R. SCHIERZ

The system magnesium-cadmium. WM. HUME-ROTHERY AND S. W. ROWELL. *J. Inst. Metals* 445 (advance copy), 18 pp. (1927).—Thermal and microscopic methods were used to study the equil. relations of Mg-Cd. Two solid solns. and the compd.

MgCd₂ occur. No evidence of the compd. MgCd was found. The transformation of the β -solid soln. takes place at 54 at. % Mg and not at 50% as previously reported. No alteration in microstructure accompanied the change. Prolonged annealing is required to attain equil. in the solid alloys when MgCd₂ is about to form. The β -solid soln. extends from 40 to 100% Mg. Equil. diagrams and tables accompany the paper.

J. W. SHIPLEY

Study of the systems uranyl sulfate-alkali sulfate-water at 25°. A. COLANI. *Compt. rend.* 185, 273-5(1927); cf. C. A. 10, 2672; 11, 2864; 19, 3183; 21, 27.—The soly. curve of the system $\text{UO}_2\text{SO}_4\text{-(NH}_4)_2\text{SO}_4\text{-H}_2\text{O}$ shows the existence of the following solid phases: $\text{UO}_2\text{SO}_4\cdot 3\text{H}_2\text{O}$, $(\text{NH}_4)_2(\text{UO}_2)_2(\text{SO}_4)_3\cdot 5\text{H}_2\text{O}$, $(\text{NH}_4)_2\text{UO}_2(\text{SO}_4)_2\cdot 2\text{H}_2\text{O}$ and $(\text{NH}_4)_2\text{SO}_4$. The existence of the compd. $(\text{NH}_4)_2(\text{UO}_2)_2(\text{SO}_4)_3\cdot 5\text{H}_2\text{O}$ had not been previously noted; but Morton and Bolton (*Chem. News* 28, 50(1873)) had shown the existence of the anhyd. compd., and Burger and Rimbach (*Inaug. Dissert.*, Bonn, p. 46(1904)) had prep'd. the corresponding hydroxylamine salt. The soly. curve of the system $\text{UO}_2\text{SO}_4\text{-K}_2\text{SO}_4\text{-H}_2\text{O}$ shows the existence of the following solid phases: $\text{UO}_2\text{SO}_4\cdot 3\text{H}_2\text{O}$, $\text{K}_2(\text{UO}_2)_2(\text{SO}_4)_3\cdot 5\text{H}_2\text{O}$ (new), $\text{K}_2\text{UO}_2(\text{SO}_4)_2\cdot 2\text{H}_2\text{O}$ and K_2SO_4 . The soly. curve of the system $\text{UO}_2\text{SO}_4\text{-Na}_2\text{SO}_4\text{-H}_2\text{O}$ shows the existence of the following solid phases: $\text{UO}_2\text{SO}_4\cdot 3\text{H}_2\text{O}$, $\text{Na UO}_2(\text{SO}_4)_2\cdot 3\text{H}_2\text{O}$, $\text{Na}_4\text{UO}_2(\text{SO}_4)_3\cdot 3\text{H}_2\text{O}$ (new), which is the only one of the salts of this series which exists in the cold (in presence of an excess of Na_2SO_4), and $\text{Na}_2\text{SO}_4\cdot 10\text{H}_2\text{O}$. The curves for the first 2 systems are given; those of the third system will be published later with details of the expts. The curves seem to indicate that at 25° the compds. obtained act as true double salts.

A. PAPINEAU-COUTURE

Electrometric study of the system potassium chloride-lead chloride water at 25°. A. J. ALLMAND AND L. J. BURRAGE. *Trans. Faraday Soc.* 23, 470-7(1927); cf. C. A. 20, 3402.—The activities of KCl and PbCl_2 in ternary solus. were measured by e. m. f. of Ag-AgCl (or Hg-HgCl) electrodes. The ternary diagram was embellished with *isodynamics*, or lines of equal activity of KCl or PbCl_2 , resp., viz., those with 0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 0.75 the activity of the solid salts. The significance of these curves is discussed, and certain confirmation of data will be sought in v. p. measurements.

A. W. FRANCIS

Studies on lactic acid. IV. The distribution of lactic acid between water and ether and between water and amyl alcohol. R. DIETZEL AND E. ROSENBAUM. *Biochem. Z.* 185, 275-86(1927); cf. C. A. 21, 3008.—The distribution coeff. of lactic acid at 20° and in concn. of 1 mol./l. between water and ether is not const., and varies from 11.3 when $c_w = 0.931$ mol./l. to 8.7 at $c_w = 0.201$ mol./l. For amyl alc. the coeff. varies from 2.42 ($c_w = 0.756$ mol./l.) to 2.13 ($c_w = 0.242$ mol./l.) and under complete suppression of dissocn. of the acid from 2.37 to 2.15. Temp. has a very slight effect upon the distribution coeff. between H_2O and ether.

S. MORGULIS

The kinetics of homogeneous catalysis. Experimental investigation of the mechanism of a homogeneous catalytic reaction. EUGEN SHMITAL'SKII AND N. KOBASEV. *Z. physik. Chem.* 127, 129-77(1927); cf. C. A. 20, 3624.—The results obtained by S. in his study of the homogeneous catalytic decompn. of H_2O_2 by chromic acid and its salts, are used to test mathematically the validity of S.'s intermediate-compd. theory of catalysis. The reaction velocity measurements permitted the calcn. of the affinity const. for the hypothetical intermediate compd. of H_2O_2 and $\text{Cr}_2\text{O}_7^{2-}$. By the use of this const. it is possible to calc. the coordinates of the reaction-velocity curve. It is necessary to assume the existence of more than one intermediate compd. in order to account for all the observed results.

R. L. DODGE

The shifting of e-uilibrium by materials that exert a simultaneous favorable influence (catalyze) reactions. II. N. SCHLESINGER AND R. MALKINA-OKUN. *Ber.* 60B, 1479-83(1927); cf. C. A. 21, 1048.—The formation and sapon. of Et acetate in the presence of HCl, HBr and H_2SO_4 at 100° and HBr and HCl at 13° was studied. The catalyzers depress the equil. consts. in proportion to the concn. of the acid. HBr has the greatest effect at 100° and H_2SO_4 the least. The influence of HBr is less at lower temp. Extrapolation of the linear relations connecting acid concn. with equil. const. for the 3 acids at 100° gives the same value for the equil. const. without acid in each case.

F. L. BROWNE

Antioxygen catalysis. CHARLES MOUREU. *Chimie et industrie Special No.*, 101-9 (1927).—An address outlining the main points of M.'s work on this subject and the theory he has put forward to explain observed facts.

A. PAPINEAU-COUTURE

Catalytic hydrogenation and dehydrogenation by metal oxides. PAUL SABATIER AND ANTONIO FERNANDEZ. *Compt. rend.* 185, 241-4(1927); cf. S. C. A. 21, 3303.—The dehydrogenating action of oxides which are practically unreducible by H was verified on compds. other than primary alcs. Passing piperidine vapors through an

empty tube heated above 600° caused very little decompn. with very slight evolution of H; but when the vapors were passed under the same conditions through a tube contg. MnO there was a steady evolution of H and production of a brown liquid consisting of a mixt. of pyridine and dipyridyl (due to dehydrogenation of the pyridine), boiling below 250°. The same dehydrogenation is readily obtained with reduced Ni even at 250°. As previously noted (*loc. cit.*), dehydrogenating oxides should also act as hydrogenation catalyzers. PhNO₂ was entrained by an excess of H₂ through a pyrex tube contg. MnO, which was heated progressively; at about 350° there was slight formation of H₂O vapor and NH₃; at 450°, and especially at 600°, the reaction was quite rapid, with evolution of considerable NH₃ and small quantities of CO₂, with condensation of a liquid contg. NH₄OH, H₂O, PhNH₂, a little C₆H₆, and considerable proportions of Ph₂NH and Ph₃N. In the absence of catalyzer, the decompn. is negligible. ZnO gives practically the same results as MnO. Al₂O₃ (prepd. by pptn. and drying in the oven) gives but slightly more decompn. than when no catalyzer is used. For direct hydrogenation of nitrous ethers ZnO is more active than MnO. With isoamyl nitrite the reaction proceeded regularly, giving mainly di- and tri-isoamylamine; and similarly with isobutyl nitrite. Direct hydrogenation of capronitrile (C₆H₁₁CN) proceeded similarly at 500° with either MnO or ZnO, with evolution of large quantities of NH₃ and formation of a mixt. of the 3 corresponding hexylamines, the dihexylamine predominating. Hydrogenation over MnO gave unsatisfactory results with the ethylene hydrocarbons (with which reduced Cu frequently does not give good results) and with ketones (the rate of decompn. of the secondary alc. formed being much greater than the rate of formation at the active temp. of the catalyzer). A. PAPINEAU-COUTURE

The catalytic decomposition of formic acid. HANS TROPSCH. *Abhandl. Kenntnis Kohle* 7, 1-8(1925); *Chem. Zentr.* 1926, 1, 3298-9.—Water-free HCO₂H vapor was conducted over heated contact substances. At 355° the decompn. to CO₂ and H occurred most readily with Fe and tinned Fe, less readily with Cu and to the smallest extent with Al. Part of the HCO₂H was recovered in all cases. At 255° with tinned Fe, HCO₂H decompd. to CO and H and formed small quantities of CH₄. Glass wool, asbestos and pumice at 355° formed both CO and CO₂ and water, as did CaCO₃ at 400°, Li₂CO₃ at 255-410° and ThO₂ at 355° with simultaneous formation of yellow liquid reduction products (probably contg. MeOH). Al₂O₃ at 305° and 435° formed almost exclusively CO and H₂O, whether the HCO₂H was dry or contained water vapor. C. C. DAVIS

The catalytic decomposition of formaldehyde. HANS TROPSCH AND OTTO ROEHLER. *Abhandl. Kenntnis Kohle* 7, 15-36(1925); *Chem. Zentr.* 1926, 1, 3298.—HCHO vapor, obtained by vaporization of paraformaldehyde or of HCHO soln., was led at high temps. (in most cases 400°) over contact substances, including Na₂CO₃ (300-500°), CaCO₃, BaCO₃, ZnO, Al₂O₃, ThO₂, Cr₂O₃, UO₂, Fe, alk. Fe, Sb, Pb (195°), quartz (600°) and activated C. Decompn. was very rapid except with Sb and quartz. Considerable MeOH was formed with Na₂CO₃, Al₂O₃ (44% of the HCHO decompd.), ThO₂, UO₂ and activated C, in the first 2 cases with much deposition of C from water-free HCHO. Formation of CH₄ occurred especially with Cr₂O₃ (8% yield) and with activated C (9% yield), while the formation of unsatd. hydrocarbons occurred with Al₂O₃ (5% yield). A 5% yield of HCO₂H was obtained with UO₂. ZnO gave few reaction products of high mol. wt., and it decompd. dry HCHO smoothly to CO and H, and moist HCHO to CO₂ and H. In almost all cases the formation of an oil with an odor of a terpene character and in some cases fatty substances were observed. C. C. DAVIS

Comparative experiments on the decomposition of carbon monoxide by contact substances. HANS TROPSCH AND ALEX. VON PHILIPPOVICH. *Abhandl. Kenntnis Kohle* 7, 44-5(1925); *Chem. Zentr.* 1926, 1, 3298.—Purified and dried CO was conducted over contact substances at 400°. Its decompn. according to the reaction: 2CO → CO₂ + C, was measured by detg. the CO₂. Ni was the most active catalyst, but this activity was almost completely destroyed by alloying the Ni with 50% Sn. Great differences were found among different types of Fe. With a CO current of 400 cc. per hr., the following % CO₂ were found in the issuing gas: with Ni, 36.4; Fe from Fe₂O₃, 10.4, ferr. reduct., 2.3; ZnO, 0.9; MnO, 0.8; Cr₂O₃, 0.6; NiSn, 0.3-0.6; Al₂O₃, 0.4; BaSO₄, 0.4; tinned Fe, 0.4; MgO, 0.2; Cu 0.0. C. C. DAVIS

The decomposition of methanol by iron, tin and aluminum. HANS TROPSCH AND ALBERT SCHELLENBERG. *Abhandl. Kenntnis Kohle* 7, 13-4(1925); *Chem. Zentr.* 1926, 1, 3298.—MeOH vapor was conducted over the metal heated and spread out with a combustion tube. At 520° C was deposited on the Fe, decompn. of the MeOH to a gas contg. 4-7% CO₂, 20-25% CO, 55-60% H and 3-12% CH₄, occurring. The small quantity of condensate was neutral and contained HCHO. With tinned Fe,

the decompn. of MeOH followed the same course, but was only slight. With Al at 520°, the gas contained 5% CO₂, 2% CO, 60% H and 4% CH₄, and at 270° it contained 2% CO₂, 5% CO, 52% H and 30% CH₄. In a receiver cooled with liquid air there condensed a reaction product contg. Al, probably AlMe₃. C. C. DAVIS

The decomposition of methanol by metals and metallic oxides. A. SCHIELLENBERG. *Abhandl. Kenntnis Kohle* 7, 9–12 (1925); *Chem. Zentr.* 1926, I, 3298.—A compilation of the literature on the thermal decompn. of MeOH by various contact substances. C. C. DAVIS

The reduction of carbon monoxide to formaldehyde and methanol at ordinary pressure. ALBERT JAEGER. *Abhandl. Kenntnis Kohle* 7, 51–4 (1926); *Chem. Zentr.* 1926, I, 3393.—A survey of the literature. C. C. DAVIS

Nature of the sintering of active copper catalysts. F. H. CONSTABLE. *J. Chem. Soc.* 1927, 1578–84.—Sintering of an active Cu surface results in 2 effects, (1) reduction of the area of the exposed surface, and (2) collapse of some of the active centers on the surface. The course of oxidation of Cu was followed by measurements of the elec. cond. of the Cu-oxide mixt. and by estn. of the thickness of the surface film of oxide by means of its color in normally reflected light. From the initial values of the rate of oxidation of active and sintered catalysts the ratio of area of the surface in the 2 states was calcd. The surface area was reduced to about 1/3 while the catalytic activity was reduced to about 1/7; thus the reduction in the surface was somewhat more effective in reducing catalytic activity than was the collapse in the actual centers existing on the surface. The energy present in the centers of activity is not very greatly in excess of that possessed by the regular arrangement of the surface atoms. R. L. DODGE

"Active" iron. A. SIMON AND K. KÖTSCHAU. *Z. anorg. allgem. Chem.* 164, 101–26 (1927); cf. Baudisch and Welo, *C. A.* 20, 438.—Guaiac resin is a more sensitive reagent for ferric or ferrous ions (the latter in the presence of H₂O₂) than benzidine. In neutral soln., the reaction can detect Fe in a diln. of 0.0056 mg. per l. Extn. with CHCl₃ intensifies the reaction, which is not sp. for Fe but is given by Co, Mn, Cu, Hg, Ni and their salts, as well as by the oxidizing agents Cl, Br, I and KMnO₄. The positive reaction obtained with ferrum reductum which has been rubbed in a mortar is ascribed to ferrous ions resulting from the soln. of Fe as the bicarbonate. Filtrates obtained from aq. suspensions of ferrum reductum decompose H₂O₂, that derived from rubbed iron being slightly more active. The activity of these filtrates disappeared only slowly on standing and was accompanied by pptn. of the Fe. In an atm. of CO₂, preps. maintained their activity and were only slightly affected by ultra-violet light. DAVID DAVIDSON

Catalytic oxidation of ammonia and hydrogen cyanide. III. J. ZAWADSKI AND I. LICHTENSTEIN. *Rocz. Chem.* 6, 824–37 (1926).—The oxidation of NH₃ to NO with a Pt catalyst commences at 250°; that of HCN at about 400°. In this reaction, if the rate of flow of the reaction mixt. is small, a considerable quantity of free N is found among the products; at velocities of more than 60 l. per hr. for NH₃ and 23 l. per hr. for HCN, part of these gases passes unchanged at a temp. of 600°. The concn. of substrate in the reaction mixts. does not appear greatly to influence the reaction, the course of oxidation depending more on duration of contact and temp. The yield of NO at a given temp. at first increases to a max. and then decreases with increasing rate of flow, the optimal value for the latter increasing with temp. By selecting appropriate values for the above two factors, yields of up to 100% of NO may be obtained. B. C. A.

Catalytic decomposition of ammonia. GEORG-MARIA SCHWAB. *Z. physik. Chem.* 128, 161–81 (1927).—The rate of catalytic decompn. of NH₃ on glowing Pt and W filaments was measured by a static method. The app. was essentially the same as that previously described (cf. *C. A.* 20, 2933, 3632). The amt. of NH₃ remaining undecompd. in the reaction vessel at the end of various time intervals was directly detd. The rate of decompn. on Pt and W at low pressures can be expressed by the equation $-dc/dt = (k.c)/(\delta n + \epsilon h)$, where C is the NH₃ pressure, n in the N pressure, and h is the H pressure. The equation is explained on the basis of Langmuir's unimol. layer theory of surface catalysis. At higher pressures the measurements no longer support this theory. R. L. DODGE

The weakening of the oxidative power of ferric chloride by heating and its regeneration. M. J. GRAMENITZKI. *Biochem. Z.* 185, 430–2 (1927).—The blueing of tincture of guaiac or of KI-starch by active O₂ is catalyzed by FeCl₃. If, however, the FeCl₃ soln. is boiled and then cooled, the blueing reaction is greatly inhibited, but the

catalyzing effect is regenerated gradually if the FeCl_3 is left standing before using it in the reaction. This effect is ascribed to the lowering of disson. of FeCl_3 by heat.

S. MORGULIS

The catalytic activity of metallized silica gels. II. The hydrogenation of acetylene. V. N. MORRIS AND L. H. REYERSON. *J. Phys. Chem.* **31**, 1332-7(1927); cf. *C. A.* **18**, 3012.—Catalysts made by reducing finely divided Pt, Pd or Cu, deposited within the pores of silica gel were tested by a dynamic method for their activity in catalyzing the reduction of C_2H_2 to C_2H_4 with H. The app. used was similar to that already described by M. and R. Both C_2H_4 and C_2H_6 were produced. As the temp. was raised the catalysts became effective in the order: Pd 50°, Pt 100°, Cu 200°. As the ratio of C_2H_2 :H was increased from 1:10 to 3:1 the production of C_2H_4 went through a max.

R. L. DODGE

The mechanism of the catalytic decomposition of hydrogen peroxide solutions by metal ions. A. V. KISS AND F. L. EDERER. *Rec. trav. chim.* **46**, 453-62(1927).—The rates of decompn. of H_2O_2 soln. in the presence of Ca, Cd, Mg, Sr, Zn, Co, Cr, Mn, Ni, Cu and Fe ions were measured at 40°. Only the Cu and Fe ions showed any considerable catalytic effect. Cr ions exhibited a slight catalytic action. In the case of catalysis by Cu ions, the reaction mechanism may be indicated by the equations, $2\text{Cu}^{++} + \text{H}_2\text{O}_2 = 2\text{H}^+ + 2\text{Cu}^+ + \text{O}_2$; $\text{Cu}^+ + \text{H}_2\text{O}_2 = \text{Cu}^+\cdot\text{H}_2\text{O}_2$; $\text{Cu}^+\cdot\text{H}_2\text{O}_2 + \text{Cu}^+ = 2\text{OH}^- + 2\text{Cu}^{++}$; $\text{H}^+ + \text{OH}^- = \text{H}_2\text{O}$. It was shown exptl. that a definite equil. between Cu^{++} and Cu^+ ions was reached during the catalysis. The position of this equil. was dependent on the exptl. conditions. However, the limiting reaction in the case of catalysis by Fe ion is not an ionic reaction.

R. L. DODGE

The adsorption of hydrogen and ethylene on a copper catalyst poisoned with carbon monoxide. C. W. GRIFFIN. *J. Am. Chem. Soc.* **49**, 2136-45(1927).—Pease's (cf. *C. A.* **17**, 2220; **18**, 188; **19**, 1981) method of measuring adsorption of H and C_2H_4 on a Cu catalyst was again employed in measuring the adsorption of these gases on Cu catalysts that had been poisoned with adsorbed CO. The poison caused an increase in adsorption at low pressures and a decrease in adsorption at high pressures. The poison decreased the activity of the catalyst for the hydrogenation of C_2H_2 . The CO, in causing extra, low-pressure adsorption of H and C_2H_2 does not leave the H or C_2H_2 in an activated state. A general interpretation of the results is made by assuming the process of sorption to comprise a secondary factor such as soln. in addn. to surface adsorption.

R. L. DODGE

The significance of iso-catalytic data and the so-called proton theory of chemical reactivity. H. M. DAWSON. *J. Phys. Chem.* **31**, 1400-3(1927); cf. *C. A.* **21**, 2834.—Bergstein and Kilpatrick's discussion (cf. *C. A.* **21**, 521) of D and Powis' earlier results (cf. *C. A.* **7**, 334) is based on a misconception. The interpretation of observations on the autocatalytic reaction between acetone and I leads to conclusions very different from those drawn by Bergstein and Kilpatrick. The factors which det. the incidence of min. reaction velocity are considered mathematically in relation to the catalytic catenary, and it is shown that the proton theory of chem. reactivity is entirely inconsistent with established facts.

R. L. DODGE

Velocity of autocatalytic decomposition of bromosuccinic acid in aqueous solutions. J. ZAWISKI AND W. WYCZALKOWSKA. *Rocz. Chem.* **6**, 415-65(1926).—Various equations for the autocatalytic decompn. of bromosuccinic acid are derived. The addn. of HBr to the reaction mixt. changes the reaction velocity equation from $dx/dt = k_0(a - x)/x$ to $k_0(a - x)/(b + x)$, where b is the concn. of HBr and k_0 remains const. (0.000768). The addn. of equiv. quantities of Na_2SO_4 , which combines with the H ions produced in the reaction, changes the velocity equation to $k(a - x)/\sqrt{\rho x}$, where k is twice as great as k_0 , and ρ is the degree of disson. of the HSO_4 ion. The same equation holds for the velocity of decompn. of aq. acid bromosuccinates, substituting for ρ the degree of disson. of bromosuccinic acid. The normal Na and K salts are hydrolyzed according to the equation $dx/dt = k(a - x)^{1/2}/\sqrt{x}$. The retarding influence of HNO_3 is half as great as the t of equiv. quantities of HCl or HBr, the velocity in this case being $k_0(a - x)/(b/2 + x)$, where b is the concn. of HNO_3 . The addn. of KBr changes the velocity of reaction to $k_0(a - x)/(b/2n + x)$, where $n > 1$. Since, therefore, the velocity of reaction is retarded by both H and Br ions, the original equation should be expressed as $k_0(a - x)/2x$, whence it follows that the real value of k is 0.000154.

B. C. A.

Graphical method for the stem correction of glass thermometers. E. BERL AND A. KULLMANN. *Ber.* **60B**, 815 7(1927).—The prepn. of a nomogram giving stem correction of a glass thermometer is described.

F. R. B. CHOW KY

A new simple method for the production of very low temperatures. FRANZ SIMON.

Physik. Z. **27**, 790-2(1926).—As a rule very low temps. are produced by liquefaction and vaporization of gases (H and He). Since no continuous transition is feasible from the b. p. of N to that of H and from the b. p. of the latter to that of He, the Linde process must be applied, which is used advantageously for industrial purposes but causes great difficulties in the laboratory on account of the necessary tech. equipment and the operating personnel. S. describes a new method which permits closing the gap between the b. ps. of the gases utilizing the fact that the heat of adsorption of the gas on adsorbent C is frequently higher than the heat of vaporization. Thus to liquefy He the following process is used: A vessel with adsorbent C is placed in a Dewar vessel with liquid H the pressure of which has been brought to a minimum by pumping. The interspace between the vessels is filled with He. He is brought into contact with the C under a pressure of several atm.; the produced heat of adsorption is conducted through the He of the interspace to the liquid H. The He of the interspace is then removed whereby the thermal insulation of the vessel with C and adsorbed He is effected. By pumping off the He from the C the temp. sinks considerably. The lowest temp. reached was well below 4° abs. as indicated by measurements of the supraconductance of a Pb rheostat. The lowest pressure was 10^{-5} mm. Hg. The gap between the b. ps. of N and H can also be bridged by the same principle. EMIL KLARMANN

Determining temperature distribution. S. WHITEHEAD. *Electrician* **99**, 225 (1927).—The mathematical evaluation of the flow of heat in isotropic media. C. G. F.

Calculation of the theoretical combustion temperatures. PAUL DROSSBACH. *Z. Elektrochem. angew. phys. Chem.* **33**, 349-50(1927).—The temp. reached by burning CO with the equiv. amt. of pure O_2 was calcd. on the assumption that the heat of reaction at room temp. T , is equal to the integral $\int_T^{T'} C_P^{CO_2} dT$ plus the product αQ , in which

Q is the heat of disson. of CO_2 at the temp. T' and α is the percentage CO_2 dissond. Since Q can be expressed as a function of the sp. heats of the substances involved and the sp. heats, theoretically at least, as functions of the temp., it is possible to calc. T' . In this instance, the calcn. was made by successive approximations, tabulating the value of $\int_T^{T'} C_P^{CO_2} dT + \alpha Q$ for different values of T' , using the data of Miething, Nernst

and Landolt-Bornstein. For the combustion of CO with pure O_2 the calcd. temp. of combustion is 2811° and with air 2237° . For H_2 with pure O_2 the temp. of combustion is calcd. as 3527° and with air 2410° . These values are higher than those given by Pollitzer (cf. *C. A.* **17**, 2222), who uses disson. values at 0.1 atm. instead of 1 atm.; and further they do not agree with the Chemiker-Kalender, the figures from which, according to Drossbach, lead to absurd conclusions. A. W. KENNEY

Thermobalance analysis of the change in various compounds heated in different gases. HEIKICHI SAITÔ. *Sci. Repts. Tôhoku Imp. Univ.* **16**, 47-200(1927); cf. *C. A.* **21**, 1744.—Using an improved form of Honda's thermobalance S. investigated the wt. changes which occur when solids are heated under given conditions. Various natural and artificial sulfates, carbonates, sulfides, oxides and metals were examd. and the weight changes during continuous heating registered by means of the thermobalance. The materials were pulverized and reduced to the same av. grain size (200 mesh). Quantities of 0.5 g. (sometimes 0.3 or 1 g.) were then heated while a current of gas (air, air + SO_2 , N_2) was passed over the sample at the rate of 100 cc. per min. The rise in temp. was usually maintained at 2° per min. In some cases the heating was carried out in steps, i. e., at rapidly rising and then constant temps. The results are presented in numerous tables and graphs. The importance of continuous observation during heating for the industrial and metallurgical roasting of sulfide ores is illustrated. In those cases where the changes in weight were the result of simultaneous increase in weight (sulfate formation) and decrease of weight (oxide formation) the changes in the gas phase were also detd. and lixiviation tests were made. A thorough qual. and quant. study of continuous changes in solids can thus be established, for which S. proposes the new term "thermobalance analysis." H. S. VAN KLOOSTER

Thermal properties of ferric oxide. GEO. G. BROWN AND C. C. FURNAS. *Trans. Am. Inst. Chem. Eng.* **18**, 309-46(1926).—"The known sp. heat of cryst. Fe_2O_3 is extended from 100° to 650° . A new allotropic transformation at 360° is reported, and the heat absorbed at this transition is reported as 4.85 cal. per g. The total heat absorbed for all transitions between 650° and 825° is estd. at 41.8 cal. per g." Advantages and disadvantages of the method for detg. the thermal properties of solids are given. The app. and its operation are described. Numerous curves and charts and a bibliography are included. W. H. BOYNTON

The thermal and electrical conductivity of a single crystal of aluminum. EZER GRIFFITHS. *Proc. Roy. Soc. (London)* A115, 236-41(1927).—An Al crystal grown according to Carpenter (cf. *C. A.* 20, 3419) was examd. for elec. and thermal cond. For the thermal detns. thermocouples were clipped on to the crystal, one end was elec. heated and a differential-flow calorimeter measured the heat arriving at the other end. The crystal was lagged with sil-o-cel and a circular shield having the same temp. gradient as the crystal. The shield was lagged with magnesia asbestos. An extruded Al bar gave the same value of K in the app. as in the standard. K in c. g. s. units was 0.551 at a mean temp. of 76.4° , 0.557 at 163.9° . These values agree with that of the bar and are higher than earlier detns., because of higher purity (99.6% Al). The change with temp. is too slight to have any definite significance. The elec. sp. resistivity, detd. by means of a potentiometer, was 2.89×10^{-6} ohms per cm. cube at 18° . The Lorentz const. ($K/\lambda T$, where K is thermal cond., λ is elec. cond., and T abs. temp.) is 5.46×10^{-9} , which is within the range of published values. R. L. HERSHEY

Experiments and studies of Volta on the uniform expansion by heat of air and water vapor and on vapor pressures. F. MASSARDI. *Naturwissenschaften* 15, 705-10 (1927). B. J. C. VAN DER HOEVEN

The specific heat of tungsten, boron, boron nitride and beryllium oxide. A. MAGNUS AND H. DANZ. *Ann. Physik* 81, 407-24(1926).—The heat capacities in cal. per gram atom over the range $400-900^\circ$ are $WC_p = 6.7807 + .0010475t$; $BC_p = 2.3658 + 7.908 \cdot 10^{-3}t - 4.902 \cdot 10^{-6}t^2$; $BN_c = 2.516 + 6.31 \cdot 10^{-3}(t - 22) - 3.29 \cdot 10^{-6}(t - 22)^2$; BeO $3.089 + 7.464 \cdot 10^{-3}t - 4.786 \cdot 10^{-6}t^2$. The measurements were made in a large anaerobic calorimeter by the drop method. C_v for W is calcd. and is much above the theoretical value of 5.98. The other substances have not reached 5.98 at the highest temps. measured. F. R. BICHOWSKY

The temperature coefficient of the dielectric constant of quartz, fluorspar and gypsum. ALBRECHT DIETERICH. *Ann. Physik* 81, 523-36(1926).—The change in capacity of a condenser on changing temp. was measured at the frequency 6.5×10^4 . The temp. coeffs. of the dielec. const. $1/\epsilon(\delta\epsilon/\delta t)$ are: fluorspar 2.05×10^{-4} ; gypsum 3.75×10^{-4} (\perp , 010); Scholt's Minosglas 1.37×10^{-4} ; quartz 0.2×10^{-4} (\perp to axis). F. R. BICHOWSKY

Specific heat of gaseous nitrogen tetroxide. J. D. MCCOLLUM. *J. Am. Chem. Soc.* 49, 26-39(1927).—The apparent sp. heat of N_2O_4 was measured over the range in which it dissociates into NO_2 . The apparent sp. heat involves the heat of disson.; correcting for this the true heat capacity of the mixed N_2O_4 and NO_2 varies from 11.4 cal. per mol. at 34° to 19.5 at 160° . The heat capacities of the pure gases were not calcd. but must be about the same. F. R. BICHOWSKY

Thermal investigation of some olefin and acetylene derivatives. W. A. ROTH AND FR. MÜLLER. *Ber* 60B, 643-5(1927).—The heat of combustion per mol. at const. vol. at 20° of solid tetramethylbutenediol, $C_8H_{14}O_2$, is 1411 ± 5 kg. cal.; of (malenoid) α -tetramethylbutenediol, $C_8H_{16}O_2$, 1171 ± 3 kg. cal.; of (fumaroid) β -tetramethylbutenediol 1174 ± 1 kg. cal. F. R. BICHOWSKY

Specific heats of a highly cooled, non-condensed phase. N. PERRAKIS. *Compt. rend.* 184, 28-30(1927).—Starting from the revised form of Trouton's rule, P. has confirmed, by means of simple thermodynamical considerations, Perrin's conclusion that all gases cooled sufficiently have mol. heats equal to those of monatomic gases. B. C. A.

Reconciliation of values obtained for thermochemical constants of organic compounds. W. SWIENTOSLAWSKI. *Rocz Chem.* 6, 578-702(1926).—Values obtained for the heats of combustion of various org. compds. by different authors are compared and correction coeffs. detd. for them. B. C. A.

A critical study of the electrical differential method for measuring the specific heat C_p of a gas. MAX TRAUTZ. *Ann. Physik* 83, 457-97(1927).—The principle of elec. differential for measuring C_p of gases has been developed to a final equation for practical use. The cases of an ideal gas with and without dependence on temp. and an actual gas dependent on temp. are treated mathematically. The null method of a differential manometer is tested and it is shown how deviations occur exptly., what errors occur and how to correct for, or overcome them. Materials having a vapor pressure of at least a few mm. of mercury give C_p to an accuracy of about 1 to 5 percent in the app. used. R. H. LAMBERT

The heat of transformation of nickel and cobalt. SABURO UMINO. *Science Repts. Tohoku Imp. Univ.* 16, 593-611(1927).—U. studies the change in sp. heat and heat content of Ni and Co in the vicinity of their transformation points using a calorimeter and working in an atm. of H_2 . Curves are given showing the heat-content of Ni from

250° to 600° and of Co from 350° to 600° and from 1000° to 1300°. Curves are also given for the mean and true heats of Ni and Co from 100° to 1300°. The heat of magnetic transformation in Ni at about 400° was found to be 2.01 cal. per g. The heat of transformation in Co at 460° from hexagonal close-packed to face-centered cubic lattice was 1.05 cal. per g. and at 1150° the heat of magnetic transformation was found to be 2.00 cal. per g.

D. H. POWERS

The heat of adsorption of gases by charcoal. S. J. GREGG. *J. Chem. Soc.* 1927, 1494-1512.—The heats of adsorption, the equil. pressure and the amt. adsorbed of N_2O , C_2H_2 , C_2H_6 , CO , SO_2 , CO_2 , C_2H_4 and N by a standard birchwood charcoal were measured at 0° with a Bunsen ice calorimeter. A few expts. at 40.35° were made in a phenol calorimeter. The phenomenon of hysteresis was traced to the presence of some non-condensable gas in the adsorption system. For the integral heat of adsorption Q , the relationship $Q = kx^n$ was found to hold, where x is the amt. adsorbed and k and n are consts.; n is characteristic of the gas and lies between 0.9 and 1.0. The Williams-Henry equation, $\log x/p = A_0 - A_1x$, where p is the equil. pressure and A_0 and A_1 are consts. at const. temp., is fairly satisfactory. The relationship between p and Q is fairly well expressed by an equation of the form $Q = B \log (p/\alpha + 1) + A$. A close parallelism exists between the value of α and the corresponding values of the consts. a and b of the van der Waals equation.

R. L. DODGE

Heats of adsorption on poisoned and heat-treated catalysts. G. B. KISTIAKOWSKI, E. W. FLOSDORF AND H. S. TAYLOR. *J. Am. Chem. Soc.* 49, 2200-6(1927).—Measurements were made of the heats of adsorption of H on an active Cu catalyst and on the same catalyst after 2 successive reductions in activity by suitable heat treatment at 250° and 300°. The measurements were made in a special glass vacuum calorimeter described by T. and K. (cf. *C. A.* 21, 2088). An accuracy of 10% is claimed. The active catalyst showed maxima in the curve of heat of adsorption plotted against amt. adsorbed. The first heat treatment reduced the heat developed at the max. and also decreased the amt. adsorbed. The second heat treatment eliminated all evidence of a max. These results are in harmony with a theory of catalytic surface with variable elementary spaces, upon the most active of which adsorption is accompanied by an endothermic activation process, possibly a dissociation into atomic H.

R. L. D.

Adsorption. XII. The heat of adsorption of carbon dioxide. A. MAGNUS AND W. KALBERER. *Z. anorg. allgem. Chem.* 164, 345-56(1927); cf. *C. A.* 21, 844.—A calorimeter for measuring the heat of adsorption of small amts. of gas at low pressures and 0° is described in detail. The mol. heat of adsorption of CO_2 by wood charcoal increased rapidly with decrease in equil. pressure below 5 mm. Hg. The mol. heat of adsorption at equil. pressures above 5 mm. was about 7450 cal., but at 0.076 mm. had increased to 12,460 cal. The results are in agreement with Magnus' theory (cf. *C. A.* 20, 3368) which postulates the existence of points of high adsorption potential on the charcoal surface. **XIII. The heat of adsorption of carbon dioxide on silica gel.** *Ibid* 357-65.—Measurements of the heat of adsorption of CO_2 on silica gel at low pressures were made in the previously described app. The heat of adsorption decreased linearly with increase in equil. pressure. The results can be almost quantitatively explained as due to the Joule-Thomson effect.

R. L. DODGE

Six-place tables of the Debye energy and specific heat functions. J. A. BEATTIE. *J. Math. Phys. Mass. Inst. Tech.* 6, 1-32(1926).—The values of $\frac{1}{3}UR^{-1}T^{-1}$ and of $\frac{1}{3}C_vR^{-1}$ have been computed as functions of the argument $x(=h\nu_m/kT^{-1})$, where ν_m is a frequency characteristic of the substance) in the range 0-24 in increments of 0.1. For values of x greater than 24, an error of less than one in the sixth significant figure is introduced by using $\frac{1}{3}UR^{-1}T^{-1} = 19.481818x^{-1}$, and $\frac{1}{3}C_vR^{-1} = 77.92727x^{-3}$.

B. C. A.

Thermodynamical theory of reversible electrodes. B. SZYSZKOWSKI. *Bull. intern. acad. Polonaise* 8A, 313-23(1926); *Science Abstracts* 30A, 446.—A description is given of the application of the laws of thermodynamics to the problem of the equil. between an electrode and a soln. of electrolytes.

H. G.

A computation of the free energy and fugacity in gaseous mixtures of ethylene and argon. G. E. GIBSON AND BENJAMIN SOSNICK. *J. Am. Chem. Soc.* 49, 2172-9(1927).—As a test of the Lewis-Randall rule that the fugacity of a constituent in a mixt. of gases is the product of the mol. fraction and the fugacity of the pure constituent at the pressure of the mixt., the fugacities of C_2H_4 and A were calcd. from the exptl. data of Masson and Dolley (*C. A.* 17, 2804). The rule has been found to be valid at low pressures, but at higher pressures (50 atms.), the error of the fugacity calcd. by the rule ranges from 0 to 20%, depending upon the mol. fraction. At 100 atm., the errors range from 0 to 100%.

J. H. PERRY

The Volta effect. EMMANUEL DUBOIS. *Compt. rend.* 185, 110-1 (1927); cf. *Compt. rend.* 184, 1424 (1927).—When a metal is heated to a sufficiently high temp., it always becomes electronegative relatively to its initial state. D. suggests these variations in the Volta effect may be due to elimination of impurities by heating and that pure metals may be free from Volta effect. Preliminary results of a systematic investigation into the nature of the impurities causing the Volta effect showed that the oxidizability of the metal seems to be without influence, and also that on distg. *in vacuo* an alkali chloride over a metal which had previously been rendered electronegative (relative to its initial condition) by heating *in vacuo*, the metal becomes strongly electropositive.

A. PAPINEAU-COUTURE

An inexpensive and accurate gas chain for liquids lighter than saturated potassium chloride solution. H. C. WATERMAN. *J. Assoc. Official Agr. Chem.* 10, 390-5 (1927).—A simple design of sharp-junction H-electrode vessel of the bubbling type is described, one form of which can be set up without any glass blowing from materials available in almost any lab. The advantages of the vessel are low cost, rapid manipulation, freedom from KCl contamination of the soln. under examn., exclusion of atm. CO₂, small vol. of sample, and accuracy. Results with 0.05 M K H phthalate as test soln. show uniformly less than 0.01 p_H variation from the theoretical value for this soln. as given by Clark.

A. PAPINEAU-COUTURE

Current density-potential curves of metals that become passive, with iron described as an example. W. J. MILLER. *Monatsh.* 48, 61-70 (1927).—On the basis of time relations, current-potential curves for the passivation of Fe are obtained. These consist of 2 branches, one corresponding to the behavior of the active, the other of the passive metal. Earlier curves, prepd. without consideration for time, give the behavior of a metal which can be either active or passive, and are unsuitable as a basis for theoretical discussion.

H. STOERTZ

Influence of pressure on electrical conductivity of platinum. A. MICHELS AND P. GEELS. *Proc. Akad. Wetensch. Amsterdam* 29, 1106-12 (1926).—A Pt resistance thermometer was used and its resistance detd. at 15.57°, 21.95° and 34.75° at pressure intervals up to 251.5 kg./sq. cm. The results differ from previously published data in that the pressure coeffs. vary more considerably with the pressure, and at lower pressures the coeff. varies to a greater extent with the temp. The importance of this for the measurement of temp. by means of the Pt resistance thermometer is pointed out.

B. C. A.

The current density of a normal cathode fall. R. SEELIGER AND M. REGER. *Ann. Physik* 83, 535-64 (1927).—A study of the normal cathode fall has been made from the c. d. by evenly and totally covering the cathode. A series of expts. in H₂ and in N₂ show that the normal c. d. is not const. with pressure. This is due to an uneven coating about the cathode. The current strength is a linear function of the length of the covering of the cathode. Expts. were also made with neon and various metals were used as cathode for the three gases studied. Mixts. of 2 gases at a given pressure gave values that were not a linear function of concn. of either gas.

R. H. L.

A source of error in conductivity measurements. F. A. SMITH. *J. Am. Chem. Soc.* 49, 2167-71 (1927).—S.'s results confirm the conclusions of others and show that the cell const. is dependent on the resistance of the solns. used in its measure. Thus, it should be used with solns. having resistances of the same order of magnitude, as shown by cond. curves of NH₄NO₃ in liquid-NH₃ soln. From a plot of the ratio of the resistances of distant to concentric electrodes against the log of resistances of the distant pair, for solns. of NH₄NO₃ and NH₄Cl in liquid NH₃ and KCl in H₂O, it is evident that the resistance of the distant pair increases more rapidly than that of the concentric, until the limiting value of the former is reached. If other factors are const., the ratios of resistances are, still, not the same.

J. BALOZIAN

Cells of the standard cell type with low electromotive forces. W. C. VOSBURGH. *J. Am. Chem. Soc.* 49, 2222-9 (1927); cf. *C. A.* 20, 327.—The c. m. fs. of the following cells are measured: Cd(Pb,Hg)/CdCl₂.2.5H₂O, sat./CdCl₂.2.5H₂O + PbCl₂, sat./Pb(Hg) (I), and, Cd(Pb,Hg)/CdI₂, sat./CdI₂ + PbI₂, sat./Pb(Hg) (II), at 25° over 8-9 months, until constancy is assured, and then at 5° intervals from 15-40° over 3-14 days. Both cells have large temp. coeffs., I showing a transition point at 26.2°, below which the coeff. is negative and above, positive. Cell II shows marked hysteresis. For these reasons neither is suitable for a standard. The heats of reaction are calcd. and compare favorably, in some cases, with those calcd. from thermochem. data.

J. B.

The potential of the gold-auric oxide electrode. R. H. GERKE AND M. DOROTHY ROURKE. *J. Am. Chem. Soc.* 49, 1855-8 (1927).—The Au₂O₃ used is prepd. by Krüss's method (*Ann.* 237, 291 (1887)), and Au (cryst.) by reducing AuCl₃ with SO₂. The

e. m. f. of the cell H_2 (1 atm.), H_2SO_4 , $Au_2O_3(s)$, Au (cryst.) is calcd. from those observed for $Hg(l)$, $Hg_2SO_4(s)$, H_2SO_4 , $Au_2O_3(s)$, Au (cryst.) and the known values of H_2 (1 atm.), H_2SO_4 , Hg_2SO_4 , Hg for 3 acid concns., by taking the av., and is found to be -1.362 v. (H^+). The free energy of formation of Au_2O_3 is calcd. as 18,810 cal. Although there are no theoretical reasons why Au_2O_3 can or cannot be prepd., G. and R. doubt that it has ever been made pure.

J. BALOZIAN

The poisoning of hydrogen electrodes. I. A. H. W. ATEN, P. BRUIN AND W. DE LANGE. *Rec. trav. chim.* **46**, 417-29 (1927).—Among the substances considered as poisons towards the H electrode are NH_3 , H_2S , cyanides, As compds. and Hg salts. In cases of poisoning the potential of the electrode towards the soln. is always too positive. Traces of O have a great influence on the poisoning effect. Electrodes of sheet Pt, or of Pt wire, either covered with bright Pd from a soln. of $PbCl_2$ or coated with Pt black were examd. in pure H, in the presence of As_2O_3 , and in the presence of O. It was difficult to prep. electrodes of the same activity, even when the same method of prepn was used. Two types of poisoning were observed—acute, from which the electrode recovered in a short time, and permanent, which went on increasing for several days. The poisoning action of As_2O_3 depended on the following factors: surface conditions of the electrode, area of the electrode, presence or absence of O, agitation of the soln., and nature of the electrolyte. $HgCl_2$ behaved like As_2SO_3 . H_2S and KCN had only a slight poisoning action.

R. L. DODGE

Studies in overvoltage. II. Oxygen overvoltage. TADASHI ONODA. *Z. anorg. allgem. Chem.* **165**, 79-92 (1927).—Using an app. previously described (cf. C. A. **21**, 695; *Z. anorg. allgem. Chem.* **162**, 57 (1927)) O detd. between 0.3° and 60° the O overvoltage (π) on electrodes of polished Pt (I) $\pi_{2.0} = 1.663$, platinized Pt (II) 1.441, Au (III) 1.6932, polished Ni (IV) 1.405, Ni with Ni black (V) 1.3992 and Cu (VI) 1.465. π was independent of the history and treatment of the electrode surface at 0.3° as well as at 20° . The electrodes were treated for periods up to 10 days as follows: (I) and (II) H_2SO_4 , HNO_3 , HCl , $AcOH$, $NaOH$, NH_4OH , (III) HNO_3 , HCl , $AcOH$, air, $NaOH$, NH_4OH ; (IV) HNO_3 , NH_4OH , (V) Ni black disappeared when treated with acids and bases, (VI) Cu underwent discoloration, etc. The temp. coeffs. are (I) $\pi_t = 1.7355 - 0.0045t$; (II) $1.7664 - 0.00388t$; (IV) 1.3880 , $0.0019t - 0.000039t$; (II) and (IV) very small. H-O cells are not reversible between 0° and 60° ; the O overvoltage always exceeds 1.23 v. III. The relation of hydrogen overvoltage, surface tension and concentration of the solution. *Ibid.* 93-136.—Using a specially designed Hg electrode with electrolyte (I) 2 N H_2SO_4 contg. varying amts. of $(NH_4)_2SO_4$, Na_2SO_4 , K_2SO_4 , leucine, mannitol and $C_2H_5(OH)_3$ separately and (II) 0.1, 0.5, 1.0 and 2 N HCl contg. NH_4Cl , O. has detd. H overvoltages π . The surface tension of Hg in the presence of these solns. and some of 0.1, 0.5, 1.0 N H_2SO_4 contg. $(NH_4)_2SO_4$, Na_2SO_4 and K_2SO_4 separately were detd. in a U tube with arms of unequal diam. The overvoltage in (I) increases with increase in concn. of salt, in (II) it decreases. The surface tension behaves in the reverse manner in each case. The relation between the

change in π and γ (dynes) can be expressed $\Delta\pi = \Delta\gamma \frac{\partial\pi}{\partial\gamma} = -0.0065 \Delta\gamma$. With amalgams contg. 0.063, 0.033% Au, 0.1, 0.0178% Ag, 0.1435, 0.0357% Pb, and 0.1% Zn it was found that the same generalizations obtained. There is no simple relation between the H overvoltage and the surface tension of H in solns. of the various acids contg. salts. Descriptions and drawings of the app. are given.

E. R. S.

Nature of the film produced by anodic oxidation of aluminum. H. SUTTON AND J. W. WILLSTROP. *J. Inst. Metals* **440** (advance copy), 5 pp. (1927); cf. C. A. **21**, 2444.—Anodically treated strips of Al were placed in a silica boat contd. in a hard glass tube. Dry HCl passed over the strips at $300-320^\circ$ removed the Al and left the film. Films varying in thickness from 0.033μ to 2μ were obtained. Si and C were found in the films. From the vol. of gas evolved when the treated Al strips were heated *in vacuo* to 1200° the film is shown to be oxide and not hydroxide.

J. W. S.

Development of an exponential equation for the preparation of spark potentials from an experimental basis by considering an electrode function. II. Determination of the ionization values α - β and $(n.v.)$ from the electrode function. FR. KLINGEL-RUSS. *Ann. Physik* **83**, 565-74 (1927).—The coeffs. of the exponential equation α and β are detd. either from 2 spark gaps or where one is equal to zero. These consts. vary with the diameter of the bulb which does not agree with the theory of ionization of gases. By assuming that for $Q = 0$, in the electrode function, the independent discharge in unit vol. of existing carrier at the time t has the same value as for produced carrier per unit vol. in the very small time $t - t_0$, good agreement is attained

with existing data for spark gaps from 1 to 40 cm. Deviations of expt. from calcn. for variant size of bulb must still be explained. R. H. LAMBERT

The dependence of the dielectric constant of vapors upon temperature. I. Benzophenone. FRITZ MASKE. *Physik. Z.* 28, 533-45(1927).—From the change in capacity of a gas condenser produced by the presence of Ph_2CO vapor M. has detd. the dielec. const. ϵ of this substance. $(\epsilon - 1)_{760}^{\text{mm.}} = 0.0205 \pm 1.5\%$; $(\epsilon - 1)_{760}^{226^\circ} = 0.0295 \pm 1\%$. At high temps. ϵ approaches a const. value; at low temps. it rises rapidly. The relation is expressed by $\frac{(\epsilon - 1)}{(\epsilon + 1)^2} \cdot \frac{1}{d_n} (T - T') = K$, in which T is temp. of measurement; T' 414° abs.; $d_n = d_{760}$. Vapor pressures of Ph_2CO detd. by boiling at reduced pressures and by introduction in a vacuum over Hg for temps. 140 – 226° are, for intervals of 10° , 0.98, 1.05, 1.4, 1.8, 2.4, 3.2, 4.25, 5.7, 7.6 and 8.85 cm. (226°) resp. Drawings and description of app. are given. E. R. SCHIERZ

Dielectric constant of "rod-like-particle" sols. J. J. BIKERMAN. *Physik. Z.* 27, 769-71(1926).—A statistical computation of the orientation of ellipsoids in a homogeneous elec. field has been made, and the conclusions have been applied to the behavior of V_2O_5 sols with rod-like particles (cf. *C. A.* 19, 1528). B. C. A.

The electrical anisotropy of liquid crystals. MIECZYSLAW JEZEWSKI. *Z. Physik* 40, 153-60(1926); cf. *C. A.* 18, 2102.—The measurements of the dielec. consts. of *p*-azoxyanisole and *p*-azoxyphenetole in a magnetic field which were reported in a previous paper were carried out under more accurate conditions. The difference between the dielec. consts. observed in the magnetic field and outside of it depends upon the temp. It decreases in the case of *p*-azoxyphenetole from 0.28 at 138.7° to 0 at 170° and in the case of *p*-azoxyanisole from 0.16 at 120.6° to 0 at 135.5° . A series of measurements has been carried out to det. the influence of the angle between the magnetic and elec. lines upon the dielec. const. The results obtained agree very closely with those calcd. from the equation: $\epsilon_\alpha = \epsilon_0 \cos^2 \alpha + \epsilon_{90} \sin^2 \alpha$. An agreement with the data calcd. from Ornstein's equation (cf. *C. A.* 18, 2827) was obtained only in the case of high field intensities. EMIL KLARMANN

The thickness of the Helmholtz double layer. J. F. MCCLENDON. *Science* 66, 200(1927).—The surface of a charged metal electrode immersed in an electrolytic soln. and the layer of excess ions of opposite sign act as the plates of a condenser the capacity of which can be measured. This capacity in microfarads is $C = 0.0885 \times 10^{-6} K S/T$ where K is the dielec. const., S is the surface area of the electrode in sq. cm. and T is the thickness of the dielectric (Helmholtz double layer). The cond. cell used to det. the capacity contained two Au electrodes each of 10 sq. cm. surface (5 sq. cm. face and 5 sq. cm. back) and acted as 2 condensers in series equiv. to one condenser with double the thickness of dielectric. Assuming $K = 80$ the equation becomes $T = 7.08 \times 10^{-6}/C$ in cm. and the thickness of the Helmholtz layer is $T/2$. The electrostatic value of the capacity could be only approx. detd. since it changed slightly with the a. c. frequency. The thickness of the Helmholtz layer increased with diln. and was found to be 0.194×10^{-6} cm. for 0.1 *N* KCl soln. and 0.325×10^{-6} for 0.001 *N* KCl soln. E. R. SMITH

Optical rotatory dispersion. III. The rotatory dispersion of quartz in the infra-red, visible and ultra-violet regions of the spectrum. T. M. LOWRY AND W. R. C. COODE-ADAMS. *Trans. Roy. Soc. London A* 226, 391-466(1927); cf. *C. A.* 16, 3581.—Previous work on the rotatory dispersion of quartz (*C. A.* 9, 1003) is now extended to include the wave-length interval from 25,170 Å. U. in the infra-red to 2327 Å. U. in the ultra-violet. Photographic methods using the line spectra of various elements were employed for the visible and ultra-violet regions. For the infra-red region galvanometer readings were made on continuous spectra. The most important result of the expts. has been to establish the complete validity of Drude's equation for the rotatory dispersion of transparent media, namely, $\alpha = \Sigma k_n/(\lambda^2 - \lambda_n^2)$. In the present work the dispersion consts. to be used in this equation for quartz are calcd. directly from the observed rotations and not from measurements of absorption or refraction. The formula derived for the rotatory power of quartz at 20° is $\alpha = [9.5639/(\lambda^2 - 0.0127493)] - [2.3113/(\lambda^2 - 0.000974)] - 0.1905$, which will give the rotation to $\pm 0.002^\circ/\text{mm.}$ for any point in the spectrum within the limits stated above. C. C. KISS

Notes on the energy of vibration of carbon monoxide and carbon dioxide molecules. FRANK MATOSI. *Z. Physik* 40, 1-3(1926).—The deformation of the molecules of CO and CO_2 was calcd. from their elec. momentum. In both cases the values are considerably smaller than the ones calcd. from the mol. refraction. E. K.

The optical anisotropy of selectively absorbing dyestuffs. H. ZEHNER AND FRIEDRICH C. JACOBY. *Kolloidchem. Beihefte* 24, 365-417(1927); cf. C. A. 20, 699.—The data on the relation between dichroism and double refraction and the optical peculiarities of selectively absorbing substances are reviewed (19 citations). By applying the rules for anomalous dispersion to each of the 2 directions of vibration of the light traversing an anisotropic layer, the course of the double refraction throughout the spectrum was traced for the several possibilities of dichroism. In the case of simple dichroism the more strongly absorbed ray is more strongly refracted in the spectral region of wave lengths longer than the wave length of max. absorption, and less strongly in the region of shorter wave lengths. Exptl. verification of the deduction was made by studying dyes that had been rendered anisotropic by four different methods. About 160 different dyes were obtained anisotropic. Three-fourths of these exhibited simple dichroism. Dyes made anisotropic by polishing in the dry state usually show positive dichroism, those polished moist show negative dichroism. Sometimes the reversal of direction takes place in only a part of the spectrum. F. L. BROWNE

Molecular refraction and the parachor. W. HERZ. *Z. anorg. allgem. Chem.* 159, 316-8(1927).—Calcs. are made of the mol. refraction and of the parachor for 51 org. liquids, from values previously published. The quotient of the parachor divided by the mol. refraction is a const., independent of the liquid. Abnormal values were obtained for liquefied gases. A close relation between n and surface energy is indicated. B. C. A.

The lag of the Kerr effect. J. W. BEAMS AND E. O. LAWRENCE. *Proc. Natl. Acad. Sci.* 13, 505-10(1927).—By means of a special exptl. arrangement the following values for the time lag in the Kerr effect (double refraction by a liquid in an elec. field) are detd.: CHBr_3 3.3×10^{-9} sec., CHCl_3 3.8×10^{-9} , Et_2O 6×10^{-9} and CS_2 and benzene less than 2×10^{-9} . For a given liquid the lag is independent of the wave length of the light. Since the time lag is roughly proportional to the permanent elec. moment of these mols., it is suggested that only polar mols. can exhibit lags as great as 10^{-9} sec. An effect of temp. on the lag in CHCl_3 was found, the lag being about 2×10^{-9} sec. longer for the liquid at -5° than at 25° . The results partially support the orientation theory of the Kerr effect, but several phenomena are not explained by this theory. F. A. JENKINS

Refractometric evidence for the existence of undissociated molecules and complex ions in solutions of strong electrolytes. K. FAJANS. *Trans. Faraday Soc.* 23, 357-81 (1927).—The relationship $(\Delta R)r^4 = k$ holds between the decrease in refractivity ΔR suffered by a halogen ion in the alkali halide lattice and the lattice distance r . The const. k for the ions I^- , Br^- , Cl^- is approx. proportional to the square of their respective refractivities. The refractivity of salts and of HCl changes with increasing concn. analogous to the changes which accompany the union of the ions into crystals or mols. These changes are in all cases attributed to the polarizing action of the ions on each other. It is concluded that in solns. these changes must be caused by such oppositely charged ions as are in direct contact with each other with no water mols. between them. From the refractivity data it follows that in soln. the least distance to which a Cl ion can approach a cation is greater for Na ion than for Li ion. Since the characteristic parameter introduced into the theory of Debye and Hückel has a greater value for Li ion than for Na ion, this parameter can hardly have the phys. significance ascribed to it by the theory, i. e., that of the distance of nearest approach of the ions. From a comparison of the partial vapor pressures of HCl and HCN from their aq. solns. it is concluded that up to concns. of about 5 mols. per 1000 g. of H_2O the decrease in refractivity of HCl with increasing concn. is due only to a very slight extent to the formation of undissoc. HCl , possibly being caused by the complex ion H_3Cl^+ . For higher concn. the equil. is strongly shifted in favor of the undissoc. HCl . E. R. SMITH

The dispersion at the extreme temperatures of the liquid state. W. HERZ. *Z. anorg. allgem. Chem.* 163, 217-20(1927).—If in the Lorentz-Lorenz formula $SR = [(n^2 - 1)/(n^2 + 2)] \cdot (1/d)$, SR is assumed to be independent of the temp., it is possible to calc. n for any given temp., providing the corresponding d is known. Using data taken from the literature, H. calcs. the n_D , n_F and n_C of 25 substances at 0°K and at their crit. temp. In every case he finds that $n_{C_0} - n_{C_\infty} < n_{D_0} - n_{D_\infty} < n_{F_0} - n_{F_\infty}$. A. L. HENNE

Physik.* 43, 199-221(1927).—Using the electronic structure of the central atom as a starting point, the authors try to establish the systematics of the complex salts. Empirical rules and regularities in the properties are found. The mag. magnetic properties follow these rules. A. L. HENNE
- The number representing the valency and its relation with the structure of the atoms**. HANS LESSHEIM AND RUDOLF SAMUEL. *Fortschritte Chem., Physik, physik. Chem.* 19, No. 3, 7-98(1927).—A general up-to-date survey of the subject presented in a non-mathematical way. As an introduction, the authors summarize the fundamental postulate of the quantum theory, the Bohr H model, the atomic models of Bohr and those of Stoners, and the natural system of the elements. The first part of the work is a study of the Köntgen spectra; it leads to a discussion of the composition of the outer atomic shell, with special attention to the alkaline metals. The second part considers the polar and non-polar linkages and their importance in the building of the mols. The last part of the work studies the chem. properties of the atoms as a result of their constitution. A. L. HENNE
- A possible significance of the tetrahedral numbers in the natural system for the arrangement of protons and electrons in the atoms. II**. HUGO STINTZING. *Z. Physik* 40, 92-106(1926); cf. *C. A.* 20, 1754.—The scheme of tetrahedral numbers affords a deductive working hypothesis in the absence of a satisfactory theory of nuclear structure. It disregards for the present the nature of forces within the nucleus

of the atom. The tetrahedral theory was applied in a previous paper to the at. wts.; now it is extended to electrons. The new tetrahedral hypothesis points to the improbability of the occurrence of elements with the masses 2, 3, 5, 13 and 21 and permits, entirely in agreement with facts, the assumption of elements with other masses and their isotopes. It suggests the existence of an element 93 in the Mn group; the existence of an element 94 or higher is improbable. The γ -radiation (Barkla) can be explained on the basis of this theory.

EMIL KLARMANN

The hydrogen and helium models. FELIX JOACHIM V. WISNIEWSKI. *Z. Physik* **44**, 385-91 (1927).—In the calcn. of the ionization potential and the magnetic susceptibility of H and He, on the ground of the author's theory (*C. A.* **20**, 2780), the model of the diatomic gases may be used for the H mols., and the model of the monoatomic gases for the He mols. This is done without involving any modification of the theory. For a correct calcn. of the dielec. const., by means of these models, the equation defining the dielec. const. is to be modified in both cases in the same way. The new definition will consequently be common to H and He, but it will remain different from the various equations characterizing the other gases.

MARIE FARNSWORTH

Undulatory theory of the mechanics of atoms and molecules. E. SCHRÖDINGER. *Phys. Rev.* **28**, 1049-70 (1926).—In the new theory, the existing discrepancy between the frequency of motion and the frequency of emission disappears in so far as the latter frequencies coincide with the differences of the former. A definite localization of the elec. charge in space and time can be associated with the wave system, and this with the aid of ordinary electrodynamics accounts for the frequencies, intensities, and polarizations of the emitted light and makes superfluous all kinds of correspondence and selection principles. In several cases, where the new theory is at variance with the old, the former is the better supported by expt.

B. C. A.

Undulatory mechanics and atomic structure of matter and of radiation. LOUIS DE BROGLIE. *J. phys. radium* **8**, 225-41 (1924); cf. *C. A.* **21**, 1220. —Most students of undulatory mechanics have tried to represent the dynamical phenomena by the propagation of waves with a continuous amplitude of the classical type in optics. At first it is difficult to comprehend how this point can be reconciled with the at. structure of matter and of radiation. The object of this paper is to show that continuous solutions furnish, in reality, only a certain static view permitting singularities. These conceptions give a clear sense to the equation proposed by Schrödinger for the dynamics of the system.

L. D. R.

Electronic states and band spectrum structure in diatomic molecules. IV. HUND'S theory; second positive nitrogen and Swan bands; alternating intensities. R. S. MULLIKEN. *Phys. Rev.* **29**, 637-49 (1927); cf. *C. A.* **21**, 206, 1057. —Hund's theory (cf. *C. A.* **20**, 2283) of mol. electronic states and band spectra is reviewed briefly. After a discussion of intensity relations and selection principles in terms of the correspondence principle, it is shown that the available evidence is in agreement with the theory. The occurrence of P -type S terms and σ -type P and D terms is explained by the theory, as also the existence of P -type and σ -type doubling. Selection rules and other relations in ${}^2P \rightarrow {}^2S$ and ${}^3S \rightarrow {}^2P$ transitions are discussed. Hund's interpretation of the second positive N_2 bands as a ${}^3P \rightarrow {}^3P$ transition is further developed and extended to the Swan bands; the apparent absence of Q branches, and other intensity relations in these bands, are explained; the rotational doubling in these bands is interpreted as σ -type doubling. The alternating intensities or alternate missing lines in the He_2 , N_2 , Swan, and N_2 bands can all be accounted for formally by the postulate that they are due to alternate (partially or completely) suppressed levels such that the suppressed values of $(j_k - \sigma_k)$ are always as follows: B rotational sub-states ($j - \frac{1}{2} - \sigma_k$) = 0, 2, 4, —; A sub-states 1, 3, 5, —; here σ_k is the part of σ which is due to the orbital angular momentum of the electron and j_k is the resultant of σ_k and the quantity m which measures the nuclear angular momentum in quantum units. The NH β bands (${}^3P \rightarrow {}^3S$) are briefly discussed. V. Bands of the violet CN (${}^2S \rightarrow {}^2S$) type. *Ibid.* **30**, 138-49. —Theoretical intensity formulas applicable to bands of the violet CN (${}^2S \rightarrow {}^2S$) type are obtained: P_1 or $R_1: i_1 = 2jk(j_k + 1)/(2jk + 1) = (j^2 - \frac{1}{4})/j$; P_2 or $R_2: i_2 = 2jk(j_k - 1)/(2jk - 1) = (j^2 - \frac{1}{4})/j$; $Q_{1,2}$ or $Q_{2,1}: i_3 = 2jk/(4jk^2 - 1) = (2j + 1)/4j(j + 1)$, with the help of the summation rules, assuming Hund's (*C. A.* **20**, 2283) case b type of interaction of the electron spin. The equations predict 2 Q branches ($Q_{1,2}$ and $Q_{2,1}$) hitherto unrecognized, which should appear as weak satellite series, one accompanying the familiar double P branch, the other the R branch. These Q branches should decrease in intensity from their first

members. The first $Q_{2,1}$ (or $Q_{1,2}$) line should accompany the otherwise single first line of the R (or P) branch, all other P and R lines being truly double; this is in agreement with Hulthén's (C. A. 21, 1227) results on the B bands of CaH. For low j values in the P and R branches, the doublet component corresponding to the parallel orientation (+ ϵ) of the electron spin vector should be appreciably more intense than that corresponding to the anti-parallel orientation (- ϵ). Treating the doublets (and their satellites) as unresolved single lines, the intensities should be exactly as in $^1S \rightarrow ^1S$ bands (CuH, HCl). The above predictions seem to be confirmed in the CaH, N_2^+ , and violet CN bands. Thus the theory appears to afford a satisfactory explanation of the observed lines and intensity relations in $^2S \rightarrow ^2S$ bands, removing previous difficulties and uncertainties in interpretation. Other $S \rightarrow S$ transitions are treated briefly. The nature of the energy differences between the 2S terms corresponding to + ϵ and - ϵ is considered. In all cases where the order of the terms can be determined, with the one exception of the initial states of the B bands of CaH, it is found that $F_1 > F_2$. This suggests that the magnetic field which causes $F_1 \neq F_2$ (developed by the mol. rotation in accordance with Kemble's theory) may be in part that of the nuclei as well as of the electrons.

BERNARD LEWIS

Radium, uranium and vanadium. F. L. HESS. *Mineral Ind.* 35, 601-10 (1926).—World sources and output are discussed, with notes on technology. A. BUTTS

Compton effect according to Schrödinger's theory. W. GORDON. *Z. Physik* 40, 117-33 (1926).—The quantum frequency and intensity of the Compton effect are found to be equal to the geometric mean of the corresponding classical magnitudes for the initial and final states in the process. B. C. A.

Hydrogen spectrum in the new quantum theory. C. ECKART. *Phys. Rev.* 28, 927-35 (1926).—Mathematical. The Born and Jordan matrices are calcd. Computed intensity ratios for the two brighter components of H_α and H_β are not in agreement with observed values, the discrepancy being too great to be ascribed to the incompleteness of the model. B. C. A.

New quantum theory and the Zeeman effect. P. S. EPSTEIN. *Proc. Nat. Acad. Sci.* 12, 634-8 (1926).—Mathematical. The difficulties encountered in the treatment of the Zeeman effect by means of Schrödinger's theory are avoided by a new derivation of the fundamental equation for the behavior of a H atom in a uniform magnetic field. It is claimed that this treatment is more rigorous, since the terms of the second order are not neglected, as in the older theory. B. C. A.

Quantum theory of the problem of two substances. J. R. OPPENHEIMER. *Proc. Cambridge Phil. Soc.* 23, 422-31 (1926); *Science Abstracts* 30A, 83-4.—An attempt is made to solve more generally than has previously been accomplished the quantum mech. problem of an ion and an electron. The methods of Schrödinger, using the characteristic functions of the wave equation $\Delta^2 u + (8\pi^2\mu/h^2)[E + (e^2/r)]u = 0$ are employed. The line intensities of the H spectrum are evaluated and a method is discussed for obtaining the radiation from hyperbolic orbits. The problem of the photoelec. and the inverse photoelec. effects is attacked and a formula obtained for the continuous absorption spectrum. The probabilities of transition, deflection and capture in a collision of an electron with an ion are computed. H. G.

Interaction of neutral atoms and homopolar binding according to the quantum mechanics. W. HEITLER and F. LONDON. *Z. Physik* 44, 455-72 (1927).—The action of forces between neutral atoms has a characteristic ambiguity in the quantum mechanics. The ambiguity seems capable of including the different modes of behavior actually found, i. e., for H either homopolar binding or elastic reflection, but for the rare gases only reflection. It also permits an evaluation of the elastic reflection effects in He, giving results of the right order of magnitude. For the selection and discussion of the various possible interactions the Pauli principle is here applied to a system of several atoms. F. A. JENKINS

A new scheme of atomic synthesis. MEGH NAD SAHA. *Physik. Z.* 28, 469-73 (1927).—By using well-known principles and without needing to assume any subdivision of energy levels, a simple scheme is developed with which the optical, chem. and ionization properties of the different atoms are correlated. The following levels are used together with the no. of electrons to fill them: K₁ 2, L₁ 2, L₂ 6, M₁ 2, M₂ 6, M₃ 10, N₁ 2, N₂ 6, N₃ 10, N₄ 14, O₁ 2, O₂ 6, O₃ 10, O₄ 14, P₁ 2, P₂ 6, P₃ 10, Q₁ 2, Q₂ 6; M₃ is placed to the right of N₁ and in the transition group the electrons are exchanged between these 2 levels. F. O. ANDEREGG

The structure of atomic nuclei. F. R. VOLOCHINE. *Compt. rend. séances soc. polon. phys.* 1925, 61-73; *Physik. Ber.* 7, 95.—In continuation of his previous work (cf. *Physik. Ber.* 4, 997 (1923)), V. considers the components of all nuclei as dynamic

systems with strong magnetic moments. The elementary components are represented by the prototypes H_2^1 , H_3^1 and H_4^2 (upper index = at. no.; lower = at. wt.). Thus H_2^1 and H_3^1 are isotopic with H_1^1 (H nucleus). $H_4^2 = \text{He nucleus} = H_A^Z = (3Z - 4)H_2^1 + (4 - 2Z)H_3^1$ (I). By an α transformation an element H_{A-4}^{Z-2} would be produced; a β change would yield H_A^{Z-1} . If $(Z - 2)$ and $(4 - 4)$ be substituted for Z and A , resp. in (I) it is found that the new element is composed of the same no. of H_2^1 and 2 less H_3^1 ($2H_2^1 = H_4^2 = \alpha$). From the supposed configuration of C = $2H_2^1 + 2H_3^1$; N = $2H_4^2 + 3H_2^1$; O = $3H_4^2 + 2H_2^1$ and the usual at. wts. the at. wt. of H_2^1 is calcd. as 2.008. $\text{Be}_9^0 = H_4^2 + H_3^1 + H_2^1$ yields the at. wt. of H_3^1 as 3.010. The energy evolved during the transformations is calcd. as 23.8×10^{-1} ergs and is available for kinetic energy of the α -particle, energy of disintegration or rearrangement. To explain the energy changes V. assumes the existence of quantum levels among which the H_2^1 , H_3^1 and H_4^1 can move about. Thus, when one moves to a lower level γ -radiation is produced. Of the energy available for rearrangement part can leave the nucleus as γ -rays. To show a quant. relationship between the α -, β - and γ -rays V. shows (1) that the additive rule holds not only for γ -rays, but also for energy differences of α rays (3 examples from Ra group); (2) of the 11 γ -rays of the Ra group the energy of 4 is identical with differences of α - and β -rays, that of 6 others equal to differences between 2 α - or 2 β -rays; (3) the energy of the β -rays corresponds to the differences between γ - or α -rays. Discussion of the structure of the elements is contained in the original. E. R. S.

An electron lattice theory of metals. B. E. WARREN. *Phys. Rev.* **27**, 797 (1926).—Metallic crystals are composed of ions and electrons, both being on definite lattices. The particular type of lattice must have a min. of potential energy. The rule is laid down that atoms with only 2 valence electrons will lose them, while atoms with more than 2 will lose only the excess. The metals of the various groups and comparison of the theory and x-ray results are discussed. Agreement is good. R. L. H.

The electric moment of the sulfur complex. A. M. TAYLOR AND E. K. RIDEAL. *Proc. Roy. Soc. (London)* **A115**, 589-609 (1927).—An infra-red examn. of several kinds of S shows the existence of electromagnetically active vibrations from which it is concluded that elec. doublets are present in the S complex. These are supposed to be the units S_2 which are built into groups $(S_2)_n$ of mass 512, fundamental in crystal structure. The linkage is thought to be pseudo-heteropolar. The elec. moment in *e. s. u.* $\times 10^{-18}$ and the effective charge on the atoms in fractions of the unit charge, resp., as calcd. by using the formula for extinction coeff. with absorption spectra data are 7.5 and 0.77, using the heat of vaporization in Kornfeld's formula are 8.0 and 0.82, while the approx. heat of dissoen. gives 4.5 and 0.46. For these calcns. the distance apart of centers of mass of the atoms is taken as 2.05 A. U. F. O. ANDEREGG

A new mass spectrograph and the whole-number rule. F. W. ASTON. *Proc. Roy. Soc. (London)* **A115**, 487-514 (1927).—With a new mass spectrograph (described in detail) possessing a resolving power of 1 in 600 and an accuracy of 1 in 10,000, new results have been obtained for the isotopic constitution of many elements. Mass nos., arranged in the order of intensity of the isotopes, have been found as follows for: S (32, 33, 34); Sn (120, 118, 116, 124, 119, 117, 122, 121, 112, 114, 115); Xe (129, 132, 131, 134, 136, 128, 130, 126, 124); Hg (202, 200, 199, 198, 201, 204). In addn., revised values of mass on the basis O = 16 are given for various elements or their more prominent isotopes. For each element studied is given its packing fraction, which measures the forces binding protons and electrons together in the nucleus. A plot of the packing fractions against mass nos. shows that all but light atoms lie on a single curve descending from a max. value for H to a negative min. for Br and then ascending again to a positive value for Hg. C. C. KIESS

The reflection of atomic hydrogen from ice crystals. T. H. JOHNSON. *Nature* **120**, 191 (1927).—A stream of at. H is allowed to be reflected from ice crystals oriented at random on to a photographic plate, the set-up of Phipps and Taylor (*C. A.* **21**, 526) being used. The preliminary results are interpreted as being in favor of the viewpoint that the diffractive nature of the reflection is assocd. with the momentum rather than with the structure of the colliding body. Some sort of selective reflections seems to be present at small angles. F. O. A.

The relation of the surface energies of different surfaces in rock-salt crystals. V. D. KUZNETSOV AND N. A. BESSONOV. *Z. Physik* **44**, 226-30 (1927).—It is experimentally detd. that the work necessary to grind off equally thick layers on the (100)

(110) and (111) planes of a rock-salt crystal is in the proportion $1:\sqrt{2}:\sqrt{3}$. Hence, the surface energies on these planes must be in this ratio. F. A. JENKINS

The age of the universe. J. H. SWARTZ. *J. Elisha Mitchell Sci. Soc.* **42**, 179-87 (1927).—The temp. of the stars cannot be satisfactorily accounted for by chem. changes, contraction or radioactivity, but can be by the transformation of mass into energy. Assuming the latter to be true, a formula for calcg. the age of a star is derived. The data obtained by the use of this formula together with other evidence indicate a max. age of 17.78 trillion years for our present stellar universe. A. L. MEHRING

Registering of α - and H-rays according to the new electrical counting method. H. GREINACHER. *Z. Physik* **44**, 319-25 (1927).—G. has described a method for measuring elementary radiation in which the primary ionization effect of the α -particle is intensified by means of electron tubes so that it may be observed galvanometrically and acoustically (*C. A.* **20**, 2116). A special oscillograph is used for the registering of α - and H-rays. The registering impulse of the H-ray is shorter than that of the α -ray. The ratio of the ionizing power of α - and H-rays is approx. $2\frac{1}{2}$. When H_2 is used in the ionizing chamber instead of air, the registering impulse for α -particles is much shorter. J. E. SNYDER

Collision of α -particles with helium atoms. S. GHOSH. *Bull. Calcutta Math. Soc.* **17**, 99-104 (1926); *Science Abstracts* **30A**, 113.—Wilson-cloud photographs of 1203 α -particle tracks in He have been obtained, of which 44 were forked, or 3.65%; this is rather high compared with that observed in H. The range of the recoil atoms varies from 0.94 cm. to 3.2 cm., higher than for H. The angle between the tracks of the recoil atoms and α -particles varies approx from $1^\circ 23'$ to $6^\circ 17'$. Darwin's theory predicts in addition, to small angles of forking angles of about 90° , no such cases were observed. Conclusion. The shape of the He nucleus is oblate spheroidal. None of the recoil-atom tracks was appreciably longer than those of the α -particles from which they originated, this shows that the recoil atoms do not exist as singly charged particles during the whole course of their existence as ionizing agents. H. G.

Fixation of the radioactivity of the air by the terrestrial electric field. EDOUARD SALLES. *Compt. rend.* **185**, 144-5 (1927).—A wire 10 to 15 m. long was stretched on a roof and exposed to the sun. It was rapidly rolled up and placed in an electroscope. The discharge averaged about 10 times as fast as the natural leak. The duration of the activity on the wire indicated Ra A, Ra B and Ra C. L. D. R.

The vaporization of polonium. P. BONET-MAURY. *Compt. rend.* **185**, 204-6 (1927); cf. *C. A.* **21**, 3016. A curve is given showing a comparison of the exptl. and theoretical distribution of Po which has passed through a slit and has condensed on a disk at any given radius. A verification of the law of cosines has been obtained. E. P. WIGHTMAN

Temperature coefficient of γ -ray absorption. L. BASTINGS. *Nature* **119**, 51 (1927).—The coeff. of γ -ray absorption of lead over a range of 250° increases by about 0.2% per 100° rise of temp. (cf. Read, *C. A.* **20**, 2616). B. C. A.

The method of streaming potentials. H. LACHS AND JOSEPH BICZYK. *Physik. Z.* **28**, 556-8 (1927); see *C. A.* **21**, 1747. MARIE FARNSWORTH

Lag in electrical discharges. W. CLARKSON. *Phil. Mag.* [7]. **4**, 121-33 (1927); cf. *C. A.* **21**, 2220.—The variation of the "peak" voltage in the intermittent discharge in discharge-tubes of scrupulous cleanliness is considered, and possible causes, both in the gas and in the electrodes, are sought for and applied in explanation. Exptl. results would agree with a "corona" lag, a theory of which is developed, if a slow "build up" is assumed. This assumption is shown to be justified from results obtained by a method, here described, for measuring the time of duration of a "flash," or condenser discharge. The small preliminary discharges often preceding a "flash" are explained on the same assumption as due to the form of the "corona characteristic." Possible causes of this slow "build up" are discussed, and it is tentatively assoc. with the apparently inevitable modification of the cathode surface by the filling gas. GEORGE GLOCKLER

Three-point spark gap. J. D. MORGAN. *Phil. Mag.* [7]. **4**, 91-100 (1927).—Expts. confirm the conclusion previously established by Wynn-Williams (*C. A.* **20**, 1351) that the action of the auxiliary spark in a three-point gap is due to ionization of the gas in the main gap by radiation given off from the auxiliary spark. They also go further, and show that the Wynn-Williams effect is due to an impulsive or transient condition. Moreover, they show that when a needle-point or an auxiliary spark-gap is connected to a steady source of potential, such as a Wimshurst machine, the action of the needle-point or the auxiliary spark on the main gap is then due not to radiation but to an ionized stream. GEORGE GLOCKLER

Two- and three-electrode systems in hydrogen. B. TREVELYAN. *Phil. Mag.* [7], 4, 64 77(1927); cf. *C. A.* 19, 436.—The current which passes in a discharge is governed by 2 factors, the applied elec. field and the unequal rate of diffusion of the ions; variation in the conditions of the discharge causes one or the other to be predominant. Under conditions which give rise to a large concn. of electrons and small potential gradient due to applied field, the current may be carried chiefly by diffusion. In the two-electrode tube large fields are absent, the main fall of potential occurs between the filament and grid, and the potential of all the luminous region beyond is not far different from that of the grid. There will, therefore, be practically no resultant field along the glow except that due to local concn. and diffusion effects. When there are no striations, the system may be regarded as consisting roughly of 2 equipotential surfaces, the walls and filament forming one, and the grid and the glow the other, practically the whole fall of potential occurring in the dark space between them. By inserting an anode as third electrode, and superposing a field between anode and grid, the system is altered. If the field between grid and filament is not too large, the grid and walls now form an approx. equipotential surface. The former acts as cathode in the main discharge between grid and anode, but here the cathode and anode are far apart and the main luminous region is between them, while in the two-electrode tube the distance between cathode and anode was small compared with the diam. of the tube, and the luminous region was beyond the grid. In one case there is a field along the glow, and in the other the applied field has practically no effect in the luminous part. In the presence of the field, diffusion along the tube is helped, but diffusion toward the walls is hindered. The greatest difference between the two- and three-electrode systems lies in the energy of the electrons. In the former, the electron temps. in the glow are high, and of the order of the ionization potential of H_2 , in the latter, the temps. are much lower. This suggests that in the two-electrode system the luminosity was produced by fast electrons able to ionize the gas directly, but in the three-electrode system by less direct means.

Corrections for the paper: "The orbits and light emission of hydrogen electrons." T. ENGSET. *Ann. Physik* 83, 903 4(1927).—A table of corrections for a previous paper (*C. A.* 21, 3152).

MARIE FARNSWORTH

The calculation of the mean value in the Lorentz electron theory. V. BURSIA. *Z. Physik* 43, 416-26(1927).—The mean value of current and charge in the electron theory is derived with the use of the Lagrange series development. This deviates somewhat from that of Minkowski-Born and Fokker but leads to the same result in a somewhat simpler manner. The mean value is expressed through quantities like polarization, magnetization, etc., which in general are not plainly definable. The question of the conditions under which the unequivocalness of the mean value can be asserted is considered.

MARIE FARNSWORTH

Heats of condensation of electrons and positive ions on molybdenum in gas discharges. C. C. VAN VOORHIS. *Phys. Rev.* 30, 318-38(1927).—A new calorimetric method for measuring the electronic work function of a metal in a gas discharge has been developed. A small Mo sphere was supported in a region of intense gas ionization by 3 fine wires, 2 of which formed a thermocouple to measure its temp., while a third carried the current of the incoming ions. Space potentials and mean electronic energies E_- were found by using the sphere as a Langmuir collector. Its rate of heating due to an increment Δj in the electron current reaching it against a small retarding field was measured and equated (with small corrections) to $\Delta j(E_- + \phi_-)$, whence the heat of electron condensation ϕ_- was found. The values of ϕ_- found by this method were: 4.76 v. in A, 4.04 or 4.35 v. in H_2 (mixed with A) and 4.77 or 5.01 v. in N. The doublet values follow different treatments of the surface. Because of uncertainties in the sp. heat values of Mo these results may be a few per cent too high; consequently, all the information required to make any necessary corrections from more satisfactory sp. heat values has been given. By a modification of the method, ϕ_+ for an A positive ion neutralized at a Mo cathode was found to be about 1 v. This low value indicates that a large part of the energy of neutralization at the cathode of a discharge is lost by the neutralized mols., probably by radiation, before they make thermal contact with the metal. The presence, in a low-pressure gas discharge, of the high-speed "secondary" electrons is shown by the good agreement between E_- obtained calorimetrically and values calcd. from the $\log j$ —against $-V$ lines of the 2 groups of electrons as obtained by Langmuir's methods.

BERNARD LEWIS

The effect of the medium on gas-ion mobility. H. A. ERIKSON. *Phys. Rev.* 30, 339-48(1927).—Results are given showing the effect on the mobility of adding foreign gases to the air through which the ions move. The conditions were such as to permit

the use, at least initially, of identical air ions. It is shown that adding CO_2 and water vapor to the air diminishes the mobility but adding H_2 increases the mobility. The results also indicate that the change in the mobility is due to the change in the medium and not to a change in the ions. It is found, however, that increasing the relative humidity gives a larger proportion of initial or 1.87 ions, indicating that H_2O simplifies the final positive air ion. It is also shown that a trace of C_2H_2 gives rise to an ion which has a mobility only slightly less than the initial air ion. It is also found that when C_2H_2 remains in air, a body is formed which when it becomes charged has a lower mobility. Results are given showing that adding Cl_2 and C_2H_4 to the air has no effect on the mobility within the time of observation used, whereas a trace of NH_3 results in the formation of a single positive ion of the same mobility as that of the negative ion which is not affected.

BERNARD LEWIS

Radiation produced by the passage of electricity through gases. J. J. THOMSON. *Phil. Mag.* [7], 2, 674-701 (1926); *Science Abstracts* 30A, 129.—An account is given of expts. on the character of the radiation produced when elec. currents pass through gas at a low pressure. The method adopted is to let the radiation fall on a disk of metal and measure the variation in the rate of emission of electrons due to the photoelec. effect when the emission is retarded by an elec. field tending to stop the escape of electrons. The theory of the variation of the rate of emission with the strength of the field is worked out, and methods are given for detg. from the graph representing the relation between rate of emission and the p. d. in the retarding of the spectrum of the radiation. The radiation produced by the passage of cathode and positive rays through the gas, and from the negative and anode glows in H, O, He and A at different pressures are discussed. The frequencies of by far the greater part of the radiation are comparable with those corresponding to quanta of the order of the ionizing and resonance potentials of the gas, in the radiation due to the cathode rays these radiations are mixed with others of higher frequency. In a few cases the radiation is fairly homogeneous, but in general it is a mixt. of radiation having a frequency comparable with that of the ionizing radiation with other radiation of a lower frequency. The electrodeless ring discharge is a very copious and convenient source of radiation of this type. H. G.

Atmospheric ionization and its effect on the propagation of short electric waves. H. LASSEN. *Z. Hochfrequenztechn.* 28, 109-13, 139-47 (1926); *Science Abstracts* 30B, 183-4.—An account is given of our present-day knowledge of the constitution of the upper layers of the atm. and their ionization by ultra-violet light, particularly with reference to the propagation of short elec. waves. It appears, from the data given that a particularly strongly ionized layer exists between the heights of 95 and 130 km. This layer has no sharply defined boundary on the lower side, within the layer the ionization increases at first in the upward direction and then decreases again. The propagation of short waves to great distances takes place principally in this layer, the explanation of the effects being found in the refraction of the waves by the ionized layers. There appears to be little or no appreciable reflection and the damping of the waves is small. The ionized layer persists through the night, but the concn. of the ions varies and explains the difference between the day and night effects. Explanations are also given of such phenomena as the dead zone, fading, etc. H. G.

Ionization phenomena in active nitrogen. P. A. CONSTANTINIDES. *Nature* 119, 163 (1927).—Differences in the ionization effects according to the gases mixed with the N are held to indicate that active N may be due to a metastable state of the N mol. with energy between 9.4 and 10.4 v. (LORD) RAYLEIGH. *Ibid.* 163.—A reply to Constantinides.

Law of force between electrons, two electron orbits and models of the helium atom. A. W. CONWAY AND G. KEATING. *Proc. Roy. Irish Acad.* 37, 40-51 (1926); *Science Abstracts* 30A, 163. The failure of the usual application of the quantum principle to the He atom to give series formulas of the correct type or a good agreement with the ionization potential is ascribed to the failure of the inverse-square law under these conditions. The correct spectral and ionization quantities are taken and the law of necessary to fulfill the conditions is investigated.

H. G.

The ionization by electrons in a homogeneous electric field. F. M. PENNING.

Z. Physik **40**, 4-9 (1926).—G. Hertz's calcs. of electronic diffusion (cf. *C. A.* **19**, 2908) and Compton and Van Voorhis' researches on the probability of ionization of gases by electronic impact (cf. *C. A.* **20**, 146, 2946) have been applied to an investigation of the electronic motion in a homogeneous elec. field. The number of impacts, the loss of energy caused by elastic impacts and the ionization per unit of length have been calcd. and the results applied to discharges in Ne. EMIL KLARMANN

Stripped yttrium (Y III) and zirconium (Zr IV). I. S. BOWEN AND R. A. MILLIKAN. *Phys. Rev.* **28**, 923-6 (1926).—The hot spark spectra of Y III and Zr IV have been identified and series relationships and term values are tabulated. In Y and Zr the normal position of the electron is in a 4d orbit rather than in a 5s orbit. B. C. A.

Configuration of a Lorentz electron moving arbitrarily along a straight line. S. C. WANG. *Phys. Rev.* **28**, 1309-14 (1926).—A differential equation is obtained which is invariant under a Lorentz transformation. The exact solution of the equation is obtained. B. C. A.

Value of the potential in the interior of a moving group of electrons. P. BRICOUT. *Compt. rend.* **183**, 1269-71 (1926).—Poisson's equation for the detn. of the distribution of the potential between 2 electrodes is applied to plane electrodes, and to coaxial cylindrical electrodes. It is concluded that in the detn. of the resonance potential of a gas by the method of electronic shock the electrodes should be placed so that the electronic current is sufficiently feeble to maintain a const. potential at different points in the gas. B. C. A.

Atmospheric ionization. J. J. NOLAN AND G. P. DE SACHY. *Proc. Roy. Irish Acad.* **37**, 71-94 (1927); *Science Abstracts* **30A**, 426. —In a previous paper (*C. A.* **20**, 1363) it was shown that about 40% of the atm. nuclei of condensation were uncharged, the remainder being positive and negative large ions carrying unit electronic charges. In this paper the problem of equil. of ionization is examd. without assuming equality of concn. of the 2 signs. The small atm. ions are found to be a mixt. of ions of different mobilities, viz., of the Langevin ions and those similar to the ions produced by the spraying and bubbling of liquids. The equil. concns. are given for different conditions. For the cond. of the lower layer of the atm. at Dublin a rough calcn. based on the data gives $A = 0.45 \times 10^{-4}$ c. s. units. H. G.

Development of the arc discharge. R. SEELIGER. *Physik Z.* **27**, 730-2 (1926); *Science Abstracts* **30A**, 215. —A discussion is given of the differences between and the similarities of the glow and arc discharges in discharge tubes. It is pointed out that the only fundamental difference between the 2 is in the phenomena at the cathode. The development of the arc discharge from the glow discharge is discussed and experimentally investigated in a special discharge tube with the cathode a Hg surface at the end of a small quartz tube, the discharge tube being filled with N or one of the rare gases. (Cf. *C. A.* **20**, 1175.) H. G.

Significance of certain critical potentials of mercury in terms of metastable atoms and radiation. H. A. MESSENGER. *Phys. Rev.* **28**, 962-75 (1926), cf. *C. A.* **21**, 3153. —When the crit. potentials of Hg are examd. by a method distinguishing between effects due to metastable atoms and those due to true radiation, all the breaks found by Franck and Einsporn (*C. A.* **14**, 3360) except those at 5.76, 6.73 and 8.35 v. are shown to be associated with increased production of metastable atoms, and breaks at 6.04, 6.30, 7.12, 7.46 and 8.09 v. are shown to be due mainly to the formation of metastable atoms. Breaks at 6.7 and 8.35 v. are due to radiation of wave length 1849 Å. B. C. A.

The total ionization due to the absorption in air of slow cathode rays. J. F. LEHMANN AND T. H. OSGOOD. *Proc. Roy. Soc. (London)* **A115**, 609-24 (1927), cf. *C. A.* **20**, 2784. —The av. energy expended in the formation of a pair of ions in air was found to be 45 electron-v. F. O. A.

The absorption of slow cathode rays in various gases. J. F. LEHMANN. *Proc. Roy. Soc. (London)* **A115**, 624-39 (1927); cf. preceding abstr. —The av. energy expended in the formation of a pair of ions in electron-v. and the efficiency of ionization are, resp., He 31, 0.78; A 33, 0.46; H 37, 0.43; N 45, 0.38; CO₂ 45, 0.32. In all cases the av. ionization for complete absorption is proportional to the initial energy of the cathode ray. The range of the rays is also estd. from the pressure necessary to absorb the rays within the ionization chamber and from the rate of absorption of electronic energy. The 2 estimates are concordant. F. O. ANDEREGG

The heat of dissociation of O₂ and O₂⁺. R. T. BIRGE. *Phys. Rev.* **27**, 641 (1926). —The heat of disson. of O₂ is 7.05 ± 0.03 v., while the ionization potential of O₂ is 13.54 v., of O₂ is 14.1 v. and, therefore, of O₂⁺ is 6.46 to 6.49 v. F. O. A.

Heat of dissociation of CO, CQ⁺, and NO. R. T. BIRGE AND BERTHA SPONER.

Phys. Rev. **27**, 641(1926).—The heat of disson. from chem. data, 10.78 v., is confirmed by combining the ionization potential of CO with that of O₁ (13.5 v.) and the heat of disson. of CO⁺ calcd. from spectral data (9.82 v.). NO dissociates to form N₁ and an excited O₁ contg. about 8.9 v. as compared with the O resonance potential at 9.1 v.

F. O. A.

The heat of dissociation of N₁ and N₂⁺. BERTHA SPONER. *Phys. Rev.* **27**, 641 (1926).—The final state for the first positive group is set at 11.87 v. Ionization potential of N₁ lies probably closer to 14 than to 13 v.; that of N₂ is 16.5 v. and that of N₂⁺ is about 9.06 v.

F. O. A.

The conductivity of activated nitrogen. P. A. CONSTANTINIDES. *Phys. Rev.* **27**, 249(1926).—The ion current of activated N produced in the electrodeless discharge follows Ohm's law up to the satn. potential. Above this a marked increase occurs near the ionization potential of N₂.

F. O. A.

The combination of nitrogen and hydrogen activated by electrons. A. CARESS AND E. K. RIDEAL. *Proc. Roy. Soc. (London)* **A115**, 684-700(1927).—With the use of thermions the production of NH₃ by the various possible mechanisms has been studied in detail. NH₃ may be formed by N₂ reacting with H₁ at the surface of Pt or Ni or with H⁺ in the bulk at 13 v. N₂⁺ is active in the bulk at 17 v. while N₁⁺ is active at 23 v.

F. O. A.

Surface layers on tungsten produced by active nitrogen. CARL KENTY AND L. A. TURNER. *Nature* **120**, 332(1927).—A clean W surface at a dull red heat when placed in an atm. of N₂ activated by a condensed discharge becomes covered with a layer of N about 1 atom deep. The layer can be flashed off in an active form or deposited on an adjacent clean surface.

C. H. GREENEWALT

The dimension of the atom and the photoelectric effect. E. N. GAPON. *Z. Physik* **44**, 535-6(1927).—From the Einstein photoelectric equation and Bohr's equation for electronic energy, G. obtains the formula $r = 5.808 \times 10^{-12} \lambda_m$, where r is the at. radius and λ_m the wave length of the photoelec. threshold. The results show a rough parallelism with those obtained by Bragg. Since C gives a value double that found by Bragg, it is concluded that the C mol. is diatomic.

Mean free path of electrons in ionized mercury vapors. K. B. BLODGETT. *Phil. Mag.* [7], **4**, 165-93(1927).—Langmuir's method of investigating the properties of glow discharges by means of auxiliary electrodes is used to det. the mean free path of electrons in ionized Hg vapors. Cf. *C. A.* **19**, 1531.

GEORGE GLOCKLER

Refraction of x-rays. BERGEN DAVIS. *J. Franklin Inst.* **204**, 29-39(1927).—A review.

R. L. HERSHEY

Refraction of x-rays by method of total reflection. R. L. DOAN. *Phil. Mag.* [7], **4**, 100-12(1927), cf. *C. A.* **17**, 2674; **20**, 1351, 2097. —Additional cases are presented in which the Drude-Lorentz theory of dispersion represents the facts, not only in regions remote from an absorption edge, but also in some instances in which the frequency of the radiation approaches the natural frequency of certain groups of electrons. The interesting possibility of studying the distribution of electrons among the lower at. levels has received additional support. The information obtained here is very definite so far as the K-electrons are concerned, but the distribution among the various L-levels is a much more complex problem. However, the detn. made for Au shows that it is not impossible to have some measure of success even here. Of course, it will be necessary to increase the accuracy of the measurements considerably before one can hope to decide between various groupings of L-electrons.

G. GLOCKLER

The Röntgen spectrum of the second kind. M. J. DRUYVESTEYN. *Z. Physik* **43**, 707-25(1927).—The intensity of the Rontgen spectrum of the 2nd kind relative to that of the normal Rontgen spectrum is theoretically discussed and it is shown that the theoretical expressions are supported by the exptl. facts. New measurements are given relative to the lines of the 2nd kind. A part of these lines can be explained theoretically and their position calcd.

MARIE FARNSWORTH

Distribution of directions of the electrons released by polarized Röntgen rays. FRITZ KIRCHNER. *Ann. Physik* **83**, 521-34(1927); cf. *C. A.* **21**, 2604, 3309. —The distribution of directions of the photoelectrons sent out by polarized x-rays is systematically studied; it is shown to be independent of the wave length of the absorbed rays in the range from 0.3 to 0.8 Å. U. and of the work of detaching the photoelectrons in the range from 300 to 3000 v. The found distribution of directions corresponds approx. to a sine square distribution; the hypotheses of Auger and Perrin and the recent one of Wentzel from wave mechanics drawn from theoretical conclusions are in agreement with the expts. For the range law $V_{KV} = \text{const. } \sqrt{R}$, where V_{KV} denotes

the initial energy of the electrons in kv., the const. for A has a value of 22.6 at 760 mm. and 0°.

MARIE FARNSWORTH

Röntgen studies of inorganic colloids. J. BÖHM. *Kolloid Z.* **42**, 276-84 (1927).—By using the Debye-Scherrer method and Fe_2O_3 , it is found that crystals > 0.1 mm. give large spots on the film, around 0.1 mm. small spots, 0.01–0.001 mm. sharp lines, colloidal dimensions broad lines, and amorphous material no lines. With hematite fiber diagrams are obtained. An analogous series is given for stannic acid gel except that here there were no particles large enough to give spots. Photographs of Au, Pt and Ag sponge are also given.

MARIE FARNSWORTH

A Röntgen apparatus for crystallographic studies in chemical laboratories. J. BÖHM. *Kolloid Z.* **42**, 285-7 (1927).—A simple set-up consisting of a source of high potential, an x-ray tube (Philips model), and a camera for line or Laue photographs is described.

MARIE FARNSWORTH

An experimental study of the relative intensities of x-ray lines in the L-spectrum of thorium. S. K. ALLISON. *Phys. Rev.* **30**, 245-54 (1927).—The relative intensities of the Th L-series lines have been measured at 31.8 kv., an ionization chamber spectrometer being used. In addn. to the lines previously reported by other investigators, the lines Th L_{γ_1} , Th L_{β_7} , Th L_{γ_2} were found. No indications of the Th L_{γ_3} or Th L_{γ_4} could be found. The relative intensities have been corrected for absorption in the mica windows and air in the path from x-ray tube to ionization chamber, and for the fraction of the radiation absorbed in Mel in the ionization chamber. In the voltage range between the crit. excitation voltage, V_0 , and 31.8 kv., the intensity of the Th L_{α_1} or Th $L_{\beta_{1,10}}$ at any voltage, V , could be expressed by $I = k(V - V_0)^2$ within the limits of explt. error. With this expression the relative intensities at 31.8 kv. were extrapolated to the relative intensities at high voltage to which it was assumed the theoretical predictions apply. The intensity rule for doublets holds for lines involving the levels L_{21} and L_{22} . The predictions of Wentzel (cf. *C. A.* **20**, 3130) based on Schrödinger's new quantum mechanics for the relative intensities of "sharp" and "diffuse" series doublets are confirmed but the explt. intensities of the "principal" series doublets are too low by a factor of 7. They are also too low in the measurements of Jönsson (cf. *C. A.* **20**, 2280) on W. The results obtained are as follows:

Line	l	α_2	α_1	η	β_4	β_2	β_1
Relative Intensity 32 kv.	36	12	100	1.1	1.4	26	0 45
Relative Intensity high voltage	36	12	100	1.8	1.4	26	0 45

Line	β_1	β_3	γ_5	γ_1	γ_2	$\gamma_3 + \gamma_6$	γ_4
Relative Intensity 32 kv.	38	1 8	0	8 5	0.81	3.1	0
Relative Intensity high voltage	62	3.3	0	14	1.5	5.3	0

BERNARD LEWIS

X-ray diffraction in liquids: primary normal alcohols. G. W. STEWART AND R. M. MORROW. *Phys. Rev.* **30**, 232-44 (1927).—Concerning x-ray diffraction in liquids, the viewpoint is taken that there is a mol. space array, not cryst., which is named *cybotaxis*. Evidence of the cybotactic state in the liquid primary normal alcs., methyl to lauryl, is adduced. By Mo $K\alpha$ x-ray diffraction ionization curves, 2 significant distances are measured, the first linearly dependent upon the content of C atoms and the second practically independent of this change in mol. length. The latter is thus the distance of sepn. perpendicular to the chain, and is 4.6 A. U. with lauryl, decreasing slowly to 4.4 A. U. with butyl and then rapidly to 3.8 A. U. with methyl. The value 4.6 A. U. is in agreement with the work of Adam (cf. *C. A.* **16**, 4, 4107; **17**, 3436), on surface films of satd. fatty acids. The increase on the first distance linearly with C content is in harmony with the work of Müller and Saville (cf. *C. A.* **19**, 1692) in that the increase is about 1.3 A. U. per C atom and leads to the conclusion that the diffraction is produced by planes contg. the polar groups which are not perpendicular to the direction of the parallel chain mols. Comparison of peaks in the liquid and solid states shows that the spacings are not the same and the phenomena are not caused by crystal fragments. The cybotactic state permits mobility but not random motion and is peculiar to the substance. The distances computed are the most probable spacings. The mols. may be regarded as having the same orientation in a small group too small to give optical anisotropy. The discussion does not therefore extend to liquid crystals but adheres to the more general condition. The conception of cybotactic state is helpful in an understanding of solns. and other liquid phenomena.

BERNARD LEWIS

Satellites of lines of x-rays. D. COSTER AND M. J. PRUYVESTEYN. *Z. Physik* **40**, 765-74(1927).—A new x-ray tube is described for fluorescence observations, with which satellites could be observed on the hard side of the lines, although the intensity was less than that obtained by cathode-ray excitation. The existence of these satellites indicates the simultaneous ejection of 2 electrons from the inner ring of the atom. The satellites on the soft side of the lines possessed normal intensity. Their interpretation is discussed. B. C. A.

Theory of the continuous x-ray spectrum. M. NEUNHÖFFER. *Ann. Physik* **81**, 493-522(1926); *Science Abstracts* **30A**, 140.—An attempt to calc. the energy distribution in the continuous x-ray spectrum, taking into account the possible hyperbolic paths of the electrons in the vicinity of the nuclei of the bombarded atoms. The degree of polarization is also discussed. The exptl. data are in moderate agreement with the theory, but several difficulties arise. H. G.

Energy transformations in certain x-ray effects. R. GLOCKER. *Z. Physik* **40**, 479-91(1926). *Science Abstracts* **30A**, 401.—A general discussion is given of the relation between the incident x-ray intensity and the consequent ionization current in the gas of the ionization chamber. It is emphasized that in the neighborhood of an absorption edge of the absorbing gas the ionization current i is independent of wave length, and is related to the incident intensity I_0 by the formula. $i/(\gamma I_0) = \text{const.}$, where γ is not the total absorbed energy but the fraction of the incident x-radiation transformed into kinetic energy of secondary electrons. A similar type of formula holds for the photographic action of x-rays. A reconsideration of Sadler's measurements of the percentage of excited atoms which emit fluorescence radiation indicates that this quantity decreases somewhat as the difference of frequency between incident and characteristic radiation increases. H. G.

• **The temperature curve of the anode of an x-ray tube.** A. BOUWERS. *Z. tech. Physik* **8**, 271-7(1927).—On account of evapn. 3000° is the maximal allowable temp. for a W x-ray anode mirror; the max temp. for the Cu in back of the W is limited to 1080°. These temps. depend on heat cond. k of W and Cu, and on their sp. heat c , on the duration of the load and the thickness of the mirror, values of $k_w = 0.45$, $k_{Cu} = 0.9$, $c_w = 0.7$ and $c_{Cu} = 1.0$ have been assumed. For a linear focal spot (3 mm. wide) of great length Seeligers soln. for temp. distribution (*Physik. Z.* **27**, 35(1926)) perpendicular to the focal line is valid. Calcd. curves are given for Cu and for Cu + a 1.7-mm. W layer. For the W surface temp. is found 2650°, at the W-Cu border line 1050° for 1-sec. exposure at 20 kw. per sq. cm. For very short exposures the Cu can be neglected and the temp. is found to be $T = 4800 \sqrt{t}$ ($t < 0.07$). T runs up with the time t , approaching a limit. T is proportional to the kw. load and the W thickness is on one side limited by the low m. p. of Cu, on the other side by the better heat cond. of Cu. The most favorable W thickness increases with exposure time. Other curves give allowable total load in millamp. sec. and in millamps, both as a function of time. Tubes with pulsating d. c. or a. c. can only be loaded to half the value of pure d. c. tubes. On a Philips Metalix tube the results were verified by taking an actual millamp. sec. versus time curve for a temp. of 1300° with 50 kv. potential. Because of slight pulsation of the current the values for the shortest exposure times are a little below the theory. From a calcd. temp. in the focal plane and practical results it was found that the temp. drop at both edges of the focal strip is very steep (1800° down to 1400° in 0.2 mm.; brightness down to 1%). B. J. C. v D. H.

Energy measurements for Röntgen rays. WALTHER RUMP. *Z. Physik* **43**, 254-95(1927).—A calorimeter has been described which detcs. the thermic effect of x-rays. It measures the total incoming radiation and the back radiation in abs. units. With this calorimeter, the relation between the x-radiation energy and the voltage of its source has been measured, the range was 43-150 kv. It seems to be established that the total energy increases with the square of the voltage. The total energy of the Röntgen radiation has been compared with the cathodic energy of the Röntgen tube, and the efficiency with which x-rays are generated has been calcd. In the range 43-150 kv., this efficiency is 0.5-1.6%, which is considerably higher than what has been assumed so far. From calorimetric energy measurements and ionization measurements, the amt. of energy has been detcd. which is necessary to create a pair of ions in air; x-rays of various qualities have been used; the required energy amts. to 40 v. per pair of ions in the case of a strongly filtered hard radiation, and is fairly const. for an electronic velocity of 28-107 kv., or for x-ray wave lengths averaging 0.43-0.12 Å. U. A. L. HENNE

Correction to the paper: "Energy measurements for Röntgen rays." WALTHER

RUMP. *Ibid* 44, 396.—Further exptl. work shows that the value 40% per pair of ions is too high. The true value, in the range studied, is only 33, which is in good agreement with the value 35 previously found by Kulenkampff (*C. A.* 20, 2943).

A. L. HENNE

The extinction of the fluorescence in solid and liquid solutions of dyes. V. L. LEVSHIN. *Z. Physik* 43, 230-53(1927).—A discussion of the various theories of the phenomenon, and of the methods of measurement and calcn. serves as an introduction. In solid solns. the extinction of the fluorescence of dyes behaves substantially the same as in liquid solns.; an increase of the concn. of the dye modifies the fluorescence spectrum. In aq. solns. of fluorescein, the fluorescence spectrum is independent of the concn.; the shape of the absorption curves is slightly modified in the region of the extinction of the fluorescence. In the case of a high concn. of the dye, an increase of the temp. increases the fluorescence output; it displaces and modifies the fluorescence spectrum; the absorption spectrum undergoes the same change.

A. L. HENNE

The atomic character of certain properties of x-rays. E. DELAUNAY. *Compt. rend* 185, 193-5(1927).—The fluorescent x-radiation of one element from a mixt. of adjacent elements is not proportional to the concn. of that element in the mixt. Mixts. of SrCl_2 and BaCl_2 were irradiated and the fluorescent radiation was measured by an ionization method. The intensity increased less rapidly than the concn. of BaCl_2 . The intensities of the fluorescent radiation from two elements in such a mixt. are given by the relations. $I_1 = I_0 p_1 \{n_1/(a_1 n_1 + a_2 n_2)\} [1 - e^{-(a_1 n_1 + a_2 n_2)l}]$ and $I_2 = I_0 p_2 \{n_2/(b_1 n_1 + b_2 n_2)\} [1 - e^{-(b_1 n_1 + b_2 n_2)l}]$, where I_0 is the intensity of the monochromatic primary beam; p_1 and p_2 are the emissive powers of the two elements; n_1 and n_2 their concns., and a_1, a_2, b_1 , and b_2 are given by $a_1 = v_1 - v_1', a_2 = v_2 - v_2', b_1 = v_1 - v_1'', b_2 = v_2 - v_2''$, where v_1 and v_2 are the absorption coeffs. of the two elements for the primary radiation, and v_1', v_2' and v_1'', v_2'' are the coeffs. for the fluorescent radiation.

R. L. HERSHEY

Emission of soft x-rays by different elements. O. W. RICHARDSON AND F. S. ROBERTSON. *Proc. Roy. Soc. (London)* A115, 280-90(1927).—The efficiency of emission of x-rays at voltages up to 500 v. were detd. for 14 elements. A special app., using a filament for supplying electrons, and a Ni plate and electrometer for measuring the x-ray intensity, and allowing six specimens to be examd. consecutively without disturbing the conditions, was used. Plots of the photoelec.-thermionic current ratio against λ show the ratio to be a periodic function of λ , increasing with increasing voltage almost proportionally.

R. L. HERSHEY

Diffraction of x-rays in liquids. G. W. STEWART, R. M. MORROW AND E. W. SKINNER. *Phys. Rev.* 27, 104(1926).—The diffraction of the Mo $K\alpha$ line by liquids was detd. by an ionization method. Solid and liquid camphor at 21° and 205°, resp., show the same location of intensity peaks, allowance being made for expansion. Naphthalene, α - and β -naphthol, when liquid, show single broad peaks, which are roughly the means of the peaks of the solid substances. These single peaks occur at temps. near the f. p.; the cryst. peaks persist to the m. p. In methyl, propyl, hexyl, octyl and decyl alcs. a single broad peak is accompanied by a smaller one, indicating a larger spacing. The intensity curves shift to smaller values of θ with heavier mols. The data are interpreted as showing crystal fragments, i. e., diffraction due to interatomic causes.

R. L. HERSHEY

A universal x-ray photogoniometer. J. D. BERNAL. *J. Sci. Instruments* 4, 273-84(1927).—B. discusses crystal lattices and planes, the diffraction of x-rays by them, the exptl. data of x-ray crystallography, the various x-ray methods with their advantages and disadvantages, and the essentials of a universal photogoniometer. The theory of the rotation method, as applied to single crystals, the reciprocal lattice and the detn. of unit cell size by the rotation method are treated in more detail.

R. L. HERSHEY

A refinement of the Debye-Scherrer method of investigating crystal structure. G. KURDJUMOV. *Z. Physik* 43, 921-33(1927).—The influence of slit height, width and position and thickness of sample upon the line breadth in the Debye-Scherrer method is treated mathematically. The width of the second opening (farthest from the sample) has no effect on line breadth. The width of the first opening can be calcd. from $\delta_1 = R(2b/a)$, where R is the camera radius, $2b$ the slit width and a the slit-object distance. Formulas for slit heights are given. Two slits, perpendicular to each other, rather than the usual round holes, give very sharp lines.

R. L. H.

X-ray diffraction patterns from liquids and colloidal gels. G. L. CLARK, R. H. ABORN, E. W. BRUGMANN AND R. L. DAVIDSON. *Proc. Natl. Acad. Sci.* 13, 549-52

(1927).—For unstretched latex films the spacings calcd. by the Ehrenfest formula ($a = 7.72\lambda/4\pi \sin \theta$, where 2θ is the diffraction angle) from the 2 principal rings were 6.03 A. U. and 14.76 A. U. When, however, the rubber was very carefully purified by a process of fractional soln. and evacuation to const. wt. the spacings were 5.97 A. U. and 11.15 A. U. Intermediate values up to 14.76 A. U. were observed with solvent swelling. With nitrocellulose the following spacings were obtained, the Bragg formula being used:

	Fresh	Aged (light)	Aged (heat)
Untreated dry	{ 7.18 A. U. 4.02	{ 7.17 A. U. 4.05	{ 6.98 A. U. 3.92
Dry, residual solvent present	{ 9.30 4.47	{ 9.32 4.47	{ 7.86 4.31
Oil softener added	{ 7.34 4.31	{ 4.39	{ 4.39

The following results, expressed as % change related to the spacings of the raw liquid oil calcd. by the Bragg formula, were obtained with China wood oil:

	● Inner ring	Outer ring
Raw liquid	8.5 A. U.	4.4 A. U.
Raw dry film (oxidized at room temp.)		+ 1%
Raw gel (polymerized by heat)	+ 3	+ 2
Prepd. liquid	+12	+16
Prepd. dry film	+13	+ 6

X-ray diffraction patterns from liquids and colloidal gels. G. L. CLARK. *Nature* 120, 119-20(1927).—Cf. preceding abstr.

Laue photograph taken with a long slit. U. YOSHIDA AND K. TANAKA. *Nature* 118, 912-3(1926).—Divergent x-rays starting from the focus on the molybdenum target of a Coolidge tube are passed through a long narrow slit, and then illuminate a long thin crystal. The Laue spots thus become an assemblage of lines, each point on any one of which corresponds with a certain part of the specimen. Such correspondence may be observed by the shadows cast by thin lead wires across the slit very near to the specimen. The orientation of the atomic plane of the crystal which causes a diffraction line, and the glancing angle of the beam of x-rays to the atomic plane can then be calcd. at each corresponding point on the specimen, and the indices of an atomic plane responsible for a diffraction line can readily be found. Measurements with single-crystal Al wires are recorded; the angles between the axis of the wire and the 3 edges of the elementary cubic lattice of the crystal are nearly the same for six specimens, and one of the (100) planes of the crystal is situated nearly parallel to the axis of the wire. B. C. A.

Slip in crystals in rolling. S. KONOBEYEVSKII. *Z. Physik* 43, 741-9(1927).—By a study of Röntgen pictures of rolled Al plate, it is established that depending on the degree of working 2 textures can result. The first is formed on account of the slip in the crystals along the rhombic dodecahedron surface, the 2nd along the cubic surface. The slip must run along the plane (110) to the 211 axis. M. F.

Atomic structure of AuSn. G. D. PRESTON AND E. A. OWEN. *Phil. Mag.* [7], 4, 133-47(1927).—The at. structure of the intermetallic compd. AuSn has been examd. by the powder and the Laue methods, the result of the powder method being confirmed by the rotating-crystal method. The analysis shows that AuSn crystallizes on a hexagonal lattice of side 4.307 A. U. and axial ratio 1.276, the d. requiring 2 mols. of AuSn to be assocd. with this unit. The space group is D_{3h}^4 , C_{6v}^4 , or D_{6h}^4 , and the intensities of the reflections agree with a structure in which Au atoms are situated at the points (000) and $(00\frac{1}{2})$ and Sn atoms at the points $(\frac{1}{3}\frac{2}{3}\frac{1}{4})$ and $(\frac{2}{3}\frac{1}{3}\frac{3}{4})$.

The connection of the specific ray intensity with the ray density. W. ALEXANDROW. *Physik. Z.* 28, 555(1927).—Mathematical.

MARIE FARNSWORTH

Explanation of spectra of Group II. P. K. KICHLU AND M. SAHA. *Phil. Mag.* [7], 4, 193-207(1927); cf. *C. A.* 21, 3022.

GEORGE GLOCKLER

Note on the spectrum of neon. M. SAHA. *Phil. Mag.* [7], 4, 223-31(1927).—Cf. preceding abstract. GEORGE GLOCKLER

Origin of terms of the spectrum of cobalt. N. K. SUR. *Phil. Mag.* [7], 4, 36-49 (1927).—A table is given of electron arrangement of the elements suitable for spectroscopic analysis. There is a discussion of term-values of Co spectrum. G. G.

Geissler discharge in argon. K. G. EMELÉUS AND N. L. HARRIS. *Phil. Mag.* [7], 4, 49-64(1927); cf. *C. A.* 21, 2221.—The Geissler discharge between cold electrodes in A has been studied by means of a cold exploring electrode. The main results, which are probably of general validity for similar discharges in wide tubes at low potential and with small c. ds. are: The electron concn. and random positive ion current attain a max. in the middle of the negative glow. The current is carried from the negative glow through the Faraday dark space by slow electrons moving in combined elec. and diffusion fields. The av. energy of the electrons is very approx. const. in this part of the discharge. The elec. field is reversed between the cathode dark space and the middle of the negative glow, and primary electrons are probably present. The greatest sources of uncertainty are: the estn. of the concn. of positive ions, and the detection of primary electrons, which depends on the analysis of the positive ion currents. It is anticipated that further expts. will make it possible to find the velocity distribution of the primary electrons. GEORGE GLOCKLER

A possibility of the experimental determination of the red shift of resonance radiation by repeated re-emission. S. I. VAVILOV. *Z. Physik* 44, 537-8(1927).—The shift of the resonance line toward longer wave lengths on repeated scattering found in the spectra of giant stars and explained by Franck (*C. A.* 21, 1931) on the basis of the Compton effect might be detected in the lab. by means of the phosphorescope (*C. A.* 20, 3132). The light which has been scattered more often will emerge from the vapor later, and its greater shift could be detd. by the absorption method.

F. A. JENKINS

The electric emission of incandescent platinum in an atmosphere of iodine. PIERRE JEZ. *J. phys. radium* 8, 245-53(1927).—The phenomenon is in agreement with the formula of Richardson. The negative emission in an atm. of I_2 increases considerably with relation to the emission in air under the same conditions. The positive emission in an atm. of I_2 is nearly nil. L. D. R.

Quantitative investigations on the absorption lines of the sun's spectrum. H. VON KLÜBER. *Z. Physik* 44, 481-516(1927).—The theory and exptl. methods of detg. the absorption in the lines of the solar spectrum are described. Preliminary results are given for some lines in the red of Ca, Na, Fe and H α . C. C. K.

The quantitative sensitivity of spectral lines. TR. NEGRESO. *Compt. rend.* 185, 453-5(1927).—A study of the spectra of a series of binary alloys in which one of the elements diminishes progressively in amt. has shown that there is an accompanying diminution in intensity of the lines of that element. For different modes of excitation it was observed that diminution of intensity with amt. was not of the same type as that which occurs when the energy of the source is varied. C. C. KIESS

The rotation spectra of the hydrogen halides. M. CZERNY. *Z. Physik* 44, 235-55 (1927).—The infra-red absorption spectra of HCl, HBr, HI and HF were measured in the region 40μ to 140μ . The spectra, resulting from rotation of the mols., all have the same structure and consist of bands whose wave nos. are represented closely by formulas of the quantum theory. From the consts. of these formulas values are calcd. for the moments of inertia of the mols. The internuclear distances expressed in units of 10^{-8} cm. are: HF 0.923, HCl 1.282, HBr 1.420, HI 1.616. C. C. KIESS

The L absorption discontinuities of silver. GUNNAR KELLSTRÖM. *Z. Physik* 44, 269-78(1927).—The absorption, by means of a suitable thickness of Ag foil, of the strongest L-lines of Ag, Zn and Sb, was measured and the data thus acquired were used to calc. the L absorption discontinuities of Ag. The coeff. μ which measures the diminution in intensity of the rays is in part dependent on the absorption coeff. $\tau = A\lambda^e$ of the absorbing medium. The value of A changes abruptly in going from one side of an absorption limit to the other. The absorption discontinuities are defined as the ratios $\delta_{K_1} = AK/A_{L_1}$, $\delta_{L_1} = A_{L_2}/A_{L_1}$, etc. From the observations the following values were found: $\delta_{L_1} = 3.17$, $\delta_{L_2} = 1.47$, $\delta_{L_3} = 1.25$. C. C. KIESS

Nuclear vibrations in the band spectrum of helium. W. WEIZEL AND CHR. FUCHTBAUER. *Z. Physik* 44, 431-54(1927).—New bands originating in the mol. He $_2$ have been photographed. These have been arranged into systems comprising P, Q and R branches. The bands of He $_2$ already known and the new ones form series systems analogous to those characteristic of the He atom. They are therefore described in the terminology of the at. series as principal, first subordinate and second subordinate

series of orthohelium,* and principal series of parahelium. *The new bands originate in the vibrational changes of the nuclei and correspond to the transitions $0 \rightarrow 1$ and $1 \rightarrow 1$. The details of the analysis including the values of the combining terms are tabulated. C. C. KIESS

The Doppler effect in hydrogen canal rays and the Balmer series. W. STREUBING. *Ann. Physik* **83**, 822-34 (1927).—New observations have been made of the Doppler effect in the canal rays of H, which consisted in measuring the relative intensities of the undisplaced or "rest" line and the displaced or Doppler line. H contg admixts. of He, Ne or Hg gives the same effect as H alone. Similar effects were observed when satd. hydrocarbons were added to the H. With O and N, however, marked changes were noted: the intensity of the Doppler line is much less than that of the "rest" line, the contrast increasing in going from H β to H γ . At H β the "rest" line is less intense than the Doppler line, but at H γ and the succeeding Balmer lines the reverse is true. C. C. KIESS

The "forbidden" line of mercury at $\lambda 2270$ in absorption. (LORD) RAYLEIGH. *Nature* **120**, 295 (1927).—The Hg line at 2270 A. U., forbidden by the selection principle for inner quantum nos., was observed in absorption through a column of Hg vapor 45 cm. long, the Hg boiling at a pressure of 95 cm. This is about 1,000,000 times the vapor density required to show the resonance line 2537 A. U. with comparable intensity. C. C. KIESS

The spectrum of gold chloride. W. F. C. FERGUSON. *Nature* **120**, 298 (1927).—The vapor of AuCl₃ in active N emits in the green a band system, of which the stronger heads are assigned to AuCl³⁶ and the weaker ones assoc'd with them to AuCl⁴⁷. The bands are shaded toward the red. No others beside these were observed in the interval 7000 to 2000 A. U. C. C. KIESS

The propagation of light and the structure of molecules. R. DE MALLEMANN. *Rev. gén. sci.* **38**, 453-79 (1927).—A résumé of the present state of the mol. theory of classical optical phenomena, and an attempt to establish a precise correlation between several apparently irreconcilable phenomena and so to predict some new numerical relations which expt. has verified. E. P. WIGHTMAN

The real and apparent widths of spectral lines. H. C. BURGER AND P. H. VAN CITTERT. *Z. Physik* **44**, 58-69 (1927).—Formulas are developed for finding the real width of a spectrum line from its apparent width as observed with a Fabry-Perot interferometer. The red line of Cd, 6438 A. U., was thus measured and was found to have a true width of 0.0114 A. U. and an apparent width of 0.0176 A. U., which satisfy the formulas derived. The true width is ascribed wholly to a Doppler effect. C. C. KIESS

The spark spectrum of neon (Ne II). I. T. L. DE BRUIN. *Z. Physik* **44**, 157-60 (1927); *Verslag Akad. Wetenschappen Amsterdam* **36**, 502-13. —The term scheme of the quartet system of Ne II, similar to that of F I, has been established and is in agreement with that required by Hund's theory. The lowest term is ⁴P characterized by the sepns. 299.0 and 518.0. Tables contain some of the multiplets which have been found and also the relative values of the combining terms. C. C. KIESS

Influence of the form of discharge on the distribution of energy in the continuous Röntgen spectrum. D. NASLEDOW AND T. KAČURA. *Z. Physik* **44**, 216-22 (1927).—The spectrum emitted by an x-ray tube varied in distribution of intensity according to the manner in which it was excited. Three types of exciting app. were used: (1) "Stabilivolt," (2) "Hartstrahl" and (3) a combination made up of parts by different makers. Ionization chamber measurements showed that the intensity by method (2) is 1.53 times smaller than that by method (1); and the wave length corresponding to max. energy in the continuous spectrum is by method (2) longer than by (1) and (3). C. C. KIESS

The spectrum of argon in the extreme ultra-violet. F. A. SAUNDERS. *Proc. Nat. Acad. Sci.* **13**, 596-600 (1927).—Lines measured in the extreme ultra-violet portion of the spectrum emitted by a discharge in A but not previously included in the spectrum of A I (C. A. **20**, 3641) are now given together with the series designations of Meissner. These lines do not vary in intensity proportionately with the resonance lines of A when the excitation conditions are varied, and were therefore regarded as due to an impurity. C. C. KIESS

Spark spectra of cesium. G. BALASSE. *J. phys. radium* **8**, 311-20 (1927).—Electrodeless discharges in Cs vapor excited continuous and line spectra. The continuous spectrum increased and decreased in intensity with the arc spectrum for moderate discharges and at temps. in excess of 200°. Among the arc lines were members of the series *ls-md*. Extensive tables give wave lengths and wave nos. in vacuum

of lines measured in the various orders of spark spectra excited with increasing strength of the discharge, and include the spectral region from 6700 A. U. in the red to 2300 A. U. in the ultra-violet. C. C. KIESS

Absorption and emission spectra of nitric oxide in the ultra-violet. MAURICE LAMBREY. *Compt. rend.* **185**, 382 (1927).—In the ultra-violet NO was observed to have a series of complex absorption bands, the heads of which are double. They lie at wave lengths 2267 and 2261 A. U., 2153 and 2147 A. U., 2046 and 2041 A. U., 1952 and 1948 A. U. When NO is excited by a condensed electrodeless discharge the first 2 pairs of absorption bands and many additional ones of longer wave length appear as emission bands. The absorption doublets have fine structures, the wave lengths of which were measured. C. C. KIESS

The quenching of mercury resonance radiation by foreign gases. P. D. FOOTE. *Phys. Rev.* **30**, 288-99 (1927).—The intensity of emitted resonance radiation in Hg vapor is decreased as the pressure of an admixed gas increases. The following cycle of transitions occurs for the rare gases or N. Absorption of λ 2537 produces 3P_1 Hg' atoms. Some of these return to the $1S_0$ state by radiating and a portion of this radiation escapes to be observed as resonance. The rest is reabsorbed in the vapor, producing more 3P_1 atoms. Some of the 3P_1 atoms undergo collision of the second type with foreign gas mols. resulting in 3P_0 atoms. A large fraction of these atoms returns to the 3P_1 state by collision of the first type with high-speed gas mols. At 18° one collision in 6000 satisfies the condition of conservation of energy and momentum requisite to such an energy transfer. Other 3P_0 atoms return to the normal state through collision with traces of H_2 impurities in which the energy of the Hg atom is utilized in the dissociation of H_2 . Still other 3P_0 atoms collide with normal Hg atoms producing Hg₂-excited mols. The cycle of transitions is completely developed from kinetic-theory considerations in which every collision, except in the mol. formation, is considered as effective. All the consts. may be computed directly. Cons. of the 3P_0 state as high as one part in a few hundred may be readily obtained under moderately intense illumination. BERNARD LEWIS

Depolarization of resonance radiation. P. D. FOOTE. *Phys. Rev.* **30**, 300-4 (1927).—Depolarization and quenching of Hg resonance radiation are phenomena of quite different type. Depolarization is produced by 2 effects. With gases which quench by effecting the transition $^3P_1 \rightarrow ^3P_0$ upon collision with Hg' atoms, there exists a pronounced reverse transition $^3P_0 \rightarrow ^3P_1$ produced by collision with high-speed mols. Atoms which radiate without any collision emit polarized light under the conditions of the expt. Those which become 3P_1 atoms after having existed as 3P_0 atoms have experienced a large no. of collisions and have lost their orientation relative to the incident elec. vector; accordingly they emit radiation polarized in random directions. The second depolarizing influence arises in collisions at distances exceeding the ordinary kinetic-theory collision such as is described above, at which the distance is too great for a collision of the first or second type but still small enough for the field of the gas atom to exert a perturbing influence on the orientation of the Hg' atom. Depolarization by H_2 is an excellent example of the second influence, while the first effect is sufficient to interpret the exptl. data with rare gases, the at. fields of which decrease with a high power of the radial distance. B. L.

The intensity ratio of the blue cesium doublet. C. F. HAGENOW and A. LL. HUGHES. *Phys. Rev.* **30**, 284-7 (1927).—The rule of Burger and Dorgelo (cf. *C. A.* **18**, 2467) leads one to expect a ratio of 2:1 for the intensities of the members of the blue doublet of Cs (4555, 4593 A. U.), a ratio which is in agreement with some exptl. detns. and in disagreement with others. The method of measuring intensities of spectral lines developed by Merton (cf. *C. A.* **21**, 1061) was employed in this investigation. The results gave ratios ranging from 2.3:1 to 3.8:1, the higher ratios being obtained with more attenuated sources where one would expect from Burger and Dorgelo's rule an asymptotic approach to the 2:1 ratio. As a check on the method the 2:1 ratio generally accepted for the K doublet (4044, 4047 A. U.) was verified. BERNARD LEWIS

Doublet separation and fine structure of the Balmer lines of hydrogen. N. A. KENT, L. B. TAYLOR and HAZEL PEARSON. *Phys. Rev.* **30**, 266-83 (1927).—Using 2 optical trains, (1) 2 crossed Lummer plates, the larger of resolving power of about 670,000, and (2) an echelon of resolving power of about 660,000, the writers have detd. the wave-length difference between the 2 well-known components λ' and λ'' ($\lambda' > \lambda''$) of H_α , H_β and H_γ as 0.1370, 0.0791 and 0.0666 A. U., resp. These values are in good agreement with those obtained by Houston (cf. *C. A.* **20**, 3642) with an interferometer. Further microphotometer curves of enlargements of the original

Lummer plate negatives reveal another component in λ' unresolved but unquestionably present in H_{α} , H_{β} and H_{γ} . Hansen (cf. *C. A.* 20, 1177) noticed asymmetries here in H_{α} and H_{β} . There are also indications of other components in λ' . The magnitudes of these components agree well with the theoretical magnitudes given by the new quantum mechanics with the spinning electron.

BERNARD LEWIS

The spark spectrum of nickel (NiII). A. G. SHENSTONE. *Phys. Rev.* 30, 255-65 (1927).—The analysis of the spark spectrum of Ni shows that the important at. structures are d^8s and d^8p . The low set of terms comprises $^4F^1$, $^2F^1$, $^4P^1$, $^2P^1$, 2D , 2G , of which $^4F^1$ is lowest. The only expected term from the structure d^8s which has not been found is 3S . All the intermediate terms (d^8p) have been found with the exception of a 2P and a doubtful 2F and $^2S^1$. A higher member of the $^4F^1$ $^2F^1$ series (d^8, s) has been found and indicates an I. P. of 17.4 v from d^8s to d^8 . The expected lowest term 2D (d^9) has not been found. Terms are inverted with the following exceptions: (1) a^4G^8 is higher than a^4G^8 , (2) a^4P^3 is higher than a^4P^1 , (3) b^4D^4 is higher than b^4D^1 , (4) triad b^4P , D^1 , F is not inverted. Zeeman effects give some irregular g -values, but the g -sum rule is apparently satisfied. The g -sum rule is not confined to terms built on the same ion term.

BERNARD LEWIS

Photographic spectrophotometry in the ultra-violet. L. A. JONES. *Bull. Nat. Research Council*, No. 61(1926).—The characteristics of photographic materials which must be considered when used for the precise measurement of radiation intensities are discussed. Such factors as the intermittency effect, failure of the reciprocity law, variation of gamma with wave length, non-uniformity of effective sensitivity, and non-uniformity of development may cause serious errors unless the method adopted and the technic followed are specifically designed to eliminate these errors. The criterion of equality between 2 radiation intensities is that equal densities shall be produced by equal exposure times, it being assumed that the radiations in question are of the same wave length or of identical wave-length compn. and that exposure is non-intermittent. A method is described which meets the theoretical requirements. The instrument required for the application of this method is also described. The application of photographic spectrophotometry to the measurement of solar radiation in the ultra-violet region is discussed and some suggestions are made for the development of a method free from objectionable features.

L. A. JONES

Deviation from Lambert's law and polarization of light emitted by incandescent tungsten, tantalum, and molybdenum, and changes in the optical constants of tungsten with temperature. A. G. WORTHING. *J. Optical Soc. Am.* 13, 635-49(1926).—The deviations from Lambert's cosine law for the light emitted by W, Mo and Ta are of the same order. The brightness increases from the normal value at normal emergence gradually with increase in emergence angle to about 75° by 20%, and then decreases rapidly to 0 at grazing emergence. Straight filaments of circular cross-section have av. brightnesses, viewed normal to their axes, which are greater than the normal brightness by 2.8% for W, 3.6% for Mo, 2.7% for Ta. The av. brightness of a filament considering all directions is about 5% greater than the normal brightness. The polarization of the light emitted, which is zero for normal emergence, increases with angle of emergence to about 95% at grazing emergence, and, for straight circular filaments viewed normal to their axes, is about 20%. The values of the optical consts. n and k for W were 3.86 and 0.81 at 300° abs. and 3.85 and 0.89 at 1900° abs.

B. C. A.

Stark-Lunelund effect. A. WEIGL. *Ann. Physik* [iv], 82, 1-15(1927).—The light emitted by H canal rays is polarized so that the component vibrating in a direction parallel to the direction of motion is 30% stronger than the component at right angles. The polarization is due to the moving atoms. An increased potential or pressure causes a changed intensity of the polarization induced in this way. The polarization persists in spite of collisions between moving and stationary atoms. Canal rays in N and in O exhibit no polarization.

B. C. A.

Polarization of canal-ray light. R. DÖPEL AND R. VON HIRSCH. *Ann. Physik* [iv], 82, 16-24(1927).—H canal rays in air exhibit a polarization of 1.12 for H_{β} which is independent of pressure, while for the N 4709 band the value is 1.00. For air canal rays in H, there is no polarization. For at. H in mol. H the value falls from 1.37 at 3600 v. to 1.11 at 32,000 v. For H in O, the value 1.16 ± 0.01 is independent of pressure and voltage. These and other results indicate that the polarization of the emitted light depends on the nature of both the gases present and is in general absent in the absence of an exciting gas.

B. C. A.

Absorption coefficient of helium for its own radiation. A. WOLF AND B. B. WEATHERBY. *Phys. Rev.* [ii], 29, 135-40(1927).—The mass absorption coeff. of He for its own radiation in the extreme ultra-violet is $1.24 (\pm 0.02) \times 10^7$ in the pressure range

0.016–0.040 mm. Below 0.016 mm., the coeff. increases rapidly with decrease in pressure. B. C. A.

Fine structure of the Balmer lines of hydrogen. N. A. KENT, L. B. TAYLOR AND H. PEARSON. *Nature* 119, 163(1927).—Values of $\Delta\lambda$ were obtained as follows: (25 milliamp./sq. cm.) H_{α} 0.1370, H_{β} 0.0791, H_{γ} 0.0669 A. U. (13 milliamp./sq. cm.) H_{α} 0.1391 A. U. A third component on the longer wave-length side of λ' is also present. B. C. A.

Determination of refractive indexes from reflection measurements in the infra-red. A. KREBS. *Ann. Physik* 82, 113–37(1927).—The relation between angle of incidence and reflection has been studied for the residual rays from Ca carbonate, silica and fluorite. The Fresnel formulas fit the reflection data for the transparent substances Se, NaCl, KCl, KBr and CaF_2 . Brewster's law affords a means of calcg. n_s from the angle of polarization corresponding with the reflection data. By combining the Fresnel formulas, a simpler method can be used. The reflection of residual rays from various com. glasses has enabled their n_s to be detd. experimentally. B. C. A.

Absorption of light by ozone between 3050 and 3400 A. U. J. DUTHIEL AND (MME.) M. DUTHIEL. *J. phys. radium* [vi], 7, 414–6(1926).— O_3 exhibits about 23 bands of low persistence in the region 3050–3400 A. U. (Huggins' bands). The wave lengths of max. and min. absorption and the corresponding absorption coeffs. have been redetd. The new data, when applied to the absorption of the atm., yield results for the thickness of the O_3 layer which are in agreement with results based on the great ultra-violet band (2550 A. U.) of O_3 . B. C. A.

Possible cause of the changes of color in vapors. (MRS.) F. LANGWORTHY. *Chem. News* 134, 20–1(1927).—When illuminated by a spark, the vapor of $HgCl_2$ appears green, that of $HgBr_2$ blue, and that of the iodide violet. This is accounted for on the supposition that, as the halogen atom becomes more positive with increasing at. wt., the violet or more negative rays are more likely to be attracted to its vicinity. Elements in the same group of the periodic table become more positive with increasing at. wt. and the conclusion is reached that this increase of positivity is acquired in stages. B. C. A.

Isotopic effect in infra-red absorption spectra. H. K. PYLER. *Phys. Rev.* 28, 284–90(1926), *Science Abstracts* 30A, 15.—The infra red absorption spectrum of brucite shows maxima corresponding to Mg^{24} , Mg^{25} , Mg^{26} and a band possibly due to Mg^{28} . Coblenz's data also show evidence of isotopic effects in Ni sulfate, Ni^{58} and Ni^{60} being observed. With K sulfate 2 isotopes are also indicated. The solid sulfates of Ba, Sr and Mg show complex maxima, but as the light was unpolarized these may be due to pleochroism. Work is proceeding on these substances with definite orientation. H. G.

The absorption of ultra-violet light by copper sulfate solutions. L. KWIECINSKI AND L. MARCHLEWSKI. *Bull. intern. acad. Polonaise* 7a, 247–53(1926); *Science Abstracts* 30A, 376.—Ley and Hegge and later Mecke and Ley have shown that $CuSO_4$ in water does not obey Beer's law (C. A. 19, 1095). The authors have exptd. with a no. of org. substances, and found none that does not follow this law; they detd. the absorption curves by Hilger's method for 2 solns. one twice the strength of the other, the thickness of the first being half that of the second. The absorption curves agreed within the limits of exptl. error. They find that with solns. of $CuSO_4$ with 0.1 mol. and 0.05 mol. per l. the deviation from Beer's law does not exceed the possible exptl. errors, except in the case where the extinction coeff. is 0.1. For more dil. solns. deviations were observed, which are represented graphically. H. G.

Auroral green line 5577 A. U. D. A. KEYS. *Nature* 119, 162(1927).—The results of McLennan, McLeod and McQuarrie (C. A. 21, 1060), indicating that the line is primarily due to O, are confirmed. B. C. A.

Wave length of ruthenium $K\beta_1$. F. H. LORING. *Chem. News* 134, 49(1927).—The wave length of this line has been detd. from the values assigned by Auger and Dauvillier to the K lines, from the exact values of $K\alpha_1$ and $K\alpha_2$, and from the values of $(\nu R^{-1})^{1/2}$ of the K series. The mean of these and of L.'s exptl. value (cf. *Chem. News* 133, 356–8(1926)) is 0.57158 A. U. B. C. A.

Measurement of absorptive power. E. C. C. BALY, R. A. MORTON AND R. W. RIDING. *Proc. Roy. Soc. (London)* A113, 709–16(1927).—The relative merits of the Hilger rotating sector photometric method and the Judd Lewis sector spectrophotometric method (C. A. 13, 1549) for the detn. of extinction coeffs. are discussed. The methods are compared by measuring, with both instruments, the absorptive powers of a thin glass plate, transmitting to about 254 $\mu\mu$, of a neutral-tinted glass plate, and of standard solns. of K chromate and K and Ba nitrates. The results given be-

tween 436 and 254μ agree well within the limits of exptl. error ($\pm 2\%$). In the visible region, the photographic and von Halban's photoelec. methods (cf. C. A. 15, 343) agree with the visual methods. The error of the photographic method, which is $\pm 2\%$ in this region with the dispersion of a Hilger E_2 spectrograph is probably greater than that shown by the photoelec. method and less than that of the visual method. In the region $240\text{--}330\mu$, the photoelec. method gives values which are uniformly smaller than those given by the 2 photometers. It is suggested that von Halban's results are subject to a wave-length error in this region. With solns of Ba and K nitrates, a new discrepancy is superimposed in the short-wave ultra-violet. B. C. A.

Anomalous dispersion of spectra produced by electric excitation of hydrogen, helium, neon and mercury. R. LADENBURG, WITH H. KUPFERMANN AND AGATHE CARST. *Physik Z.* 27, 789-90 (1926); cf. C. A. 20, 3389.—The classical theory of dispersion suggests the occurrence of anomalous dispersion in the spectra of all glowing gases, but as a rule such dispersion could not be detected. By using the very sensitive method of horizontal interference bands anomalous dispersion could be made visible on the following spectral lines when the current d. is less than 1 milliamp.: Ne 6402 ($s_2\text{--}p_0$), He 5876 ($^3P\text{--}^3D$) and Hg 5461 ($^3P_2\text{--}^3S_1$). The s_2 lines of Ne and the red line of H show this effect at current ds above 100 milliamps. The effect increases irregularly with increasing gas pressure until a max is reached, this is 1 mm. in the case of Ne and $1\frac{1}{2}$ mm. in that of H. EMIL KLARMANN

Magnetic separation of the mercury line 5770 into a nonet of special type. H. NAGAOKA AND T. MISHIMA. *Proc. Imp. Acad. (Japan)* 2, 479-80 (1926).—When resolved in a field of 27,000 gauss, the p components consist of a triplet in which the sepn. amts. to ± 0.083 A. U., and in which the n -components are sym. situated about the initial position of the line, and consist each of 3 components sepd. from the initial line by ± 1.0 , ± 1.083 and ± 1.66 A. U. B. C. A.

Double normal state of the arc spectrum of fluorine. T. L. DE BRUIN. *Nature* 118, 804 (1926).—The line 606.9 is identified as a $^4P^2P'$ combination, and the lines 657.69, 658.31 as a 2P combination. One of the 2P term differences 145.5 (0.02 volt) or 325.6 (0.04 volt) is assigned to the double normal state ("Grundterm") of the F atom. B. C. A.

Impact-broadening of spectral lines and the sharpness of quantum states. G. HETTINGER. *Physik. Z.* 27, 787-9 (1926).—Theoretical. The sharpness of a quantum state depends strictly on its duration period. Whether a quantum theoretically, equiv. to the collisional damping of Lorentz can be found is discussed. It has been shown that addn. of foreign gases can in fact bring about a broadening of lines by collisions. The breadth and broadening of lines in the ultra-red rotation and rotation-vibration spectra of gases with pressure increases are regarded as essentially due to impact-damping. B. C. A.

Line-spectrum of wave lengths of a few decimeters. G. MITT. *Physik. Z.* 27, 792-5 (1926).—Weichmann (C. A. 16, 684) has measured n of water for wave lengths, from 27 to 65 cm., and has found several sharply defined regions of anomalous dispersion. The water he employed has a cond. varying from 20×10^{-6} to 40×10^{-6} . When specially purified water of cond. 2×10^{-6} is used, no trace of anomalous dispersion is found, and the n of water is 8.975 approx. over the range 52-58 cm. Weichmann's results can be reproduced by adding a trace of a soln. made up from NaHSiO_3 . The curve, refractive index vs. wave length, shows 3 max. between 54 and 57 cm. The curve for clean solns. of NaHSiO_3 can now be expressed by the ordinary dispersion formula, the resonance wave lengths being 54.49, 55.55 and 56.29 cm. The physical interpretation of the curve is discussed. B. C. A.

Optical constants of single-crystal bismuth. L. H. ROWSE. *Phys. Rev.* 27, 247 (1926).—The extinction modulus and n for light traveling parallel to the optic axis were detd. by measuring the ellipticity produced by reflection from the cleavage surface of single-crystal Bi. A Stokes analyzer was used and readings in the visible spectrum only were taken. n rises from 1.05 at 470μ to 1.55 at 670μ , while the extinction modulus rises from 2.7 to 3.6 over the same range. R. L. HERSHEY

The emissivity of thorium oxide. W. E. FORSYTHE. *Phys. Rev.* 25, 252 (1925).—The black-body emissivity of ThO_2 was 0.40 when heated either with oxy-H or oxy-gas flames. F. O. A.

The cause of the colors shown during the oxidation of metallic copper. F. HURN CONSTABLE. *Proc. Roy. Soc. (London)* A115, 570-88 (1927).—The change in color developed during the oxidation of Cu rods whether massive or deposited on china has been followed through 3 orders. A definite color was developed by heating the

rod to a given temp. in air in a furnace, after which the color was fixed by sudden evacuation. The change in thickness was closely correlated with the color by following the change in mass, or the decrease in pressure of the oxidizing gas or the change in elec. cond. of a Cu film on a china rod. The colors are shown to be interference colors. A dull film scatters negligible light, while if highly polished the scattering is marked from green films.

F. O. ANDEREGG

The value of spectrography in theory and practice. S. A. SCHOU. *Dansk Tids. Farm* 14, 419-28(1927).—A brief historical outline is given of the study of absorption spectra in which the importance of quant. spectrography to chemistry is pointed out. Reference is made to the fact that an increase in the conjugate double bonds in many org. compds. is accompanied by an increase in their absorbing power. Thus, stilbene and its derivs. will show a gradually increasing absorption in passing from the lower to the higher homologs with increasing alternating double linkages between the 2 extreme phenyl groups. Similar results are obtained by increasing the no. of carbonyl groups in certain org. mols. Such problems as the question of the constitution of $\text{CH}_3\text{COCH}_2\text{COOC}_2\text{H}_5$ have been solved by the aid of spectrography since the spectrographic results can be checked by a suitable Br titration, which follows closely the equil. between the keto and the enol forms of this ester. It is possible to obtain accurate results since the double bond between two C atoms causes an absorption about 10,000 times as strong as that produced by the carbonyl group. S. shows spectrographically the existence of an enol form of acetaldehyde, $\text{CH}_3\text{CHO} \rightarrow \text{CH}_2 = \text{CHOH}$. Because the absorption band, which is produced by alural in a non-aq. solvent and which is due to the aldehyde group, disappears in chloral hydrate solns. it is believed that the water in the hydrate is present as a hydroxide rather than water of crystn. The quant. aspect of spectrography is expressed in the equation $E = \log(I_0/I) = \epsilon cd$, where E represents the extinction of light, I_0 the intensity of the light entering the substance, I that of the light leaving it, ϵ the coeff. of extinction (which varies only with the wave length and the nature of the substance), c the concn. and d the thickness of the absorbing substance. From this equation the relationship $\epsilon = (n/cd) \log(I_0/I)$ can be derived, in which n is a const., t_0 the time of exposure (spectrum photography) for the solvent, and t that for the soln. By varying c and d the value of ϵ can be obtained for different wave regions and a graphic relationship established between ϵ and the wave lengths in A. U. Practical use is made of spectrographic detn. of the purity and the concn. of substances in soln. It is applicable to forensic chemistry in dealing with alkaloids. Since the spectrum from a vapor is more discontinuous than that from a soln. the study of vapor spectra is more suited to a detailed investigation of mol. absorption than soln. spectra. Vapor spectrography lends itself in a practical way to a quant. measure of the concn. of absorbing gases. For example, it is possible to det. accurately 0.001 mg. CaH_2 in a vol. of one l.

E. O. ELLINGSON

The wave length of the green auroral line in the oxygen spectrum. J. C. McLENNAN AND J. H. McLEOD. *Proc. Roy. Soc. (London)* A115, 515-27(1927).—With a Fabry-Perot interferometer the wave length of the green line of O was measured as 5577.341 A. U., practically identical with the value 5577.350 A. U. found by Babcock for the auroral line. This strengthens the conclusion that the auroral line has its origin in O in the upper atm.

C. C. KIESS

The hydrogen band spectrum: new band systems in the violet. O. W. RICHARDSON. *Proc. Roy. Soc. (London)* A115, 528-48(1927).—Lines in the violet portion of the secondary spectrum of H which are strengthened when H_2 is excited by direct electron impact have been arranged into a system of bands. Only the Q branches are as yet worked out but the evidence indicates the existence of P and R branches as well. These bands are degraded toward the violet opposite to those previously described (C. A. 20, 2949; 21, 705). The details of the analysis are given in comprehensive tables.

C. C. KIESS

Transmission properties of some filters. E. PETTIT. *Astrophys. J.* 66, 43-58 (1927).—The detn. of transmissions between $\lambda = 230 \text{ m}\mu$ and $450 \text{ m}\mu$ were made photographically with a 1-m. concave grating spectrograph; those of wave lengths longer than $\lambda = 450 \text{ m}\mu$ were made with a monochromatic illuminator and vacuum thermocouple. **Standards of wave length in the infra-red.**—A table of wave lengths of easily recognized features of absorption spectra is given for the region $\lambda = 740 \text{ m}\mu$ to $\lambda = 2.1 \text{ }\mu$ which may be used where accuracy greater than $0.01 \text{ }\mu$ is not required. **Transmission data.**—The transmission curves of 44 filters are given from $\lambda = 0.23$ to $\lambda = 2.3 \text{ }\mu$ and in several cases to greater wave lengths in the infra-red. **Photochemical effects.**—The effect of sunlight on green celluloid, glass, Ag and Au films has been studied. Solarized green celluloid is a valuable filter transmitting the infra-

red with an efficiency of 80-90%, has a sharp cut-off at $\lambda = 0.4 \mu$ and transmits nothing from this point to $\lambda = 0.23 \mu$.

E. P. WIGHTMAN

Studies of the Becquerel effect. I. I. LIFSCHITZ AND S. B. HOOGHOUT. *Z. physik. Chem.* **128**, 87-109(1927); cf. *C. A.* **21**, 2097.—It is shown experimentally that the Becquerel effect is independent of the H-ion concn. in solns. of dyes. The effect depends upon secondary changes occurring in solns. of simple electrolytes with Pt electrodes. Both pos and neg. effects were observed depending upon the nature of the ions of simple electrolytes. Substances which are sensitive to light in the ordinary sense often show no effect. Impurities often exert a very great influence upon the effect. At reversible electrodes of metal against metal ions or H against H ions no effect is observed. It occurs only in polarizable electrodes or phase boundaries.

F. O. ANDEREGG

The life period of resonance phenomena. F. FUES. *Z. Physik* **43**, 726-40(1927).—Atoms with several like electrons may exist in excited states, whose energies are equiv. to the state of the concerned ions, so that a probability results that they so pass spontaneously into these with electron emission. This transition process can be followed by wave mechanics and in this way a life period for the first state and a theoretical value of the above possibility can be calcd. If one compares with it the possibility of a transition to a not excited state of the atoms with emission of a light quantum, the order of magnitude of both proves the Auger expt. of the fluorescent yield of absorbed Röntgen rays. The influence of the spontaneous conversion possibility on the dispersion is discussed.

MARIE FARNSWORTH

Fine structure of cadmium lines in the ultra-violet. W. MOHAMMAD AND S. B. L. MATHUR. *Phil. Mag.* [7], **4**, 112-20(1927).—M and L investigated the fine structure of prominent Cd lines in the spectral region between 4800 and 2775 Å. U. Their work is in generally good agreement with MacNair (cf. *C. A.* **20**, 3636).

G. G.

Band spectra associated with silicon. W. H. B. CAMERON. *Phil. Mag.* [7], **3**, 110-5(1927).—An attempt is made to produce band spectra of Si compds analogous to the band spectra of C (due to CO or CO⁺). The Si used was only commercially pure and the spectra obtained may be due to impurities.

GEORGE GLOCKLER

Correction to our article: The relations between fluorescence and phosphorescence in solid and liquid media. S. I. VAVILOV AND V. L. LEVSHIN. *Z. Physik* **44**, 539(1927); cf. *C. A.* **20**, 3132.—New results indicate that U salts in the solid state show only phosphorescence and no fluorescence, in contrast with the results obtained with other phosphorescent substances.

F. A. JENKINS

Ultra-violet fluorescence of IBr vapor. A. FILIPPOV. *Naturwissenschaften* **15**, 682-3(1927).—A fluorescence band spectrum (9 bands) between 3000 and 3500 Å. U. was found for IBr. Addn. of N₂ at 260 mm.-pressure caused bands to appear up to 3800 Å. U. Excitation of Br₂ or ICl by quartz filtered ultra-violet light was without result. Irradiation of ICl by Al spark yielded weak violet luminescence from I₂.

B. J. C. VAN DER HORVEN

Blue zirconium from Siam and its behavior toward Becquerel rays. HERMANN MICHEL AND KARL PRZIBRAM. *Anz. Akad. Wiss. Wien* **62**, 49-52(1927).—The change in color under the influence of Ra and cathode rays and the changes on heating are described.

MARIE FARNSWORTH

Contribution to the luminescence and change of color of alkali chlorides treated with Becquerel rays. EDUARD JAHODA. *Sitz. Akad. Wiss. Wien, Abt. IIa* **135**, 675-703(1927).—J. studies the luminescence and the change of color of a rock-salt crystal from Stassfurt, which exhibits a red radiophotofluorescence. The results are compared with those obtained with rock salt from Wieliczka. Following are the characteristic differences: Red radiophotofluorescence; increase in the luminescence properties; initial red color, which shifts to yellow-green by radio- or thermoluminescence; faster rise, higher max. and slighter stability of the color change; no appearance of blue light. As in the case of common rock salt, the max. of the absorption spectrum is at 460mμ; the max. of the excited red radiophotofluorescence is at 495mμ. A chem. analysis and the use of artificial crystals contg. metallic particles have proved that the red radiophotofluorescence of the crystal from Stassfurt is to be attributed to traces of Mn. Artificial NaCl crystals contg. various metals have been obtained by fusion. They show the same peculiar properties as the natural crystals, but increased to a larger extent. The metallic inclusions have a considerable influence on the luminescence power, but only a very slight on the absorption spectrum. The fusion broadens the absorption bands. Crystals of the remaining alkali chlorides have been prepd. by fusion. They exhibit the same peculiarities as do artificial NaCl crystals, with

the only important exception that the fusion increases the color change, but at the same time stabilizes it. The absorption spectra of RbCl and CsCl have their max. at 610μ and 560μ , resp.

A. L. HENNE

Color change and luminescence in Iceland spar submitted to Becquerel rays. LUISA GRÖGER. *Sitz. Akad. Wiss. Wien., Abt. IIa* **135**, 705-14(1927).—Iceland spar was illuminated with β - γ rays of intensities 1, 0.52, 0.31, 0.17 and 0.137, resp. The effect of the radiation duration on the absorption coeff. and the luminous total was studied. In first approxn. both relations are of the type $n = n_{\infty}(1 - e^{-\beta t})$. A quant. study of the relation of the max. of the color change and the total amt. of light to the radiation intensity indicates that $n_{\infty} = \alpha j / (\beta_1 j + \delta)$ (cf. Przibram, *C. A.* **21**, 1411). These exptl. results are criticized from a theoretical standpoint. Finally it has been qual. found that an increase in the radiation duration causes the radiofluorescence to become brighter.

A. L. HENNE

Extinction of the retarded luminescence in mercury vapor. S. PIENKOWSKI. *Compt. rend. soc. Pol. de phys.* **1925**, Part 4, 7-16; *Physik. Ber* **6**, 1633.—Rapidly moving Hg vapors were excited by electronic bombardment. An elongation of the luminescence band occurs in the direction of movement. From the marked asymmetry and the observations with the revolving mirror it is evident that a retarded luminescence is present. Photographs of the luminescence spectra show various extinctions for the different wave lengths. Photometric measurements made in the direction of the beam indicate for individual wave lengths an exponential relation to the extinction. This indicates that the no. of atoms which change from condition a to b in unit time is proportional to the total no. in condition a.

E. R. SCHIERZ

Elementary mechanism of photochemical action. V. HENRI AND R. WURMSER. *J. phys. et radium* **8**, 289-310(1927).—According to Einstein's law the no. of mols. reacting in a photochem. change is equal to the no. of quanta absorbed in the same time. Most photochem. reactions do not follow this law; the relation between the velocity of the reaction and the energy absorbed is not inversely proportional to the frequency. These reactions are made up of a series of partial reactions, of which the first, the elementary photochem. phenomenon, obeys Einstein's law. This elementary phenomenon is either a simple activation of the mol., a predissociation or a dissociation. By a study of the various properties of the substance and the effects of outside influences, it is possible to det. for a gaseous reaction which of the 3 above modes of action is responsible for the photochem. change. There exist certain simple reactions for which Einstein's law may be verified.

S. M. GERHARD

Production of ozone in air by ultra-violet rays. J. DADLEZ. *Compt. rend.* **185**, 89-91(1927).—Air confined in a space of 18 cu. m. was made to aspire at variable distances from a George quartz lamp of 1500 c. p. The amt. of ozone produced varies with the distance of the air column from the lamp. Similar results were obtained with the Gallois and Chénaille lamps. The quartz lamp under ordinary conditions does not produce enough ozone to make the air unfit for respiration.

L. W. R.

The action of light on chlorine. G. B. KISTIAKOWSKY. *J. Am. Chem. Soc.* **49**, 2194-200(1927).—All theories which assume the presence of foreign mols. to be necessary for the primary photochem. process assume simultaneously that pure Cl_2 , and similarly Br_2 , do fluoresce. An approx. detn. of the convergence limit gave 4790 A. U. with an accuracy of about 10 A. U. thus confirming the results of previous investigators. In expts. on the absorption of light by dry and moist Cl_2 , av. results for the % of the total radiation absorbed were 8.75 and 8.90, resp. The fraction of absorbed light energy which is reëmitted as fluorescence by dry Cl_2 must be very much smaller than the upper limit of 5% detd. by means of a thermopile. The structure of the absorption spectrum and the total absorption of Cl_2 are not appreciably changed by extreme drying. The decrease of the Budde effect on drying Cl_2 is, however, real. Since fluorescence is absent and the extent of absorption is unchanged, it is concluded that one and the same amt. of light energy introduced may or may not cause a heating effect, depending only on the presence or absence of impurities in Cl_2 .

J. H. PERRY

The action of light on concentrated aqueous solutions of ammonium thiocyanate. S. S. BHATNAGAR, H. B. DUNNICLIFF AND MOHAMMAD ALI. *Quart. J. Indian Chem. Soc.* **4**, 229-38(1927); cf. *C. A.* **20**, 3645.—The red color which appears when sunlight falls on concd. NH_4CNS solns. has been ascribed to colloidal S. It could be due to $\text{Fe}(\text{CNS})_3$. The Fe could come from the glass. But the color appears at the same time in quartz tubes, in glass tubes, and in tubes to which a little $\text{Fe}(\text{ClO}_4)_3$ has been added. Then Fe cannot be the cause. The color appears first in the most concd.

solns. Solns. less concd. than 3.5 *N* do not become colored. The first color appears in concd. solns. exposed to direct sunlight in 10 sec. and is definite in 1 min. A ppt. appears in about 5 hrs. Expts. with a light filter showed that wave lengths longer than blue had no effect; and blue, violet and ultra-violet were increasingly effective. Dry crystals were not discolored. Stored solns. were discolored as readily as fresh solns. The presence of acids promotes the development of the color and the presence of base prevents its formation. Boiling and some solvents discharge the color, one solvent, ether, dissolves the colored substance. H_2S discharges the color. Little or no color is developed in the absence of air, unless oxidizing agents are present. H_2O_2 and other oxidizing agents produce the same color and ppt. as air and sunlight. Absorption spectra (5 plates reproduced) for the mixts. colored by sunlight, Hg vapor arc, and iron arc, and those colored by oxidizing agents are similar. The analysis of the ppts. from irradiated and oxidized solns. is the same. NH_4CNS or $KCNS$ is hydrolyzed to form $HCNS$. $HCNS$ is oxidized to produce CNS , which produces the color. CNS polymerizes to form $(CNS)_n$, which is the ppt. Light promotes oxidation by atm. O_2 .

F. E. BROWN

The quantum yield in the action of Röntgen rays on silver bromide. J. EGGERT AND W. N. DDACK. *Z. Physik* **43**, 222-9 (1927).—In the photolysis of the $AgBr$ of a photographic film by means of Röntgen rays, the quantum yield is about 1000 Ag atoms per $h\nu$, measured for $\lambda = 0.45$ A. U. Each absorbed $h\nu$ makes it possible to develop one grain of $AgBr$. When a screen of $CaWO_4$ is illuminated by means of Röntgen rays, every $h\nu$ from Röntgen source generates at least 30 $h\nu$ of blue fluorescence light.

A. L. HENNE

Effect of chemically active rays on gelatin. H. BRINTZINGER AND K. MAURER. *Kolloid-Z.* **41**, 46-50 (1927).—Gelatin subjected to the rays from a quartz lamp was altered so that its tendency to swell in water was lessened, the effect being proportional to the duration of illumination. Further, the soly of the swollen gelatin in water was reduced, prolonged boiling being necessary to effect dissolution. Elementary analysis failed to detect a difference, but the irradiated specimen was found to reduce ammoniacal silver nitrate soln. The same effect was observed when the gelatin was irradiated in an O -free atm., but was considerably reduced by rigorous purification of the gelatin. The effect of light is dependent on the presence of an iron catalyst normally found in the ash of gelatin.

The Rennerfelt electric furnace. G. SEPULCHRE. *Aciers spéciaux* **2**, 514-9 (1926); *Chimie et industrie* **18**, 250(1927).—Description of the furnace and discussion of its merits. A. PAPINEAU-COUTURE

Electric furnace used in annealing cylinders for air-cooled engines. I. S. WISHOSKI. *Fuels and Furnaces* **5**, 1199-202(1927).—The furnace and its operation are described. E. H.

The production of cast iron and synthetic pig iron in the electric furnace. H. STAMM. *Continental Met. Chem. Eng.* **2**, 135-8(1927).—An outline covering progress in the production of gray Fe and of synthetic pig Fe in the elec. furnace. The presence of Al and of Ca as metals or as carbides in cast Fe is discussed. The presence of SiC has not been established. The difficulties connected with the production of elec. pig Fe have been largely solved and may be practically eliminated by correct smelting. The only difference between elec. and cupola gray Fe is the replacement of coke by the heating effect of the elec. arc. Closed elec. furnaces are most commonly used. Elec. furnace smelting of gray Fe saves Fe, Si and Mn; slag production is very low and the entire charge is introduced at once. The quantity and quality of the C added are important. To obtain similar properties in low-C gray Fe to those of cupola gray Fe, the C content of the elec. product must be maintained 0.2% higher, for Fe of the same general compn. The non-continuous operation of the elec. furnace is a disadvantage where large castings are involved. W. H. BOYNTON

The aluminum industry of Japan. ANON. *J. four elec.* **36**, 200(1927).—Japan does not yet figure as a producer of Al but is a heavy importer of the metal. In 1926 5000 tons were imported as against 500 tons in 1915. C. G. F.

New process for the preparation of boron. L. ANDRIEUX. *Compt. rend.* **185**, 119-20(1927); cf. *C. A.* **21**, 1413. —Electrolyzing a molten bath having the compn. $2B_2O_3 + MO + MF_2$ gives at the cathode either the metal M or a boride of this metal mixed with a greater or less proportion of B. In the first case only the oxide MO is decompl., while in the second, the metal M reduces the B_2O_3 of the bath, liberating B, which combines partly or wholly with M. On carrying out the electrolysis at 1000-1200° with baths yielding metals which can reduce B_2O_3 , A. found: (1) with alkali borate and fluoride the results are similar to those obtained hitherto with $Na_2B_4O_7$ or $K_2B_4O_7$; alone (low yield of very impure B), (2) with alk. earth metals or earth metals the cathode deposit consists mainly of the boride of the metal, but with Mg the product may consist almost entirely of B. Electrolyzing at 1100° a bath consisting of $2B_2O_3 + MgO + MgF_2$ in a graphite crucible (as anode) gives a cathode deposit of B agglomerated by part of the solidified electrolyte. Pulverizing and treating the deposit with HCl gives a residue of amorphous B, which, after drying *in vacuo* at 140°, contains up to 95% pure B; it may be further purified by fusing in dry H₂ according to Weintraub (*C. A.* **5**, 2221; **7**, 2022). The process can be made continuous, as the cathode can be withdrawn from the bath and replaced without fear of igniting the B. The current efficiency can reach 95%. A. P.-C.

Preparation of alkali and alkaline-earth amalgams; electrolytic production of barium compounds. OCTAVE DONY-HÉNAULT AND FRANCIS MEUNIER. *Chimie et industrie Special No.*, 431-4(May, 1927).—Insol. or sparingly sol. alkali or alk.-earth salts (e. g., $NaHCO_3$ or $BaCO_3$) can be readily electrolyzed in suspension in a soln. of a sol. salt of the same metal, using a Hg cathode to amalgamate the liberated alkali or alk.-earth metal. In electrolyzing a suspension of $BaCO_3$ in $Ba(ClO_3)_2$ or $Ba(ClO_4)_2$, the Ba liberated at the cathode is amalgamated and the ClO_4 liberated at the anode immediately attacks the $BaCO_3$, regenerating the electrolyte. The $Hg_{12}Ba$ formed is not oxidized by $Ba(ClO_3)_2$ or by $Ba(ClO_4)_2$ in neutral or alk. soln., and highly concd. solns. of the electrolyte may be used with almost quant. yields and very high (nearly 100%) current efficiencies at current densities of 3000-4000 amps. per dm.² The industrial possibilities of the process, particularly for the cheap production of Ba compds. of a high degree of purity, are discussed. A. PAPINEAU-COUTURE

Aluminum and bauxite. R. S. MCBRIDE. *Mineral Ind.* **35**, 11-47(1926).—World production, metallurgy, new alumina processes, and uses are covered. A. BUTTS

A study of the influence of variables on the structure of electro deposited copper. A. KENNETH GRAHAM. *Trans. Am. Electrochem. Soc.* **52**, (advance copy), 23 pp.(1927).—A

study of the variables in the electrodeposition of Cu, namely, the influence of the base metal, metal concn. of electrolyte, acid concn. of electrolyte, agitation, c. d., temp., addn. agents and the cathode potentials, in conjunction with each of the above variables, was made under uniform conditions, with an acid copper sulfate electrolyte. Their effect upon the structure of the electrodeposited metal was observed, and the relation of cathode polarization to the structure of the deposit was noted. Additional confirmation was obtained of the evidence that the base metal influences the structure of electrodeposited Cu. A simple device for maintaining a const. soln. level and a new design of calomel electrode for preventing diffusion of KCl into an electrolyte were employed. C. G. F.

Electrolytic deposition of metals on an industrial scale. PH. NAVILLE. *Chimie et industrie Special No.*, 405-7 (May, 1927).—Brief discussion of the effects of the compn. of the electrolytic bath, and particularly of the addn. of relatively small amts. of various cations and anions, on the character of the deposit. A. P. C.

Observations on chromium plating. F. R. PORTER. *Brass World* **23**, 267-9; *Metal Ind.* (N. Y.) **25**, 375-7 (1927).—The bath recommended is CrO_3 16-32 oz./gal. (120-240 g./l.), $\text{Cr}_2\text{O}(\text{CO}_3)_2$ 1-2 oz./gal. (7.5-15 g./l.), $\text{Cr}_2(\text{SO}_4)_3$ 0.4-1 oz./gal. (3-7.5 g./l.). Some discussion of the historical development of the use of these constituents is given. 40° to 46° C. (110° to 115° F.) is recommended as the most satisfactory range for bright plating. Parts with plane surfaces were plated with about 70-350 amps. per sq. ft. but with irregular-shaped objects 200-250 amps./sq. ft. were generally required to obtain a continuous deposit covering the recessed portions as well as the projecting parts. The quantity of CrO_3 in the bath had practically no effect upon the deposit within the limits used (16 to 32 oz./gal.). Likewise the quantity of carbonate present had little or no effect. The sulfate, however, caused trouble unless carefully controlled. More than 0.4 oz./gal. resulted in reducing the apparent throwing power. Many details of technic in the application of Cr plating are discussed. In the protection of Fe against rust Cr plate is applied as a finish over Cu or Ni plate as it does not protect Fe from rusting when used alone. G. DUBPERNELL

Electrodeposition as corrosion preventive. S. WERNICK. *Brass World* **23**, 251-2 (1927).—Zn and Cd protect because they are anodic to Fe but it is pointed out that a few ten-thousandths of an in. of such metals as Cu, Ni and Sn are totally inadequate because of the generally porous nature of the Fe base. The deposit may cover up the small pores in the base metal but will not enter comparatively large crevices. The porous base metal frequently exerts a sponge-like action and absorbs the solns. into which it enters and these later influence corrosion. About 0.0005 in. of Zn gives satisfactory results; it should be as free as possible from impurity; Sb, Fe and Cu are especially to be avoided in the bath. Cd is beginning to replace Zn to a considerable extent. G. DUBPERNELL

The pressure factor in electrolysis. B. WAESER. *Continental Met. Chem. Eng.* **2**, 141-2 (1927).—It is shown that in the electrolytic production of highly compressed gases the voltage need hardly be increased beyond the value required for carrying out the process at ordinary pressures—the benefits of compression being obtained practically without additional current cost. The size of the gas bubbles formed in the electrolyte is smaller, because of the smaller vol. occupied by compressed gas. This tends to eliminate disagreeable accompaniments of electrolysis at ordinary pressures, and facilitates the sepn. of the gases from the electrolyte. The smallness of the bubbles evolved causes a decrease of the conversion resistance, accompanied by an almost violent development of gas, permitting the use of a higher amperage and the attainment of much higher capacities per electrode area. Pressure possesses a strong influence on the cond. of the electrolyte, the resistance of aq. soln. against the passage of the elec. current growing smaller with increasing pressure, the degree of change depending upon the kind and concn. of the soln. Several patents embodying the employment of pressure-electrolysis are briefly reviewed. W. H. BOYNTON

Electrolytic white lead. ANON. *Paint, Oil and Chem. Rev.* **84**, No. 8, 10 (1927).—A process description of electrolytic refining of Pb bullion and its conversion to white lead by the Sperry method. R. J. MOORE

Iron as an impurity in the lead accumulator. I. Capacity loss due to self-discharge. II. Permanent capacity loss. Adsorption and desorption of iron by the positive plate. F. M. LEA AND J. T. CRENNELL. *Trans. Faraday Soc.*, (advance copy), 1927.—Expts. of a semi-quant. nature were carried out initially at lab. temps. by selecting groups of 4 cells of equal capacity, as detd. by a long series of preliminary cycles of charge and discharge, and introducing Fe into the cells so that in any one group the Fe concns. in the electrolyte were 0.1, 0.01, 0.001 and zero g. of Fe per 100 cc. In actual practice the "zero" cell always contained some Fe derived from the

cell materials which was not completely removed by changing the electrolyte. There were 2 types of capacity loss proportional to the Fe concn. in a cell. (a) A cell contg. Fe when discharged after various periods of standing was found, compared with a cell with pure electrolyte, to show a loss of capacity increasing with time. This loss is termed the "self-discharge loss" and is due to the action of the Fe as suggested by the Dolezalek theory. (b) A cell contg. Fe, if discharged immediately after charge, exhibits a loss of capacity compared with a cell contg. pure electrolyte. This loss is termed the "permanent" loss as it has been shown that it cannot be due to self-discharge similar to (a) during the period required for discharge. A close check was kept on the electrolyte Fe concns. of all cells. The Fe tends to become unequally distributed throughout the electrolyte of a cell, the concn. increasing toward the bottom. In addn. the Fe is adsorbed by the positive plate (PbO_2), and the resulting equil. is dependent on a no. of factors. This adsorption is related to the permanent loss occurring in a cell contg. Fe. There is an approx. linear relation between the Fe content and the self-discharge loss, but the rate of loss tends to decrease with time. The normal action of Fe on the neg. plate is expressed by the equation: $\text{Pb} + \text{Fe}_2(\text{SO}_4)_3 = \text{PbSO}_4 + 2\text{FeSO}_4$. The increase in weight of a pos. plate immersed in H_2SO_4 soln. contg. Fe^{++} , as compared with a similar plate in a pure acid, is in agreement with the equation: $\text{PbO}_2 + 2\text{FeSO}_4 + 2\text{H}_2\text{SO}_4 = \text{PbSO}_4 + \text{Fe}_2(\text{SO}_4)_3 + 2\text{H}_2\text{O}$. The rate of self-discharge is proportional to the electrolyte Fe concn. and increases with temp. The titanous chloride method for detg. Fe has been applied to the estn. of small traces of Fe in H_2SO_4 solns. The relations between the permanent loss occurring in a cell contg. Fe and the adsorption of Fe by the positive paste have been studied. The permanent loss has been measured for a series of temps., Fe concns. and discharge rates. The adsorption of Fe by the positive paste increases with decreasing acid concn. and also with increase in temp. This adsorption has been attributed to the presence of a hydrolysis product of $\text{Fe}_2(\text{SO}_4)_3$. The adsorption by the PbO_2 is to a large extent irreversible, but desorption is produced by the elec. working of cells in which the paste and electrolyte Fe concns. are not in equil. The permanent loss and the adsorbed Fe concn. are connected approx. linearly. The permanent loss is recovered by the renewal of electrolyte in proportion as the Fe concn. is reduced. Both H_2SO_4 and $\text{Fe}_2(\text{SO}_4)_3$ are adsorbed by the PbO_2 , but the latter is adsorbed more strongly. The permanent loss has been attributed to this preferential adsorption of the Fe and a theory of the action has been suggested.

C. J. BROCKMAN

The function of inert substances in lead accumulators. O. SCARPA. *Chimie et industrie Special No.*, 408-9 (May, 1927); cf. C. A. 13, 1049.—The beneficial effect of BaSO_4 when added in the grid is due to its retarding action on the transformation of spongy into massive Pb, the BaSO_4 particles interposed between the small crystals of reduced Pb decreasing or preventing their growth at the expense of neighboring crystals. This effect increases with the fineness of the BaSO_4 particles. The p. d. between lampblack and H is practically negligible, while between spongy Pb and H it is 0.38–0.65; as a result, when an accumulator contg. lampblack in the grid is recharged, minute gas bubbles are formed on the lampblack particles, thus regenerating the porosity of the grid each time the accumulator is recharged. In addn., lampblack may also function in the same way as BaSO_4 . Addn. of *pptd.* SiO_2 in the grid is injurious, because adsorption of PbSO_4 by the SiO_2 greatly accelerates sulfation of the grid.

A. PAPINEAU-COUTURE

Light copper-zinc storage batteries. B. L. RÖSING AND (MISS) I. P. DMITRIENKO. U. S. S. R. *Sci. Techn. Dept. Moscow No.* 147, 11 (1926); *Science Abstracts* 30A, 234. (In German.)—The employment of cells of the Daniell type as accumulators of small capacity (up to 0.1 amp. hr.) is proposed. The given construction provides light cells which can be regenerated by current and show no local reactions. They are especially suited for high-tension batteries. The wt. of a battery of 200 v. is 1.5 kg.

E. H.

Some current-time relations in the aluminum cell. [Tantalum.] W. E. MESERVE. *Phys. Rev.* 30, 215–21 (1927).—The relation between the current and the time in an Al cell with the Al as anode and with d. c. applied has been investigated. App. and methods for obtaining data are described whereby many of the past difficulties have been overcome. The results obtained are in agreement with the theory of Guthe (*Phys. Rev.* 15, 327 (1902)) as modified by Fitch (C. A. 11, 917). After the lapse of a certain time (t_0), which was found to be 300 sec. from the moment of applying the v., the dependence of current on v. conforms to the relation $E/i^2 = Ct + D$. From this is deduced a linear relationship between E/i and the quantity of electricity passing through the cell, $(E/i) - (E/i_0) = Cq/2$. The slope, $Cq/2$ is in the nature of a resist-

ance and assuming that it represents the resistance of the oxide layer, the thickness and resistivity (3.403×10^{12} ohm/cm.) of the layer are computed. The data obtained show that the slopes of these lines vary inversely with the square of the anode areas which checks with the theory. Results obtained by Gunther-Schulze (*C. A.* 15, 2232) with Tu are compared and are shown to check the theory. After a short time of closed circuit the opposition to the flow of current when the Al is the anode is shown to be due primarily to the ohmic resistance of the solid layer which increases in value with time of closed circuit.

BERNARD LEWIS

The use of carbon dioxide in a mercury interrupter. G. R. PARANJPE AND H. D. TENDULKAR. *Nature* 120, 117-8(1927).—The efficiency of a Hg interrupter using CO_2 and also H_2 as a dielec. instead of coal gas is tested. The efficiency is greater with either than when coal gas is used.

Oxide cathode. G. I. HERTZ. *Can.* 272,708, July 26, 1927. Oxide cathodes are manufd. by coating a body, of which at least part of the surface consists of CuO , with 1 or more alk. earth metals, after which it is heated in a non-oxidizing atm. so that the alk. earth metal melts. The alk. earth metal is then at least partly oxidized and the body is heated in a reducing atm.

Primary cell and electrolyte. G. W. HEISE. *Can.* 273,488, Aug. 30, 1927. A galvanic cell electrolyte comprises caustic alkali and bentonite.

Diaphragm for electrolytic apparatus. J. BILLITER and SIEMENS & HALSKE, AKT-GES. *Brit.* 262,470, Dec. 23, 1924. A diaphragm is formed with fibrous foundation material, such as asbestos, and a filler and binder free from compds. of any metals which could be sepd. during electrolysis, e. g., colloidal CaF_2 and viscous salt solns., such as those of Ti oxalate or Al formate. The diaphragm is moistened before use and may be protected on the anode side by a layer of glass fleece or glass netting. A glass fabric may also be used as a foundation material. Cf. *C. A.* 21, 210.

Electrolytic copper from ores. H. S. MACKAY. *Brit.* 262,546, Sept. 24, 1925. A soln. of Cu and Zn sulfates such as may be obtained from ore is electrolyzed to effect deposition of Cu until the concn. of $CuSO_4$ is low relative to that of $ZnSO_4$ and the $ZnSO_4$ is then crystd. out by evapn. An app. and various modifications of procedure are described. Cf. *C. A.* 20, 3397.

Electrolyte for nickel plating. H. GARDNER. U. S. 1,642,238, Sept. 13. $Ni-NH_4$ sulfate 8 oz., Ni sulfate 4 oz., H_3BO_3 2 oz., NH_4Cl 0.03 oz., $CdCl_2$ 3 dwts., glycerol 1.5 oz. and H_2O 1 gal.

Malleable iron or steel or alloys. E. G. T. GUSTAFSSON. *Brit.* 262,126, Nov. 28, 1925. In producing malleable Fe or steel or their alloys in a closed elec. furnace, a reducing agent comprising carbonaceous material is added during the first part of the smelting in less quantity than that theoretically required for the complete reduction of ore simultaneously supplied, and a further quantity of the reducing agent is later added to bring the total above the theoretical requirement for reduction and supply the desired quantity of C in the product. The second supply of carbonaceous material is fed on to the slag bath.

Iron, steel and their alloys. E. G. T. GUSTAFSSON. *Brit.* 262,127, Nov. 28, 1925. Ore, fluxes and reducing agent are fed in a thin layer on to a slag bath in an elec. furnace and reduced by the heat developed in the slag. The ore may be partially reduced in a previous preliminary operation by gases from the elec. furnace and the reducing material which may be carbonaceous or ferro-Mn or ferro-Si may be preheated. Various details and modifications are described.

Coating metal articles. M. FOURMENT. Brit. 262,439, Dec. 5, 1925. Gear wheels or other articles are heated by elec. currents, preferably by high-frequency induced currents, to effect diffusion of coating materials such as Zn or Al. App. is described.

False data in the history of photography. J. M. EDER. *Naturwissenschaften* 15, 653-4(1927).—Historical.

Contribution to the problems of photographic gelatin. B. J. C. VAN DER HOEVEN. V. ISAJEVIC. *Kolloid-Z.* 42, 339-50(1927).—The physico-chem. properties of a no. of com. photographic gelatins were compared with the object of distinguishing the essential differences between hard and soft gelatins. The hard gelatins are stated to be of higher mol. wt., contain a lower percentage of dialyzable material, and more firmly bind the adsorbed H₂O than the soft gelatin. The viscosity of gelatin sols is regarded as being primarily a function of particle size, which, in turn, is influenced by temp., age, etc.

J. G. McNALLY.

Anomalies of exposure. LÜPPO-CRAMER. *Phot. Rund.* **64**, 259-64 (1927).—The inverse square and reciprocity laws have a marked tendency to fail in special cases. In general, a greater distance from a const. light source requires more time for equally developed densities than that calcd. from the inverse square law. L.-C. gives many examples of low-speed emulsions in which the reverse is true. C. E. MEULENDYKE

The sensitizing activity of the silver halides. A. STEIGMANN. *Phot. Ind.* **25**, 676-7 (1927).—Not only the OH-ion concn. of the gelatin, but the different Ag halides of the emulsion, influence the reactivity with the labile S of the gelatin sensitizer. AgCl is more reactive than AgBr which in turn is more reactive than bromo-iodide. The reactivities apparently parallel the soly. C. E. MEULENDYKE

Contribution to our knowledge of the latent image. J. EGGERT AND J. REITS-TÖTTER. *Z. wiss. Phot.* **24**, 350-61 (1927).—Methylene blue, present in an emulsion in the quantity of 3.5×10^{-9} g. per sq. cm. surface, or 5×10^3 mols. per AgBr grain, is sufficient to cause fog on chem. development, and a marked decrease in the sensitiveness of the plate to light exposure. If the light exposure be applied before the dye, no loss in speed is noted, although the fog is produced as before. On physical development after fixation, the results are substantially the same with regard to loss in speed, although no fog is produced. Since methylene blue affects the latent image only in its nascent state, and not after it has once been formed, it is concluded that the Ag is in a more dispersed condition during the formation of the latent image than in its final state. The Ag atoms are assumed to be capable of assembling themselves on the grains at certain preferred places detd. by external (e. g., adsorptive) influences, rather than the positions of light absorption. M. W. SEYMOUR

Reversal of film. J. HENRI-ROBERT. *Rev. franç. phot.* **8**, 233-4 (1927).—H.-R. discusses reversal of motion picture films diagrammatically, considering the upper portion of the emulsion layer as negative material and the lower portion as positive material. The reversal is of the type employing complete development of the Ag halide surviving the bleaching operation. Exact and equal conditions of exposure and precise first development are essential to successful positives. C. E. MEULENDYKE

Eliminating fog in photogravure. H. M. CARTWRIGHT AND F. J. TRITTON. *Phot. J.* **67**, 403 8 (1927).—Gelatin gravure resists developed on Cu cylinders show a slight uniform hardening (fog) due to tanning by Cu salts. The hardening destroys the true density relations particularly in the highlights. C. and T. verify the suggestion that resists developed on silvered Cu have less inherent fog, and find that etching in perchloride is hastened by the Ag, owing to elec. couple privation. Gilded Cu is even more reactive. K. C. D. HICKMAN

Ripening of silver halide emulsions. R. E. LIESEGANG. *Phot. Ind.* **25**, 885-6 (1927).—While the chem. side of ripening problems now claims the major interest, the older physical side should not be neglected. This includes the dependence of sensitivity on grain-size as connected with coagulation and Ostwald ripening. C. E. MEULENDYKE

Plate gradation and ripening germs. LÜPPO-CRAMER. *Camera (Luzern)* **6**, 39-41 (1927).—The effect of an oxidizing after-treatment on ripened emulsions has only been investigated thoroughly as regards threshold sensitivity. Expts. are described on the effect of desensitization with chromic acid on the ascending portion of the sensitivity-density curve. Different plates were bathed for 3 min. in a soln. of $K_2Cr_2O_7$ 20 g., concd. H_2SO_4 40 cc., H_2O to 1 l.; washed for 2 hrs., and dried. Each, together with the corresponding untreated plate, was given an exposure under the Goldberg wedge extending into the over-exposure portion of the curve for normal plates; all were developed for 2 min. in metol-hydroquinone. With the slower and more contrasty plates, the effect of the treatment is to produce a moderate displacement of the curve approx. parallel to itself, whereas with the faster plates the displacement is much greater and the 2 curves are less nearly parallel. With an exptl emulsion, the ripening of which was arrested at several different points, L.-C. obtains a curve confirming his previous observation that the threshold speed of a chromic acid-treated, ripened emulsion may actually be lower than that of a similarly treated but unripened emulsion. E. R. BULLOCK

Developers for hot countries. A. LUMIÈRE, L. LUMIÈRE, AND A. SEYEWETZ. *Chimie et industrie Special No.*, 458 (May, 1927).—Swelling of gelatin at 35-40° can be prevented by adding a large amt. (up to 200 g. per l.) of alkali sulfite to certain developers (e. g., metol-hydroquinone, metoquinone), or of Na_2SO_4 to others (diaminophenol); but this increases the bulk of the solid developer and prevents swelling only during developing and not during washing. Normal pyrogallie acid developers can produce permanent insolubilization during the development; but their rapid oxidation

at 35–40° gives a yellow image, which prevents their use. The same insolubilization can be obtained with most of the alk. developers by making alk. with either an alk. carbonate or an alk. hydrate, provided only a small amt. of sulfite is used (not over 1.5 g. per l. with carbonates and 3 g. with hydrates); the insolubilization is produced by the oxidation products of the developer. Owing to the rapid oxidation of most developers under these conditions, only a small no. of them can be used in practice.

A. PAPINEAU-COUTURE

Metoquinone and mixtures of génol and hydroquinone. A. LUMIÈRE AND A. SEYEWETZ. *Sci. ind. phot.* Nov. 1926, *Industrie chimique* 14, 217(1927).—In reply to an observation of Hübl, L. and S. protest against the opinion of the Agfa labs., according to which metoquinone is not a compd. of hydroquinone and génol comparable to a salt, but an addn. compd. which is split up into its constituents by soln. in H_2O or in a sulfite soln.; in metoquinone the amino radicals of 2 génol mols. seem to be esterified by 2 phenol groups of the hydroquinone mol. On cooling a boiling satd. soln. of metoquinone in water or sulfite soln. it crystallizes without change in m. p. (metoquinone m. 135°; hydroquinone m. 169°; methyl-*p*-aminophenol m. 87°). Dissocn. by water or sulfite solns. would not be incompatible with the hypothesis of an esterification, as a large no. of salts are ionized in aq. soln., and sulfites, acting as weak alkalies, liberate the base from certain salts, e. g., the hydrochlorides of *p*- $C_6H_4OHNH_2$ and of diaminophenol.

A. PAPINEAU-COUTURE

Insolubilization of gelatin on photographic plates by means of developers. A. LUMIÈRE, L. LUMIÈRE AND A. SEYEWETZ. *Chimie et industrie Special No.*, 459–62(May, 1927).—Most org. developers can insolubilize gelatin during development, in the same way as pyrogallie acid, provided the developing soln. contains but a small quantity of Na_2SO_3 , not over 2 g. per l. in presence of alk. carbonate or 4 g. per l. in presence of alk. hydrate, as compared with up to 16 g. with pyrogallie acid in presence of alk. carbonate or 6 g. with pyrocatechol in presence of alk. hydrates. The insolubilization is effected by the action of oxidation products, which Na_2SO_3 either destroys or prevents from forming. Some developers which are but slightly oxidized by air in alk. soln. (e. g., pyrocatechol, hydroquinone, metoquinone, génol-hydroquinone) can be used in presence of a very small quantity of Na_2SO_3 as substitutes for pyrogallie acid for obtaining images by removal of gelatin in hot water as in the so-called "carbon" process.

A. PAPINEAU-COUTURE

Speed of fixing. ANON. *Photo-Revue* 38, 176(1926).—The max. of rapidity of fixing is with 30% hypo, with or without boric acid. $NaHSO_3$ should be employed only when it is desired to clear the gelatin.

J. R. ELLIOTT

Red filter in the printing-out process. F. FORMSTECHE. *Phot. Ind.* 25, 885 (1927); cf. *C. A.* 20, 1038.—A Ponceau-red filter absorbs the green but transmits some blue and violet rays. A monochromatic red filter made by conjunction of Ponceau-red and filter-yellow dyed gelatin sheets was not equiv. to a gray filter of density 3.3. Four weeks of diffused daylight were required for an image on a collodion printing-out paper. The color of the image was a brownish yellow as against the normal blue to red-violet.

C. E. MENLENDYKE

Secondary colored image. J. J. HANSMA. *Photo-Revue* 39, 56(1927).—The colored residual image which remains after dissoln. of a Ag photographic image with Farmer's reducer is thought to be Ag_2S . The fact that this colored material is removed if KNC , $KMnO_4$ plus HCl , or a very concd. soln. of ferricyanide and hypo is used, is considered as proof. KCN , or a mixt. of this and $K_3Fe(CN)_6$, dissolves a Ag_2S image. $KMnO_4-HCl$ soln. converts Ag_2S to $AgCl$.

C. F. IVES

Two-color process: generalities, advantages over the three-color. R. NAMIAS. *Photo-Revue* 38, 189–92(1926).—Two negatives are made on panchromatic film taken through red-orange, and blue-green filters, resp. Positives are made and mordanted in a bath of Cu thiocyanate 40 g., Na citrate 60 g., AcOH 30 cc., NH_4CNS 20 g., H_2O 1 l. The positive made from the red-orange filter is dyed green in a soln. of malachite green 5% and AcOH 1%. The other is dyed in a soln. of rhodamine and auramine 2% and AcOH 1%. These are then washed to clear the high lights and superimposed, giving a good two-color positive.

A. D. SLACK

Theory of carbro. C. LIGHTON. *Phot. J.* 67, 362–73, 409–21(1927).—Carbro pictures from bromide prints involve the use of $K_3Fe(CN)_6$ and $K_2Cr_2O_7$. $Ag_3Fe(CN)_6$ is formed, then $AgBr$ while the $Ag_3Fe(CN)_6$ reduces the $K_2Cr_2O_7$. Carbons prepd. by this simple scheme have too high gammas, the shadows being clogged and the highlights bare. A few sec. immersion in an acid hardening bath after bleaching gives correct reproduction but uniformity cannot be secured in the necessarily short time. Attempting to compound a single bath showed that $K_2Cr_2O_7$ could be replaced

by chromic acid, within limits and gamma reduced. Loss of high light detail is generally due to slowness in squeegeeing, some $\text{Ag}_2\text{Fe}(\text{CN})_6$ produced at the moment of soln. contact being allowed to escape before true gelatin contact is secured. The action of the second or acid bath in the carbonyl process is examd.; compounded usually with a hardening substance and a dil. acid its beneficial action is due chiefly to diln. of the surface layers of ferricyanide-dichromate sensitizer in the tissue. The acid may equally well be placed in the first sensitizing bath and the hardener is best omitted. Gamma can be controlled by a second bath of dil. chromic acid and dichromate.

K. C. D. HICKMAN

Photographic spectrophotometry in the ultra-violet (JONES) 3.

Screen for color photography. L. DUFAY and SOC. ANON. COMPAGNIE D'EXPLOITATION DES PROCÉDÉS DE PHOTOGRAPHIE EN COULEURS L. DUFAY. Brit. 262,386, Dec. 4, 1925.

Photomechanical printing surfaces. E. B. ELDRIDGE and J. A. HAESLER. Brit. 262,531, Sept. 15, 1925. To obtain grainless collotype printing surfaces from Ag images, an ordinary plate or emulsion is developed with a developer, the action of which is so feeble or restricted as to produce an extremely faint and tenuous image, before being fixed and treated with the dichromate or like hardening bath. Amidol developer, dild 12-20 times from the usual strength, may be used, and a hardening bath may be formed from CuSO_4 , KBr, $\text{K}_2\text{Cr}_2\text{O}_7$ and chromic acid. The bleached Ag image may be dissolved out or left in. Various details and modifications are described.

Mixture for photosensitization. E. E. JELLEY. Dutch 16,836, Aug. 15, 1927. A soln. of an Ag salt, 4%, with a hydrazine compd (e. g., nitrate), 1%, is used to coat a surface. It gives a printing out effect.

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

Ebullioscopic determination of some complexes. F. BOURION and E. ROUYER. *Compt. rend.* 185, 127-30 (1927); cf. *C. A.* 21, 1772.—It is shown that in solns. of $\text{KCl} + \text{CdCl}_2$ when there is an excess of CdCl_2 there is formed mainly the complex K_2CdCl_4 , but also an appreciable amount of K_2CdCl_4 . In equimol mixts. of HgCl_2 and KBr there are formed the complexes $\text{K}_2\text{HgCl}_2\text{Br}_2$ and KHgCl_2Br , the former predominating; in non-mol. mixts. there is probably present K_2HgCl_4 together with addn. products and double-decompn products. In equimol. mixts. of HgCl_2 and AcONa there is formed either the complex $2\text{AcONa} \cdot 3\text{HgCl}_2$ or a mixt of 2 complexes, one contg. more and the other less HgCl_2 than in the preceding formula. In non-equimol mixts. there is a superposition of the complex $2\text{AcONa} \cdot 3\text{HgCl}_2$ and of a complex contg. more AcONa than $\text{AcONa} \cdot \text{HgCl}_2$, but it was not found possible to det. the compn. and equil. const. of the latter because concd. AcONa and dil. HgCl_2 soln. gives progressive pptn. of a red compd. which interferes with the observations.

A. P.-C.

The structure of complex compounds. E. GAPON. *Ukrainskii Khim. Zhurnal* 1, 595-632 (1925); *Chem. Zentr.* 1926, II, 153-4.—To reduce the indefiniteness of the coordination no. of an element, the postulate is advanced that the no. of the secondary valences is equal to 8 minus the no. of primary valences, and that in complex compds. the secondary valences are always satd. If the central atom in a compd. has the coordination no. 6 or 4, it is bound to 2 mols. through double or triple bonds (I or II, resp.). The presence of multiple bonds restricts the capacity of compds. with coordination no. 6 or 4 for further addns. In addn. reactions, the displaced radical remains no longer united to the central atom, but only with the entering mol. (see III and IV). With several mols. contending for the addn., the mol. with the highest dielec. const. enters the compd., a result which is shown to be related to the Nernst-Thomson law. In complex compds. of higher order, the secondary valences of the central atom also play a part in the addn. of a mol., e. g., with the O in water and the N in NH_3 . In compds. with a coordination no. of 6, both double bond mols. lie in a plane, and the other 4 mols. or radicals in another plane at right angles to the first plane. Therefore compds. of the type: $[\text{Me}(\text{NH}_2)_2\text{X}_3]$ or $[\text{Me}(\text{NH}_2)_2\text{X}_4]$ can exist only in one stereo form, whereas 2 stereoisomeric forms are possible for compds. of the type: $[\text{Me}(\text{NH}_2)_2\text{X}_2]$. The compd. $[\text{Co}(\text{NH}_2)_2(\text{OH})_2\text{Cl}_2]\text{Cl}$ can likewise exist only

in 2 isomeric forms (V and VI), while the Werner theory foresees 5 forms. For the radicals: $\text{H}_2\text{O}=\text{---}$, $\text{H}_2\text{O}=\text{---}$, ---OH and $\text{H}_2\text{O}=\text{---}$, which the theory of G. distinguishes, the mol. vols. are 15.764, 13.512, 14.638 and 12.386, so that the differences in their modes of formation are confirmed.

C. C. DAVIS

The complex stannic and stannous iodides. TRYPHON KARANTASSIS. *Ann. chim.* 8, 71 119 (1927), cf. *C. A.* 20, 1570. K. describes the prepn. of SnI_4 and discusses equil. between SnI_4 , H_2O and HI , properties of soln. and action of the alics., Et_2O , and Me_2CO , prepn. of SnI_6 , CS_2 ; properties of SnI_6Rb_2 with action of heat and solvents, H_2O , abs. alc., anhyd. Et_2O , CHCl_3 , CS_2 and CCl_4 , properties of RbI_3 ; prepn. of $\text{SnI}_6[(\text{CH}_3)_4\text{As}]_2$, $\text{SnI}_6[(\text{C}_6\text{H}_5)_2\text{NH}_2]_{2.5}$ and 5 , $[\text{SnBr}_3]_{7.5}\text{I}_{0.75}[\text{K}]_2$, $[\text{SnBr}_3]_{3.5}\text{I}_{0.65}[(\text{NH}_4)_2]$, $[\text{SnBr}_3]_{5.1}\text{I}_{1.19}[\text{Rb}]_2$ and $\text{SnBr}_3\text{KBr}_2$ (prepn. of the iodobromostannate mixts. of Sr and Ba was tried without result), and the prepn. of $[\text{SnCl}_3]_{0.94}\text{I}_{0.06}[(\text{NH}_4)_2]$ and SnCl_3Rb_2 . An attempt to prep. a titanium iodide of Rb resulted in a residue consisting of a mixt. of RbI and $\text{Ti}(\text{OH})_3 \cdot 2\text{H}_2\text{O}$. $\text{ZrOI}_2 \cdot 8\text{H}_2\text{O}$, $\text{ThI}_3 \cdot x\text{H}_2\text{O}$, CeCl_3 and $\text{CeCl}_4[(\text{CH}_3)_4\text{As}]_2$ were prepd. The iodide of Ce does not exist. Alc. solns. of aniline-HCl and of CeCl_3 formed a ppt., but this could not be analyzed. There were prepd. complex salts of SnI_4 of the types $\text{Sn}(\text{Hal})_4\text{M} \cdot \text{H}_2\text{O}$ and $\text{Sn}(\text{Hal})_4\text{M}_2 \cdot 2\text{H}_2\text{O}$, in which Hal represents halogen and M represents K or NH_4 ; SnI_3Rb , SnI_3Rb_2 , SnI_3Cs , $\text{SnI}_3\text{N}[(\text{C}_6\text{H}_5)_4]$, $\text{SnI}_3\text{---NH}_2\text{C}_6\text{H}_5$, 2SnI_2 , CsI , and 2SnI_2 , RbI ; SnCl_2 , SnI_2 (by the direct action of I_2 on Sn in a sealed tube, the action of SnCl_2 on KI, from SnCl_2 and NaI in the presence of HCl, and the action of I_2 on Sn in the presence of HI), SnCl_4 , SnBrI , SnBr_2 and SnClBr . Points of fusion of various mixts. of SnI_2 and SnCl_2 , SnI_2 and SnBr_2 , and SnCl_2 and SnBr_2 are given. Double-decompn. reactions were found to take place between SnCl_4 and AsI_3 , BiI_3 , PI_3 and TiI_4 , SnI_4 and AsBr_3 , AsCl_3 , SbCl_3 , SbI_3 and PbCl_2 ; PI_3 and AsCl_3 , SbCl_3 , BiCl_3 , PbCl_2 , TiCl_4 and SbCl_3 , PCl_5 and TiI_4 , PCl_5 and SbI_3 . No reaction was observed between PCl_5 and AsI_3 , SbI_3 , BiI_3 , PbI_2 , SnI_4 or SiCl_4 ; PI_3 and ZrCl_4 or ThCl_4 ; SnI_4 and SiCl_4 , TiCl_4 , ZrCl_4 or ThCl_4 .

N. M. BOUDER

New series of complex compounds of tervalent iridium. V. V. I. BEDINSKII. *Ann. inst. platine* No. 4, 235-42 (1926). --L. prepares triethylenediamine iridiiodide, $[\text{Iren}_3]_3 + \text{H}_2\text{O}$, and picrate from 1 g. $\text{Na}_3[\text{IrCl}_6] + 12\text{H}_2\text{O}$ and 2 cc. ethylenediamine monohydrate in 10 cc. water by heating in a tube at 140° . This is pptd. with KI, giving yellow-rose tablets from water, mol. cond. 388.04 at 25° in 0.001 M soln. It also gives a cryst. ppt. with Na_2PtCl_6 , yellow plates, $(\text{NH}_4)_3\text{PtCl}_6$ flesh-colored, $\text{Na}_2\text{---Pt}(\text{CN})_4$ white, H_2PtBr_6 yellow prisms, Na chloroiodate greenish, Na chloroosmate yellow-green, K ferrocyanide yellow, K ferricyanide yellow-orange, NH_4CNO no ppt., K oxalate no ppt., $(\text{NH}_4)_2\text{SO}_4$ no ppt. With Na picrate there are formed canary-yellow plates, little sol. in water of $[\text{Iren}_3](\text{C}_6\text{H}_5(\text{NO}_2)_3\text{O})_3$. NaClO_4 forms no ppt.

WILLIAM M. MALISOFF

Germanium. XX. Preparation of fused germanium directly from germanium dioxide. KATHARINA M. TRESSLER AND L. M. DENNIS. *J. Phys. Chem.* 31, 1429-32 (1927). -- GeO_2 is reduced by C under a flux of NaCl. The yield of metal is about 90% and about 7% of the Ge charged is recoverable. The advantage of this method is that any amt. of the metal may be prepd. in the massive form in a short time.

RUBY K. WORNER

Chromium carbonyl. ANDRÉ JOB AND ANTOINE CASSAL. *Bull. soc. chim.* 41, 1041-6 (1927); cf. *C. A.* 20, 3404. --Chromium carbonyl has been prepared with a 22% yield by dropping a Grignard reagent in a suspension of CrCl_3 in a mixt. of ether and benzene, in a CO atm.; the optimum temp. is between 0 and 4° . $\text{Cr}(\text{CO})_6$ is purified by washing with benzene and repeated sublimations. The crystals are orthorhombic,

$d_{18} = 1.77$, insol. in C_6H_6 , Et_2O , alc., $AcOH$; little sol. in $CHCl_3$ or CCl_4 (less than 2% at room temp.). The solns. are destroyed by light. $Cr(CO)_6$ sublimes at room temp., explodes at 210° , freezes $149-50^\circ$ in a sealed tube, starts to decompose at 200° , burns with a luminous flame. When heated at 230° it yields CO and Cr; this Cr is completely passive, and only fuming HNO_3 attacks it readily. This procedure may be used for analytical purposes, but even after heating at 700° , CO is always deficient, whereas Cr is correct, providing the heating reaches 450° . The decompn. of $Cr(CO)_6$ is limited by pressure, but is not reversible on account of the passivity of the Cr liberated. The formula, the volatility and the stability of $Cr(CO)_6$ agree with the Sedgewick theory. Each of the 6 CO groups contributes 2 electrons to the outer shell of the metallic atom. Cr having already 6 outer electrons, an envelop is built which is analogous to the outer shell of Kr.

A. L. HENNE

The relationship between the complex constitution of chromium salts and their capacity of formation of metal organic derivatives. FR. HEIN, JOH. RESCHKE AND FR. PINTUS. *Ber.* 60B, 679-87 (1927).—The following general rule has been established: Only those complex derivs. of $CrCl_3$ and $CrBr_3$ (probably also CrI_3) permit the introduction of org. radicals in the place of the halogen atoms in which at least 3 halogen atoms are connected directly (*i. e.*, not ionizable) with the Cr and which do not contain any ions in the outer sphere. This corroborates the assumption that in $CrCl_3$ and $CrBr_3$ the halogen is bound directly to the Cr. Chromous salts like $CrCl_2$ or $Cr(OAc)_2$ are also capable of reacting with $PhMgBr$. This indicates their non-heteropolar nature. They are to be regarded as ψ -salts according to Hantzsch. The reactions between $PhMgBr$ and the following Cr compds. have been studied: trichloropyridine chromium, $[CrCl_3, pvr.]$, K chromic chloride, hexamine chromic chloride, $[Cr(NH_3)_6]Cl_3 + H_2O$, triethylenediamine chromic chloride, bromide and iodide, $[Cr(en)_3]Cl_3 + 3\frac{1}{2}H_2O$, hexaquo chromic chloride, $[Cr(OH)_6]Cl_3$, chloropentamine chromic chloride, $[CrCl(NH_3)_5]Cl$, *cis*-dichloro-dien chromic chloride $[CrCl_2(en)_2]Cl$, dichlorotetraquo chromic chloride hydrate, $(CrCl_2(OH_2)_4)Cl + 2H_2O$, dry $CrBr_3$ and CrF_3 , trifluorotripyridine chromium, $CrF_3, pyr.$, dry chromic sulfate, dry chromic thiocyanate, K chromithiocyanate, $K_3[Cr(SCN)_6]$, $CrCl_2$, chromous acetate.

EMIL KLARMANN

The phosgeno-aluminates of lithium, magnesium, potassium, and lead. MOLECULAR association in phosgene solutions. D. M. BIROSEL. *Proc. Iowa Acad. Sci.* 33, 174-5 (1926).—An abstract. The work of Germann and his students has definitely established that phosgene is a mother solvent for a system of acids, bases, and salts. The acids are capable of reacting with metals and bases of this system to form salts. By neutralizing phosgeno-aluminic acid with the anhyd. halides of Li, Mg, K and Pb, their respective salts are obtained. The K and Pb salts are difficult to work with because they form crusts at the end of the Faraday tubes. Li and Mg form $LiAlCl_4$ and $Mg_2Al_2Cl_6$, resp. By a study of the pressure-concn. curves, these salts have been shown to be associated. 14 mol. of the Na salt, 12 of Sr and about 70 of Ba are associated to give a single mol. That of Ba is of colloidal magnitude.

W. G. GAESSLER

Reactions of metals with dry salts at high temperatures. BERNWARD GARRE. *Metal u. Erz* 24, 230 2 (1927); cf. *C. A.* 21, 2414.—Heats of reaction and the temp. of starting the reaction are given for Mg and Al with the alkali carbonates, oxides of Fe, PbO, CuO, ZnO, CdO and FeS.

C. G. K.

The system iron chloride-water at high temperatures. ERNST STIRNEMANN. *Neues Jahrb. Mineral. Geol. Beil.-Bd.* 52A, 334-77 (1925).—The mol. wt. of the vapor at $250-300^\circ$ corresponds to the formula Fe_2Cl_6 . The sublimation and vapor pressure curves were detd. Between 270° and 410° $FeOCl$ results by the reaction of Fe_2Cl_6 with H_2O . The system $Fe_2Cl_6-FeOCl-Fe_2O_3$ was investigated.

J. F. SCHAIER

The ternary systems $KCl-LiCl-RbCl$ and $KCl-RbCl-CsCl$. HELLMUTH KEITEL. *Neues Jahrb. Mineral. Geol. Beil.-Bd.* 52A, 378-423 (1925).—The m. ps. $LiCl$ 607° , KCl 776° , $RbCl$ 722° , $CsCl$ 629° (transition temp. at 443°) were detd. The binary system $KCl-RbCl$ shows complete miscibility with a min. at 60 mol. % $RbCl$ and at a temp. of 715° . $RbCl$ and $LiCl$ form a double salt $LiCl \cdot RbCl$ (incongruent m. p.). The complete binary and ternary diagrams are given.

J. F. SCHAIER

Reduction of silver compounds in alkaline solution. WALTER FARMER AND J. B. FIRTH. *J. Chem. Soc.* 1927, 1772-80.—A soln. of 2 g. $AgNO_3$, 25 cc. H_2O , 25 cc. NH_3 (d. 0.880), and 25 cc. 3 N KOH deposited a black film on being heated to 100° and then exploded. When excess of NH_3 was avoided, the black ppt. was gradually reduced to Ag, with the evolution of an equiv. of N ; a fragment of Al, however, caused explosion. The black ppt. was found to be a mixt. of Ag_3N and Ag_2O . The original soln. did not explode when heated with Al filings, reduction occurring quantitatively in $1\frac{1}{2}$

hrs. In another case additional quantities of 2 g. of AgNO_3 in 25 cc. NH_3 and 25 cc. H_2O were added at 20-min. intervals to the original soln. undergoing reduction at 100° in the presence of Al until 8 g. of AgNO_3 had been added. Ag was pptd. to the extent of 66.94% when AgNO_3 was used as the Ag compd. and to the extent of 48.27% when AgCl was employed. Similar results were obtained when Ag activated at 900° was substituted for the Al.

DAVID DAVIDSON

Reactions of incandescent tungsten with nitrogen and with water vapor. C. J. SMITHells AND H. P. ROOKSBY. *J. Chem. Soc.* 1927, 1882-8.—The brown deposit formed on the bulbs of N-filled W lamps was shown to be WN_2 (see Langmuir, *C. A.* 7, 3717) by means of x-ray analysis as well as by the vol. of N liberated on burning in air. The analyses were carried on in specially designed app. The d of the nitride is 5 ± 0.5 g. per cc. The black deposit formed in W-filament bulbs contg. H_2O was shown by x-ray analysis to be W. Any oxide which might have been deposited (*C. A.* 15, 3424) is supposed to have been reduced by the atomic H which is formed by the contact of mol. H with incandescent W (Langmuir, *Gen. Elec. Rev.* 29, 153(1926)).

DAVID DAVIDSON

The constitution of boron compounds. Remarks on the contribution of M. Ulmann. ALFRED STOCK. *Ber.* 60B, 1039-40(1927).—Ulmann (*C. A.* 21, 3325) proposes the mol. scheme $(\text{B}^{+4}(\text{H}^{-1})_2)(\text{B}^{-3}(\text{H}^{+1})_4)$ for the simplest B hydride, B_2H_6 . Both parts of the formula are held together electrostatically, two of the H atoms being negative as in LiH . He constructs similar formulas for the remaining compds. Their chem. behavior contradicts his theory. B_2H_6 is easily hydrolyzed, while according to Ulmann the positive H atoms therein, should be more resistant to H_2O . From the theory the unstable dichloride, $(\text{BCl}_2)(\text{BH}_4)$, should be stable and NH_3 should add differently to B_2H_{10} . H_2 is not evolved by adding H_2O to $\text{B}_3\text{N}_3\text{H}_6$, whereas Ulmann expects the negative H atoms therein to be hydrolyzed with ease. He also misses peculiarities that must be exhibited in the infra red absorption spectrum of B_2H_6 , which has so decided a polar construction.

J. BALOZIAN

The formation of phosphorus sulfides from phosphine. LOUIS DELACHAUX. *Helv. Chim. Acta* 10, 195-7(1927).— PH_3 has been allowed to react with S for various lengths of time at different temps and pressures. The gas formed consists entirely of H_2S . The solid is a mixt. of the sulfides of P. The ratio p/T (p , pressure, T , temp.) is const. from 450° indicating that the reaction is finished at this temp. The reaction between H_2S and PH_3 was also investigated. The velocity of this reaction under 320° is practically nil. Above 320° the ratio p/T increases without, however, indicating the establishment of an equil. This reaction is considerably less rapid than the one between PH_3 and S. The resulting products are H and sulfides of P which could not be identified with any of the known, well-defined sulfides.

E. K.

Phosphate. V. Hydration of sodium metaphosphate in alkaline solution at 75° . S. J. KREIL AND H. P. COATS. *J. Am. Chem. Soc.* 49, 2180-3(1927); cf. *C. A.* 21, 1068.—The alk. hydration of metaphosphate was carried out in silver flasks, the pyrophosphate formed being detd. by the $\text{Zn}(\text{OAc})_2$ method, and the orthophosphate in the filtrate in the usual way. Pure metaphosphate was prepd. and hydrated to the di-hydrate. Solns contg. 0.1 mol. per l. NaPO_3 , and 0.5 mol. per l. NaOH ; 0.2 mol. per l. NaPO_3 and 0.5 mol. per l. NaOH ; 0.1 mol. per l. NaPO_3 and 2.0 mol. per l. NaOH ; 0.2 mol. per l. NaPO_3 and 2.0 mol. per l. NaOH , were studied. Both orthophosphate and pyrophosphate were formed in every case as end products and no equil. appeared to exist under the explt. conditions employed. Three mols. of NaPO_3 hydrated to one mol. of orthophosphate and one of pyrophosphate simultaneously. Increase in OH-ion concn. increases the rate of hydration.

J. W. SHIPLEY

Compounds of nitrosyl chloride with inorganic chlorides. HEINRICH RHEINHOLDT AND RICHARD WASSERFUHR. *Ber.* 60B, 732-7(1927).—The prepn. is carried out generally by addn. of a soln. of the metal chloride in CCl_4 to a soln. of NOCl in the same solvent, or by treating the dry metal chloride with liquid NOCl in a wide cylinder carrying a P_2O_5 tube. Further research is necessary to permit the selection of a structural formula for the individual compds. from the 2 possible ones (e. g., with Sn):

The prepn. of the following compds. is described: $\text{SbCl}_5 \cdot \text{NOCl}$; $\text{SnCl}_4 \cdot 2\text{NOCl}$; $\text{TiCl}_4 \cdot 2\text{NOCl}$; $\text{PbCl}_4 \cdot 2\text{NOCl}$; $\text{AlCl}_3 \cdot \text{NOCl}$; $\text{BiCl}_3 \cdot \text{NOCl}$ and $\text{FeCl}_3 \cdot \text{NOCl}$.

EMIL KLARMANN

The decomposition of nitrous acid in aqueous solution. T. W. J. TAYLOR, E. W. WIGNALL AND J. F. COWLEY. *J. Chem. Soc.* 1927, 1923-7.—Solns. of HNO_2 which were covered with a layer of "medicinal paraffin" were much more stable than similar

solns. under N or air. There was a crit. concn. dependent on the temp. and pressure above which the rate of decompn. was very rapid and below which it was much slower. The velocity of the slow reaction at 25° roughly agreed with the unimolecular law but the results were not significant because the rate depended on the initial concn. and the shape of the vessel. The decompn. was depressed by H_2SO_4 and Na_2SO_4 . The authors advance the view that the equilibria involved are: $2\text{HNO}_2 \rightleftharpoons \text{H}_2\text{O} + \text{N}_2\text{O}_3 \rightleftharpoons \text{NO} + \text{NO}_2$. Disturbance of the equilibria due to the insoly. of NO and the hydration of NO_2 results in the decompn. of the HNO_2 . DAVID DAVIDSON

The reaction between arsenite and permanganate in sulfuric acid solutions. TADEUSZ ORYNG. *Z. anorg. allgem. Chem.* **163**, 195-205(1927). In the absence of Na_2HPO_4 and MnSO_4 , the titration of As_2O_3 never requires more permanganate than the quantity corresponding to the passage of the Mn ion from septivalency to tervalency. The cloudiness due to the quadrivalent Mn appears only at the start of the titration; it fades immediately and never shows again. The required quantity of permanganate decreases when the acidity increases from 0.1 to 0.8 mols, but increases for higher acidities until it resumes its initial value for an acidity of 8.6 mols. In strongly acid solns. (2 mols. and more), KMnO_4 causes a red coloration which is to be attributed to the quadrivalent ion. The presence of MnSO_4 accelerates the transformation into green trivalent Mn, but requires an excess of KMnO_4 . Phosphoric acid has the same effect and besides, builds complex salts with the bivalent Mn. A. I. H.

The regeneration of molybdate residues. The specific gravity of aqueous-ammoniacal and aqueous solutions of "ordinary" ammonium molybdate. STANISLAW HOLYNSKI. *Mem. inst. natl. polonais économie rurale Pulawy* **6A**, 213-9(1925); *Chem. Zentr.* **1926**, I, 2898.—Detailed directions are given for the prepn. of $(\text{NH}_4)_2\text{MoO}_4$ from Mo residues after the detn. of H_2PO_4 . This is based on the pptn. of H_2MoO_4 by means of HNO_3 soln. in aq. NH_4OH and crystn. of $(\text{NH}_4)_2\text{MoO}_4$. Values of the d. of $(\text{NH}_4)_2\text{MoO}_4$ solns. in 0.51-6.35% NH_3 and in pure water are also given. An aq. 15% soln. has d_{18}^{19} 1.109, a 30% soln. d_{18}^{19} 1.205, and a 55% soln. d_{18}^{19} 1.375. C. C. DAVIS

The variability of valency (Ray) **2**. New process for the preparation of boron (ANDRIEUX) **4**.

7—ANALYTICAL CHEMISTRY

WILLIAM T. HALL

Review of analytical chemistry. I. Fluorescence and its applications. Ed. BAYLE, R. FABRE AND H. GEORGE. *Chimie et industrie* **17**, 179-200(1927).—A review dealing with the technic of the production of fluorescence, methods and app. used in the study of fluorescent substances, and the results obtained by the authors. **II. Method of analysis of colored gases based on the use of the photoelectric cell.** MARIE CLERGEOT. *Ibid.* 375-82.—A detailed description of the method of H. and A. Copaux (*C. A.* **20**, 1043) and its application to the detn. of dil. nitrous gases. **III. The polarizing microscope.** C. DIGAUD. *Ibid.* 554-60.—Description of the accessories required to make exams. under polarized light with ordinary types of microscopes (not mineralogical microscopes), with bibliography of 20 references. A. P.-C.

Spectrophotometry in the determination of p_H value. A. DEFORGE. *Halles aux Chais* **1927**, 229-35. H. B. MERRILL

The use of liquid amalgams in volumetric analysis. IX. Some new methods for the determination of vanadium and tungsten. KIN'ICHI SOMEYEA. *Z. anorg. allgem. Chem.* **163**, 206-13(1927).—I. *Iodometric detn. of V.*—By means of liquid Zn-Hg it is easy to reduce vanadic acid to the bivalent vanadous condition in the presence of dil. HCl or H_2SO_4 . Then, if an excess of 0.1 N I_2 soln. is added and the soln. is neutralized by adding NaHCO_3 , the V is oxidized back to the quinquevalent state in about 15 min. with frequent shaking in dispersed sunlight. The excess I_2 can be titrated with thiosulfate. **II. Titration of trivalent tungsten chloride with copper sulfate soln.**—In the presence of strong HCl , W can be reduced to the trivalent state by either Bi-Hg or Bi-Hg and the W can be oxidized back by means of 0.1 molar CuSO_4 . The end point is shown by the yellow color of the soln. exactly as in the titration of SnCl_2 with FeCl_3 . **III. Reduction of vanadic acid with Pb amalgam and subsequent titration with dichromate.**—In the presence of concd. HCl , Pb-Hg reduces vanadic acid completely to the bivalent vanadous state. Zn-Hg can also be used. Then,

on adding an excess of CuSO_4 soln. the V can be oxidized to the quadrivalent vanadyl state and the resulting cuprous chloride can be titrated with dichromate using diphenylamine as indicator. Good results are obtained if the amt. of Cu salt added, and the concn. of the HCl at each stage of the process, are properly regulated.

W. T. H.

Influence of hydrophilic colloids on the color change of indicators. A. GUTBIER AND H. BRINTZINGER. *Kolloid Z.* **41**, 16 (1927).—The effect of hydrophilic colloids on the end point, as shown by various indicators, was detd. by direct titration of 0.1 N HCl acid with 0.1 N NaOH and *vice versa*. In the cases where a difference was noticed, the deviation increased progressively with increasing amounts of colloid, and the result depended on whether the neutral point was approached from the acid or alk. side. The colloids studied were gelatin, gum arabic and dextrin, and the results obtained with the indicators were as follows: axolitmin and neutral-red underwent the color change at the normal value of p_H ; phenolphthalein and rosolic acid behaved normally in the titration of acid, but the end point was premature in the titration of alkali; alizarin behaved normally in the titration of acid, but the end point was delayed in the titration of alkali, Congo-red and methyl orange gave a premature end point in the titration of acid and a delayed end point in the titration of alkali. The use of indicators in such cases is thus very limited. Parallel expts., following the course of the titration electrometrically, showed that the presence of the colloid depresses the concn. of H ions in acid and of OH ions in alk. solns. The electrometric titration curve of HCl and NaOH in presence of 3% of gelatin or gum arabic resembles that of a weak acid and a weak base. In addition to the buffering effect of the colloid it is considered that the degree of dispersion of the indicator partly accounts for the effect. Excepting solns. of methyl orange and alk. solns. of phenolphthalein, rosolic acid, and Congo-red, the indicators were found to be colloiddally dispersed. B. C. A.

The use of cupferron in gravimetric analysis. A. PINKUS AND F. MARTIN. *Chimie et industrie Special No.*, 1827 (May, 1927).—Systematic investigation of the solubilities in H_2O , acids and bases of the ppts. of cupferron with the metals of the first 3 groups. The results are summarized in a table. The metals investigated can be divided into 5 groups: (I) practically complete pptn. even in presence of dil. strong acids, Hg^{++} , Cu, Bi, Sb⁺⁺⁺, Sn^{++} , Sn^{IV} , Fe^{++} , Fe^{+++} ; (II) practically complete pptn. in neutral soln., no pptn. in acid soln., Al; (III) partial pptn. in neutral or weakly AcOH soln., no pptn. in presence of a strong acid, Pb, Cd, Ni, Co (practically complete pptn. may be obtained, particularly with Pb or Cd, by working rapidly and with a considerable excess of reagent); (IV) partial pptn. in neutral soln., no pptn. in acid soln. (including AcOH) Ag, Hg^{++} , Cr (ppts. partially in very weakly acid solns.), Mn, Zn (with sufficient excess of cupferron it could perhaps be placed in group II); (V) no pptn., even in neutral and concd solns. As⁺⁺⁺, As^v, Sb^v. The possibilities of cupferron as a group-reagent are discussed. When using it, the following precautions should be observed: pptn. should be obtained with a sufficient excess of reagent, preferably at 0° and in concd soln., particularly with Sb, Sn, Fe and Al; when operating in presence of a strong mineral acid, use HCl or H_2SO_4 preferably to HNO_3 ; filter the ppts. rapidly, preferably with suction; for washing use cold H_2O contg. a little cupferron, acidulated (if necessary) with AcOH, HCl or H_2SO_4 , but avoid NH_4OH which frequently gives colloidal solns., particularly with Fe, Sn and Sb.

A. PAPINEAU-COUTURE

New volumetric analytical method: mercurimetry. AL. IONESCO-MATIU. *Chimie et industrie Special No.*, 1748 (May, 1927); cf. Votoček and Kašparek, C. A. 17, 1769.—I.-M. has applied V. and K's method to the detn. of Me_2CO and *alkaloids*. To det. Me_2CO : boil the Me_2CO soln. for 20 min. with 10 cc. of 50% H_2SO_4 , 10 cc. HgSO_4 (50 g. HgO dissolved in 200 g. concd H_2SO_4 and dild. to 1 l.) and 100 cc. H_2O in a 200-cc. Erlenmeyer flask provided with a reflux condenser, let cool somewhat, filter, wash repeatedly with 20 cc. H_2O , transfer the ppt. to an Erlenmeyer flask with a wash-bottle jet, add 25 cc. of 1:2 HNO_3 - H_2SO_4 mixt., warm gently to complete soln. of the ppt., destroy nitrous compds by addn. of 10% KMnO_4 to a permanent pink, transfer to a beaker contg. 100 cc. H_2O , add 12 drops of 10% Na nitroprusside and titrate with 0.1 N NaCl to disappearance of the turbidity. From the formula $\text{Hg}_2\text{SO}_4 \cdot 3\text{HgO} \cdot 4\text{Me}_2\text{CO}$, 1 cc. 0.1 N NaCl theoretically = 0.002348 g. Me_2CO ; but with the above technic 1 cc. = slightly less than 0.0028 g. probably on account of slight secondary reactions. To det. *alkaloids*: add 5 cc. of Mayer-Valzer reagent (10 g. KI and 15 g. HgI_2 per 100 cc.) to the alkaloid soln. (contg. 0.01–0.02 g. alkaloid), shake, let stand 5 min., filter, wash repeatedly with 20-cc. portions of 1% H_2SO_4 , transfer the ppt. to an Erlenmeyer flask with 10–20 cc. H_2O , add 25 cc. of 1:2 HNO_3 - H_2SO_4 mixt., warm

gently to complete soln., and proceed as for Me_2CO . By following this technic troublesome pptn. of HgI_2 is avoided. The Valzer-Mayer reagent is preferable to the ordinary Mayer, as the excess KI in the latter is liable to dissolve part of the alkaloidal ppt. The method has been applied to the detn. of quinine, morphine, strychnine, codeine and cocaine. The theoretical (assuming the ppt. to be of the type $(\text{HgI}_2)_3 \cdot \text{alk.HI}$) and practical (found by analysis of 1% solns. of pure alkaloids) equivs. of 1 cc. 0.1 N NaCl are: quinine 0.0127, 0.0066; strychnine 0.011, 0.014; morphine 0.0102, 0.0083; codeine 0.0107, 0.010; cocaine 0.0102, 0.009 g., resp. In attempting to apply the method to the detn. of albumins, complete pptn. by Tanret's, Millon's or other reagents was obtained, but it has not yet been found possible to det. the albumin equiv. of the standard NaCl, presumably on account of adsorption of Hg by the complex albumin molecules.

A. PAPINEAU COUTURE

Microchemistry and industrial analysis. R. GOUBAU. *Chimie et industrie Special No.*, 170-3 (May, 1927); cf. *C. A.* 21, 1603.—Discussion of the advantages and disadvantages of micro analysis in ordinary commercial and industrial work, with a description of the technic of the micro-detn. of Na via Blanchetière (*C. A.* 17, 3006) and of H_2O .

A. PAPINEAU COUTURE

Method of analysis for graphite packing. ALFRED E. LEEVEY. *Chemist-Analyst No.* 47, 15 (1926); *Chem. Zentr.* 1926, II, 1806.—The detns. suggested are: acetone-sol. graphite, ash and cotton. First, ext 5 g. with acetone in a Soxhlet app and weigh the residue in the thimble after drying. To det. graphite, treat the residue from the acetone extn. with ether and pour the washings into a weighed alundum crucible. Turn out the packing onto a sieve and wash with ether until all the graphite is carried away. Filter the ether through the crucible, dry and weigh. To det. cotton, either ignite the graphite-free strands and weigh or digest with concd. H_2SO_4 , pour into water, filter, wash with alc., dry and weigh.

W. T. H.

Filtration of stannic oxide. G. W. BURKE. *Chemist-Analyst No.* 47, 12-3 (1926); *Chem. Zentr.* 1926 II, 1671 2.—In the analysis of an alloy, treat 1 g. of filings with 7.5 N HNO_3 , eventually evap. to dryness. To the residue add 50 cc. of hot water and 5 cc. of concd. HNO_3 . Filter and wash.

W. T. H.

"Oxidation quotients." HELMUT MÜLLER. *Biochem. Z.* 186, 451-60 (1927).—By "oxidation quotient" is meant the ratio between N and the quantity of O_2 required for complete oxidation of the substance. To det. this the substance is digested with H_2SO_4 in the presence of KIO_3 . The O_2 used up in the reaction is measured by detg. the residual KIO_3 . The detn. is made as follows: a definite quantity of KIO_3 (200-400 mg.) is placed in a 300-500-cc. Erlenmeyer flask together with 20-30 cc. H_2SO_4 and left for 15 min. The substance or soln. to be analyzed is now added and the mixt. heated gradually to 200° on the sand bath. When no more I_2 fumes are given off the reaction is completed. The traces of dissolved I_2 are driven off by boiling. The mixt. is now transferred quant. to a 500 vol flask and dild. to vol. In 100 cc. portions the N is detd. by the Kjeldahl method of distn., while in a similar sample the KIO_3 is detd. by titration with thiosulfate, after a preliminary addn. of KI, a cc. 0.1 N $\text{Na}_2\text{S}_2\text{O}_3 = 3.567$ mg. KIO_3 .

S. MORGULIS

Sodium peroxide fusions in nickel crucibles. L. E. PITZER. *Chemist-Analyst No.* 47, 13; *Chem. Zentr.* 1926, II, 1775.—To prevent the attack of the crucible, place 20 g. of soda in the bottom and melt it over a Meker burner. Remove the crucible from the flame and give it a swirling motion so that a crust is obtained all over the sides. Then add the substance and Na_2O_2 . If during the ensuing fusion, the temp. is not raised enough to melt the Na_2CO_3 , there will not be any appreciable attack of the crucible.

W. T. H.

The accuracy of quantitative determinations of basic ions. MARY WHELAN. *Am. J. Physiol.* 76, 233 (1926).—The common methods for the detn. of the inorg. basic ions were tested in order to test the accuracy of Fiske's method for total fixed base. A plus error of 3-5% was obtained for Kramer and Tisdal's methods for Na, K and Ca, while their Mg method gave an error of plus 15%.

J. B. BROWN

The analysis of ammonium sulfite. STANLEY KETTLE. *Chemist-Analyst No.* 47, 6; *Chem. Zentr.* 1926, II, 1669.—Dissolve 5 g. of the sample in water, filter and make up to 250 cc. Titrate 20 cc. of 0.1 N I_2 solu. with the sulfite soln. to get the sulfite and thiosulfate contents. If bisulfite is present, det. in the usual way. Det. the sulfate in another portion by pptn. with BaCl_2 . In a third portion det. sulfate and sulfite by pptn. with $\text{Sr}(\text{NO}_3)_2$.

W. T. H.

Rapid method for approximate determination of sodium hydroxide in used sodium plumbate solution. H. E. KUEHN. *Chemist-Analyst No.* 47, 16; *Chem. Zentr.* 1926, II, 1670.—When Na_2PbO_2 soln. is used in the treatment of petroleum distillates, it

is often desirable to det. the NaOH of the "spent doctor." Treat a measured vol. with PbCl_2 soln., filter off the PbS and titrate the filtrate with $0.1\text{ }N\text{ H}_2\text{SO}_4$. Titrate another portion without treatment with Pb soln. In the first case the NaOH content and in the second titration the NaOH and Na_2S are obtained. W. T. H.

The determination of iodates in the presence of iodides, nitrates, nitrites and chlorides. G. LEIMBACH. *Caliche* 8, 409-11(1926).—Basing an analysis on the slow addition of neutral AgNO_3 to ppt. successively iodide, chloride, iodate and nitrite, L. added sufficient AgNO_3 to ppt. all the iodide and part of the chloride, filtered, and endeavored to remove the nitrite by acidification and boiling the filtrate, by treating with urea, by oxidizing and boiling with Cl water, or by NaOH followed by addition of iodide and titration with $\text{Na}_2\text{S}_2\text{O}_3$. The results tended to be low, as a result of decompn. of iodate in acid soln. with loss of I on boiling. Useful results are obtained by adding only a slight excess of Cl_2 or NaClO and phenol to the acid soln. The expts. were conducted in solns. contg. NaNO_3 . J. HOWARD FLINT

Determination of halogens by Volhard's method in the Chilean nitrate industry. G. LEIMBACH. *Caliche* 8, 428-30(1927).—Before back titrating the excess of AgNO_3 , L. filters off the Ag ppt. and titrates an aliquot part of the filtrate. The presence of considerable nitrate causes only slightly high results. Iodates do not interfere. J. HOWARD FLINT

Determination of sulfur in compounds containing a large amount of free sulfur. W. W. YATES. *Chemist-Analyst*. No. 47, 14. *Chem. Zentr.* 1926, II, 1669.—Treat 0.5 g. of sample together with 1 g. of quartz sand and 1 g. of pure CaCO_3 with a little water and 30-40 cc. of fuming HNO_3 . After 2 hrs. add 3 g. of KClO_3 and evap. to dryness. Bake for 30 min., take up with dil. HCl , filter if necessary and ppt. BaSO_4 in an aliquot part of the filtrate. W. T. H.

An arrangement for combustion by means of the copper oxide spiral. S. Tschirmanoff. *Z. anorg. allgem. Chem.* 162, 31(1927).—To det. CO in air it is often customary to oxidize it with yellow HgO but the same effect can be accomplished by means of a CuO spiral heated electrically. Take a 30 cm. long glass tube and cover it with a spiral of nickel wire of 0.3 mm. diam. and 5 mm. long. Solder the ends of the wire to heavier Cu wires leading to the ends of a larger combustion tube in which the smaller tube is eventually placed. Electroplate a thin coating of Cu on the nickel spiral. Then, on heating in a current of air by means of 2 amps. of current at 110 v., the superficial layer of Cu is converted into CuO which will serve for the oxidation of CO when a gas mixt. is passed through a tube contg. the red hot spiral. W. T. H.

Note on the electrolytic determination of alkali. P. DROSSBACH. *Z. anorg. allgem. Chem.* 165, 149-56(1927).—Hildebrandt's method was tested and found satisfactory but an improvement in the app. is suggested. An attempt is made to explain the reactions that take place at the cathode. W. T. H.

The potentiometric titration of molybdenum. H. BRINTZINGER AND F. OSCHATZ. *Z. anorg. allgem. Chem.* 165, 221-4(1927).—The results of much experimentation show that Mo can be reduced quantitatively from the sexivalent to tervalent state by means of CrCl_2 . The electrometric titration shows a noticeable drop in e. m. f. when the reduction to the quinquevalent state is finished and a more distinct drop when the reduction to tervalent Mo is completed but there is no noticeable change in the e. m. f. curve at the point where the reduction to quadrivalent Mo is complete. To carry out the titration it is recommended to prepare $0.1\text{ }N\text{ CrCl}_2$ by the method of Zintl and Rienäcker (*C. A.* 21, 3173), standardizing against CuSO_4 . To 20 cc. of neutral molybdate soln. add 50 cc. of concd. HCl and 50 cc. of water. Sat. the hot soln. with KCl and remove all dissolved O_2 by boiling 30 min. while passing CO_2 into CrCl_2 soln. and thence into the Mo soln. Titrate at $80\text{--}100^\circ$ with the standardized CrCl_2 soln., using as indicator electrode a Pt wire, connected with a satd. calomel cell. W. T. H.

The volumetric determination of arsenic trioxide by permanganate. OTTO PROČKE AND JOSEF ŠVĚDA. *Časopis Československého Lékařnictva* 5, 68-73(1925); *Chem. Zentr.* 1926, I, 1859.—The detn. of As_2O_3 with KMnO_4 in acid medium can be carried out very rapidly, even at room temp., if a suitable catalyzer (I^+) is used. The end point is sharp, and this method is comparable with the iodometric method. C. C. D.

The ceruleomolybdate estimation of phosphate-phosphorus. B. E. GILBERT AND J. B. SMITH. *J. Biol. Chem.* 74, 223-9(1927).—The color formation in the ceruleomolybdate estn. of PO_4^{---} (cf. Denigés, *C. A.* 17, 1974) is inhibited by acids, intensified by bases and affected by the presence of certain salts. For accurate results it is, therefore, necessary to have the same conditions of acidity and salt concn. in the com-

parison standard as in the original soln. The colored complex is destroyed by reducing agents. It is not dialyzable through collodion. A. G.

Determination of phosphoric acid. P. BOISCHOT. *Ann. sci. agron.* 1925, 199-202; *Intern. Rev. Sci. Practice Agr.* 3, 1057.—Free H_3PO_4 can be detd. in solns. contg. strong mineral acids and Ca salts by titration with alkali, methyl orange and phenolphthalein being used as indicators. Titration with methyl orange gives the quantity of alkali required to neutralize the mineral acid plus the amt. required to neutralize the first H-ion of H_3PO_4 . Titration with phenolphthalein gives the quantity of alkali required to neutralize the mineral acid plus the quantity required completely to neutralize the H_3PO_4 . K. D. JACOB

The volumetric determination of hydrazoic acid with ceric sulfate in acid solution. JEROME MARTIN. *J. Am. Chem. Soc.* 49, 2133-6(1927).—When an acid soln. of a ceric salt is added to a soln. contg. hydrazoic acid or its alk. salt, the following reaction takes place: $2\text{Ce}^{++++} + 2\text{HN}_3 = 3\text{N}_2 + 2\text{Ce}^{+++} + 2\text{H}^+$. If the reaction takes place out of contact with the air, to avoid the O_2 error, accurate results can be obtained by detg. the excess Ce iodometrically. W. T. H.

The determination of the nitric nitrogen by means of the Davis-Lunge process. A. PINKUS AND J. JACOBI. *Bull. soc. chim. Belg.* 36, 448-68(1927).—The Lunge-Davis' nitrometer method is generally used for the N detn. in nitro or nitroso compds. although it is subject to many causes of error. Among the more important ones are the formation of side products and the partial fixation of NO by Hg_2SO_4 . To show the extent of these errors, numerous nitrometric titrations were made, with pure and dry KNO_3 as a standard. The H_2SO_4 concn., the amt. of acid and the amt. of KNO_3 were varied. The NO vol. is always too small; the discrepancy increases with the quantity of KNO_3 used and with the acid concn. The results obtained with an acid concn. higher than 90% are fallacious, because NO is absorbed by stirring, and the gaseous phase sometimes disappears completely. The discrepancy per cc. of acid increases when the amt. of liquid decreases. It is always larger than the soly. of NO in the acids used. The conclusion is that the Davis-Lunge method is unfit for exact analyses. A. L. HENNE

Determination of sulfur trioxide in the presence of sulfur dioxide, together with some analyses of commercial liquid sulfur dioxide. J. R. ECKMAN. *Bur. of Standards, Ser. Papers* 22, No. 554, 277-85(1927).—A nearly satd. soln. of BaSO_3 is prepd. by leading SO_2 into BaCl_2 soln. in 0.02 N HCl. This reacts with SO_3 to form insol BaSO_4 which is filtered off and washed with O_2 -free water in an atm. of N_2 . The app. involved is somewhat complicated so that interested chemists should send 5 cents to the Supt. of Documents at Washington, D. C., for a copy of the paper. W. T. H.

Determination of carbon disulfide in emulsions. H. J. FISHER. *Ind. Eng. Chem.* 19, 1201-2(1927).—An attempt to adapt the methods of Doran and of Weiss to the analysis of CS_2 emulsions that are sold for treatment of lawns infested with the Japanese beetle showed that a modification of the Weiss method will give good results. The CS_2 is oxidized in alk. peroxide soln. and the resulting sulfate detd. as BaSO_4 . W. T. H.

Sensitive test for carbon disulfide. P. SACCARDI. *Giorn. chim. ind. applicata* 8, 315-6(1926); *Analyst* 51, 636.—When boiled with a liquid contg. as little as 1 part of CS_2 in 1,160,000, a reagent composed of a benzene soln. of lead plaster mixed with alc. KOH soln. gives a black coloration. This reaction serves for the detection in olive oil of oil which has been extd. by means of CS_2 . H. G.

The combustion of carbon monoxide and methane by cuprous oxide (Jaeger's method of analysis). EMERICH BRODY AND THEODOR MILLNER. *Z. anorg. allgem. Chem.* 164, 96-100(1927).—The irregularities observed by Terres and Mauguin (*C.* 9, 1239) in the preferential combustion of H_2 , CO and CH_4 by CuO (Jaeger, *Gasbeleucht.* 41, 764(1898)) cannot be accounted for thermodynamically and are therefore due to kinetic relationships. DAVID DAVIDSON

Influence of insoluble matter on the Marsh test. L. BARTHE AND R. MASSY. *Bull. soc. pharm. Bordeaux* 64, 66(1926); *J. pharm. chim.* 119, 30-1(1927); *Analyst* 52, 168.—Low results were obtained by the Marsh test method of detg. As when CaSO_4 was present. Probably any other insol. solid would have the same effect of preventing the complete liberation of AsH_3 . H. G.

Determination of hydrogen in mine damp. HEYER. *Kali* 21, 147-8(1927).—A review. D. THUSEN

A method for proteins. R. M. CHAPMAN. *Oil & Fat Ind.* 4, 172-4(1927).—Weigh out 2.5 g. of sample into a 500-cc. Kjeldahl flask, add 0.7 g. of HgO , a small

piece of paraffin, not over 7 g. of Na_2SO_4 , and 25 cc. of concd. H_2SO_4 . Start the digestion at a low heat, increase the temperature slowly and continue until the soln. is colorless, which should not take over 45 min. After cooling, add H_2O until the flask is $1/2$ full, then a few pieces of mossy Zn and 15 cc. of Na_2S soln. After thoroughly mixing allow 50 cc. of NaOH to run down the side of the flask, distil the NH_3 into 50 cc. of standard acid and titrate the excess acid with cochineal or methyl red as indicator.

E. SCHERUBEL

Application of spectroscopic analysis to the estimation of metallic impurities. EDMOND BAYLE AND LUCIAN AMY. *Compt. rend.* **185**, 268-70 (1927); cf. *C. A.* **20**, 1640.—The method, consisting essentially in photographing the ultra-violet spectrum of a highly condensed spark passing between 2 C electrodes, is applied to detection of traces of metals. The limit of sensitiveness by observation of de Grammont's ultimate rays (*C. A.* **1**, 2762) was found to be as follows, when using B. and A.'s technic: Au 10^{-6} , Ag 10^{-6} , Pb 10^{-10} , Cu 10^{-7} , Co 10^{-7} , Ni 5×10^{-7} , Fe 10^{-7} , Cr 10^{-8} , Mn 10^{-10} , Zn 10^{-8} g. The technic is an adaptation of Jolibois and Bonnet's method (*C. A.* **20**, 723-4), the soln. being electrolyzed at boiling temp. to deposit the impurity looked for at the end of the electrode to be used in the arc. The sensitiveness is of the same order as that of the method of Hartley and Moss (*C. A.* **7**, 303).

A. P.-C.

Analysis of lead base bearing metal. BURTON PAXTON. *Chemist-Analyst* No. **47**, 3 (1926); *Chem. Zentr.* **1926**, II, 1672-3.—Treat 1 g. of the sample with 2 g. K_2SO_4 and 15 cc. concd. H_2SO_4 . After the decompn. is complete, cool, dil. with 100 cc. of water and add 10 cc. of concd. HCl . Boil 12 mins., cool rapidly, add 200 cc. of water and titrate the Sb with 0.1 N KMnO_4 . Cool the titrated soln. and filter off the PbSO_4 . Wash with cold water, dissolve in hot NH_4OAc and titrate the Pb with molybdate. To the filtrate from the PbSO_4 ppt., add 25 cc. of concd. HCl , 4 Fe nails and enough of Sb soln. (obtained by dissolving 1 g. Sb in 20 cc. of concd. H_2SO_4 , diluting to 100 cc. with dil. HCl and adding sufficient HCl to dissolve any SbOCl that may ppt.) to dissolve all Sb (up to 0.15 g.) that may have been pptd. by the Fe. Boil 25 min., cool in CO_2 , filter and titrate the Sn with 0.1 N I_2 soln.

W. T. H.

Thermal methods for assaying gold and platinum. J. A. PINTO. *Rev. facultad cienc. quim.* **4**, 95-140 (1926).—A critical review of methods for assaying Au and Pt. A detailed account is given of the methods used by P., for which the original paper should be consulted.

B. C. A.

Determination of the purity of metallic boron. J. W. ANDREWS. *Chemist-Analyst* No. **47**, 16 (1926); *Chem. Zentr.* **1926**, II, 1669-70.—Fuse with NaOH-KNO_3 mixt. in a covered Ag crucible. Make slightly acid with HCl and boil off CO_2 under reduced pressure. Neutralize with *p*-nitrophenol as indicator, add mannitol and titrate the H_3BO_3 with phenolphthalein as indicator in the usual way.

W. T. H.

Confirmatory test for aluminum. J. W. ALLARDYCE. *J. Am. Chem. Soc.* **49**, 1991 (1927).—A modification of the test proposed by Attack, which depends on the adsorption color with alizarin, is given. After washing the original ppt. of $\text{Al}(\text{OH})_3$, it is dissolved in dil. HCl and repptd. with a slight excess of NH_4OH . Then, without filtering, 1 drop of satd. alizarin soln. in concd. AcOH is added. A pink coloration is obtained which soon settles out.

W. T. H.

Spectrographic detection and determination of impurities in aluminum and its alloys. R. ADAN. *Chimie et industrie Special No.*, 193-6 (May, 1927); cf. *C. A.* **21**, 1439.—Traces of impurities can be detected and estd. quant. by comparing spectrographs obtained by means of a quartz-prism spectroscope with spectrographs of 99.99% Al to which has been added known amts. of impurities. De Grammont's method and comparison of the ultimate spectral rays (*C. A.* **1**, 2762; **3**, 2900) are particularly useful for the purpose.

A. PAPINEAU-COUTURE

Rapid method for determining copper in copper concentrates. S. V. CROMPTON. *Chemist-Analyst* No. **47**, 4 (1926); *Chem. Zentr.* **1926**, II, 1671.—Treat 0.25 g. of ore with as little aqua regia as will decomp. it sufficiently. Dil. with 25 cc. of water and add enough NH_4OH to cause partial pptn. of the Fe. Add 3 cc. of AcOH and 2 g. of NaF . Shake until all $\text{Fe}(\text{OH})_3$ is dissolved. Continue as in the usual iodometric method.

W. T. H.

Determination of nickel by precipitation as hydrated oxide. B. SETLIK. *Chimie et industrie Special No.*, 188 (May, 1927); cf. *C. A.* **20**, 349.—Sufficiently accurate results for industrial purposes and works' control are obtained by adding excess NH_4OH , filtering, boiling till pptn. of $\text{Ni}(\text{OH})_2$ is complete, filtering, igniting and weighing as NiO . Analysis of pure $\text{NiSO}_4 \cdot 7\text{H}_2\text{O}$ gave 19.77% Ni (theoretical 20.10%); of $\text{NiSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$, 14.35% (theoretical 14.89%); of Ni-plating salts contg. NiSO_4 , MgSO_4 , Na_2SO_4 , NH_4Cl and boric acid, 15.62% (15.72% by electrolysis).

A. P.-C.

Phosphorus and silicon in ferro-phosphors. L. E. PRITZER. *Chemist-Analyst* No. 47, 8(1926); *Chem. Zentr.* 1926, II, 1670-1.—Treat 0.25 g. of sample with 35 cc. of 60% HClO_4 , heating until the sample is all decompd. Cool, make slightly ammoniacal and add a slight excess of concd. HNO_3 . Dil. to 75 cc. and ppt. with molybdate in the usual manner. For the Si detn., treatment with HClO_4 instead of HNO_3 and H_2SO_4 is also advantageous. W. T. H.

Determination of small amounts of magnesium in the presence of excess ammonium salts, with special reference to the determination of magnesium in portland cements. O. KALLAUNER, J. SIMANE AND B. IIELAN. *Trans. Ceram. Soc. (Eng.)* 26, 86-8(1927).—The removal of NH_4 salts or addn. of a known amt. of Mg is recommended when considerable NH_4 salt is present. H. F. K.

A new specific color reaction of magnesium and a simple colorimetric method for the determination of traces of this element. I. M. KOLTHOFF. *Biochem. Z.* 185, 344 8(1927).—See C. A. 21, 2632. S. MORGULIS

Determination of lead in manganese bronze. F. B. DIANA. *Chemist-Analyst* No. 47, 6-7(1927); *Chem. Zentr.* 1926, II, 1672.—To avoid the pptn. of SnO_2 when Pb is to be detd. electrolytically as PbO_2 in HNO_3 soln., treat the alloy with 3 cc. of satd. $\text{Fe}(\text{NO}_3)_3$ soln. and then with 25 cc. of HNO_3 . Boil off the excess acid, dil. to about 150 cc. and electrolyze. W. T. H.

New researches on selenium. PIETRO FALCIOLA. *Ann. chim. applicata* 17, 357-8(1927).—None of the known reducing agents for Se compds. is satisfactory in the presence of HCl and many ions. Thiocarbamide, however, is an excellent reagent, and almost instantly liberates Se as a red powder from HCl solns., even when only traces are present. The test may well be made by moistening with the soln. filter paper impregnated with thiocarbamide, whereby an orange-red deposit appears. There are very few substances which inhibit the test, but Cu in large quantities forms an insol. compd. with thiocarbamide, and the NO_3 anion must be removed by extn. with benzene, AcOEt , Et_2O , etc. Solns. of free H_2SeO_3 deposit Se only partially when H^+ ions are deficient, and if the reaction mixt. is allowed to stand, filtered and a little NH_4OH added, the soln. acquires a lilac or violet fluorescent turbidity, from which Se is ultimately deposited. Colloidal Se is probably formed. If an ammoniacal soln. contg. a Se compd. is acidified with AcOH and dild., the deposit is first yellow, but changes to orange-red. This renders the thiocarbamide test uncertain in alk. solns. To sep. Se from Te, the soln. is dild., acidified with HCl, thiocarbamide is added until all Se is pptd. and the soln. becomes yellow, the latter is immediately filtered and the Se washed with EtOH , dried and weighed. This method is as accurate as the SO_2 method. C. C. DAVIS

A reaction of tellurium. PIETRO FALCIOLA. *Ann. chim. applicata* 17, 359 60 (1927); cf. preceding abstr.—Unlike Se, Te is not liberated from soln. by thiocarbamide, and this applies to dil., concd., acid and neutral solns. When the soln. is concd., a yellow cryst. compd. is pptd. which is insol. in ordinary org. solvents, except EtOH . The reaction is very sensitive and the soln. turns yellow with 1 part of Te per 500,000 of soln. This test may also be made on filter paper (cf. preceding abstr.), though Bi and Sb give somewhat similar colors. The yellow compd. contains Te, Cl, C, N and S, and m. 165° (turning brown). It hydrolyzes when washed with water, becoming green, but it is stable after washing with $\text{EtOH-Et}_2\text{O}$ mixt. Its compn. was not detd. If the yellow reaction mixt. is shaken with Et_2O and K xanthate, the Et_2O layer acquires a mahogany-red color with subsequent sepn. of a blackish ppt., the aq. soln. becoming colorless. Se gives no coloration. If Mo is present, it may color the Et_2O layer and mask the color of the Te, but the addn. of NH_3 decolorizes this and gives a blackish turbidity or ppt. with Te. By repeated extn. with Et_2O contg. K xanthate, it is possible to effect a quant. sepn. of Te from soln. Evapn. of the Et_2O leaves a lustrous ruby-red cryst. hygroscopic substance, with disagreeable odor, and which decomp. when warmed. Its compn. was not detd. C. C. DAVIS

Electrolytic determination of zinc from solutions which are acid with sulfuric acid R. BELASIO AND E. MELLANA. *Ann. chim. applicata* 17, 336-46(1927).—The method is the first one by which a quant. deposition of Zn can be obtained from solns. contg. mineral acids. The Zn is deposited as a compact, cryst., adherent grayish white mass with no evidence of sponginess and contg. no Pb. Systematic expts. led to the choice of the following most favorable conditions. Chlorides and nitrates should not be present. Add excess NaOH or NH_4OH to the soln. (which may contain up to 1 g. of Zn in the form of ZnSO_4), make acid (to Me orange) with $N \text{ H}_2\text{SO}_4$, dil. to 250-300 cc. and electrolyze at room temp., using a Winkler coppered cathode or better, a Winkler brass amalgam cathode, and a cylindrical Pt gauze anode covered with

PbO₂. With a c. d. of 0.1–0.2 amp. and rotating the anode slowly, 10 or more g. of PbO₂ can be deposited in compact, adherent form on the Pt from a satd. Pb(NO₃)₂ soln. Begin the electrolysis of the Zn soln. with 0.4–0.5 amps. and after 3–4 hrs. increase to 0.7 amps. When 1 cc. of electrolyte gives no turbidity with 1 drop of aq. K₄Fe(CN)₆ after 10–15 min., the deposition of Zn is complete (5–6 hrs.). Replace, without interrupting the current, the electrolyte with water, and after 5–10 min. remove the cathode, wash it with water, EtOH and Et₂O, dry at 70–80°, cool and weigh. The method is applicable to brass, crude Zn, Zn ores, etc., after other metals have been removed and the Zn has been converted into ZnSO₄ soln. C. C. DAVIS

Diphenylamine as a qualitative reagent for zinc. W. H. CONE AND L. C. CADY. *J. Am. Chem. Soc.* **49**, 2214–5(1927); cf. *C. A.* **21**, 872.—In the analysis of the Fe and Al group in qual. analysis, a soln. is obtained contg. possibly Zn and Cr. Test one part of this soln. for Zn by making acid with AcOH and adding 5 drops of a 1% soln. of diphenylamine dissolved in glacial AcOH and 5 cc. of 0.5% K₄Fe(CN)₆ soln. The immediate appearance of a dark brown, green or purplish black turbidity indicates the presence of Zn. The amt. of Zn present can be estd. by the depth of color. W. T. H.

Method for determining chromium in pig iron. H. J. MILLER. *Chemist-Analyst* No. **47**, 4(1926); *Chem. Zentr.* **1926**, 11, 1671.—Directions are given for carrying out the NaBiO₃ method. The sample is dissolved in dil. HNO₃, the insol. residue fused with soda and niter, and the Mn is pptd. as MnO₂ when the Cr is oxidized to CrO₄ by bismuthate. W. T. H.

Thioglycolic acid as a color test for iron. EDWARD LYONS. *J. Am. Chem. Soc.* **49**, 1916–20(1927).—It has been known for a long time that a characteristic coloration is produced by the action of thioglycolic acid upon an Fe salt in neutral or slightly alk. soln., but the color has generally been attributed to the formation of ferric thioglycolate. It now appears that the red coloration is really due to the formation of the corresponding ferrous salt. The test, however, is independent of the original state of oxidation of the Fe because the reagent itself accomplishes reduction. To carry out the test treat 5 cc. of the neutral or slightly alk. soln. with 1 drop of thioglycolic acid and 5 cc. of concd. NH₄OH. If Fe is present in the ferric state a transient blue coloration is produced which soon changes to an intense red. W. T. H.

The precipitation of calcium oxalate in the presence of large amounts of ammonium salts. JOSEPH GROSS. *Chemist-Analyst* No. **47**, 8(1926); *Chem. Zentr.* **1926**, 11, 1670.—It is recommended to place the reagent in a beaker together with a little of the soln. to be analyzed. After a cryst. ppt. has formed, the rest of the soln. is added and the mixt. is heated 2 hrs. W. T. H.

Salts of cadmium- or bismuth-hydrohalogen acids with organic bases and their analytical use. RICHARD BERG AND OTTO WURM. *Ber.* **60B**, 1664–71(1927).—To det. Cd, when present alone, mix the neutral Cd soln. with 50 cc. of 2 N H₂SO₄ and 50 cc. of 10% Na tartrate soln. Add a slight excess of 2.5% naphthoquinoline in 0.5 N H₂SO₄ and a little H₂SO₄, making the total vol. about 150 cc. Add a slight excess of 0.2 N KI and after 15–20 min. filter off the ppt. of (C₁₀H₇N)₂.H₂(CdI₄). Wash the partially dried ppt. with a dil. soln. of naphthoquinoline, H₂SO₄ and KI. Heat the ppt. with 20 cc. of 2 N NaOH to decompose it, make slightly acid and titrate the Cd by the cyanide method. To sep. Cd and Zn, ppt. the Cd as above and titrate the Zn with ferrocyanide in the filtrate. The presence of the tartrate and iodide prevents the pptn. of Sn or Sb with Cd. To det. Bi, treat the soln. contg. H₂SO₄ or HNO₃ with an excess of 5% o-hydroxyquinoline soln. in 0.2 N H₂SO₄ and 0.1 N KI. Filter promptly and wash the ppt. with a soln. contg. 50 cc. of 2 N H₂SO₄, 25 cc. of 0.1 N KI, 18 g. of o-hydroxyquinoline and a few crystals of hydrazine sulfate in each l. After washing dry the ppt., dissolve it in HCl and titrate with KIO₃. The sepn. of Bi from Cu by this procedure requires the presence of pyridine and the sepn. of Bi from Sb or Sn requires considerable tartaric acid. A. L. HENNE

The determination of benzoic acid. O. NOETZEL. *Z. Untersuch. Lebensm.* **53**, 383–7(1927).—Detailed directions are given for the detn. of benzoic acid in ground meat, fat, wine, etc. WILLIAM J. HUSA

The analytical determination of higher alcohols, especially of hydrogenated phenols in mixtures of organic solvents, especially hydrogenated naphthalenes. II. Determination of methylhexalin in tetralin. K. LINDNER AND J. ZICKERMANN. *Chem. Umschau Fette, Oel, Wachse Harze* **34**, 199–205(1927).—Oxidation and acetylation fail to separate sharply hydrophenols from mixts., because technical methylhexalin is a mixt. of 3 isomeric hydrocresols and contains ketones and acid condensation products as impurities. L. and Z. worked out a method for detg. methylhexalin based on its (slight) soly. in H₂O, tetralin being insol. The mean soly. in 300 g. H₂O is 4.163 g.

out of 15 g. tech. methylhexalin; tech. tetralin has a very slight soly. and must first be steam-distd. to make it entirely insol. Detns. of the soly. in water of methylhexalin-tetralin mixts. ranging from 0.5 to 100% methylhexalin led on plotting to Freundlich's adsorption equation $Y^n = K \cdot x$, in which Y = methylhexalin dissolved in H_2O on the basis of the methylhexalin-tetralin mixt., x = total % methylhexalin in the methylhexalin-tetralin mixt., n and K are consts.; $n = 1.30$ and $K = 0.76$. **Method.**—A known amt. of the mixt. is steam distd., the methylhexalin in the H_2O is shaken out with ether and weighed after evapg. the ether. The oily distillate is dried with anhyd. Na_2SO_4 and 15 g. of it are shaken in a shaking app. with 20 vols. H_2O (300 cc.) for $1\frac{1}{2}$ hr. at $15-18^\circ$. The H_2O soln. is filtered off, 250 cc. of the filtrate is shaken 3 times with ether, the ether soln. is dried with Na_2SO_4 , evapd., weighed as methylhexalin and calcd. back to 300 cc. H_2O , representing 15 g. of the mixt. This value (a) is related to Y in the exponential equation as follows: $(a) =$

$Y \cdot \frac{15}{100}$ and the % of methylhexalin (X) in the mixt. is then: $\log X = 1.30 \log (a) + 1.1902$. By adding to this result the amt. of methylhexalin found by steam distn., the % methylhexalin in the original mixt. can be calcd.

P. ESCHER

Determination of isopropyl alcohol in the presence of acetone, and of methylethyl ketone in the presence of secondary butyl alcohol. H. A. CASSAR. *Ind. Eng. Chem.* 19, 1061-2(1927).—Isopropyl alc. can be oxidized to acetone by chromic acid and the excess of the latter detd. iodometrically. A similar method under different concns. can be applied to the detn. of secondary butyl alc. in the presence of methylethyl ketone. The last-mentioned compd. can be detd. iodometrically if a correction is applied for a const. error which is probably caused by the fact that 2 oxidation reactions take place simultaneously.

W. T. H.

The determination of isopropyl alcohol in the presence of ethyl alcohol. O. NORTZEL. *Z. Untersuch. Lebensm.* 53, 388-91(1927).—An accurate method for detg. isopropyl alc. in presence of EtOH is based on oxidation with $K_2Cr_2O_7$ and H_2SO_4 , the resulting acetone being detd. by titration with alkali after addn. of hydroxylamine.

WILLIAM J. HUSA

Method for the determination of the methoxyl content of volatile substances in dilute aqueous solutions in the presence of aldehydes. KARL WIESLER. *Z. angew. Chem.* 40, 975(1927).—Zeisel's method is not applicable in its original form for the detn. of methoxyl in the presence of formaldehyde or acetaldehyde. A simple change in the app. is suggested to overcome the difficulty. Before the substance comes in contact with the III the aldehyde is oxidized with moist Ag_2O . For this purpose a slight excess of $AgNO_3$ soln. is treated with NaOH and the ppt. filtered off onto a paper filter and washed with water. With the aid of a little water the ppt. is removed from the paper and transferred to the small flask. Then the soln. to be tested is added and the flask is stoppered and connected with a CO_2 generator on one side and with the decompn. flask of the Zeisel app. on the other side. The decompn. flask contains 10 cc. of HI, d. 1.96. An upright gas delivery tube from the decompn. flask runs into a reservoir contg. red P suspended in water and from thence the gas escapes into a measured vol. of standard $AgNO_3$ soln. A slow current of CO_2 is passed through the app. The decompn. flask is heated in a water bath and the flask contg. the original soln. is heated with a free flame. The analysis is finished in the usual way.

W. T. H.

Critical study of methods of analysis of antipyrine and pyrimidone. A. BORLOZ. *Helv. Chim. Acta* 10, 543-8(1927).—From the results obtained, it is clear that antipyrine can be detd. accurately by the iodometric method of Bougault (*C. A.* 11, 2386) or of Kolthoff (*C. A.* 17, 1689) but there does not appear to exist an equally good method for the detn. of pyrimidone. If a mixt. of the 2 substances is present contg. small quantities of antipyrine, det. the latter by the method of Patein (*J. pharm. chim.* 22, 5(1905)). Ext. the pyrimidone with $CHCl_3$ in the filtered soln. and det. it by the method of Pégurier (*Ann. chim. anal. chim. appl.* 10, 392(1905)). If the mixt. contains considerable antipyrine, proceed in accordance with the methods of Pégurier and Lemaire but use 2 samples for the analysis. With the first sample det. the pyrimidone by titration. Treat the second sample with an excess of picric acid and titrate the excess.

W. T. H.

Note on the determination of diacetyl and acetyl methylcarbinol. C. B. VAN NIEL. *Biochem. Z.* 187, 472-8(1927).—Diacetyl is detd. by slowly distg. the slightly acidified liquid, the distillate being collected into a mixt. of 2 cc. 20% of $NH_4OH.HCl$, 3-5 cc. 20% $AcONa$ and 1-2 cc. 10% $NaCl$ soln., which is sufficient for 100 mg. of substance. When about $\frac{1}{2}$ of the fluid has distd. over, the flask contg. the distillate is closed and

heated for 1 hr. at 80° on a water bath. The ppt. is then collected on a weighed filter, and after thorough washing with hot water it is dried at 110°. Wt. of ppt. \times 0.596 = wt. of diacetyl. Acetyl-methylcarbinol is detd. in the same way except that an excess of FeCl_3 is added to the liquid prior to distn. Wt. of ppt. \times 0.61 = wt. of acetyl-methylcarbinol. In case the detn. is to be made on a mixt. of these 2 substances, the analysis is carried out separately with and without the addn. of FeCl_3 , and each substance is detd. from the difference. S. MORGULIS

The volumetric estimation of hydroxyl groups in sugars and other organic compounds. V. L. PETERSON AND E. S. WEST. *J. Biol. Chem.* 74, 379-83 (1927).—Place 0.1 to 0.8 g. of the substance in a Pyrex test-tube 16 \times 150 mm. Add 3 to 5 cc. of a mixt. of 1 vol. Ac_2O and 2 vols. of pyridine. After acetylation is complete (24 to 48 hrs. at 60-80°) mix the product with 200 cc. of ice water and titrate to phenolphthalein with 0.5 cc. NaOH. A blank detn. is necessary. Results are given of detns. on a variety of sugars, sugar derivs., hydroquinone, benzoïn, resorcinol and β -naphthol. ARTHUR GROLLMAN

"Active" iron (Simon, Kötschau) 2. The determination of iodates and sulfates and its application to the estimation of total base in blood serum (VAN SLYKE, *et al.*) 11B. The occurrence of I in Fe and Fe slags (LUNDÉ, FELLEBERG) 9.

8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIER

The occurrence of covellite and chalcocite in the Mansfeld copper deposits. WERNER HOFFMANN. *Neues Jahrb. Mineral. Geol. Beil.-Bd.* 52A, 157-69 (1925).—Digenite and carmenite are undoubtedly mixts. of chalcocite and covellite and not mineral species. An analysis of Cu ore from Mansfeld is given. J. F. SCHAIER

Iron sulfide pseudomorphs of plant structures in coal. G. M. SCHWARTZ. *J. Geology* 35, 375-7 (1927).—Rounded concretionary masses of sulfide, mainly pyrite, taken from the Illinois coal field showed, when sections were polished, well-preserved plant structures of various types. W. F. HUNT

Optical anomalies of calcite under pressure. S. NISHIO. *Proc. Imp. Acad. (Japan)* 2, 395-7 (1926); *Brit. Chem. Abstracts* 1927A, 188.—From a knowledge of the optical anomalies shown by a specimen of calcite, it is possible to discuss its geol. history. C. J. WEST

The thermal dissociation of magnesium carbonate and dolomite. W. EITEL. *Neues Jahrb. Mineral. Geol. Beil.-Bd.* 51, 477-93 (1925).—The data of Mauchot and Lorenz (*C. A.* 18, 1795) and Marc and Simek (*C. A.* 7, 3090) are discussed. Analysis of the methods employed indicates the work of the latter to be the more reliable. J. F. SCHAIER

Chemical composition of crocidolite or Cape Blue asbestos. C. J. N. JOURDAN. *J. Chem. Met. Mining Soc. S. Africa* 27, 287-90 (1927).—Many samples were arranged in 8 groups according to color and phys. similarity, and a typical sample from each group was analyzed. There is no evidence that the chem. compn. has any bearing on the spinning properties of the fiber. With one exception the compns. of the samples analyzed were in close agreement although they differed markedly in color and were from widely sepd. localities. L. W. RIGGS

Olivine from Önundarfjord, N. W. Islands—A contribution to the knowledge of the olivine group. E. ERNST. *Neues Jahrb. Mineral. Geol. Beil.-Bd.* 52A, 113-56 (1925).—From the available data on olivine, forsterite, fayalite and hortonolite, the relation between chem. compn. and optical properties is derived and presented by means of tables. J. F. SCHAIER

New minerals of the mosandrite group from the Chibine Mountains. E. M. BONSHTEDT, K. A. NENADKEVICH AND I. D. STARUINKEVICH-BORNEMAN. *Bull. acad. Sci. Leningrad* 1926, [vi], 1181-98.—To 2 yellow, greenish yellow, or brownish yellow minerals of the mosandrite group, with a pale yellow streak the names *rinkolite* and

lovtchorrite are given. Their hardness is about 5 and they melt readily in the blow-pipe flame and are easily dissolved by acids. Rinkolite, $d_4^{17.6}$ 3.40, has a vitreous cleavage surface with a fatty fracture, and lovtchorrite, d 3.32, a fatty luster. The percentage compns. of the 2 are:

	SiO ₂	TiO ₂	ZrO ₂	ThO ₂	CeO ₂	Ca ₂ O ₂ (DiLa) ₂ O ₂ , Y ₂ O ₃	
Rinkolite	27.58	11.15	0.35	18.02	
Lovtchorrite	27.61	12.71	0.20	0.23	8.79	5.15	1.36
	Al ₂ O ₃	Fe ₂ O ₃	MnO	CaO	SrO	BaO	MgO
Rinkolite	1.47	0.99	trace	24.70	3.30	trace	trace
Lovtchorrite	0.13	..	0.53	27.26	3.56	...	0.80
	Na ₂ O	K ₂ O	H ₂ O	F	—O for F	Total	
Rinkolite	6.73	0.16	1.75	5.99	2.47	99.72	
Lovtchorrite	7.18	0.28	0.51	6.38	2.68	100.00	

No crystallographic measurements were possible.

B. C. A.

Detection and analysis of secondary uranium minerals. ALFRED SCHÖPF. *Chimic et industrie Special No.*, 179-81(May, 1927).—The technic of the detn. of U in its acid-sol. minerals and the identification of secondary U minerals by the Becke method are outlined.

A. PAPINEAU-COUTURE

The relations between the chemical composition and physical and optical properties of the mica group. W. KUNITZ. *Neues Jahrb. Mineral. Geol. Beil.-Bd.* 50, 365-413 (1924).—Eleven new samples of muscovite, 12 of Mg-Fe-mica and 8 of Li-Fe-mica were analyzed and the phys. and optical properties detd. on the analyzed material. The following pairs are isomorphous in the mica group: OH, F; K, Na, Si, Ti. J. F. S.

A study of glauconite. HYRUM SCHNEIDER. *J. Geology* 35, 289-310(1927).—Chem. analyses of purified samples taken from widely sepd. localities indicate the formula $KMgFe_3Si_6O_{18} \cdot 3H_2O$. The Fe content varies from 16 to 30% and alumina from 2 to 10%. Glauconite is optically—and biaxial with a small optic angle, the *ns*, and birefringence varying with the Fe content. X-ray patterns show that it is a definite mineral and not a mixt.

W. F. HUNT

The chemical composition of minerals which contain oxides of the quadrivalent and pentavalent elements. B. GOSSNER. *Neues Jahrb. Mineral. Geol. Beil.-Bd.* 52A, 265-85(1925).—G. discusses the compns. of chalcamprite, polymignite, euxenite-polycrase, blomstrandine-priorite and lewisite from the viewpoint of isomorphous replacements.

J. F. SCHAIKER

Vanadium compounds and the new mineral usbekite from the radioactive deposit in Ferghana. IVAN KURBATOFF. *Centr. Mineral. Geol.* 1926A, 345-53.—Many unusual U and V minerals occur in this region, especially at Tyuya-Muyun. The notable ones are alaite, $V_2O_5 \cdot H_2O$, turanite, $5CuO \cdot V_2O_5 \cdot 2H_2O$, and tangeite, $2CuO \cdot 2CaO \cdot V_2O_5 \cdot H_2O$. Analyses are given of colloidal mixts. of these, and efforts made to calc. the mineral compns. At Kara-Chagir there occurs a green finely cryst. mineral which gave on analysis: CuO 44.69, NiO 0.90, CaO 0.31, MgO trace, $Al_2O_3 + Fe_2O_3$ 1.40, V_2O_5 37.71, SiO_2 1.17, $H_2O - 0.53$, $H_2O + 12.82$, sum 99.53%, corresponding to $3CuO \cdot V_2O_5 \cdot 3H_2O$. This is called usbekite by Fersman. The origin of the difference in compn. of related minerals at the 2 localities is briefly discussed.

E. T. WHERRY

The occurrence of the rare mineral nadorite in Cornwall, and of beraunite in Co. Cork, Ireland. ARTHUR RUSSELL. *Mineralog. Mag.* 21, 272-5(1927).—Nadorite ($PbClSbO_2$) was found in a small Sb mine at St. Endellion, Cornwall, in a cavity of jamesonite assoc. with bindheimite, anglesite, siderite, limonite and quartz. It is orthorhombic, optically +, with strong birefringence, optic plane (010) and Bx_0 (—) \perp (100). Beraunite (hydrated Fe⁺⁺ phosphate) was found on the dump of an Fe-Mn mine in Co. Cork. The fibers are strongly pleochroic, red brown lengthwise and yellow crosswise; $n = 1.78$; sp. gr. = 2.99.

W. F. HUNT

The Natas mine in Southwest Africa, a pegmatitic-pneumatolytic-hydrothermal deposit with scheelite, molybdenite, copper ores and gold. E. REUNING. *Neues Jahrb. Mineral. Geol. Beil.-Bd.* 52A, 192-264(1925).—Geological. An analysis of scheelite is included.

J. F. SCHAIKER

Composition and structure of meteoric iron of Tametit. A. LACROIX. *Compt. rend.* 185, 313-7(1927).—The microscopic structure is described. Analysis by Raoult gave: Fe 91.13, Ni 8.39, Co 0.38, Mn 0.07, P 0.23, S 0.01, C 0.06, Si traces, sum 100.25%;

W, Mo and Cr were absent. The melting of the meteorite by means of the oxy-acetylene blowpipe raised a no. of questions as to origin of structures which are discussed at length.

L. W. RIGGS

Italian resources in ferriferous ores. GAETANO CASTELLI. *Rass. min. met. chim.* 66, 121-5(1927).—A general survey.

C. C. DAVIS

The Gonderbach lead deposits near Laasphe and their origin. ERNST KOLBE. *Neues Jahrb. Mineral. Geol. Beil.-Bd.* 52A, 286-331(1925).—The high-grade Pb-Ag ores are described. The relation of galena to sphalerite with H₂O and H₂S was studied experimentally, but few conclusive results were obtained.

J. F. SCHAIRER

Geology of the country around Ipswich, England. P. G. H. BOSWELL. *Dept. Sci. Ind. Research Geol. Survey Gt. Britain Sheet No.* 207, 121 pp.(1927).—The deposits of this region are used for making cement and bricks. Phosphate deposits were formerly worked for fertilizer, but the percentage of P is too low for profitable investment. The chalk deposits are used both as CaCO₃ and CaO in agriculture.

L. W. RIGGS

Fertilizer deposits of South Africa. A. J. PELLING. *J. Chem. Met. Mining Soc. S. Africa* 27, 277-87(1927).—A few of the deposits contain a proportion of P that should make them available for manuf. fertilizers.

L. W. RIGGS

Abrasives. I. Siliceous abrasives. V. L. FARDLEY-WILMOT. *Can. Dept. Mines, Mines Branch, No.* 673, 113 pp. 14 plates(1927); cf. *C. A.* 21, 2860.—The occurrence, quarrying and prepn. for market of grindstones, pulpstones, millstones, sharpening stones, sandstones and sand for blasting, tripoli, amorphous silica, pumice, volcanic dust and pumicite, and non-siliceous soft abrasives are described with special reference to Canadian production. World production and trade in these abrasives are reviewed. Many chem. analyses are quoted.

L. W. RIGGS

Determination of the mineral association in eruptive rocks. E. LEHMANN. *Neues Jahrb. Mineral. Geol. Beil.-Bd.* 52A, 61-112(1925).—The methods of detg. mineralogical compn. from chem. analyses are reviewed. Numerous analyses are plotted on triangular diagrams to show mineralogical compn. and variations in compn. of different eruptive rocks.

J. F. SCHAIRER

A new deposit of intrusive sodium rocks in Portugal. PEREIRA DE SOUSA. *Compt. rend.* 185, 467-9(1927).—The syenites of the region of Vila Boim are in general more quartziferous than those of Alter Pedroso (cf. Lacroix, *C. A.* 11, 22). Five analyses by Raoult are quoted showing a series with decreasing SiO₂ and an av. of 7% of Na₂O.

L. W. RIGGS

Experimental studies on chemical processes in the formation of glacial clay. O. TAMM. *Sveriges geol. Undersökning* 18, No. 5(1924); *Intern. Rev. Sci. Practice Agr.* 4, 347-8.—Clay was artificially prepd. by rotating quartz flasks contg. small pieces of granite and H₂O, either free from or contg. CO₂, in a thermostat for 12 hrs. The rate of decompn. of the granite was nearly independent of the temp. but was largely dependent on the intensity of grinding and on the amt. of CO₂ present. The clays thus prepd. were similar to natural glacial clays even in chem. compn. The dissolved bases, MgO, CaO, K₂O and Na₂O, in water free from and contg. CO₂ amounted to 1.17 and 3.24%, resp., of the clay formed at the same time. The content of the 2 clays in chemically dissociated minerals was 15.6% in the presence of CO₂ and 6% without CO₂. The artificial clays appeared to have a higher content of biotite than natural glacial clays. Expts with K feldspar also indicated a high degree of decompn. and it is concluded that feldspar plays an important part in the change of granite into glacial clay. "These expts. throw light, in some respects, on the chem. processes concerned in the formation of glacial clay and furnish a method which may enable us to clear up the processes of hydrolysis and decompn. of the silicate minerals."

K. D. JACOB

Origin of the rock-marls in the French variegated red marls. GEORG FISCHER. *Neues Jahrb. Mineral. Geol. Beil.-Bd.* 51, 413-76(1925).—Geological. Many rock analyses are quoted and discussed. Several new analyses of rock-marls and concretions are given.

J. F. SCHAIRER

The Gleinalps locality as a metamorphic entity. F. ANGEL. *Neues Jahrb. Mineral. Geol. Beil.-Bd.* 51, 213-39(1924).—Petrographic. Equations showing chem. changes in mineral alteration are given.

J. F. SCHAIRER

Silicification of sedimentary rocks. C. W. CORRENS. *Neues Jahrb. Mineral. Geol. Beil.-Bd.* 52A, 170-81(1925).—Silicification of limestones occurs by means of acid or weakly alk. solns. while in clays silicification is caused by alk. solns.

J. F. S.

Occurrences of platinum metals. J. L. HOWE. *Science* 66, 220-1(1927).—It is probable that Pt and all of the Pt metals would be found in all meteorites if analyses were made with this end in view. An attempt is made to give a rough approximation of the relative amts. of the metals of the 8th group in the earth, assuming that the Fe of

the interior of the earth contains the same proportion of Pt metals as the Canyon Diablo meteorite. L. W. RIGGS

Geochemistry of the platinum-metals. ERICH HERLINGER. *Z. angew. Chem.* 40, 649-55(1927).—A review is given of the geochem. data on the occurrences and relations of the Pt metals to basic rocks. J. F. SCHAIRER

Molybdenum. ALAN KISSOCK. *Mineral Ind.* 35, 468-70(1926).—Technology and production are discussed. A. BUTTS

Superficial refining of metals by diffusion. GRUBE. *Z. ges. Giessereipr.* 47, 173-4(1926); *Chimie et industrie* 18, 68(1927); cf. *C. A.* 21, 2407.—Investigation of the diffusion of Cr, Al, W and Mo into Fe and of Cr into Ni showed penetration to a depth of 2.5-5 mm. Compn. of the different layers was detd. by removing successive thicknesses of 0.05 mm. by means of a lathe and analyzing the turnings. Fe and Cr can diffuse into each other in all proportions. Diffusion of Al into Fe proceeds at an appreciable rate at 900°, and after 40 hrs. (temp. not stated) the metal contains 27% Al. In spite of their high m. p. W and Mo diffuse very easily. The concn. of W in the superficial layer is not high; but the rate of diffusion is so rapid that it cannot be greatly increased. A. PAPINEAU-COUTURE

Reactions and equilibria in the system copper-iron-sulfur with reference to copper ores. O. REULFAUX. *Metall u. Erz* 24, 99-111(1927).—Phase diagrams and photomicrographs are given for the systems Cu-Fe, Cu-S, Fe-S, Cu₂S-FeS, Cu-Fe-FeS-Cu₂S. *Ibid* 129-34 (with W. GUERTLER).—Discussion of the above systems with bibliography. C. G. K.

Method of approximate analysis of an ore (copper) which can readily be pulverized into separate particles. K. WAGEMANN. *Metall u. Erz* 24, 52-5(1927).—The method is based upon microscopic appearance of different Cu minerals and gang in crushed ore. C. G. K.

Production of metallic cobalt from cobalt-bearing works-residues. A. BREMHORST. *Metall u. Erz* 24, 7 8(1927).—An exptl. procedure is described for treating residues low in Co and high in Fe, Mn and Zn. The residue is roasted 8 hrs. with C and Na₂SO₄ at 1000°, then at 1300° with a flux, giving a bottom layer contg. 80% of the original Co, and consisting of 66% Co and 29.5% S. Further roasting raised the Co content to 90-93%. C. G. K.

Ammonia leaching processes for zinc ores. H. M. LAWRENCE. *Bull. Am. Zinc Inst.* 10, No. 5-6, 107-18(1927).—With the aid of a flow sheet the author describes the NH₃-CO₂ leaching process as it is usually carried out. The Zn-bearing material, after grinding, is agitated with (NH₄)₂CO₃ soln. The Zn, Cu and Cd dissolve; the Pb becomes insol. basic carbonate. The Cu and Cd are removed from the Zn-bearing liquors by displacement with Zn. Steam distn. of the liquors yields basic Zn carbonate which is filtered and calcined to ZnO. NH₃ and CO₂ are recovered in the distillate as well as by liming the filtrate. The author discusses the following: (1) the difficulties involved in putting the process into commercial operation, (2) the patents involved, and (3) exptl. plants now operating. The results of a series of expts. on Zn ores and concentrates show that the percentage of Zn extd. by the NH₃ leaching process may be anywhere from 2 to 50% less than when the H₂SO₄ leach is applied to the same material. The yield of Zn in the NH₃ process is also more affected by the previous treatment and roasting of the ores. Expts. with Zn-Pb fume show that an almost complete extn. of the Zn can be accomplished with the NH₃ leach. A recently patented blast furnace process for smelting Zn ores is discussed. WILLIAM F. EHRET

The preparation of pure platinum from the ore. V. V. LEBEDINSKII and V. G. KHELOPIN. *Ann. inst. platine* No. 4, 317-23(1926).—To 100 g. Pt ore add at first at 70-80°, then at a boil 1-1.2 l. of a mixt. of 1 vol. HNO₃ (d. 1.4), 3 vol. HCl (d. 1.19) and 4 vol. of water, and allow to evap. under a pressure of 30 mm. Hg. The residue, including Os, Ir, etc., is mixed with 160-165 concd. H₂SO₄ and heated for 2-2.5 hrs. on a water bath and then on a sand bath at 140-142° till all HCl has disappeared. The diluted soln. gives (NH₄)₂PtCl₆ with NH₄Cl. The evapd. residue on cooling sets to a cryst. mass which is diluted with 500-600 cc. water and heated for 1/2 hr. on the water bath to drive off HNO₃. Filter and add 150 g. solid NH₄Cl. The pure (NH₄)₂PtCl₆

which is formed is washed with satd. NH_4Cl soln., ice water and alc. Its purity has been shown by cond. and thermal resistance measurements. WILLIAM M. MALISOFF

Methods of handling gold and platinum wastes. C. M. HOKR. *Metal Ind.* (N. Y.) 25, 371-2(1927); cf. C. A. 21, 2452. E. H.

The relation between the behavior on roasting and the mineralogical nature of Sieglund spathic iron ore. H. SCHNEIDERHÖHN. *Ber. Erzausschusses Ver. deut. Eisenhüttenleute* 1925, 1-4; *Chem. Zentr.* 1926, I, 1789.—A crude spar with fine quartz fragments and lamellar quartz requires the addn. of 3% of coke for roasting, while an almost pure ore requires 7-8% of coke. The former is fractured and broken up by the different coeffs. of expansion of the various minerals, so that oxidation and disson. can take place more readily and more rapidly. C. C. DAVIS

Coöperative research in ferrous metallurgy and the problem of inclusions in steel. A. C. FIELDNER. *Proc. Eng. Soc. West. Penn.* 43, 221-54(1927).—Coöperation among the U. S. Bureau of Mines, the Carnegie Institute of Technology and the iron and steel industry are discussed. E. H.

Some features of Australian blast-furnace construction and practice. DAVID BAKER, JR. *Proc. Eng. Soc. West. Penn.* 43, 255-66(1927). E. H.

The duplex process employed in India. I. B. YANESKE. *Blast Furnace Steel Plant* 15, 419-22(1927).—A combination of Bessemer and open-hearth processes consists of desilicizing and almost completely decarburizing molten pig iron in an acid-lined Bessemer converter and subsequently dephosphorizing the metal in the basic open-hearth. Description of the process as employed at Jamshedpur, India is given. A curve shows the av. rate of oxidation of C, Si, and Mn in the Bessemer converter during blowing, and tables show the compn. of Bessemer-blown metal required for various grades of basic open-hearth steel, the av. compn. of ladle samples of normal converter slags, the av. analyses of high-P Fe-Mn, and low-P Fe-Mn, and analyses of converter slag samples at different stages of the blow. W. H. BOYNTON

Effects of the average manganese content of the furnace charge and of the silicon content of the finished metal in the manufacture of steel tires. H. G. VOSGIENS. *Arts et métiers* No. 83, 289-94(Aug., 1927).—A sudden increase in rejected ingots and tires from 5-8% to 25-50% in a given plant was finally traced to variations in the Mn and Si contents. It was found that under the conditions of working at the particular plant the Mn content of the charge (exclusive of that added as Fe-Mn) should be maintained as high as possible and never be allowed to fall below 0.8%, and that the Si content should be such as just to give a still fusion (0.21% in the present instance). A. PAPINEAU-COUTURE

Chromium-nickel-electro-steel. KURT POPPE. *Zentr. Hüttenw.* 30, 91-4; *Chem. Zentr.* 1926, I, 2961.—With the aid of data obtained in practice with various melts and of chem. and heat balances, the attempt was made to develop a satisfactory process for the production of steel with high Cr and Ni contents for ingots weighing 4.5 tons. The results indicate that the length of the ingots should be 3-5 times the dimension of the greatest cross-section, and the thickness at the top 15-20% greater than that at the bottom. For cross-section a regular or an irregular polygon is recommended. The pouring temp. lies about 100° to 250° above the m. p. of the steel. Electro-Cr-Ni-steel is ordinarily cast in small ingots, so that the radial and axial sepn. of P, S and C can be disregarded in practice. C. C. DAVIS

Properties and economic importance of acid electric steel. L. GRINBERG. *Ousp. promychl. techn.* 1926, No. 4, 99-105; *Chimie et industrie* 18, 248-9(1927).—Outline of its manuf. and discussion of its merits. A. PAPINEAU-COUTURE

Hollow steel drilling rods. N. DANIELSEN. *Teknisk Tidsskrift, Uplaga C, (Bergsvetenskap)* 57, 25-7(1927).—A review considering the manuf. and properties of steel for hollow drilling rods and the manuf. of such rods. C. A. ROBAK

The iodine content of industrially prepared iron. TH. VON FELLEBERG AND GULBRAND LUNDE. *Biochem. Z.* 187, 7-14(1927).—See C. A. 21, 2864. S. M.

The occurrence of iodide in iron and iron slags. GULBRAND LUNDE and TH. V. FELLEBERG. *Z. anorg. allgem. Chem.* 165, 225-48(1927).—A method of extg. I from silicate slags with KOH and alc. is described in detail. If less than $2 \cdot 10^{-6}$ g. are present in the ext. obtained, then the I is detd. colorimetrically, but if more, the soln. is titrated with $\text{Na}_2\text{S}_2\text{O}_3$. I in Fe is detd. by dissolving Fe in hot H_2SO_4 or HCl and then using the methoxyl app. of Decker (*Ber.* 36, 2895(1903)). Various expts. are made to study the action and distribution of I in the course of the reaction, known quantities of KI and steel chips being used. These show that the H_2SO_4 soln. gives up but little of the I to alc.; that the alkali extn. is necessary, but not sufficient if all the crystals are not previously in soln.; and that a part of the I is retained by the C in Fe and cannot be

recovered by the method given. Other expts. show that I can be extd., from an acid soln. of pure FeSO_4 with alc., but not from the FeSO_4 obtained in dissolving steel chips; that the I remaining after acid treatment may be recovered by alkali extn.; that if Fe is dissolved rapidly, by heating strongly, then the HI present escapes before it becomes attached to the C formed, while slow heating gives it a chance to be absorbed by C before it is distilled; and the final expt. shows that besides C and Na_2SiO_3 , silicates, carbonates and sulfates, when used with FeSO_4 , have very little influence on the amt. of I retained in soln. The elements, found as impurities in various kinds of Fe and steel, are detd., the I content is obtained by a method similar to the one described, the methoxyl app. being substituted by a reflux condenser. All samples contain from 0.1 to 1.10 mg. of I per kg. of sample. The distribution of I between Fe and the silicate slags of the blast furnace is for 3 samples in the ratio of 100 : 40, 59, 72; and somewhat greater for the acid slags of the cupola furnace. The materials used and the products of the furnaces, ore, coke, limestone, castings and slags contain I. Various natural stones contain 0.2–0.3 mg. of I per kg. of stone.

J. BALOZIAN

A new pipe casting process in Choindez. M. VON ANACKER. *Bull. mensuel Schweiz Gas u. Wasserfack.* 7, 195–200(1927).—A description of a new centrifugal casting method for Fe pipe. Molten Fe is supplied to all parts of the mold at the same time before the centrifugal process is started. Tensile strength and other data are given for ordinary and centrifugally cast pipe.

R. W. RYAN

Spot welding of dissimilar metals. R. T. GILLETTE. *Gen. Elec. Rev.* 30, 443–5 (1927).—A few observations are made regarding the spot welding of certain ferrous and non-ferrous metals and alloys. Combinations of metals dissimilar in heat and elec. cond. are best welded by the use of 2 dissimilar electrodes such as Cu and Cu-W alloys of high W content. Where Cu-W or pure W is used, it is best to use inserts because of the cost and the introduction of too much high-resistance material into the welding circuit, if the whole electrode is made of either material. The machine used is illustrated and the heat distribution of 2 electrode combinations showing how and why electrode shape should be adjusted to metal thickness is shown. In line welding it is usually best to use an interrupter in the primary circuit of the welding machine, which gives, in effect, a series of overlapping spot welds and permits the employment of a higher welding current without danger of burning through the metal being welded.

W. H. BOYNTON

New method and instrument for the determination of Hertzian hardness. R. ESNAULT-PELTERIE. *Rev. métal.* 24, 396–400(1927); cf. *C. A.* 21, 551–2.—Further work with the previously described method and instrument brought out that the measurement of the radius of the contact circle was delicate and tedious, and that the machining and silvering of the test balls were extremely delicate. In order to overcome these drawbacks, E.-P. devised a method in which the total area of the contact circle is obtained by measuring the elec. resistance at the contact of the 2 balls. He gives a mathematical discussion of the theory of elec. resistance at the point of contact of 2 conducting bodies to prove the soundness of the principle of his method. It can only give a pressure-elec.-resistance curve (and even then only provided the secondary resistances are sufficiently const., or at least vary regularly), and the trend of the curve thus obtained is similar to that of the true theoretical curve, and particularly reproduces the angular points of the latter.

A. PAPINEAU-COUTURE

X-ray investigation of the internal stress in metals. SINKITI SEKITO. *Sci. Repts. Tôhoku Imp. Univ.* 16, 343–55(1927).—The x-ray spectra of a cold-worked Cu wire, annealed at different temps., were examd., to det. the magnitude of the internal stress. The app. and methods of calcn. are described. The internal stress in the crystals distorted the space lattice and decreased the breadth of the spectral line. Photograms of the wire are shown, and the breadths of 3 spectral lines are tabulated for different annealing temps. In wires reduced by cold drawing from 2.2 to 0.3 or 0.5 mm. diam., the lattice parameter was widened about 0.22%. The direction of greatest internal stress was perpendicular to the (111) plane, and that of the least, perpendicular to the (110) plane, the (100) plane being intermediate.

GEO. F. COMSTOCK

The surface tension of molten metals and alloys. YOSIHARU MATUYAMA. *Sci. Repts. Tôhoku Imp. Univ.* 16, 555–62(1927).—The surface tensions of 6 molten metals and 3 binary alloys are studied by the drop-weight method. A glass capillary 5 cm. long and 2 cm. inside diam. is fitted in a small elec. resistance furnace and molten metal allowed to drop into a weighing bottle under varying pressure in an atm. of CO_2 . The surface tension was detd. at temps. from 250° to 762° with Sb. The curves obtained for the pure metals were all linear and their slopes almost the same. Some surface tension results for Zn carried out in vacuum expressed in mg./mm. are 470°–78.8; 545°–

76.4; 635°-74.3. Other values obtained in vacuum are Sn 250°-58.7, 400°-55.6, 600°-51.6; Bi 350°-38.9, 600°-35.0; Cd 400°-65.3, 589°-60.2; Pb 370°-47.5, 657°-42.4; Sb 640°-37.5, 762°-37.2. The values for k as calcd. by the Eötvös formula differ from the usual 2.1 and approx. 1.1. A study of some binary systems shows that the intermetallic compds. do not decomp. during melting and exist in the liquid phase. A change of slope of the surface-tension curve is noted at the point of compd. formation. Some results obtained are: Sn-Pb alloy 20% Pb-38.0; 50% Pb-40.9; 80% Pb-43.6; 100% Pb-47.0; Sb-Cd alloy 0% Sb-65.0; 20% Sb-49.1; 40% Sb-42.8; 50% Sb-42.3; 60% Sb-40.6; 80% Sb-39.2; 100% Sb-37.4. So-Zn alloy 10% Sb-65.6; 45% Sb-41.8; 65% Sb-40.0; 85% Sb 38.6.

The "hydrogen point" in iron. H. S. RAWDON AND PETER HIDNERT. *Phys. Rev.* 25, 898(1925).—Heated Fe absorbs a very appreciable quantity of H and the heating curves show that heat is evolved beginning at 325° to reach a max. at about 380°.

F. O. A.

The cause of variations in pig-iron qualities. R. S. McCaffery. *Am. Foundrymen's Assocn.* (preprint) No. 27-25, 7 pp.(1927).—Pig Fe is composed of 6 common elements, which form numerous binary or more complex compds. The temp. conditions in different blast furnaces or in different parts of the same furnace are not uniform, and the compds. formed in the furnace will vary as the time during which the Fe is held at certain temps. varies. The chem. analysis does not indicate how the elements are combined. The undetd. compds. formed at blast-furnace temp. may not be changed in remelting at lower temps., and must have considerable effect on the properties of the Fe.

GEO. F. COMSTOCK

Test bars to establish the fluidity qualities of cast iron. C. CURRY. *Am. Foundrymen's Assocn.* (preprint), No. 27-23, 17 pp.(1927).—Fluidity is defined as "the aptitude of a liquid in a given condition to fill a mold prepd. under detd. conditions." The fluidity of cast Fe is detd. by other factors beside temp. Previous methods of measuring fluidity are reviewed, with sketches of the test-bars used. An improved form of spiral bar for this purpose is described, and precautions necessary in its use are noted. The mold must be horizontal and accurate in dimensions, but venting and the moisture content of the sand were not important. Graphite mold-facing was found to assist the fluidity of Fe, and an oil spray had the same effect with brass. Instances are described of the value of definite fluidity tests on Fe, bronze and brass. Of various deoxidizers for Cu, Mn and P were most effective in increasing the fluidity and the malleability when cold.

GEO. F. COMSTOCK

Unusual microstructure of iron and tungsten. C. J. SMITHELLS AND H. P. ROOKSBY. *Nature* 120, 226-7(1927).—The peculiar microstructure found by Tritton (*Metallurgist* June, 1927) for iron and by the author previously for W was further investigated. By the x-ray reflection method it was found that the spots of the diffraction pattern of the subdivided large crystals are slightly spread out, indicating that the small grains formed by the subboundaries have nearly but not quite uniform orientation in each crystal. It is suggested that the subboundaries are formed under the influence of stresses set up during the rapid cooling of the metal.

Carbon and manganese in tungsten magnetic steel. K. SCHÖNERT AND G. HANNACK. *Ber.* No. 73 Werkstoffausschusses des Vereins deutsche Eisenhüttenleute. *Sitz.*

Nov. 5, 1925; *Physik. Ber.* 7, 113.—The magnetic values were detd. with a Koespel app. at intervals of 0.01% C for steel of 0.50–0.75% C. The curves of residual magnetism and greatest inductivity show a pronounced break at 0.57% C. This is not evident in case of the coercivity force of the quality no. The increase in C is accompanied by an increase in Mn, but plotting the values against the Mn content did not serve to differentiate the influence of each element. E. R. SCHIERZ

The cause of temper-brittleness in steels. KOTARO HONDA AND RYONOSKE YAMADA. *Sci. Repts. Tôhoku Imp. Univ.* 16, 307–19(1927).—A review of recent literature on temper-brittleness is given, and the authors agree with Andrew and Dickie in associating the cause with carbide pptn. during slow cooling from 650°. Magnetic and elec. tests show temper brittleness as well as notched-bar tests. Brittleness depends on the amt. of carbide in soln. at the tempering temp., which is available for pptn. at the grain boundaries. The effects of Mo, N, P, etc. are explained by their effects on the carbide soly. below the A₁ point. A notched specimen is needed for showing the intergranular brittleness, but impact is not necessary. A Ni-Cr steel susceptible to temper-brittleness was tested by impact at various temps., and showed a marked increase in resistance at a lower temp. in the tough state than in the brittle state. GEO. F. COMSTOCK

Influence of the wall thickness of the ingot mold on the ingot. F. LEITNER. *Ber. No. 77 Werkstoffausschusses des Vereins deutsche Eisenhüttenleute. Sitz.* Nov. 5, (1925); *Physik. Ber.* 7, 106.—The influence of the thickness (between 75 and 25 mm.) of the mold wall on the primary crystn. and rate of solidification was detd. on blocks of soft Cr-Ni steels and steels rich in C and Mn. For blocks 140 mm. in diam., 250 mm. on edge, and 230–250 mm. diam. walls of 30–35 mm. and 35–40 mm. thick, resp., were found most favorable. Crystn. was better and the rate of solidification was about the same as with heavier walls. E. R. SCHIERZ

Stainless iron and its application to chemical-plant construction. W. M. MITCHELL. *Ind. Eng. Chem.* 19, 1171–5(1927).—Stainless alloys may be classified thus: 1. The original "stainless steel" of Brearley and Haynes, with a practical compn. range of 11 to 13% Cr and with sufficient C to confer hardening properties, usually 0.30 to 0.40%. 2. The "stainless irons," a modification of the above with similar Cr, but less C, usually under 0.12%. These are virtually mild stainless steels, and when first brought out were heralded as non-hardening. They do, however, possess distinct hardening properties, although not to the extent of type (1). 3. The alloys with over 16% Cr and low C (usually under 0.10%) with or without small addns. of other elements. These are more nearly true stainless irons as they have very little hardening capacity. 4. The Ni-Fe-Cr alloys, the compn. ranges of which may vary considerably. 5. High-Cr alloys contg. upward of 20% Cr and with medium or high C, and without the addn. of appreciable percentages of other elements. Properties of these alloys, their behavior upon heat treatment and when brought into contact with chemicals, their behavior upon fabrication, and suggestions as to the best ways of using them, are given in detail. W. C. EBAUGH

Rust-proof steel. B. STRAUSS. *Z. Elektrochem. angew. physik. Chem.* 33, 317–21 (1927); cf. C. A. 20, 3438.—A review of the development of Ni-Cr steel and its varied applications. The presence of free C in Cr-steel destroys the resistance of this alloy to corrosion, but if the carbide is in soln. this property is not destroyed. The addition of Ni facilitates the soln. The C content has an important influence upon the magnetic properties, an alloy with 0.16% C, 20.5% Cr and 6.8% Ni giving for magnetic satn. 845 lines when quenched at 1180° and 1845 lines heated at 800° for 8 hr., while an alloy contg. 0.23% C, 20.4% Cr and 6.8% Ni gave 17 and 990 lines under the above conditions. H. STOERTZ

Selection of corrosion-resistant alloys. W. M. MITCHELL. *Blast Furnace Steel Plant* 15, 427–34(1927).—A discussion of factors causing corrosion and of the characteristics of the different types of alloys best suited to combat it. Modern methods of combating are: methods based on the treatment or elimination of the corroding material or liquid; the use of a protective coating of another metal or by a substance in the form of a paint or enamel; electrochem. protection; replacement of the metal attacked by some other metal, inherently immune or whose resistance to attack is greater than that of the metal employed. The mechanism of corrosion, the effect of homogeneity of the metal, and of dissolved O on corrosion, surface films, the effect of electrolytes in soln. and the types of alloys, Fe-Si, Cr-Ni-Fe, Fe-Cr alloys and non-ferrous alloys are considered. External factors which affect corrosive attack are listed. W. H. B.

Miscibility gap in liquid iron-copper alloys. RUDOLPH RUER. *Z. anorg. allgem. Chem.* 164, 366–76(1927).—A reply to Müller's criticism of a previous article by Ruer

and Goerens (*C. A.* 12, 577). The soly. curve of liquid Fe-Cu alloys shows no critical point such as given by Müller at about 1500°, nor at any other temp. Even with slow cooling down to 1445° and vigorous stirring, there was no flowing together of the 2 layers which sepd. at higher temps. It was possible to produce the sepn. of 2 layers in some cases even as low as 1470°. Müller's failure to produce sepn. at temps. lower than 1500° is attributed to impurities or the absorption of traces of O. H. STÖERTZ

The constitution of iron-chromium alloys. EDMUND PEKULLA AND PAUL OBERHOFFER. *Ber. No. 68 Werkstoffausschusses des Vereins deutsche Eisenhüttenleute. Sitz. Nov. 5, 1925; Physik. Ber.* 7, 105.—The alloys were prepd. in a Mo vacuum oven using Al_2O_3 crucibles. Temps. were taken with an Ardrometer. A continuous series of mixed crystals was pptd.; no eutectic was observed. 10% HCl was used for etching specimens up to 20% Cr; above that 10% H_2SO_4 . The m. p. of pure Cr is higher than that usually accepted. Changes in the solid state were measured with a delicate dilatometer. Up to 10% Cr at 890° A_2 increases, then falls rapidly in intensity and is not detectable beyond 16%. A_2 decreases with increase in Cr content. Above 20% Cr the A_2 and A_3 curves coincide. Hardness increases with Cr content.

E. R. SCHERZ

Metallurgy and motors. J. A. MATHEWS. *Ind. Eng. Chem.* 19, 1089-91 (1927).—The metallurgist has contributed to automotive endeavor chiefly along 2 lines: (1) the production of new alloy steels; and (2) development of methods to improve the natural mech. properties of these by heat treatment. Some new alloy steels, the development of improved methods of manuf., and of non-corrosive steels are mentioned.

W. H. BOYNTON

The magnetic, electric and thermal properties of nickel-cobalt alloys. HAKAR MASUMOTO. *Sci. Repts. Tôhoku Imp. Univ.* 16, 321-32 (1927).—Pure Ni and Co were mixed in various proportions, fused, chillcast into rods, and annealed, and some properties of the alloys were detd. The results are tabulated and shown in the form of curves. The magnetization-concn. curve shows a min. at 6% Ni and a max. at 15%, for all fields. For weak fields, min. were also found at 30%, the lattice change-point, and at 70% Ni. Tests of magnetostriction showed a max. magnetic expansion at 30% Ni. The elec. and thermal cond. varied similarly, both showing max. at 25% Ni, and min. at 10 and at 70% Ni.

GEO. F. COMSTOCK

The coefficient of thermal expansion in nickel-cobalt and iron-cobalt alloys, and the magnetostriction of iron-nickel alloys. HAKAR MASUMOTO AND SITISABURO NAKA. *Sci. Repts. Tôhoku Imp. Univ.* 16, 333-41 (1927).—The thermal expansion of Ni-Co alloys was measured using a low rate of heating from 30° to 100°, and the expansion-coeff.-concn. curve showed a max. at 40% Ni, and min. at 30 and 65% Ni. A similar curve for Fe-Co alloys showed a max. at 65% Fe, and min. at 47 and 73% Fe. Alloys of high-purity Fe and Ni were chill-cast and annealed and their magnetic expansion was detd., the results being tabulated and shown as curves. Max. were found in all fields at 20 and 60% Ni, and a min. at 25%. In a weak field, another max. was found at 5% Ni and another min. at 15%. An alloy contg. 81% Ni showed no magnetic change of length.

GEO. F. COMSTOCK

Effect of work and annealing on the lead-tin eutectic. F. HARGREAVES. *J. Inst. Metals* (advance copy) No. 444, 12 pp. (1927); cf. *C. A.* 21, 1955.—Previous results are quoted to show that both Pb and Sn harden when cold-worked and that the presence of a 2nd constituent in a metal usually increases the time or temp. required for recovery from strain effects. Samples of the Pb-Sn eutectic were chill-cast, and cold-worked by hammering, the hardness being detd. by the Brinell method at different stages of working and aging. The procedure is described in detail. All the samples showed a reduction in hardness after working, especially after 30% reduction in thickness, and the severely hammered eutectic was softer than pure Pb or Sn. After heating or aging the hardness generally increased. The effect of cold-work on the microstructure was to destroy the contrast after $FeCl_3$ etching. After reheating, the contrast returned, slip zones appeared, and recrystn. occurred. The changes were probably similar to those occurring in the pure metals, but, because of complexity of structure, there was a large lag in the time factor. Also in *Engineering* 124, 375-6 (1927).

GEO. F. COMSTOCK

Heat treatment and grain growth in ($\alpha + \beta$) brass. R. HINZMANN. *Z. Metallkunde* 19, 297-303 (1927).—Results are given of expts. and tests carried out in the lab. and in the works on brass contg. Cu 50%, Pb 2%, and the rest Zn. This alloy is much used in forming pressed brass articles by forcing the heated metal into steel dies by means of hydraulic pressure. The alloy, upon solidification, yields only β -mixed crystals. Upon cooling below 700°, needle-like mixed crystals of α -brass begin to sep.,

thereby lending toughness to the otherwise brittle β -crystals. The best temp. for pressing the alloy is just above that at which α -brass begins to sep. At this temp. the β -crystals possess sufficiently good forming properties and the temp. is not so high as to induce grain coarsening. Heat treatment must also be carried on above the temp. at which the α -component seps. Slow cooling then yields needle-like α -crystals. Pressed articles often show very uneven surfaces and side cracks. The microstructure shows this to be due to the presence of α in the β -brass before pressing. The great pressure causes the needle-like crystals of α to ball together into chunky grains, thereby making the alloy brittle and subject to cracking. Further cause for the formation of side-cracks is found in the fact that before pressing, the rods are often very coarsely cryst. near the outside. This comes about as the rods are being pressed through the matrix. The temp. at the surface is lower than in the interior, thus giving rise to different degrees of deformation. This also accounts for the presence of granular α in β in the rods. The ability to change from the granular ($\alpha + \beta$) structure to the tougher needle like structure depends upon the aforementioned degree of deformation. Slight deformation requires a high recrystn. temp. and large crystals are formed. Marked deformation requires lower recrystn. temp. and finer crystals are formed. A study of the phys. properties shows that needle-like ($\alpha + \beta$) brass, obtained from the granular mixture by reheating, is somewhat more brittle than if the structure had resulted from slow cooling of the original melt.

WILLIAM F. EHRET

Properties of brass at the elastic limit. W. KÖSTER. *Z. Metallkunde* 19, 304-10 (1927); cf. *C. A.* 20, 3421.—In the tension-elongation diagram of brass a break is sometimes found in the curve of the elastic limit. This is analogous to the breaks found in the similar curves for ingot Fe. The break is confined to the Cu-Zn alloys sepg. in the heterogeneous condition and is coupled with the mech. arrangement of the components of the structure. There is a decrease in the tension at the elastic limit on the elongation curve of previously stretched brass. This decrease disappears when the samples are heated to 200°. The reason given for the observed decrease is that a metastable condition has been set up. The condition of stress which raises the elastic limit is brought on, on the one hand, by a certain grain structure of the heterogeneous alloy and on the other, by the distribution of stresses due to previous stretching of the samples.

WILLIAM F. EHRET

Constitution and physical properties of some of the alloys of copper, zinc and cadmium. C. H. M. JENKINS. *J. Inst. Metals* (advance copy) 446, 39 pp. (1927); cf. *C. A.* 20, 3420.—A very detailed study of the Cu-Zn-Cd alloys and 2 commonly used brasses contg. Cd is given including thermal and phys. data, equil. diagrams and photomicrographs. Cd is not completely volatilized from brass unless the metal is melted at high temp. Cd in brass causes little alteration in the properties of cold-rolled metal, but reduces the workability of 70-30 alloy when hot. The solid soly. of Cd in α brass diminishes with increasing proportions of Zn from a max. of 2.7%. Cd, beyond what is held in solid soln., occurs as Cu_2Cd . Alloys contg. α brass and more than a trace of Cu_2Cd melt between 549 and 614°. At 614° the β brass reacts with liquid to form α brass and Cu_2Cd changing the properties of the alloy. Increase in temp. increases the solid soly. of Cd in β brass, up to 8% Cd content. At low temp. the γ constituent has a greater power of retaining Cd in solid soln. than the β . Addns. of Cd up to 1% improve the tensile strength and reduce the elongation of brass.

J. W. SHIPLEY

Miscellaneous non-ferrous metals and alloys. H. W. GILBERT. *Ind. Eng. Chem.* 19, 1091-4 (1927).—G. deals with the odds and ends of the non-ferrous alloys employed in automotive transportation. The employment of anti-rust materials, the success of chem. and metallurgical control, an outline of unsolved problems, and of the application of other sciences by the metallurgical chemist are indicated. W. H. B.

Magnesium and its alloys. JOHN A. GANN AND ARTHUR W. WINSTON. *Ind. Eng. Chem.* 19, 1193-1201 (1927).—Results are given of phys. tests of the mech. properties of high-Mg alloys with the following metals: Al, Cu, Ni, Zn, Cd, Sn. New information on the compn. and m. ps. of the various eutectics and compds. formed in the above binary systems is given. Mn is often introduced into the alloys to reduce corrosion and to improve the mech. properties. The properties, compn. and uses of the several Mg alloys called "Downmetal" are discussed. A technic is suggested for the etching and polishing of the alloys. The microstructures of 25 diff. alloys are shown. Complete directions are included for the foundry practice, heat treatment, fabrication and surface finishing of Mg alloys. A list of the many present and possible uses of the alloys is appended.

WILLIAM F. EHRET

Bearing metal bronzes. H. J. ROAST AND FRED NEWELL. *Iron and Steel Can.* 10, 236-44 (1927).—Alloys made from Sn, Pb, Zn, Cu, Mn, P and Al were tested and

compared as to cost. Expts. indicated that re-melting for casting was unnecessary, providing the original melting and mixing were properly carried out. Increasing the Pb, and decreasing the Sn in a bronze does not necessarily soften it. A bronze made from good used metal is just as satisfactory as one made from virgin metal. A Zn-Cu-Al white metal alloy may be substituted for the more costly high Sn bronze for heavy pressure duty. Mn bronzes properly made combine in themselves greater strength, ductility and hardness than ordinary bronzes. A data chart and 35 photomicrographs showing the structure of the alloys discussed are given. Also in *Can. Mining J.* **48**, 651-9(1927).

The aluminum-silicon alloy "alpac" and its applications. LEON GUILLET AND G. SENSAUD. *J. four élec.* **36**, 196(1927).—Cf. *C. A.* **21**, 3337. C./G. F. J. W. SHIPLEY

Aluminum and its alloys. F. C. FRARY. *Ind. Eng. Chem.* **19**, 1094-5(1927).—An outline of the chem. problems, of recent developments, and of future problems in the manuf. of Al and its alloys. W. H. BOYNTON

Note on aluminum bronzes. J. MOREAU. *Arts et métiers* **80**, 218-21(1927); cf. *C. A.* **21**, 3036.—Photomicrographs of a no. of bronze test bars (Al 9-10%, Mn 1-3%) of different sizes and subjected to various mech. and thermal treatments are given and discussed, particularly from the standpoint of trying to translate the results of the micrographic examn in terms of tensile strength and reduction in cross sectional area.

Study of aluminum bronzes. JEAN BOULDOIRES. *Rev. métal.* **24**, 357-76, 463-73 (1927); cf. *C. A.* **21**, 560, 2245-6. A much more detailed account of the work with bibliography of 19 references. A. PAPINEAU-COUTURE

Corrosion-resistant aluminum alloys. E. H. DIX, JR. *Mining Met.* **8**, 395-6 (1927).—Strong Al alloys are best protected from intergranular corrosion by a thin coating of Al of high purity. A photomicrograph of an Al alloy sheet so protected is shown and discussed. The pure coating is electronegative to the strong alloy, so that slight exposure of the latter is not harmful. GEO. F. COMSTOCK

Knowledge of the corrosion of aluminum and its alloys in various electrolytes. N. IZGARUISHEV AND V. JORDANSKII. *Korrosion u. Metallschutz* **3**, 54-8(1927).—The corrosion of Al and its alloys with small quantities of Cu, Ni or Mg in various acid, base and salt solns. has been studied. The corrosion increases with the copper content of alloys, local cells explaining this effect. For pure Al, corrosion is greater in HCl (1*N*) than H₂SO₄ (2*N*); chloride and fluoride ions accelerate corrosion in H₂SO₄ (2*N*) while bromide and iodides are not so noticeable. The effects of solns. of other salts are also reported. J. K. ROBERTS

Orientation of aluminum crystals. KENZO TANAKA. *Japn. J. Phys.* **4**, 137-40 (1927).—Preliminary cold working, such as twisting, elongation and drawing before annealing, has no remarkable effect upon the orientation of the large single crystals in thin Al wires. The majority of the large single crystals are situated in such an orientation that their (210) axes are nearly parallel to the axis of the wire. With the Al plate the crystals are orientated rather at random. C. J. WEST

The lattice constant of metallic cobalt. SINKITI SEKITO. *Sci. Repts. Tohoku Imp. Univ.* **16**, 545-53(1927).—S. makes an x-ray investigation of metallic Co at room temp. and at 700° using an x-ray app. of the Siegbahn type with an iron anti-cathode. The exposures were carried out for 4 hrs. in an atm. of H₂. A sample of granular Co purified by electrolysis and then melted, forged and annealed gave an axial ratio of 1.622 and a lattice const. of 2.498 Å. U. These const. give a d. of Co of 8.89 and S. concludes that the α-cobalt lattice which is stable at ordinary temp. is a hexagonal close-packed type. The lattice const. as detd. at 700° is 3.558 Å. U. and gives a d. of 8.64. The observed and calcd. intensities show satisfactory agreement and S. concludes that the β-cobalt has a face-centered cubic lattice. A sample of electrolytic Co showed the presence only of the α-form. These results confirm the view of Masumoto (*C. A.* **21**, 559) that an allotropic transformation occurs in Co at 477° during heating and at 403° on cooling. The amt. of the discontinuous elongation calcd. from the lattice const. was 0.007 and is in satisfactory agreement with the dilatometric results obtained by M. D. H. POWERS

Some of the effects of sulfur on copper. P. SIEBE. *Z. Metallkunde* **19**, 311-15 (1927).—The presence of S in Cu has been variously considered as (1) beneficial, (2) detrimental, and (3) as without any effect. S usually occurs in Cu as SO₂ or Cu₂S. The effects of both of these on the phys. properties of Cu have been studied by S. Graphs of the phys. properties plotted against % impurity show that S in the form of Cu₂S, even when present up to 0.8%, has little influence upon the tensile strength of electrolytic Cu. The presence of 0.1% S, as Cu₂S, reduces the ductility about 10% and 0.8%

S reduces it about 14%. The Brinell hardness of samples contg. up to 0.8% S fluctuated irregularly between 45 and 59 Brinell units. Test specimens drawn into wires 2 mm. in diam. showed a gradual increase in tensile strength, reaching 10% when the S content was 5%. With increasing Cu_2S content the elec. cond. is gradually decreased. When % S = 0.45 to 0.7 the cond. of the Cu has fallen to 75% of its original value. The presence of Cu_2S greatly reduces the resistance to breaking under the bend test. S. concludes that the greater the amount of S (as Cu_2S) in excess of 0.12%, the poorer will be the quality of the sample as compared to pure Cu. The effect of the presence of S as SO_2 in Cu was studied by heating Cu with CuSO_4 . By decompn of the latter both SO_2 and Cu_2O are formed. The elec. cond. is reduced in a like manner whether the S is present as SO_2 or Cu_2S . However, all other phys. properties are very much poorer, at corresponding S percentages, when S is present as SO_2 . A graphical comparison of the effect of similar amts. of Cu_2S and Cu_2O on the phys. properties of Cu shows that the two act very much alike, the effect of the Cu_2O being slightly more pronounced in all cases. Photomicrographs are presented to show that Cu_2S particles in Cu are flattened out by rolling and are, therefore, rather soft. Cu_2O particles seem to be little affected by rolling. This is held to account for the increased softness and flexibility of Cu sheet contg. as much as 0.45% S as Cu_2S . The presence of a similar amt. of O_2 would render the metal more brittle. The presence of S has a further softening influence upon Cu in that it has a strong affinity for such metals as Ni and As which tend to form mixed crystals with Cu. By combining with the Ni and As the S diminishes their hardening influence.

WILLIAM F. EHRET

Galvanization and tinning of iron and steel wire. M. P. KRUMME. *Centr. Hütten Walzwerke* (March 16, 1927); *Technique moderne* 19, 474-5(1927).—A review of the chief processes of protection of iron and steel wire against oxidation. A. P.-C.

Rolled zinc and zinc-coated products for industrial structures. J. P. HUBBELL AND WM. H. FINKELDEY. *Trans. Am. Inst. Chem. Eng.* 18, 51-67(1926).—Precautions necessary in the use of rolled Zn and Zn-coated steel, and their marked resistance to atm. corrosion are pointed out. Resistance is less in atms. high in SO_2 and CO_2 . Zn-coated products discussed are galvanized sheets, wires, and structural steel, pipe and fittings, and hardware. A brief discussion is included. W. H. BOYNTON

Ore-flotation apparatus. H. WALL. U. S. 1,642,051, Sept. 13.

Ore-sampling apparatus. O. H. GRAY and C. E. MURDOCK. U. S. 1,642,337, Sept. 13.

Apparatus for charging cupolas, etc. W. A. GRIFFIN. U. S. 1,643,208, Sept. 20.

Metal recovery. H. V. WELCH. Can. 271,592, June 14, 1927. Ores contg. Cu and Ag or Au are leached with a soln. contg. a sol. cyanide to dissolve the Cu and Ag or Au; these are pptd. from the soln. by the action of a pptg. agent. At least 4 mols. of cyanide to 1 mol. of Cu present are maintained in the soln. throughout to prevent the formation of insol. $\text{Cu}(\text{CN})_2$ compds.

Removal of oxide from ferrous metal. R. PORTER and J. C. WHETZEL. Can. 271,552. June 14, 1927. Oxide is removed from ferrous-metal articles by first immersing in a caustic alk. soln. to break down the resistance of the oxide to acid, and then immersing the articles in a hot acid soln. of 5-15% HCl or HNO_3 . Cf. C. A. 20, 1215.

Metallurgy of tin. E. A. C. SMITH. Can. 272,867, Aug. 2, 1927. Sn is recovered from materials contg. it by reducing the Sn in the material to the metallic state, leaching

the reduced Sn with a mixed solvent contg. a stannic salt, a ferrous salt and an acid, and electrolyzing the soln. to deposit a portion of the Sn and to regenerate the solvent.

Chloridizing roasting of ores. H. STEPHAN. Brit. 262,392, Dec. 4, 1925. In the chloridizing roasting of burnt ore such as Fe_2O_3 or the like for obtaining the valuable secondary metals such as Cu, Zn and Ag, the process is carried out in the presence of H_2O in the nascent state, *e. g.*, by the use of hydroxides such as $\text{Fe}(\text{OH})_3$ from which H_2O is split off at high temp. or by the use of cryst. salts contg. H_2O such as Na_2SO_4 , MgSO_4 , or NaHSO_4 , or by the use of acids which react with the chloride with production of H_2O .

Treating copper ores. W. DEWAR. Brit. 262,552, Oct. 6, 1925. Cu silicate in ore or other material is converted into oxide (so that it is sol. in an ammoniacal soln. or solvent in the absence of an oxidizing atm.) by subjecting the ore or other material contg. the silicate to a preliminary heating, which may be at $190\text{--}230^\circ$ in the presence of producer gas for $\frac{1}{2}\text{--}1$ hr. or the material may be heated in air at $500\text{--}550^\circ$. After heating, the Cu may be recovered by leaching without employing a current of air or O.

Apparatus for reduction of iron ore or other ores by hydrogen. S. L. MADORSKY. U. S. 1,642,683, Sept. 20.

Separating zinc blende from associated minerals by froth flotation. C. P. LEWIS. Brit. 262,492, Aug. 12, 1925. With a mixt. contg. a mineral such as PbS , sepn. is effected by use, together with a frothing agent, in such quantity as to be wholly in soln., of a small quantity of a metallic salt of an alkyl deriv. of sulfothiocarbonic acid such as an alkali xanthate, which prevents the ZnS from floating while the PbS is enabled to float. Several modifications of the process to different ores are described.

Treating lead dross. O. P. CHISHOLM. U. S. 1,642,358, Sept. 13. In treating impure Pb dross to remove Cu as a speiss, the dross is mixed with fluxes such as SiO_2 and lime rock and subjected to a smelting temp. to promote formation of a speiss contg. Cu and Pb, and the Pb in the speiss is then replaced by Fe without replacing the Cu.

Treating slag. A. CRAWFORD and J. CRAWFORD. Brit. 261,976, March 26, 1926. A small proportion of acid steel slag is added to blast-furnace slag, preferably while molten, to lessen the tendency of the blast-furnace slag to disintegrate.

Rotary puddling furnace. E. F. BLESSING. Brit. 261,812, July 17, 1925.

Furnace for melting type metal, etc. W. ALDERDICE. U. S. 1,642,351, Sept. 13.

Cast iron. H. HANEMANN. Brit. 262,043, Nov. 25, 1925. The proportion of fine flaky graphite in gray cast Fe is increased by heating to a high temp., *e. g.* $1400\text{--}1500^\circ$ for 15 min. or $1250\text{--}1300^\circ$ for 2 hrs. Test castings in the form of small rods may be made from time to time and the fracture or polished face of these observed to det. the progress of the transformation.

Alloyed steel and iron. G. and E. STIG. Can. 272,224, July 12, 1927. Alloyed steel and Fe with Cr is produced by bessemerizing an alloy until the C content is decreased to the desired degree but not lower than that required to retain a sufficient amt. of Si to avoid the formation of nitrides. The product is pulverized and mixed with a suitable quantity of pulverized metal oxides to oxidize the remaining Si. The mixt. is briquetted, and the briquets are introduced into melted Fe or steel to form an alloy.

Centrifugal refining of molten iron and steel. J. MAXIMOFF, M. S. DE COSTA and R. P. D. KREBS. Brit. 262,136, Nov. 28, 1925. An app. is described.

Alloy. S. E. WINSLOW. Can. 271,976, June 28, 1927. A metallic compn. comprises Ni and Cu in approx. the atomic proportions of 10 to 4, and Sn in an atomic proportion of not greater than 1.

Magnetic alloy. I. F. KINNARD. Can. 273,189, Aug. 16, 1927. A magnetic alloy contains Ni 60–80, Cu 40–20, and Fe approx. 2%. The alloy has a substantial and approx. a linear negative temp. coeff. of permeability between 0 and 100° , which gradually reduces to unity in the neighborhood of 100° .

Magnetic alloy of high permeability. E. GUMLICH. Brit. 262,153, Nov. 30, 1925. Fe 20–46, Ni 50–75 and Mn 4–14% form alloys having high permeability at low magnetizing forces, low coercive force and high elec. resistance.

Separating constituents of alloys. C.-G. BOSSIERE and H. ZANICOLI. U. S. 1,642,574, Sept. 13. See Brit. 241,880 (C. A. 20, 3442).

Steel alloy. L. M. BROWN. U. S. 1,643,054, Sept. 20. An alloy steel which is suitable for making cutting tools comprises C 0.40–1.00, Mn 0.50–1.50, Si 1.50–2.50 and Mo and V at least 0.15% of each and 0.50–1.00% of both together.

Alloy irons and steels. W. B. HAMILTON and T. A. EVANS. Brit. 262,206, Sept. 24, 1925. In making alloy irons and steels such as those contg. Cr, alloy Fe scrap such as rustless Fe scrap, with or without mild steel scrap, is melted with sufficient slag-

forming materials to form a slag of sufficient mass for starting and ore is then added with reducing material in such quantity as to reduce the added ore, the Fe oxide in the slag and the alloy metal compds. used. The C content of the metal may be reduced by addn. of oxide during melting.

Aluminum-base alloy. R. S. ARCHER. Can. 272,656, July 26, 1927. An Al-base alloy contains 3-15% Si, more than 0.8% Fe and 0.05-2.0% of a metal of the 6th group of the periodic system having an at. wt. less than 190.

Aluminum and lithium alloy. J. CZOCHRALESKI. Can. 272,309, July 12, 1927. Articles are made from an Al alloy contg. 1-42% Zn, up to $\frac{1}{2}$ of 1% Li, up to 4% Cu and the rest chiefly Al. The articles are heated to a temp. above 100°, and are then cooled. Cf. C. A. 21, 1247.

Aluminum alloy. W. A. MUDGE. Can. 271,780, June 21, 1927. In the manuf. of Al-Cu-Ni alloys, an alloy contg. not over 85% Al is added to a molten bath contg. Cu and Ni.

Alloy for electric conductors. W. S. SMITH and H. J. GARNETT. Can. 273,100, Aug. 16, 1927. An alloy suitable for loading telephone and telegraph conductors is composed of Ni 65, Fe 18, Cu 10, Cr 7, and Mn 0.5%.

Alloy for metal-cutting tool. W. A. WISSLER. Can. 273,209, Aug. 16, 1927. A cutting edge of a metal-cutting tool is composed of an alloy contg. Cr 15-40, W 15-35, B 0.5-2.5, C 0.75-2.5, Ni 15-50%, and a substantial quantity of Co. Cf. C. A. 21, 887.

Metal for bearings. H. M. WILLIAMS and A. L. BOEGEHOLD. U. S. 1,642,347, Sept. 13. A mixt. of finely divided Sn, Cu and salicylic acid, with or without graphite and Pb, is compressed into the desired form under a pressure of about 80,000 lbs. per sq. in. and heated to about 675° in a non-oxidizing atm. to form bearings or bushings. U. S. 1,642,348 specifies mixing finely divided alloyable metals such as Cu and Sn together with a finely divided material such as salicylic acid which volatilizes on heating, and heating the materials in the presence of a volatile flux such as NH_4Cl to effect alloying of the metals. U. S. 1,642,349 specifies mixing metals such as Cu and Sn with material such as salicylic acid and MgCO_3 which partially volatilizes when heated and leaves a residue serving as a supporting filler for the bearing material, compressing this mixt. and then heating it under non-oxidizing conditions to effect alloying of the metals and decompn. of the added auxiliary material.

Metal-treating composition. F. M. BECKETT. Can. 272,167, July 5, 1927. Molten metal is treated with a compn. composed of Zr, which is not combined with C, a percentage of Si in excess of half the Zr percentage, and an effective quantity of Mn capable of lowering the m. p. of zirconia-silica slags.

Surface treatment of aluminum. A. PACZ. Can. 273,443, Aug. 30, 1927. Al articles are provided with a hard, permanent surface by subjecting them to the simultaneous action of a sol. fluosilicate, a salt of a non-ferrous metal of the iron group and an alkali nitrate.

Annealing metal. A. S. MACDONALD. Can. 272,002, June 28, 1927. Non-ferrous metal is annealed without soaking by heating up to a proper annealing temp. by passage of current through it, and cutting off the current the moment such temp. is reached.

Tools of tungsten carbide, etc. F. KRUPP AKT.-GES. Brit. 262,723, Dec. 12, 1925. Solid bodies produced by pressing a mixt. of hard powder such as W carbide and softer powder such as Co, Ni or Fe are sintered at 700-1100°, shaped as far as possible, further sintered at a higher temp., and finished.

Apparatus for cooling and annealing metal bars. J. R. GEORGE. U. S. 1,642,437, Sept. 13.

Coating electron metal. W. PIEPER. U. S. 1,642,309, Sept. 13. In order to produce a weather-proof protecting coating on Mn base Zn-Al alloy or similar metals by oxidation, the metal is treated with a soln. of NaOH contg. KNO_3 , free from oily substances, and which also may contain other oxidizing agents such as Fe(OH)_3 .

Protection of metals from corrosion. S. D. and A. C. ZIMMERMAN. Can. 271,441, June 7, 1927. Metals are coated by immersion in a heated soln. of a sol. silicate held at a temp. below its b. p., and then heated.

Protecting ferrous metals from corrosion. T. E. MURRAY. Brit. 261,809, June 24, 1925. Fins of boiler tubes or other articles are coated with Cr and Ni, preferably electrolytically, and then heated in an oxidizing atm. to cause the Cr to alloy with the Fe and form an outer adherent oxide coating.

Prevention of rust on iron and steel. T. W. COSLETT. Can. 272,406, July 19,

1927. The oxidation or rusting of Fe and steel is prevented by treating with a soln. of H_3PO_4 contg. Zn and B. Cf. C. A. 21, 372.

Soldering flux. C. J. MEIER. U. S. 1,642,884, Sept. 20. A flux is formed from Zn 240, HCl (1.2 sp. gr.) 567, aq. NH_3 (0.9 sp. gr.) 142, NH_4Cl 15, Bi subnitrate 60, alc. 12 and spirits of turpentine, 2 parts.

Solder for aluminum. A. J. LINE. Brit. 262,192, Sept. 8, 1925. Ag 3 and Al 12 parts are melted together or mixed in the form of filings.

Weld rod for arc welding. C. B. LANGSTROTH and G. G. WUNDER. U. S. 1,643,274, Sept. 20. Metallic wire is coated with wood flour previously digested, e. g., with an alk. soln., to remove its gas-producing properties.

Apparatus for pickling coils of wire or rods. H. A. BEACH and H. K. BEACH. U. S. 1,643,186, Sept. 20.

Ingot mold. EMIL GATHMANN. U. S. 1,643,241, Sept. 20.

10 - ORGANIC CHEMISTRY

CHAS. A. ROULLER AND CLARENCE J. WEST

New methods of complex organic synthesis from elements. V. P. KRAVETZ. *J. Chem. Ind.* (Russia) 2, 335-7; *Chem. Zentr.* 1926, I, 3313.—A review. C. C. D.

Direction lines in organic chemical synthesis. J. P. WIBAUT. *Chem. Weekblad* 24, 370-5.—An address. The trend of org. synthesis with growth of this branch is discussed. The use of org. reactions in compd. prepn., studies on structure with proof of structure, catalytic reactions, hydrolytic splitting and enzyme reactions are presented.

M. ACHTERHOF

A new class of tautomeric compounds; ionic theory of tautomerization. CHARLES PREVOST. *Compt. rend.* 185, 132-4 (1927).—The word *synionie* is given to designate those properties exhibited where a mobile group is attached to an atom which in turn is connected by a double bond to another atom. For instance, there exists the possibility of the following forms: $\text{A} = \text{B} - \text{CX}$ (I) may ionize to $\text{A}^+ - \text{B}^- - \text{C}^+$, X^- which is also an active form of $\text{XA} - \text{B} = \text{C}$ (II) (cf. Lowry, C. A. 20, 3620). When X is only slightly mobile, I and II can exist separately. If X is very mobile there are two possibilities: either it occupies that position giving it greater mobility (pseudoisomerism), or, if the influence of A and C are similar, I and II exist together (desmotropism). Examples are given showing the effect of physical conditions and groups on the foregoing tautomerization. P. chooses the ionic theory because it is the only one providing an explanation for the influence of substituents and physical conditions on the nature of the tautomerization.

FREDERICK C. HAHN

Oxidation of wood charcoal with sulfuric acid. ERNST PHILIPPI AND REINHARD SEKA. *Monatsh.* 48, 375-89 (1927).—By using 100 g. charcoal and 1200 g. H_2SO_4 (d. 1.83), the following yields of pyromellitic acid are obtained from the following woods (g. pure acid): hazel, 1.5; beech, 1.13; willow, 0.75; cherry, 1.4; apple, 1.1; sycamore, 1; birch, 1; alder, 1; linden, 2. In studying the gases of the oxidation reaction it is found that the SO_2 curve sinks between 100° and 250° (15-75 min.) at first rapidly, then slowly and then remains nearly horizontal ($75-165$ min.); the CO_2 curve gradually increases between 225° and 300° (2nd hr.), then follows a noticeable min. with nearly const. temp. (3rd hr.) and finally an increase to about the previous height, and remains const. to the end of the reaction. The residual gas consists of CO and is 6-8% for 2-2.5 hrs. and then increases until it is 30% at the end of the reaction.

C. J. WEST

Oxidation of *n*-triacontane. FRANCIS FRANCIS AND N. E. WOOD. *J. Chem. Soc.* 1927, 1897-902.—The similarity is shown between the oxidation of synthetic $\text{C}_{30}\text{H}_{62}$, the mixt. of solid hydrocarbons termed paraffin wax and the pure constituents isolated from the latter; this extends not only to the velocity of oxidation but to the nature and amts. of the products formed. The highest acid present among the acidic products of the oxidation of $\text{C}_{30}\text{H}_{62}$ has 26 C atoms and appears to be identical with cerotic acid from beeswax. Other acid products were $(\text{CH}_2\text{CO}_2\text{H})_2$, $\text{C}_{24}\text{H}_{48}\text{O}_2$, $\text{C}_{26}\text{H}_{50}\text{O}_2$, $\text{C}_{16}\text{H}_{32}\text{O}_2$, $\text{C}_{22}\text{H}_{44}\text{O}_2$ and probably others. The inert products contain a compd., $\text{C}_{20}\text{H}_{40}\text{O}_2$, m. 69° , either a ketonic alc., or a di-HO deriv.; from the residue was isolated a ketone, $\text{C}_{40}\text{H}_{80}\text{O}$, m. 62.5° , purified through the oxime. The ketone is probably $\text{Me}(\text{CH}_2)_{18}\text{CH}_2\text{COPr}$.

C. J. WEST

Optically active borohydroxyisobutyric acid. J. BÖSEKEN, H. D. MÜLLER AND R. T. JAPHONGJOUW. *Rec. trav. chim.* 45, 919-22 (1926).—The resolution of asymmetric B compds. derived from α -hydroxyisobutyric acid and α -hydroxy- α -methylbutyric

acid has been effected by means of their brucine salts. A soln. of α -hydroxyisobutyric acid (2 mols.), boric acid (1 mol.), and brucine (1 mol.) in the minimal quantity of alc. was heated at 50° in a vacuum desiccator, the vitreous mass dissolved in ether, and the ether evapd., until the residue after drying over P_2O_5 was sol. in $CHCl_3$. Fractional extn. of this soln. with light petroleum yields the *l*-brucine *l*-di(α -hydroxyisobutyryl)-borate, $[\alpha]_D^{18} -55.8^\circ$, while the $CHCl_3$ residue contains the *ld*-salt, $[\alpha]_D^{18} -25.6^\circ$, both of which slowly change to the const. value, $[\alpha]_D^{18} -42^\circ$, of the racemate. By substitution of the appropriate base instead of brucine in the above prepn., the cryst. aniline, *o*-toluidine, and dimethylaniline salts are obtained. Similar resolution of brucine di-(α -hydroxy- α -methylbutyryl)borate yields the *ll*-isomeride, $[\alpha]^{18} -44.4^\circ$, and the *ld*-form, $[\alpha]_D^{18} -16.1^\circ$, both changing to the value of the racemate, $[\alpha]_D^{18} -28^\circ$. B. C. A.

Mutual transformations of alkyl phosphites. M. JANCZAK. *Rocz. Chem.* 6, 774-93(1926).—Na di-Et, di-Pr and di-*iso*-Bu phosphites are converted by the action of $AgNO_3$ into the corresponding Ag salts, which are also produced, although in smaller yield, from the corresponding acids. This supports the view that P is trivalent in the ester salts, but quinquivalent in the acid esters. $EtONa$ reacts with $(EtO)_2PH:O$ to yield $(EtO)_2POONa$, $EtO.PH(O)ONa$, Et_2O and $EtOH$. With $(EtO)_2PEt:O$ it reacts as follows: $(EtO)_2PEt:O + EtONa \rightarrow EtOPeEt(O)ONa + Et_2O$, while no reaction takes place with $P(OEt)_3$, $EtOPH(O)ONa$ or $EtO.PEt(O)ONa$. B. C. A.

Decomposition of some halogenated sulfides and the nature of the "polymeric" ethylene sulfides. E. V. BELL, G. MACD. BENNETT AND A. L. HOCK. *J. Chem. Soc.* 1927, 1803-9.—An indication of intermol. addn in a γ -halogenated sulfide was obtained by the conversion of γ,γ' (C_2H_5)₂S into the corresponding diiodide; on keeping the latter decompd., giving $1(CH_2)_3I$ and a dark viscous material contg. ionic I. Heating 2.5 g. $(ClCH_2CH_2)_2S$ in a sealed tube for 18 hrs. in boiling PhOH vapors gives 0.5 g., (50%) of dithian and $C_2H_4Cl_2$, the formation of dithian is due to a series of reactions involving both the intermol. and the intramol. types of addn. Similarly, dithian heated at 180° with excess of $C_2H_4Cl_2$ gives $(ClCH_2CH_2)_2S$, showing that the reactions are reversible at each stage. The "polymeric" ethylene sulfide of class I (cf. Meyer, *Ber.* 19, 3262(1886)) gives no dithian when dry-distd. or when heated in boiling PhOH for several hrs.; heated with $C_2H_4Br_2$ at 130° for 18 hrs. it gives dithian; dithian also results when PhOH satd. with HBr is used. $S(C_2H_4OH)_2$, $C_2H_4(SC_2H_4OH)_2$ and $S(C_2H_4S-C_2H_4OH)_2$ yield dithian readily when heated with a boiling soln. of HBr in PhOH. C. J. WEST

cis-trans-Isomerism of disulfoxides. E. V. BELL AND G. MACD. BENNETT. *J. Chem. Soc.* 1927, 1798-803.—Oxidation of 1,4-dithian by H_2O_2 in glacial AcOH at 0° for 24 hrs. gives the α -disulfoxide (Crafts, *Ann.* 124, 110(1862)), decomp. 263° , monoclinic, $a:b:c = 1.267:1:0.979$, $\beta 104^\circ 3'$; d_4^{20} (vac.) 1.570; 100 cc. EtOH dissolves less than 1 g. at the b. p. and approx. 0.1 g. at 20° ; 90.7% EtOH at 22° dissolves 0.38 g. From the mother liquor there is isolated the β -dithian dioxide, decomp. $235-50^\circ$, anorthic system, d_4^{20} (vac.) 1.554; crystallographic data are given; it is 3 times as sol. in cold EtOH as the α -isomer; in 100 cc. 90.7% EtOH, 2.26 g. dissolves at 22° . The oxidation product contains 11% of the β - and 89% of the α -isomer. Both isomers are reduced by Zn and HCl to 1,4-dithian. The two isomers could not be interconverted. α -Dimethylethylene disulfoxide, m. $163-4^\circ$; β -isomer, m. $128-30^\circ$; at room temp. 100 cc. soln. in AcOH contains 0.16 α - and 0.42 g. β -isomer. It is tentatively assumed that the α -isomer is the *trans* form. C. J. WEST

Methods for condensing aldehydes and ketones. VICTOR BOULEZ. *Rev. parf.* 7, 380(1927).—Condensation of citral and Me_2CO is obtained rapidly without need for agitation or other solvents and without resinification, in concd. aq. Na salicylate soln. to which has been added more or less free NaOH or KOH. The excess Me_2CO and the Na salicylate can readily be recovered. Citral and Me_2CO can also be condensed by diffusional in an alc. soln. of dry neutral K soap. A. P.-C.

Configurational relationships of 2-hydroxybutyric and lactic acids. P. A. LEVENE AND H. L. HALLER. *J. Biol. Chem.* 74, 343-50(1927); cf. *C. A.* 20, 579.—*d*-2-Hydroxybutyric acid was transformed into 1,2-dihydroxybutane. $ClCH_2CO_2Et$ was converted into $HOCH_2CO_2Et$. The latter was reduced by fermentation to *d*-1,2-dihydroxybutane. This glycol was converted into the *l*-chlorohydrin, which was reduced to *d*-EtMeCHOH. Hence, *l*-1,2-dihydroxybutane derived from *d*-2-hydroxybutyric acid yields *l*-EtMeCHOH and *d*-2-hydroxybutyric acid has the same configuration as *d*-lactic acid, *i. e.*, it belongs to the *l* series of hydroxy acids. ARTHUR GROLLMAN

Methylmercuric halides and hydroxide. L. B. HINKEL AND T. H. ANGEL. *J. Chem. Soc.* 1927, 1948-50; cf. Marvel and Gould, *C. A.* 16, 1561.—The conditions given for the prepn. of MeHgI by M. and G. resulted only in the production of the double compd., MeHgCl₂·2MeHgI (MeMgI + excess HgCl₂), m. 129°; this compd. has a more intense and unpleasant odor than MeHgI. MeHgI is obtained from MeMgI and HgI₂. The double compd. is converted by HgCl₂ into MeHgCl. MeHgOH is obtained by shaking 10 g. MeHgI in 50 cc. MeOH and 2 cc. H₂O with 7 g. Ag₂O contg. 34% H₂O; the filtered soln. is evapd. to dryness, warmed to 30° with 20 cc. PhCl and EtOH added until soln. results. On removing the EtOH *in vacuo* and repeating the purification several times, pure MeHgOH is obtained, m. 145°. C. J. WEST

Natural rotatory dispersion, in the ultra-violet, of aqueous solutions of neutral sodium, potassium and ammonium tartrates. R. DESCAMPS. *Compt. rend.* 185, 116 9 (1927); cf. *C. A.* 21, 3045.—Results obtained at λ 5780 to 2536 on solns. of neutral Na, K and NH₄ tartrates and tartaric acid partially neutralized with NaOH, by means of a special photographic spectropolarimeter (*Compt. rend.* 182, 22 (1926)) are tabulated and discussed. The dispersion curves ($[\alpha]$, λ^2) for the neutral tartrates rise regularly with decrease in wave length, reach a max. between λ 3022 and 2894, then fall off sharply and $[\alpha]$ changes sign. This confirms Lowry and Austin (*C. A.* 16, 3581) as to the complexity of the $[\alpha]$ of alkali tartrates in the visible spectrum, while the NH₄ tartrate curve does not agree with Nutting's (*Phys. Rev.* 17, 1(1903)). The Darmon lines of the neutral tartrates and the partially neutralized tartaric acid do not converge to the intersection point of the Darmon lines of tartaric acid solns., the difference being greater in the ultra-violet than in the visible spectrum. In passing from tartaric acid to tartrate soln. by progressive neutralization, the Darmon lines corresponding to successive stages of neutralization intersect along a given straight line. A. PAPINEAU-COUTURE

Separation of the optical antipodes of chlorobromopyruvic acid. MARIO GARINO AND GIORGINA BORNATE. *Gazz. chim. ital.* 57, 330-2(1927).—The method adopted for the sepn. was to prep. the salts with optically active alkaloids, for which purpose quinine, cinchonine, strychnine and brucine were chosen. The results were without success, as described in the following expts. ClBrCHCOCO₂H and quinine (equimol. parts) in EtOH evapd. at room temp. gave lustrous needles and a brown mother liquor. Attempts to recryst. the salt were unsuccessful, there being a marked tendency to form a brown resin. The unpurified quinine chlorobromopyruvate, which was very unstable, turned yellow at 135° and black through decompn. at 250°. A 1% EtOH soln. showed $[\alpha]_D^{15}$ —115°. Treated in a similar manner, cinchonine and ClBrCHCOCO₂H formed a non-crystallizable pitch. From hot alc. ClBrCHCOCO₂H and brucine (equimol. parts) there crystd. a salt, which, chiefly because of its practical insolv. in all solvents, could not be purified. The most favorable solvent was EtOH, in which 0.23% dissolved at 15°. The unpurified salt turned yellow at 108° and decompd. completely at 195°. Its 0.2% EtOH soln. showed $[\alpha]_D^{15}$ —37.5°. Alc. (ClBrC)CHOCO₂H and strychnine (equimol. parts) at room temp. gave a readily crystd. salt, which turned brown at 150° and decompd. completely at 185°. EtOH dissolved approx. 12% at 15°, CHCl₃ 20%, Et₂O 1% and water 1.75%, the soly. increasing with increase in temp. The value of $[\alpha]$ depended upon the solvent and the concn. For 1% solns. $[\alpha]_D^{15}$ was —31.5° in EtOH, —23.5° in CHCl₃ and —28.0° in water. Attempts to sep. by fractional crystn. the 2 optical antipodes from EtOH and CHCl₃ solns. did not give conclusive results, since the various fractions differed little or not at all in their $[\alpha]$ values. From 1.75% aq. solns. at 10° and then at 5° were obtained crystals which, tested immediately, showed in 1% aq. soln. a max. value of $[\alpha]_D^{15}$ viz., —64.3°. After 1 hr. this changed to —43.8° and after 3 hrs. to —30.2°. The salt, therefore, racemizes very rapidly and renders very difficult the sepn. of pure antipodes. Attempts at sepn. by means of microorganisms were also unsuccessful, racemization being more rapid than their destruction of one of the antipodes. C. C. DAVIS

α -Sulfo-*n*-valeric acid. H. J. BACKER AND M. TOXOPEUS. *Rec. trav. chim.* 45, 890-907(1926).—The prepn. and resolution of α -sulfo-*n*-valeric acid and its derivs. have been effected, and the dispersions of its salts detd. *dl*- α -Sulfo-*n*-valeric acid, + 1.5H₂O, m. 65.5° (Ba, Cu + 2H₂O, Ni + 2H₂O, Cu + 1H₂O, CuH + 5H₂O, Ag, AgII, aniline, m. 146°, strychnine + 4H₂O, strychnine II + 4H₂O, brucine + 6H₂O, brucine H + 2H₂O, salts described), may be obtained by the sulfonation of *n*-valeric acid; it is also obtained in 70% yield by the action of SO₃ on propylmalonic acid, and decompn. of the mixed malonic sulfuric anhydride, which is the initial product of the reaction. *d*- α -Sulfo-*n*-valeric acid, $[M]_{D^{25}} + 1.7^\circ$ (aniline, and aniline II salts), is obtained by repeated crystn. of the brucine H salt and is isolated as its Ba salt + 3H₂O,

[M] + 37°, while conversion of the mother liquors into the normal brucine salt and fractional crystn. yield *l*- α -sulfo-*n*-valeric acid, [M]₀₂₅ - 1.7° (BaH, Co + 2H₂O, Ni + 2H₂O, Cu + 1H₂O, CuH + 5H₂O salts), isolated as its Ba salt + 3H₂O, [M]₀₂₅ - 37°, which is also obtained by crystn. of the strychnine H salt of the *dl*-acid. The metal H salts of the active acids have approx. the same rotation as the parent acids, and show very little dispersion, but the normal salts show a much greater rotation and dispersion in aq. solns., but no dispersion in alc. soln. On heating aniline sulfovalerate with excess of aniline for 5 hrs., *aniline valeranilide- α -sulfonate*, m. 257° (decompn.) (Ba + 2H₂O, Co + 3H₂O, Ni + 3H₂O, and Cu salts), is obtained, which on resolution by means of its strychnine salt yields *d*-valeranilide- α -sulfonic acid, [M]₀₂₅ (in water) + 2.9°, isolated as its Ba salt, + 3H₂O (Co + 3H₂O, Ni + 3H₂O, and Cu salts). *d*-Sulfovaleric acid heated with excess of PhNH₂ yields aniline *l*-valeranilide- α -sulfonate. The metal salts of *d*-valeranilide- α -sulfonic acid in aq. soln. have practically the same rotation as the free acid, but in alc. soln. the value in each case is increased sixfold, and the Co and Ni salts show abnormal dispersion curves in this solvent, due, probably, to the coordination of the metal with the N. The action of *o*-C₆H₄(NH₂)₂ on α -sulfovaleric acid yields β -benzimidazolebutane- α -sulfonic acid (decompn. without fusion) in 70% yield (Ba + 4H₂O, Co + 5H₂O, Ni + 5H₂O salts), which is resolved by slow crystn. in the cold of a mixt. of the Ba salt and strychnine acetate, which yields the *d*-acid (Ba salt + 4H₂O, $\frac{1}{2}$ [M]₀₄₄ 14.8°, Co salt + 5H₂O). Treatment of *d*-sulfovaleric acid with *o*-phenylenediamine yields the *l*-benzimidazolebutanesulfonic acid, isolated as its Ba salt. B. C. A.

Synthesis of succinic dialdehyde. S. SUGAWA. *J. Pharm. Soc. Japan* No. 545, 551-7 (1927).—AcOEt, HCO₂Et and Na give Na formylacetic ester, which on treatment with EtOH-HCl gives β , β -diethoxypropionic ester (I) (yield 60%). Sapon. of I with EtOH-KOH gives the K salt of the propionate, which on electrolysis in aq. soln. gives succinaldehyde tetraethylacetal (yield 67%). The subsequent decompn. with mineral acid gives the dialdehyde. NAO UYHI

Action of the metallic derivatives of ethyl dehydroundecenoate upon alkyl halides. WM. W. MYDDLETON AND R. G. BERCHEM. *J. Chem. Soc.* 1927, 1928-30.—CH : C(CH₂)₈CO₂Et and AgNO₃ in EtOH give the Ag deriv., AgNO₃.CAG : C(CH₂)₈CO₂Et (I), sol. in hot EtOH and stable in bright sunlight. I and C₇H₁₅Br in EtOH give AgBr, EtO-C₇H₁₅ and the free ester; in the absence of EtOH C₇H₁₅ results. PrI, iso-BzI, EtBr and EtI also give quant. AgBr and the free ester. NaNH₂ and the ester give a Na deriv., which reacts like the Ag deriv. C. J. WEST

Configuration of oleic and elaidic acids. J. BÖESEKEN AND A. H. BELINFANTE. *Rec. trav. chim.* 45, 914-8 (1926).—A preliminary note outlining 2 methods by which it is hoped to det. the configurations of oleic and elaidic acids. In the first method, the Et esters are converted into the octadecenols and thence into octadecenes of similar configurations to the original acids. That obtained from elaidic acid m. +2°, and that from oleic acid m. about -15°. The second method is based on a comparison of the glycols obtained by oxidation with alk. permanganate or with peracids and subsequent hydrolysis of the oxido acid. B. C. A.

The saturation ability of rosin acids. III. B. M. MARGOSCHES, K. FUCHS AND W. RUZICZKA. *Chem. Umschau Fette, Oele, Wachse u. Harze* 34, 215-7 (1927).—A discussion of the "plus acid" in the I no. detn., and the analogy between abietic acid and pinene. The formation of HI when I is added to unsatd. fatty acids, is usually considered a secondary reaction, either by splitting off a neighboring H atom or by hydrolysis. M., F. and R. consider the HI formation a primary reaction, occurring as it does during the 5 min. required for the rapid method of I no. detn. developed by Margosches-Hinner-Friedmann the iodosous acid splitting off HI and forming an anhydride-like product, which later may also react with absorbed H₂O. The I no. of *d*-pinene ([α]_D = +34.65) by Hübl's method, with 70% excess of I, is 375, while *l*-pinene ([α]_D = -34.98) under the same conditions shows 251; by M.-H.-F.'s rapid method similar results were obtained. The free HI formed for *d*-pinene was 86% of the I used, equal to 83-50 = 36% "plus acid," and for *l*-pinene 68-50 = 18% "plus acid." It thus seems that the added I which det. the I no. also fixes the amt. of liberated HI. Since the unsatd. pinene is characterized by one double bond and one bridge-union, it is probably the latter which det. the amt. of HI. If it be assumed that the added iodosous acid splits off HI and forms in one case monoiodohydrin, C₁₀H₁₇O₂I, and in the other case the anhydride, C₁₀H₁₆O₂, then the monoiodohydrin would correspond to 75% acid (= 25% "plus acid") and the anhydride to 100% acid (= 50% "plus acid"). The free acid actually found for pinene and for abietic acid amts. to only 36%, lying between 25 and 50%, so that the 36% may represent a mixt. of these two compds. or of their isomers

and this would also confirm the abietic acid formula, which assigns to it one double bond and one bridge-union.

Anhydrides of aliphatic acids. D. HOLDR. *Chem.-Ztg.* **50**, 994-6(1926).—A review of the present knowledge of anhydrides and a discussion of their properties, methods of prepn., liability to decompn., and use for edible purposes. B. C. A.

Is melezitose a combination of sucrose with glucose? M. BRIDEL AND CH. AAGAARD. *Compt. rend.* **185**, 147-8(1927).—Of 3 prepn. made from cultures of *Aspergillus niger* by different methods, one hydrolyzes sucrose readily but has little action on melezitose; another hydrolyzes melezitose readily but has little action on sucrose. These facts do not support the hypothesis of Kuhn and von Grundherr (*C. A.* **21**, 64).

L. W. RIGGS

The presence of gentiobiose in the products obtained by the hydrolysis of maize. W. EKHARD. *Z. Spiritusind.* **50**, 145(1927).—A brief résumé of the work on isomaltose is given and the relation of the so-called isomaltose to gentiobiose is discussed. Gentiobiose is a component of the sirup known as isomaltose. The m. p. and the rotation of gentiobiose and its derivs. are given. Only 70% of the wt. of glucose produced by acid hydrolysis is fermentable.

C. N. FRIEY

Synthesis of lactose. AMÉ. PICTET AND H. VOGEL. *Compt. rend.* **185**, 332-4(1927).—Equal wts. of β -galactose and β -glucose were heated with a small amt. of ZnCl_2 (I) under 15 mm. pressure for 0.5 hr. at 175° , the product was dissolved in H_2O and I sepd. by the addn. of Ag_2CO_3 . The residue after evapn. of the filtrate was heated with Ac_2O and NaOAc and sapond. with NaOMe . The sugar thus obtained is believed to be lactose as checked by its rotation, osazone, acetate and nitrate. D. H. POWERS

Relation between rotatory power and structure in sugar group. I. C. S. HUDSON. *Bur. Standards, Bull.* **21**, 241-384(1926); cf. *C. A.* **20**, 2484.—A summary of the author's earlier work, and a collection of 10 papers published during 1924-25. A table of the rotatory powers of 104 pure substances examd. during the course of the work is given. B. C. A.

Synthesis of glucosides. I. Synthesis of indican. ALEXANDER ROBERTSON. *J. Chem. Soc.* **1927**, 1937-43.—*Me 3-hydroxyindole-2-carboxylate*, m. $157-8^\circ$ (I) (*Ac deriv.*, m. 145°) and tetraacetyl- α -glucosidyl bromide in $\text{KOH-Me}_2\text{CO}$ give *Me 3-tetraacetyl- β -glucosidoxyindole-2-carboxylate* (II), m. $229-30^\circ$; a suspension of 3 g. in dry MeOH , satd. at 0° with dry NH_3 gives 0.3 g. *3- β -glucosidoxyindole-2-carboxylamide*, darkens 245° , m. $254-6^\circ$ and a straw-colored liquid, probably impure *Me 3- β -glucosidoxyindole-2-carboxylate*, since with 6% HCl it gives I and with Ac_2O and AcONa it gives II. II and KOH in MeOH give the K salt (III) of *3- β -glucosidoxyindole-2-carboxylic acid*, m. $230-1^\circ$; dil. HCl contg. FeCl_3 gives indigotin. *1-Acetyl-3-tetraacetyl- β -glucosidoxyindole(pentaacetylindican)*, m. 148° , results from III, fused NaOAc and Ac_2O , from II and 5% Ba(OH)_2 at $40-5^\circ$ for 24 hrs., and from *1-acetyl-3-hydroxyindole* and tetraacetyl- α -glucosidyl bromide in $\text{KOH-Me}_2\text{CO}$. Dry NH_3 in MeOH converts this into *3- β -glucosidoxyindole(indican)*. C. J. WEST

Chemistry of starches. XX. Dispersion of polyamyloses. HANS PRINGSHEIM AND PAUL MEYERSOHN. *Ber.* **60B**, 1709-16(1927); cf. *C. A.* **20**, 1390.—The computed mol. optical rotation of diamylose (I) is 44,200, and of triamylose (II) is 72,200; the exptl. value for the mol. rotation of II is 73,400. Subtracting the mol. rotation of the γ -glucose residue (28,000) from the mol. rotation of I leaves 16,200 as the mol. optical rotation of the unknown constituent of I; subtracting $2 \times 28,000$ from the exptl. mol. rotation of II leaves 18,400 as the mol. optical rotation of the unknown constituent of II; similar computations with diamylose acetate gives a value of 19,100, and for triamylose acetate 104,300 and 101,500. Cryoscopic detns. give the mol. wts. of several acetate derivs. as follows: (the first no. gives the exptl. value, the second the calcd. value) in C_6H_6 diamylose acetate (III), 576; diamylose acetate (IV) from the decompn. by heat of tetraamylose acetate, 576; tetraamylose acetate (V) 1050, 1152; in glacial AcOH IV 577, 576; V 544, 1152; in PhOH V 618, 1152. The calcd. mol. wt. for hexaamylose acetate is 1728; the exptl. values are 1690 with glacial AcOH , 1705 and 1687 with C_{10}H_8 , 1587 with camphor, and 537 with PhOH . C. D. INGERSOLL

Saccharification of the dextrins. P. PETIT AND RICHARD. *Compt. rend.* **185**, 224-5(1927).—Dextrins were formed by the action of amylase and pptn. by concd. alc. at 50° and at 70° , different dextrins being produced at the different temps. These were purified by washing in boiling alc. and again were subjected to the action of amylase under temps. ranging from 20° to 70° , and the amt. of maltose formed was detd. For dextrins prepd. at 50° , the maltose formed may be represented by a linear equation, but for the dextrins prepd. at 70° , a logarithmic expression must be added to the linear equation in order to represent the maltose formed. L. W. RIGGS

d-Galacturonic acid from pectins. K. SMOLENSKI AND W. WLOSTOWSKA. *Rocz. Chem.* 6, 743-6 (1926).—A monohydrate of d-galacturonic acid, m. 116-20°, isolated from beet pulp, is described. B. C. A.

The so-called carbohydrate group in protein. (Preparation of glucosamine-mannose.) SIGMUND FRANKEL AND CURT JELLINEK. *Biochem. Z.* 185, 392-9 (1927).—An elaborate procedure was followed to sep. the carbohydrate group from egg albumin. This substance is found to be glucosamino mannose, which does not rotate polarized light, has no reducing power, and the amino group of which can only be freed by hydrolysis. S. MORGULIS

Azides. A. ANGELI. *Atti accad. Lincei* [6], 5, 732-6 (1927).—The unsettled problem whether HN_3 and its derivs. have open-chain formulas, $\text{HN}:\text{N}:\text{N}$, or ring formulas, $\text{HNN}:\text{N}$, is discussed. The various exptl. facts advanced in support of the chain

formula are in accord with the reactions: $\text{PhN}:\text{NNH}_2 + \text{O} \longrightarrow \text{PhN}:\text{N}:\text{N}$ and $\text{PhN}:\text{NCl} + \text{NH}_2\text{OH} \longrightarrow \text{PhN}:\text{N}:\text{N}$. On the other hand the formation of PhN_3 from $\text{PhN}(\text{NO})\text{NH}_2$ seems at first an argument against the open chain. But the transposition discovered by Thiele (*C. A.* 5, 457), where the NO group of H_2NNH_2 derivs. migrates from 1 N atom to the other may explain the reaction, thus: $\text{PhN}(\text{NO})\text{NH}_2 \longrightarrow \text{PhNHNHNO} \longrightarrow \text{PhN}:\text{N}:\text{N}$. In the same way the reaction of $\text{PhN}(\text{NO})\text{NH}_2$ in its tautomeric form $\text{PhN}(\text{NH})\text{NOH}$ with HNO_2 , thus: $\text{PhN}(\text{NH})\text{NOH} \longrightarrow \text{PhN}(\text{NNO})\text{NOH} \longrightarrow \text{PhN}:\text{NOH} + \text{H}_2\text{O}$, is analogous to the reaction of HN_3 with HNO_2 , thus: $\text{HN}_3 + \text{HNO}_2 \longrightarrow \text{N}_2 + \text{N}_2\text{O} + \text{H}_2\text{O}$. $\text{PhN}(\text{NH})\text{NOH}$ is representative of a group of compds. which contain quinquivalent N, e. g., PhNO_2 , $\text{PhN}(\text{O})\text{H}_2$ (tautomer of PhHNOH), $\text{PhN}(\text{O})\text{NH}$ (tautomer of PhNNOH), $\text{PhN}(\text{O})\text{NOH}$ (tautomer of $\text{PhN}(\text{NO})\text{OH}$), $\text{PhN}(\text{O})\text{NR}$ (tautomer of $\text{PhN}:\text{N}(\text{O})\text{R}$), $\text{PhN}(\text{NH})\text{NOH}$ (tautomer of $\text{PhN}(\text{NO})\text{NH}_2$), and $\text{PhN}(\text{O})\text{CHR}$ (tautomer of nitrones) and the similarity in behavior of which renders it justifiable to consider the forms above. This similarity is well illustrated by the fact that $\text{PhN}(\text{O})\text{NOH}$ and $\text{PhN}(\text{NH})\text{NOH}$ both form $\text{PhN}:\text{NOH}$. C. C. DAVIS

Action of sulfur on organic compounds. IX. I. SZPERL. *Roczniki Chem.* 6, 728-37 (1926).—*o*- $\text{MeC}_6\text{H}_4\text{CH}_2\text{OH}$, m. 33.7-34.2°, prep'd. from *o*- $\text{MeC}_6\text{H}_4\text{CH}_2\text{Br}$, yields, on heating at 200° with S, *o*- $\text{MeC}_6\text{H}_4\text{CHO}$, *o*- $\text{MeC}_6\text{H}_4\text{CO}_2\text{H}$, probably 2,2'-dimethylstilbene, and a number of unidentified products. (With I. LIEBACH).—*m*- $\text{MeC}_6\text{H}_4\text{CH}_2\text{OH}$ when heated with S yields *m*-methylbenzyl ether, b. 315-21°, *m*- $\text{MeC}_6\text{H}_4\text{CHO}$, *m*- $\text{MeC}_6\text{H}_4\text{CO}_2\text{H}$, 3,3'-dimethylstilbene, and a number of unidentified products. (With F. SZPIC).—*p*- $\text{MeC}_6\text{H}_4\text{CH}_2\text{OH}$, similarly treated, gives *p*- $\text{MeC}_6\text{H}_4\text{CHO}$, *p*- $\text{MeC}_6\text{H}_4\text{CO}_2\text{H}$, 4,4'-dimethylstilbene, and unidentified products. B. C. A.

Cyclic compounds. I. Ethyl 2,3-dimethylbutane-1,1,4,4-tetracarboxylate and some cyclobutane compounds derived therefrom. ISRAEL VOGEL. *J. Chem. Soc.* 1927, 1985-94.—Reduction of $\text{MeCH}:\text{C}(\text{CO}_2\text{Et})_2$ with moist Al-Hg gives 45% of *Et* 2,3-dimethylbutane-1,1,4,4-tetracarboxylate (I), b_{16} 225.6°, d_4^{17} 1.0887, n_D^{17} 1.44873, $[\text{R}_L]_D$ 92.16 (calcd., 91.93); *di-Na* deriv., best prep'd. with MeONa , pale yellow, the free acid consists of a mixt. of the *dl*-acid, m. 185-5.5 (decompn.) and the *meso*-acid, m. 152-4° sep'd. by fractional crystn., the *meso* acid being the more sol. Heating the mixed acid at 200° gives a mixt. of β,β' -dimethyladipic acids, yielding chiefly an acid m. 113-7°. I (50 g.), 6.5 g. Na, 11.3 cc. MeOH and 13.5 cc. Br in 450 cc. Et_2O give 40 g. *Et* 2,3-dimethylcyclobutane-1,1,4,4-tetracarboxylate, b_{16} 208.10°, d_4^{16} 1.1216, n_D^{16} 1.45573, $[\text{R}_L]_D$ 90.16 (calcd., 89.73). Hydrolysis gives the free acid, m. 138-9° (correct analytical results could not be obtained). Heating the acid at 180° and esterification gave a mixt. of *Et* 2,3-dimethylcyclobutane-1,4-dicarboxylate, b_{14} 138-9°, d_4^{16} 1.0095, n_D^{16} 1.43888, $[\text{R}_L]_D$ 59.43 (calcd. 58.72); sapon. and treatment with Et_2O gives the *trans*-acid, m. 200.5-1.5°; heating the mixed acids with AcCl gives the *cis*-anhydride, m. 50-1°; the *cis*-acid, m. 87-8°. The *trans*-anhydride could not be isolated. Distg. of the mixed acids *in vacuo* gives the *cis*-acid and some anhydride. Heating the pure *trans*-acid with AcCl gives the *cis*-anhydride. C. J. WEST

Aromatic sulfofluorides. WILHELM STEINKOPF, KURT BUCHHEIM, KURT BEYTHIEN, HERMANN DUDEK, JOHANNES EISOLD, JOHANNES GALL, PAUL JAEGER, HORST REUMUTH, ALEXIS SEMENOFF AND ARTUR WEMME. *J. prakt. Chem.* 117, 1-82 (1927).— C_6H_6 (55 g.) added to 225 g. FSO_3H at 16-20° during 6 hrs. and then stirred at the same temp. for 9 hrs. gives 62% of benzenesulfofluoride (I), b_{14} 90-1°, b. 203-4°, d_4^{20} 1.3286, n_D^{19} 1.49316; it also results from PhSO_2Cl and FSO_3H after 24 hrs. at room temp. I (2 g.), shaken with 8 cc. concd. NH_4OH 15 min., gives 71% PhSO_2NH_2 ; 4 g. I with 8

g. liquid NH_3 overnight at room temp. gives 92%. I does not react with PhNH_2 after several hrs.' heating at $180-5^\circ$. I does not react with EtOH , even after standing several days; on addn. of alkali at temps. not over 15° , 10 g. I gives 9 g. PhSO_2Et ; 2 g. I and 3 g. PhNHNH_2 after 1 day give 0.8 g. $\text{PhSO}_2\text{NHNHPh}$, m. $154-5^\circ$. I (5 g.) and 5 g. AlCl_3 in 20 g. CS_2 , warmed to 50° , give 5 g. PhSO_2Cl . I (5 g.), 20 g. C_6H_6 and 5 g. AlCl_3 , warmed to $50-5^\circ$, give 40% sulfobenzene. Reduction of 10 g. I with excess of Zn gives only 2 g. PhSH . Nitration of I with fuming HNO_3 and concd. H_2SO_4 gives the *m*-nitro deriv., deep yellow, m. 48° ; reduction with Sn in concd. HCl gives the *m*-amino deriv., m. $29-30^\circ$, b. $297-9^\circ$ (partial decompn.); HCl salt, m. $165-7^\circ$. The SnCl_4 salt, diazotized in the usual manner, gives benzene-1-sulfofluoride-3-diazonium chloride stannichloride, rose, decomp. $155-6^\circ$; the salt couples with $\beta\text{-C}_{10}\text{H}_7\text{OH}$ to give a fiery red dye. The HCl salt, upon being diazotized, gives the light yellow diazoaminobenzene-3,3'-disulfofluoride, m. $175-6^\circ$ (decompn.). Through the diazo reaction there is obtained *m*-iodobenzenesulfofluoride, b_{13-14} 137° ; with Cl (cooling) there results 1-phenyldiochloride-3-sulfofluoride, yellow, m. $98-9^\circ$, which is rather stable. *m*-Cyanobenzenesulfofluoride, m. $69-70^\circ$ (30-40% yield). *m*- $\text{C}_6\text{H}_4(\text{SO}_2\text{Cl})_2$ (15 g.) and 80 g. FSO_3H , heated 19 hrs. at $90-100^\circ$, give 3 g. *m*-benzenedisulfofluoride, m. $38-9^\circ$. PhMe (300 g.) and 1200 g. FSO_3H , 12 hrs. at $20-23^\circ$, give 89% of a mixt. of *o*- and *p*- $\text{MeC}_6\text{H}_4\text{SO}_2\text{F}$, contg. approx. 40% of the *o*-deriv. Fractional distn. or crystn. gives 23% of the pure *p*-deriv. (II), m. $43-4^\circ$, b_{16} 112.5° , b_{22} 121.5° , b_{35} 133.8° , b_{51} 144.9° , b_{67} 151° , b_{182} 169.5° . The *p*-deriv. also results from *p*- $\text{MeC}_6\text{H}_4\text{SO}_2\text{Cl}$ and FSO_3H . II or the mixt. does not react with boiling H_2O during 8 hrs.; with 25% H_2SO_4 the *o*-compd. is hydrolyzed less readily than the *p*-compd. With Me_2NH II gives *p*-toluenesulfondimethylamide, m. $86-7^\circ$. 2-Nitro deriv. of II, pale yellow, m. $48-9^\circ$ (84% yield); 20 hrs.' treatment with liquid NH_3 gives the sulfamide, m. $144-5^\circ$. Reduction with Sn and concd. HCl gives 83% of 2-aminotoluene-4-sulfofluoride, m. $96-7^\circ$; 1c deriv., m. $188.5-9.5^\circ$. Toluene-4-sulfofluoride-2-azo- β -naphthol, bright red, m. 217° . Oxidation of II with CrO_3 in AcOH gives 32% of 4-sulfofluorobenzoic acid, m. 270° ; NH_4 salt; acid chloride, m. $53-3.5^\circ$; *Et* ester, m. $49-9.5^\circ$; amide, m. $187-7.5^\circ$. 3- $\text{ClO}_2\text{SC}_6\text{H}_4\text{CO}_2\text{H}$ and FSO_3H give 58% of 3-sulfofluorobenzoic acid, m. $154-5^\circ$; NH_4 salt, m. $130-2^\circ$; chloride, m. $108-10^\circ$, anhydride, m. $120-2^\circ$, by heating the acid with Ac_2O in $\text{C}_6\text{H}_5\text{Me}_2$ 9 hrs.; amide, m. $100-10^\circ$ (methylamide, m. $145-7^\circ$); *Et* ester, b. $126.5-8.5^\circ$ (methylamide, b. $192-4^\circ$ (high vacuum)); *Pr* ester, b. $118-20$ (high vacuum) (benzylamide, m. $60-1^\circ$); anilide, m. $157-8^\circ$. Nitration of a mixt. contg. 71% *o*- $\text{MeC}_6\text{H}_4\text{SO}_2\text{F}$ gives 4-nitratoluene-2-sulfofluoride (III), m. $57-8^\circ$; with AlCl_3 this gives 4,2- $\text{O}_2\text{N}(\text{SO}_2\text{F})\text{C}_6\text{H}_3\text{Me}$; III does not give ClSO_3H during 20 hrs. at room temp. Reduction of III gives the 4-amino deriv., light yellow, m. 62° (45% yield); *Ac* deriv., m. $120-1^\circ$. Through the diazo reaction there results *o*-toluenesulfofluoride, $b_{66.5}$ 133.9° , b_{88} 146.2° ; heated 3 hrs. with FSO_3H at $130-40^\circ$, there results 48% of toluene-2,4-disulfofluoride, m. $87-8^\circ$. *p*- $\text{C}_6\text{H}_4\text{Me}_2$ and FSO_3H 20 hrs. at 25° give 85% 1,4-dimethylbenzene-2-sulfofluoride, b_{21} $124-5^\circ$, m. $24-5^\circ$; 6-nitro deriv., m. $74-4.5^\circ$ (76% yield); AlCl_3 in CS_2 gives the chloride, m. 61° . *m*- $\text{C}_6\text{H}_4\text{Me}_2$ gives 1,3-dimethylbenzene-4-sulfofluoride (IV), b_{14} $149-50^\circ$, b. $239-40^\circ$; 6-nitro deriv., m. $109-10^\circ$ (80.6% yield); 6-amino deriv., m. $55-6^\circ$ (HCl salt, decomp. $191-6^\circ$). Heating IV with FSO_3H at 100° for 5 hrs. gives 69.6% of 1,3-dimethylbenzene-2,4-disulfofluoride, m. $116-7^\circ$. Mesitylenesulfofluoride, m. $73-3.5^\circ$, b_{12} 125° ; nitro deriv., m. $58-9^\circ$. Mesitylenedisulfofluoride, from the sulfofluoride and ClSO_3H , m. $121.5-2.5^\circ$; disulfamide, m. $240-1^\circ$. Pseudocumenesulfofluoride, b_{12} $123-6^\circ$, b_{20} $137-9^\circ$; nitro deriv., b_{14} $163-4^\circ$. 1,3-Dimethyl-5-*tert*-butylbenzenesulfofluoride, m. $115-6^\circ$; dinitro deriv., m. $127-8^\circ$, whose chloride m. $139.5-40.5^\circ$. α -Naphthalenesulfofluoride (V), m. 56° , from 250 g. C_{10}H_8 in 600 g. H_2SO_4 and 400 g. FSO_3H (65 g. yield); also from $\text{C}_{10}\text{H}_8\text{SO}_3\text{Na}$ and FSO_3H . β -Naphthalenesulfofluoride (VI), m. $87-8^\circ$. C_{10}H_8 (25 g.) and 100 g. FSO_3H , 6 hrs. at $70-80^\circ$, gives a disulfofluoride, m. 125° , which yields a disulfochloride, m. 118° . V, allowed to stand 24 hrs. with FSO_3H , either at room temp. or at 100° gives a mixt., from which Et_2O or PhMe exts. naphthalene-1,5-disulfofluoride, m. 203° ; the disulfamide does not m. 340° . V, gradually added to ClSO_3H , gives naphthalene-1-sulfofluoride-5-sulfochloride, m. 174° ; the Et_2O soln., satd. with NH_3 , gives the 5-sulfamide, m. $252-3^\circ$. VI (1 part), gradually added to 2.4 parts ClSO_3H , gives naphthalene-2-sulfofluoride-6-sulfochloride, m. $114-6^\circ$; 6-sulfamide, m. 208° . Tetralin (180 g.) and 730 g. FSO_3H , 12 hrs. at $15-20^\circ$, give 12-16% of 1-tetralinsulfofluoride, m. $75-7^\circ$; nitro deriv., m. $108-9^\circ$ (methylamide, m. $169-71^\circ$); with AlCl_3 in CS_2 there results an addn. comp. of the fluoride and chloride, $\text{C}_{20}\text{H}_{20}\text{O}_2\text{N}_2\text{FClS}_2$, m. $87-8^\circ$; amino deriv., decomp. $226-7^\circ$ (HCl salt, m. $83-4^\circ$); cyano deriv., m. $113-6^\circ$. PhOH (25 g.) in 30-40 g. CS_2 , added to 100 g. FSO_3H at room temp., gives 27 g. *p*-phenolsulfofluoride (VII), m. 77° ; this also results from *p*- $\text{HOC}_6\text{H}_4\text{SO}_3\text{Na}$ and FSO_3H ; with NH_3 in Et_2O it gives the NH_4 salt, sinters 120° .

30°, m. 200–3°; after standing 0.5 yr., there is formed a small amt. of *phenyl-p-sulfonyl-*ide, m. 276–7°, also formed when an aq. soln. of the salt stands several days. VII and liquid NH₃, 3 days at room temp., give *di-p-phenolsulfonamide*, (*p*-HOC₆H₄SO₂)₂NH, m. 154–5°. VII and 33% EtOH-MeNH₂ give *p-phenolsulfonmethylanilide*, m. 81–2°; the *dimethylanilide*, m. 95–6°. VII and PhNH₂, heated 1 hr. on the H₂O bath, give the *PhNH₂ salt of p-phenolsulfanilide*, m. 112–3°. VII, AlCl₃ and C₆H₆ give *p-hydroxydiphenylsulfone*, m. 131°. PhOH gives *p,p'-dihydroxydiphenylsulfone*. Nitration of VII or the action of *o*-C₆H₄NC₆H₄OH and FSO₃H gives the *2-nitro deriv.*, m. 66–7°; *2-amino deriv.*, m. 131° (*HCl salt*, m. 203–5° (decompn.); *formyl deriv.*, m. 241–2°). Heating 25 g. VII and 100 g. FSO₃H 3 hrs. at 100° gives 30% of *2,4-phenoldisulfofluoride*, m. 120–1°; *NH₄ salt*, m. 184–5°, decomps. 188°. *6-Nitro deriv.*, m. 98.5–9.5° (68% yield); *6-amino deriv.*, m. 119–20°. *Phenol-2,4-disulfanilide*, m. 203–4°; FeCl₃ gives a ruby-red color. *Phenol-2-sulfochloride-4-sulfofluoride*, m. 75–6°; *2-sulfamide*, m. 175–5.5°; *2-sulfoluide*, m. 147–8°. *Phenol-2,4-disulfamide*, m. 239–40°. *p-HOC₆H₄Me* and FSO₃H in CS₂ at 20° give 36% of *4-hydroxy-1-methylbenzene-3-sulfofluoride*, b₂₀ 135–6°, m. 58–9° (*NH₄ salt*); excess liquid NH₃ gives the *3-sulfamide*, m. 151–2°. Warming with dil. HNO₃ gives 4,3,5-HO(O₂N)₂C₆H₂Me, m. 85°; with HNO₃ and H₂SO₄ at –10° there results 85% of the *6-nitro deriv.*, m. 87–8°; *6-amino deriv.*, analyzed as the *HCl salt*, 4,3-HO(KO₂S)C₆H₂Me (20 g.) and 85 g. FSO₃H, heated 2 hrs. at 80–90°, gives 8.9 g. of the *K salt*, brownish white, of *4-hydroxy-1-methylbenzene-3-sulfofluoride-5-sulfonic acid*, crystg. with 2.5 mols. H₂O, m. 120–1°; *NH₄ salt*, decomps. 265°. *5-Bromo-p-cresol-3-sulfofluoride*, m. 75°; *NH₄ salt*, m. 193–6°; *3-sulfodichthylamide*, m. 102–3°. *2,6-Diiodophenyl-4-sulfofluoride*, m. 132°; *NH₄ salt*, m. 208–10°. *o-Cresol-sulfofluoride*, m. 56–7° (8% yield); *NH₄ salt*; *nitro deriv.*, light yellow, m. 60–0.5°. *m-Cresol-sulfofluoride*, b₁₁ 169–70°, m. 49–50.5°; *di-m-cresolsulfonamide*, m. 154–6°. *p-Anisolesulfofluoride*, b₆₀ 175°, m. 13° (22% yield); *2-nitro deriv.*, m. 78.5°; *2-amino deriv.*, m. 66° (*HCl salt*, m. 202°). *p-Phenolesulfofluoride*, m. 38°; *2-nitro deriv.*, m. 73°. *2-Naphthol-3,6-disulfochloride*, m. 112–3°; PhNH₂ gives the *6(or 3)-sulfanilide*, m. 138–9°. *2-Naphthol-3,6-disulfofluoride* (VIII), m. 108–9.5°; *NH₄ salt*, yellow. In the prepn. from *β*-C₁₀H₇OH, there is also formed the *2-naphtholsulfonate of VIII*, m. 265° (decompn.). VIII heated with FSO₃H 16 hrs. at 115–30°, gives *2-naphthol-3,6,8-trisulfofluoride*, (IX), m. 153–9°. VIII and 33% Me₂N soln. give *2-naphthol-3,6-disulfontetramethylamide*, m. 159–60.5°. *2-Naphthol-6,8-disulfofluoride*, m. 175–6°, from *G salt* and FSO₃H; *NH₄ salt*, does not m. 240°. *R salt* gives IX. *2-Hydroxy-5-sulfofluoridebenzoic acid*, m. 183° (36% yield); *NH₄ salt*, decomps. 190°; *Ac deriv.*, m. 149°; *Me ether*, m. 107–8°.

C. J. WEST

Bromophenols. XXII. Several halogenated phenols prepared from *o*-chlorophenol. MORITZ KOHN AND J. J. SUSSMANN. *Monatsh.* 48, 193 202(1927); cf. C. A. 21, 574. 2,4,6-Cl(Br)₂C₆H₂OH is reduced to 2,4-ClBrC₆H₂OH (I) by Zn and AcOH upon boiling for 1.5 hrs.; it is characterized by its 6-NO₂ deriv., m. 195°. *o*-ClC₆H₄OH with Me₂SO₄ and NaOH gives *o*-ClC₆H₄OMe, b₇₆₁ 194–200°; with PBr₃ this gives *2-chloro-4-bromoanisole*, b₇₄₉ 241–8°, m. 70°, demethylated to I by 66% HBr. I (10 g.) in 50 cc. H₂O and 5.8 g. NaOH, diluted to 300 cc. and treated with 18 g. I and 23 g. KI in 30 cc. H₂O, gives *2-chloro-4-bromo-6-iodophenol*, m. 70°; the corresponding *anisole*, m. 39°. *o*-ClC₆H₄OH (20 g. suspended in 5 l. H₂O) treated with 70 g. Br and 200 g. KBr in 500 cc. H₂O gives *2-chloro-4,6-dibromophenol bromide*, oxidized by fuming HNO₃ to 2,6-chlorobromiquinone; reduction with H₂SO₄, methylation and nitration give *2-chloro-6-bromo-3,5-dinitrohydroquinone di-Me ether* (II), m. 135°, rhombic, *a:b:c* = 0.89439:1:1.61023 (other crystallographic data given); boiling with C₆H₅N and decompn. of the salt with 20% KOH give the *mono-Me ether*, m. 124°, yellow monoclinic prisms, *a:b:c* = 1.13723:1:0.93586, *β* 94° 22.9'. II is also obtained from 2,4-Cl₂C₆H₂OH by the same series of reactions as from *o*-ClC₆H₄OH. XXIII. Diphenyl ether of 2,5-dihydroxyquinol and related compounds. *Ibid* 203–10.—Bromoanil, gently boiled 0.75 hr. with Zn and AcOH gives 2,5,4-Br₂(AcO)C₆H₂OAc, m. 165°; this also results from tribromoquinone, Zn and AcOH. Bromoanil and PhOK in H₂O, heated 0.5 hr. on the H₂O bath and the crude ether boiled 2 hrs. with Zn and AcOH, give 2,5-diphenoxyquinone, yellow, m. 236°; if this is heated further with Zn and AcOH until the soln. is completely decolorized, there results 2,5-diphenoxyhydroquinol, m. 128° (*diacetate*, m. 148°); Me₂SO₄ gives the 1,4-di-Me 2,5-di-Ph ether of 1,2,4,5-C₆H₂(OH)₄, m. 147°. 2,5,3,6-Br₂(NaO)₂C₆H₂, boiled 2 hrs. with Zn and Ac₂O, and the resulting product again treated in the same way, gives 1,2,4,5-tetraacetoxybenzene, m. 226°. Dibromotoluquinone is likewise reduced by Zn and Ac₂O to dibromotoluhydroquinone diacetate, m. 140°. XXIV. Dehalogenation of bromophenols. M. KOHN AND JULIUS PFEIFER. *Ibid* 211–20.—Reduction of 2,4,6-Br₃C₆H₂OH by an equal wt. of Zn dust and 4 parts AcOH by heating

97 min. gives 60% of 2,4-Br₂C₆H₃OH, whose Me ether *b*₇₄₄ 258-62°, m. 62-4° and whose benzoate, m. 92°; the 6-nitro deriv. m. 118.5° (crystallographic data given). An improved method is given for the prepn of Br₃C₆OH; reduction of this with Zn and AcOH gives 3,4,6-tribromophenol (I), m. 79°, benzoate, m. 99°. Me₂SO₄ and 10% KOH give 3,4,6-tribromoanisole, *b*₇₃₃ 306-9°, m. 105°; 2-nitro deriv., yellow, m. 70°; fuming HBr gives 3,4,6-tribromo-2-nitrophenol, m. 122°. Bromination of I gives 2,3,4,6-Br₄C₆HOH, m. 114°, oxidized by fuming HNO₃ to tribromoquinone, yellow, m. 150°. I is chlorinated by 1 mol Cl₂ diluted with CO₂, giving the 2-Cl deriv (II), m. 101°; Me ether, m. 82°; benzoate, m. 112°. 3,4,6-Tribromo-2-chloro-5-nitroanisole, m. 114°; fuming HBr gives the 3,4,6-tribromo-2-chloro-5-nitrophenol, m. 156°. II is also formed by reducing 2,3,4,6-Br₄C₆HOH with Zn and AcOH (70% yield). Tribromoresorcinol with Zn and Ac₂O gives 4,6-dibromoresorcinol diacetate, m. 94°. 4,5-Dibromopyrocatechol diacetate, m. 173°. XXV. Halogenation of chlorophenols. *Ibid* 231 41.--2,3,4,6-Cl₄C₆HOMe, *b*₇₄₄ 266-70°, m. 60°, yields a 5-nitro deriv., m. 58°; fuming HBr gives 2,3,4,6-tetrachloro-5-nitrophenol, m. 122°. 2,3,4,6,5-Cl₅BrC₆OH, m. 197°, d. 2.287, monoclinic prismatic crystals, *a*·*b*·*c* = 2.3615 1.3.09882, *β* 108° 57' 9". 3,5-Cl₂-C₆H₃OH and Br give 3,5,2,4,6-Cl₅Br₂C₆OH (I), m. 183°, triclinic, *a*·*b*·*c* = 0.47145:1:0.32873, *α* 86° 44' 5", *β* 102° 10' 18", *γ* 92° 44' 10". 3,5-Dichloro-2,4,6-tribromoanisole, *b*₇₄₄ 349 50°, m. 149 50°. Oxidation of I with fuming HNO₃ gives 2,6-dichloro-3,5-dibromoquinone, yellow, does not m. 260°. 3,5-Dichloro-2,4,6-triiodophenol, decomp. 185°. m. 205°; Me ether, m. 197°; oxidation gives 3,5-dichloro-2,6-diiodoquinone, red, m. 240° (decompn.). 1-Acetyl-2,4-dinitro-3,5-dichlorobenzene, yellow, m. 124 5°; PhNH₂ gives the 3,5-dianilino deriv., red, m. 235°. XXVI. 2,4,6-Trichloro-3-bromophenol and 2-chloro-4,6-dibromophenol. M. KOHN and FANNY RABINOWITSCH. *Ibid* 347-60 --2,1,6-Cl₃C₆H₂OH with Br-KBr gives trichlorophenol bromide (I), rearranged by heating with concd. H₂SO₄ on the H₂O bath to 2,4,6-trichloro-3-bromophenol, m. 76° (cor.), purified through the Me ether (II), *b*₇₄₁ 285 90°, m. 64 5° (cor.); Bz deriv., m. 117°. Oxidation of I gives 2,6-dichloroquinone II and fuming HNO₃ give 2,4,6-trichloro-3-bromo-5-nitroanisole, m. 74°; HBr gives the corresponding phenol, m. 131°. 2-Chloro-4,6-dibromoanisole (III), *b*₇₃₉ 269 72°, m. 75°, d. 2.213, monoclinic, *a*·*b*·*c* = 2.04550:1:3.20181, *β* 92° 35' 20". 2,4,6-Cl₃C₆H₂OMe forms monoclinic needles, d. 1.640, *a*·*b*·*c* = 2.01105 1.3.1917, *β* 92° 58' 25". 2-Chloro-4,6-dibromo-3(or 5)-nitroanisole, m. 73°, from 6 g. III and 50 cc. fuming HNO₃ at room temp.; from 13 g. III and 130 cc. fuming HNO₃ on adding to the soln. 70 80 cc. concd. H₂SO₄, there results 4,6-dibromo-2-chloro-3,5-dinitroanisole, m. 128-9°; the corresponding phenol, m. 180-1°. *o*-ClC₆H₄OH (5 g.) and 3.5 g. NaOH in 200 cc. H₂O, treated with 20 g. I and 20 g. KI in 100 cc. H₂O, give 2.5 g. 4,6-diiodo-2-chlorophenol, m. 96°; Me ether, m. 65°, monoclinic (crystallographic data given). Dibromo-*o*-chlorophenol bromide, heated with concd. H₂SO₄, gives a tribromo-*o*-chlorophenol, m. 96°, which may be a mixt. of 2,4,5,6-ClBr₃C₆HOH and 2,3,1,6-ClBr₃C₆HOH, Me ether, *b*₇₃₇ 320-5°, m. 87°. Oxidation of the bromide gives 2-chloro-6-bromoquinone, golden yellow, m. 113 4°. XXVII. Dibromo-*o*-cresol resulting from the action of aluminum chloride and benzene upon tetrabromo-*o*-cresol. *Ibid* 361 74 --4,6-Dibromo-3,5-dichloro-*o*-cresol, m. 196-7°, by chlorination (Cl₂ + CO₂) of 4,6,2-Br₂(HO)C₆H₂Me, Me ether, m. 115 6°; oxidation gives 4,6-dibromo-3-chlorotoluquinone, yellow, m. 231°. 4,6-Dibromo-3,5-diiodo-*o*-cresol, m. 176-7°; Me ether, m. 141°; oxidation gives 4,6-dibromo-3-iodotoluquinone, reddish yellow, m. 216-7°. 4,6-Dibromo-*o*-methoxytoluene, *b*₇₄₁ 268 72°; nitration with HNO₃ and H₂SO₄ gives the 3,5-dinitro deriv., m. 111 2°; the corresponding cresol, m. 165°. 4,5,6-Tribromo-3-iodo-*o*-cresol, m. 180-2°, Me ether, m. 139°. The 3-chloro deriv., m. 209-11°. Me ether, *b*₇₃₇ 345 8°, m. 128°. 4,6-Dibromo-5-chloro-*o*-cresol (I), m. 112-3°; Br gives 3,4,6-tribromo-5-chloro-*o*-cresol (II), pale brown, m. 197 8°; oxidation gives tribromotoluquinone, yellow, m. 232°. The Me ether of I *b*₇₃₁ 300-12°, m. 232°; of II, m. 132°. 4,6-Dibromo-3-iodo-5-chloro-*o*-cresol, rose, m. 169 70°; Me ether, pale rose, m. 124°.

C. J. WEST

Condensation of chloral with phenol. F. D. CHATTAWAY AND A. A. MORRIS. *J. Chem. Soc.* 1927, 2013 7; cf. *C. A.* 21, 233. PhOH (100 g.) added to 1000 cc. cooled H₂SO₄ (d. 1.8) and after an hr. treated with 400 g. chloral hydrate, gives 150 g. anhydro-2-β,β-trichloro-α-hydroxyethylbenzene-1-β,β,β-trichloro-α-hydroxyethylbenzene-5-sulfonic acid (I), crystg. with 3H₂O, of which 2 are lost at 110° after 0.5 hr., m. 150-66° (decompn.); NH₄ salt, prisms. Nitration of I gives anhydro-3,5-dinitro-2-β,β,β-trichloro-α-hydroxyethylbenzene, sepg. 1st as a labile form, silky needles, changing in contact with the mother liquor to stable, pale yellow rhombohedra; both forms m. 163°; the position of the 2nd NO₂ group was established by the formation with EtOH-KOH of ω,ω-dichloro-3,5-dinitro-2-ethoxyacetophenone, yellow, m. 82-4° (osa-

zone, orange, m. 224°). I and PCl_5 give the *sulfonyl chloride*, m. 130.5°; MeOH gives the *Me ester*, m. 150°; *Et ester*, m. 143°; *amide*, m. 207°; *dichloroamide*, m. 165–74° (decompn.); *anilide*, m. 188.5°.

C. J. WEST

Some physical properties of Nitrophenols. LOUIS DESVERGNES. *Rev. chim. ind.* **36**, 194–6, 224–6 (1927); cf. *C. A.* **19**, 2036, 3257; **20**, 2325; **21**, 740.—*o*- $\text{O}_2\text{NC}_6\text{H}_4\text{OH}$ solidifies at 45.13° (dtd. in air-jacketed tube); soly. at 15.5° in AcOEt 130.95, Me_2CO 69.14, MeOH 11.83, 96% EtOH 25.31, abs. alc. 24.55, C_6H_6 107.38, CHCl_3 99.68, Et_2O (anhyd.) 95.03, $\text{C}_6\text{H}_5\text{N}$ 144.44, CS_2 47.59, CCl_4 40.42, C_7H_8 45.28. When $\text{C}_6\text{H}_5\text{N}$ is brought into contact with picric acid there is a slight rise in temp. with formation of canary-yellow (O_2N) $_3$ - $\text{C}_6\text{H}_2\text{OH}$. 2,3,4,5,6- $\text{C}_6\text{H}_2\text{N}_3$, m. 144.5°.

A. PAPINEAU-COUTURE

Nitro derivatives of the homoprocatechol ethers. A. E. OXFORD. *J. Chem. Soc.* **1927**, 1964–72.—2,4-MeO(Me) $\text{C}_6\text{H}_3\text{OAc}$ (32.2 g.) and 35 cc. AcCl in 140 cc. CCl_4 in a freezing mixt., treated during 2.5 hrs. with 36 g. powdered AgNO_3 , give 5 g. of a liquid b_{10} up to 167° (I), 8 g. b_{10} 167–77° (II) and 5 g. of a solid, b_{10} 177–210°; I and the liquid part of II, hydrolyzed and distd. with steam, give 6(?)-chlorocresol, m. 71°; *Ac deriv.* m. 61°; *Me ether*, m. 37–8°. The part not volatile with steam is a mixt. of 6-nitrocresol and the 2-nitro deriv., which does not solidify at –15°; the Bz deriv. does not cryst.; the *p*-nitrobenzyl ether (2-nitro-3-methoxy-4-*p*-nitrobenzyltoluene), m. 114–4.5°; the corresponding 6-nitro deriv., pale yellow, m. 202–3°. 2,5-Dinitrocresol, yellow, m. 86–7° (25% yield); *Ac deriv.*, m. 53–4°. With Me_2SO_4 and K_2CO_3 in $\text{C}_6\text{H}_5\text{Me}$ there results 2,5-dinitrohomoveratrole, m. 36°. 2-Nitrohomoveratrole may be obtained by methylating the mixt. of 2- and 6-nitrocresol and distg. with steam, then fractionating repeatedly *in vacuo*. Boiling 6-nitrohomoveratrole with KOH soln. gives 6-nitroisocresol, pale yellow, m. 168–70°; Na salt, bright yellow; *Ac deriv.* (III), pale yellow, m. 98–8.5°. 6-Bromo-2-nitrohomoveratrole, m. 102–3°. Nitration of III, followed by hydrolysis, gives 5,6-dinitroisocresol, very pale yellow, m. 128–9°; Na salt, orange-yellow; FeCl_3 gives a brownish red color. The nitration of 2,6-Me(MeO) $\text{C}_6\text{H}_3\text{OAc}$ gives chiefly the 4- NO_2 deriv.

C. J. WEST

Displacement of bromine accompanying the nitration of 6-bromohomoveratrole. TOM HEAP, T. G. H. JONES and ROBT. ROBINSON. *J. Chem. Soc.* **1927**, 2021–2.—Attempts to prep. a mono- NO_2 deriv. of 6-bromohomoveratrole (I) according to Jones and Robinson (*C. A.* **12**, 135) give only 6-nitrohomoveratrole (II) (36% yield); the compd., m. 121°, may have been 4-bromo-5-nitroveratrole (III). Reduction of 100 g. vanillin with Zn-Hg and HCl gives 60 g. cresol, converted into homoveratrole (91%) and then into I (94%); oxidation with KMnO_4 gives 6-bromoveratric acid, m. 183–4°. By the method of Pollecoff and Robinson (*C. A.* **12**, 2314) II is hydrolyzed almost quant. to 6-nitroisocresol in 73 hrs.; it m. 168–70°; *Ac deriv.*, m. 100–1°; methylation gives II. In the bromination of Me veratrate in cold AcOH the yield of the 6-Br

deriv. is not satisfactory. Pure 6-bromoveratric acid and cold HNO_3 give 50% of **III**, m. 121-2°; **III** prepd. from bromoveratrole had the same m. p. C. J. WEST

Preparation and hydrolysis of the isomeric β -tolylethyl bromides. J. B. SHOE-SMITH AND R. J. CONNOR. *J. Chem. Soc.* 1927, 1768-72. — β -o-Tolylethyl bromide (**I**), from the alc. and PBr_3 in C_6H_6 , b₁₀ 99-100°; *m*-isomer (**II**), b₁₁ 101-3°; *p*-isomer (**III**), b₁₁ 103.5-5°. The bromides were stable to aq. EtOH at 76° for 4 hrs. and toward aq. AcOH-HI . Differences in the rate of hydrolysis by aq.-alc. KOH have been observed, the order being: $\text{PhCH}_2\text{CH}_2\text{Br}$ (1.25) > **II** (0.83) > **III** (0.7) > **I** (0.6); the figures in parens. denote the reciprocal of the time for half-hydrolysis of the bromide at 76°.

C. J. WEST

Behavior of aldehyde acetals upon reduction according to Sabatier and Senderens (formation of ethers from acetals). FRITZ SIGMUND AND GERHARD MARCHART. *Monatsh.* 48, 267-88(1927). — The catalytic reduction of $\text{PhCH}(\text{OEt})_2$ with Ni at 180° gives 45% of PhCH_2OEt . Phenylacetaldehyde dimethylacetal, b. 219-21° (cor.) (84% yield), upon reduction, gives 50% $\text{PhCH}_2\text{CH}_2\text{OMe}$. $\text{C}_6\text{H}_{13}\text{CH}(\text{OEt})_2$ gives 61% of $\text{C}_6\text{H}_{13}\text{CH}_2\text{OEt}$. Enanthal dipropylacetal, b₉ 112.5° (97% yield), is reduced to $\text{C}_6\text{H}_{13}\text{CH}_2\text{OPr}$, b. 187.6° (64% yield); the diisobutylacetal, b₁₀ 126.6° (cor.) (92% yield), gives on reduction 64% of heptyl isobutyl ether, b. 194-6°. Phenylacetaldehyde dipropylacetal, b₁₁ 129-31° (71% yield); reduction gives 80% of phenylethyl propyl ether, b. 225-7°. $\text{PhCH}:\text{CHCH}(\text{OEt})_2$ gives $\text{PhCH}_2\text{CH}_2\text{CH}_2\text{OEt}$, b. 220-2°.

C. J. WEST

α -Bromo and hydroxyaldehydes. RUDOLF DWORZAK AND PAULA PFIFFERLING. *Monatsh.* 48, 251-66(1927). — The action of 2 atoms Br upon $(\text{EtCHO})_3$ at -5° to -10° and treatment with EtOH gives about 30% $\text{MeCHBrCH}(\text{OEt})_2$ (**I**), b₉ 69° and about 15% of the dibromoacetal, together with considerable high-boiling material. The action of 4 atoms Br (320 g.) upon 58 g. $(\text{EtCHO})_3$ gives 20 g. pure **I** and 87 g. dibromoacetal (**II**), $\text{MeCBr}_2\text{CH}(\text{OEt})_2$, b₉ 91°. The high boiling fraction, b₂₋₃ 130°, analyzes for $\text{C}_8\text{H}_{16}\text{O}_2\text{Br}_3$, may be $\text{MeCHBrCHBrCMcBrCH}(\text{OH})\text{OEt}$. The action of 2 atoms Br upon 1 mol. $\text{C}_6\text{H}_{13}\text{CHO}$ and treatment with EtOH gives 60% of a mixt. of about 1 part α -bromocanthole, b₂ 62° and about 2 parts of the acetal, b₁ 92°. Heating **I** with twice its wt. of H_2O a short time gives lactaldehyde, which may be extd. with Et_2O after addn. of a little alkali. It was identified as the osazone; the phenylhydrazone could not be obtained. **II** behaves similarly toward H_2O , but the reaction is much slower; AcCHO was identified as the osazone, m. 145°. Similarly was prepd. α -hydroxyenanthole, m. above 100° (not sharply), which is the dimeric form, as shown by mol. wt. detns.

C. J. WEST

Condensation of *o*-nitrophenylacetic acid with 6-nitropiperonal. N. KISHI. *J. Pharm. Soc. Japan* No. 545, 571-4(1927); cf. *C. A.* 21, 2259. — Heating 4,6-nitropiperonal, 4.2 g. $\text{o-O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CO}_2\text{Na}$ and 50 cc. Ac_2O for 5.5 hrs. gives α -(*o*-nitrophenyl)- β -(3,4-methylenedioxy 6-nitrophenyl)hydroxypropionic acid (**I**), yellow, m. 271°. *Na* salt, colorless; methyl ester, yellow, m. 157°. With FeSO_4 and NH_4OH gives β -hydrazonyl-2-amino-3,4-methylenedioxyphenyl)- α -*o*-aminophenylpropionic acid (**II**), decomps. 210°; with excess HCl gives the HCl salt of 2-aminopiperonylhydroxyindolylcarbinol (**III**), colorless, blackens at 360°.

NAO UYEI.

Catalytic hydrogenation of aromatic acids and their salts. V. N. IPAT'EV AND G. A. RAZUVAYEV. *J. Russ. Phys.-Chem. Soc.* 58, 122-8(1926); cf. *C. A.* 20, 1798; 21, 235. — The hydrogenation of Li , Ca , Ba , Zn , ferrous and Ni benzoates, as also of the Na salts of salicylic, *p*-hydroxybenzoic, and mandelic acids, was carried out by Ipat'ev's

method (C. A. 2, 1958) in the solid state, Ni_2O_3 being used as catalyst. The alkali and alk.-earth salts hydrogenated smoothly and rapidly, giving a 60–70% yield of hexahydrobenzoic acid, but the ferrous, Ni and Zn salts decompd. with the formation of an orange sublimate. The residual gas contained more than 90% of H. Salicylic and *p*-hydroxybenzoic acids gave 80% yields of cyclohexanol, through loss of the carboxyl group. The residual gas contained much CH_4 . Mandelic acid gave, with decompn., a 40% yield of phenylacetic acid, with traces of cyclohexylacetic acid, *i. e.*, in this case it is the OH group which is removed. B. C. A.

Carbalthionic acids and esters. III. Carbithionic acids and esters. Y. SAKURADA. *Mem. Coll. Sci. Kyōto* 10, 79–83(1926); cf. C. A. 21, 2458; 6, 487.—By passing dry H_2S into an ethereal soln. of the corresponding thio-iminoesters the following carbithionic esters were prepd.: Et dithioacetate, b. 128–32°, d_4^{28} 0.9807, n_D^{28} 1.5303; Et dithiopropionate, b. 150–5°, d_4^{27} 0.9711, n_D^{27} 1.5259, η^{27} 2.1535; ethyl dithiobenzoate, b. 122–5°; ethyl dithiophenylacetate, b. 140–44°, d_4^{29} 1.0462, η^{29} 2.9831; ethyl dithio-*p*-toluate, b. 160–5°, d_4^{27} 1.0085, η^{27} 2.3215; ethyl dithio- β -naphthoate, b. 200–5°; diethyl tetrathionoxalate, b. 90–3°. By hydrolysis of these esters with alc. KOH, dithioacetic, dithiopropionic, dithiobenzoic, dithiophenylacetic, dithio-*p*-toluic, and tetrathionoxalic acids were isolated. B. C. A.

Condensation product of vanillin and salicylaldehyde with acetone and the mechanism of this condensation. ERHARD GLASER and ERWIN TRAMER. *J. prakt. Chem.* 116, 331–46(1927).—Vanillylaceton (3 g.) in 10 cc. 96% EtOH and 25 cc. 10% NaOH, treated dropwise with 2 g. *o*- $\text{HOC}_6\text{H}_4\text{CHO}$, gives 50–60% salicylidenevanillylaceton, m. 155° (decompn.); *di*-Ac deriv., m. 149°; *di*-Bz deriv., m. 175–6°. A by-product of this reaction is the compd. $\text{C}_{17}\text{H}_{14}\text{O}_3$, m. 152° (decompn.), probably dihydroxydibenzalacetone. Vanillin (6 g.) and 2 cc. Me_2CO in 25 cc. HCl (d. 1.19) give 60% of divanillylaceton, orange, crystg. with 1 H_2O , m. 155–6°; in alkali it gives an intense bluish red color, visible in a diln. of 1:10,000,000; *di*-Ac deriv., m. 182°; *di*-Bz deriv., 192°; *di*-Ac tetra-Bz deriv., m. 159–61°. Bromovanillylaceton, yellow, m. 147–8°; Ac deriv., m. 135–6°; Na salt. C. J. WEST

The rearrangement of phenyl acetate into *p*-hydroxyacetophenone. V. I. MINAEV. *J. Russ. Phys. Chem. Soc.* 58, 729–36(1926).—Nenzki and Stoeber (*Ber.* 30, 1769(1897)) obtained only 21% of *p*- $\text{HOC}_6\text{H}_4\text{Ac}$, probably because of a no. of mutually interfering reactions. By dropping AcCl (a slight excess) into dil. PhOMe in CS_2 in presence of 1.5 equivs. of AlCl_3 , M. obtained a 62% yield of *p*- $\text{MeOC}_6\text{H}_4\text{Ac}$, from which not more than 20% of *p*- $\text{HOC}_6\text{H}_4\text{Ac}$ could be expected on HBr hydrolysis. PhH_2PO_4 (or PhOPOCl_2) + AcCl was tried without success. The amt. of HCl given off during the prepn. according to N. and S. shows that *p*- $\text{AcOC}_6\text{H}_4\text{Ac}$ is not formed. Dry satd. HCl in PhOAc treated gradually with 1 equiv. of AlCl_3 (vigorous reaction at first), refluxed for 2 hrs. until no more HCl comes off, the yellow viscous mass treated with boiling H_2O , and the sepg. oil dissolved in EtOH and repptd. by the addn. of H_2O gives *p*- $\text{HOC}_6\text{H}_4\text{Ac}$ in 28.82% yield. BASIL C. SOYENKOFF

The reality of semipinacolic rearrangement. Study of anisylmethylglycol. JEANNE LEVY and P. WEILL. *Compt. rend.* 185, 135–7(1927); cf. C. A. 21, 1111.—New evidence is given proving the reality of semipinacolic transformation. Anisylmethylglycol is transformed by semipinacolic dehydration and migration of the Et radical into 3-anisyl-2-pentanone, while 2-anisyl-2-methylbutanal by the action of concd. H_2SO_4 gives 2-anisyl-3-pentanone. The oxide of 1-anisyl-2-methyl-1-butene by distn. at about 250° isomerizes into 3-anisyl-2-pentanone. In the semipinacolic transposition the ethyl group migrates more easily than the methyl group. F. C. H.

The principle of induced alternating polarity in organic compounds and the general and *o*-effect of substituents. C. F. VAN DUIN. *Rec. trav. chim.* 46, 256–67(1927).—I. According to Verkade (C. A. 20, 2937), a general and alternating effect, starting from the same key atom, are not in agreement with one another, as this would mean that this atom can induce electron displacements in opposite directions. It is shown that this opinion is not correct; according to Kermack and Robinson (C. A. 16, 2633) and to Højendahl (C. A. 18, 2836) the alternating effect is transmitted by means of the C chain and the terms positive and negative can be legitimately applied in this sense only, that a negative atom has the electrons longer and a positive shorter in its neighborhood than would be the case in absence of the key atom. On the other hand it is generally assumed (Lewis) that the general effect causes definite electron displacements, while recent researches make highly probable that this effect is not transmitted by means of the C chain; otherwise it would be incomprehensible how it could be detected so far from the key atom as has been shown to be the case in the hydration of stearolic

acid (Robinson and Robinson, *C. A.* 20, 3445). II. The question whether or not the alternating effect is transmitted through the C chain has also been discussed by Olivier and Berger (*C. A.* 21, 2887) in connection with the reaction of Friedel and Crafts between the nitrobenzyl chlorides and benzene. They consider the action of the catalyst to be a direct one and much stronger than the alternating effect, the latter being only feebly perceptible in the hydrolysis of the nitrobenzyl chlorides. van D. does not agree with these views; in his opinion a strong alternating effect is to be expected in the reaction of Friedel and Crafts because of the red color which develops when the reacting components are brought together. Thus he comes to a conclusion, different from that of O. and B., viz., that the expts. on the reaction of Friedel and Crafts do not give a more or less negative indication, but a strongly positive proof for the correctness of the principle of induced alternating polarity. III. A method is presented for the calcn. of the general, alternating and *o* effect of substituents, which is based on the above mentioned theory of Højendahl and on the supposition that the general and alternating effect decrease in strength in the same way with increasing distance from the key atom. From the figures obtained by Olivier in the hydrolysis of substituted benzyl chlorides (*C. A.* 18, 48) the 3 effects were calcd. for the Me, Cl, Br, I, CO₂H and NO₂ groups and, although for details of the calcn. as well as of the results the original paper must be consulted, emphasis must be laid on the fact that for the Me group a strong retarding and for the NO₂ group a relatively strong accelerating *o*-effect was found. IV. In connection with this result mention is made of several reactions, in which the SO₃H and the OMe groups exhibit accelerating as well as retarding *o*-effects, an acceleration occurring in the esterification of the sulfobenzoic acids with MeOH, in the hydrolysis of the sulfaminobenzoic acids with mineral acids and in the action of sodamide on methoxybenzophenones. A retarding *o*-effect is noticed in the sapon. of the Me esters of the sulfobenzoic acids and, quite unexpectedly, in the sapon. of the *Et o* methoxy-trans-cinnamate, m. 34-4.5°, prepd. from pure acid (in 184-4.5°) by the Fischer procedure.

C. F. VAN DUIN

Electron displacement and alternating polarity; their quantitative relation in aromatic compounds. G. BERGER *Rec trav chim.* 46, 511-8 (1927).—van Duin (preceding abstract) doubted whether the general effect of a substituent is transmitted by means of the C chain on the ground that the general effect is still perceptible at a far greater distance from the key atom than would be possible according to the theory of Højendahl (*C. A.* 18, 2836). The quant. relations of H.'s theory cannot be right, this theory requiring that the introduction of a β Cl atom into crotonic acid would enhance the dissoen. const. three times as much as the introduction of a β Cl atom into PrCO₂H, while the ratio: dissoen. const. β -chlorocrotonic acid/dissoen. const. crotonic acid = 6.55 and the ratio: dissoen. const. β -chlorobutyric acid/dissoen. const. butyric acid = 6.04. Also the introduction of a *m*-Me group into BzOH would diminish the dissoen. const. 3.3 times as much as the introduction of such a group into hexahydrobenzoic acid; however, the ratio: dissoen. const. *m*-toluic acid/dissoen. const. BzOH = 0.85 and the ratio: dissoen. const. hexahydro *m*-toluic acid/dissoen. const. hexahydrobenzoic acid = 0.96. A method is presented to calc. the *o*, alternate and general effect of substituents, the assumption being made that the total influence of these effects is the product of the sep. influences of each substituent and not the sum as had been assumed by van Duin. This assumption was made, the expts. of Olivier (*C. A.* 20, 2485) on the hydrolysis of substituted benzyl chlorides and of Goldsworthy (*C. A.* 20, 2840) on the reaction between substituted phenolates and EtI having proved that the influence of 2 substituents is the product of the influences of each substituent separately in the same position. In the case of the hydrolysis of the substituted benzyl chlorides the following equations are obtained: For the halogens $K_0 = K.a_0.\omega/g_0$; $K_m = K/a_m.g_m$; $K_p = K/a_p.g_p$; for the COOH and NO₂ groups $K_0 = K.\omega/a_0.g_0$; $K_m = K.a_m/g_m$; $K_p = K/a_p.g_p$; for the Me group $K_0 = K.a_0.g_0.\omega$; $K_m = K.a_m/g_m$; $K_p = K.a_p.g_p$; K_0, K_m, K_p being the reaction consts. of the unsubstituted and the isomeric substituted benzyl chlorides, resp., and *a*, *g* and ω the alternate, general and *o*-effect. Secondly the assumption is made that the alternate and general effect decrease in the same way with increasing distance from the key atom, which gives the equations: $a_0/g_0 = a_m/g_m = a_p/g_p$. By means of these equations it is possible to calc. for the halogens *a*, *g*, ω and for the other substituents *a*_p and *g*_p. The calculation has been carried out for the hydrolysis of the substituted benzyl chlorides (Olivier, *C. A.* 18, 48), for the reaction between ethylene oxide and phenolates (Boyd and Marie, *C. A.* 9, 198) and for the sapon. of substituted Et benzoates (McCombie and Scarborough, *C. A.* 9, 1466).

C. F. VAN DUIN

Earliest history of the Friedel-Crafts reaction. A. A. ASHDOWN. *Ind. Eng.*

Chem. 19, 1063-5(1927).—In honor of the 50th anniversary of the discovery of the Friedel-Crafts reaction A. has given a translation of the original article as it was presented before L'Académie des Sciences. A brief history of the life of James Mason Crafts, who later became president of M. I. T., also is given. D. H. POWERS

Chlorobenzene and its most important derivatives. I. ZUCKERMANN. *J. Chem. Ind. (Russia)* 2, 338-42; *Chem. Zentr.* 1926, I, 3317.—An exhaustive study was made of the nitration of *PhCl* according to the method of Schaarschmidt (*C. A.* 19, 1252); of the sepn. of *o*- and *p*-*ClC₆H₄NO₂*; of the conversion of *o*-*ClC₆H₄NO₂* to *o*-nitroanisole by the action of alc. NaOH (cf. Blom, *C. A.* 15, 3996) in which it was found that increasing the concn. under 3-5 atm. pressure accelerates the reaction, but that the yield of the by-product, *o*-chloroazoxybenzene also increases, that the formation of azoxy compds. becomes temporarily the chief reaction, and that the most suitable method is to work at first without excess pressure and only to increase the pressure when the alky. of the soln. has diminished to about 50% of its value; and of the reduction of *o*-nitroanisole to *o*-anisidine and hydrazoanisole. C. C. DAVIS

Coordination compounds of beryllium and *m*- and *p*-nitrobenzoylacetone. HENRY BURGESS. *J. Chem. Soc.* 1927, 2017-9.—*p*-Nitrobenzoylacetone, golden yellow, m. 112-3.5°, in 1.5 g. yield from 50 g. *p*-O₂NC₆H₄CO₂Et, 19.8 g. Me₂CO and 10.5 g. NaNH₂ in 150 cc. Et₂O at -17°. *Be* compd., brownish yellow, m. 243-4°. *m*-Nitrobenzoylacetone, pale yellow, m. 114-5°; FeCl₃ gives a wine-red color; *Be* compd., orange-yellow, m. 207-8°. *Et* bis-*p*-nitrobenzoylacetatoacetate, m. 137-9°, and *Et* *p*-nitrobenzoylacetatoacetate, pale yellow, m. 43-5°, result from AcCHNaCO₂Et and *p*-O₂NC₆H₄CH₂Br; the latter gives a deep reddish purple color with FeCl₃ and a green Cu deriv. C. J. WEST

Reactions of displacement in the tropic acid group. II. C. A. KERR. *J. Chem. Soc.* 1927, 1943-8; cf. McKenzie and Strathern, *C. A.* 19, 1134.—Chlorotropic acid (I) is conveniently prepd. in 16 g. yield from 27 g. CH₂:CPhCO₂H in 135 cc. H₂O contg. 2 cc. glacial AcOH and 1.5 mols. H₂NCONHCl soln., 8 g. CH₂:CPhCO₂H being recovered. I could not be reduced to tropic acid. The action of NaOH or Na₂CO₃ on I gives HOCH₂CPh(OH)CO₂H, m. 144-5°. I (3 g.) in 50 cc. concd. NH₄OH, allowed to stand 7 days at 0°, gives 1.3 g. α -amino- β -hydroxy- α -phenylpropionic acid (II), m. 285-8° (decompn.), $[\alpha]_D^{20}$ 40.6° (HCl, *c* 6.208); *HCl* salt, prisms, m. 225° (decompn.). I may be resolved by morphine in MeOH, 30 g. I finally giving 5.8 g. *d*-I, $[\alpha]_D^{15}$ 12.6° (MeOH, *c* 3.025), m. 123-4°; the mother liquor gives the *l*-I, $[\alpha]_D^{15}$ -12.4° (MeOH, *c* 3.586). The action of Na₂CO₃ on *d*-I gives inactive HOCH₂CPh(OH)CO₂H, as does Ag₂O; concd. NH₄OH gives II, with the same rotation. C. J. WEST

Constitution of the chlorides of acetylated α -hydroxy acids. E. E. BLAISE AND HERZOG. *Compt. rend.* 184, 1332-3(1927); cf. *C. A.* 6, 1287.—From the Ac derivs. of α -HO acids and SOCl₂ are obtained chlorides which would be expected to have the formula: RCH(OAc)COCl (I). These chlorides react with org.^o Zn derivs. as though they had the formula: R'CH.CO.O.CR''Cl.O (II), and react in the presence of Al₂Cl₆

as II and as I, formed from II by isomerization. There is no indication that I and II are tautomers. The chloride (III) of Me₂C(OAc)CO₂H, b₁₇ 70° (anilide, m. 100°) and C₆H₅ in the presence of Al₂Cl₆ give Me₂C(OAc)COPh (IV) and Me₂C.CO.O.CMePh.O

(V). IV, b₁₄ 135-7°; semicarbazone, m. 186-8°; *p*-nitrophenylhydrazone, m. 171°. Me₂C(OH)COPh, derived from IV by hydrolysis, b₁₉ 125°; semicarbazone, m. 184-5°; oxime, m. 106°. V, m. 60°, gives on hydrolysis Me₂C(OH)CO₂H and MeCOPh. III and *p*-C₆H₄Me₂ in the presence of Al₂Cl₆ give *p*-Me₂C(OAc)CO.C₆H₄Me₂ (VI), *p*-Me₂C(OH)CO.C₆H₄Me₂ (VII) and 2,5-Me₂C₆H₃COMe (VIII), VII and VIII being decompn. products of a cycloacetal homologous to V. VI, b₁₇ 148°; *p*-nitrophenylhydrazone, m. 212°. VII, b₁₆ 130°; semicarbazone, m. 166°. *p*-Nitrophenylhydrazone, m. 219°. VIII gives a semicarbazone, m. 153°, and a *p*-nitrophenylhydrazone, m. 152°.

MARGARET W. MCPHERSON

Intermolecular condensation of styryl methyl ketones. I. ROBT. DICKINSON, I. M. HEILBRON AND FRANCIS IRVING. *J. Chem. Soc.* 1927, 1888-97.—3,4-(MeO)₂-C₆H₃CH:CHAc (I) m. 85-6°; semicarbazone, m. 205°; it is phototropic, becoming S-yellow on short exposure to light; from 50% AcOH it seps. as canary-yellow needles, m. about 180°, probably an unstable acetate. 3,4-(MeO)₂-C₆H₃CHO and I in EtOH or with Me₂CO give 3,3',4,4'-tetramethoxydistyryl ketone (II), m. 84° (tetra-bromide, m. 152°). II and AcCH₂CO₂Et with EtONa in EtOH give *Et* 3-*m*,*p*-dimethoxyphenyl-5-*m*,*p*-dimethoxystyryl- Δ^4 -cyclohexen-1-one-2-carboxylate, bright yellow, m. 160-1°, which, boiled with AcOH-H₂SO₄ for 4 hrs., gives 3-*m*,*p*-dimethoxyphenyl-5-*m*,*p*-dimeth-

oxystyryl- Δ^4 -cyclohexen-1-one, m. 168°, identical with the compd. obtained by Francesconi and Cusmano (C. A. 2, 2951) from 3,4-(MeO)₂C₆H₃CHO and aq. Me₂CO with NaOH; the monosemicarbazone, golden yellow, m. 226-7°. I (20 g.), heated on the steam bath with 30 cc. piperidine for 24 hrs. gives a dimeride of I, amorphous powder, m. 209-10°. 3-Methoxy-4-ethoxystyryl Me ketone, from ethylvanillin and Me₂CO with 1% NaOH, yellow needles, m. 106°, from dil EtOH; or colorless after standing in H₂O or C₆H₆Me₂ suspension for several weeks in direct sunlight; semicarbazone, pale yellow, m. 208-9°; dimeride, amorphous, m. 187°; if 10% NaOH soln. is used, there results 3,3'-dimethoxy-4,4'-diethoxystyryl ketone, yellow, m. 123-4°. Propylvanillin, m. 59-60° (60% yield); semicarbazone, m. 156°. 3-Methoxy-4-propoxystyryl Me ketone, bright yellow, m. 92-3°; with Me₂CO and 2 N NaOH, this gives a small amt. of 3-m-methoxy-p-propoxyphenyl-5-m-methoxy-p-propoxystyryl- Δ^4 -cyclohexen-1-one, pale yellow, m. 152-3°; it absorbs 2 mols. Br but a solid tetrabromide could not be isolated. Isopropylvanillin, b₁₈ 150-2°; semicarbazone, m. 151-2°. 3-Methoxy-4-isopropoxystyryl Me ketone, yellow, m. 51-3°; semicarbazone, yellow, m. 203-4°. 3-Methoxy-4-benzoyloxystyryl Me ketone, yellow, m. 93°; semicarbazone, yellow, m. 200-1°; 3,3'-dimethoxy-4,4'-dibenzoyloxystyryl ketone, golden yellow, m. 155°; tetrabromide, m. 141° (decompn.); an apparent isomer was obtained when 10 g. of the monostyryl ketone in 36 cc. Me₂CO and 36 cc. EtOH were treated with 25 cc. 8% NaOH: it forms dark orange-yellow needles, m. 174-5°; a solid bromide could not be isolated. Phenyl 3,4-dimethoxystyryl ketone, yellow, m. 88°; this could not be condensed to a cyclohexenone. C. J. WEST.

Grignard synthesis of certain organic arsenic derivatives. E. GRYSZKIEWICZ-TROCHIMOWSKI AND E. ZAMBRZYCKI. Roczn. Chem. 6, 794-803 (1926).—As₂O₃ added to Et₂O solns. of various Mg org. derivs yields with Mg aryl salts partly oxidized products, while alkyl salts produce trialkylarsines. Thus the following compds. are prepd.: diphenylarsine oxide, dibenzylarsenious acid, di- α -naphthylarsine oxide, trimethylarsine, b. 48-51°, triethylarsine (when chlorodimethylarsine, b. 155°, is prepared), tri-n-propylarsine and triallylarsine, b₁₇ 104°. B. C. A.

Synthesis of some new acylated derivatives of arsanilic acid. II. T. UKAI, T. HASEGAWA AND M. HASHIMOTO. J. Pharm. Soc. Japan No. 536, 871-4 (1926).—In paper I (Ibid No. 534, 662), acetylsalicylarsanilic acid (I) could not be obtained from atoxyl by heating with aspirin, because of decompn. of the latter. By converting aspirin first to o-AcOCCl₂COCl with PCl₅, and then heating with aq. atoxyl in the presence of NaHCO₃, I was obtained. Contrary to published data, I is slightly sol. in Et₂O. Next p-MeC₆H₄COCl was similarly heated with atoxyl, and p-tolylarsanilic acid was obtained. S. T.

Wislicenus' method for the preparation of ketonic acids. N. KISHI AND Z. KISHI. J. Pharm. Soc. Japan No. 545, 574-7 (1927).—One mol. of 4-nitro-m-xylene and 1 mol. of (CO₂Et)₂ in Et₂O in presence of KOEt give 2-nitro-5-methylphenylpyroracemic acid, the only mono-condensation product (63% yield), showing that the Me group ortho to the NO₂ group is the only reactive group of the 2 Me groups. NAO UYEI.

Camphor oils. VIII. Catalytic action of Japanese acid clay upon cineole. KASHICHI ONO AND SHUJI MIYAZAKI. Bull. Chem. Soc. Japan 2, 207-9 (1927); cf. C. A. 21, 1642.—Cineole (500 g.) heated with 150 g. Japanese acid clay at 180° 2 hrs. reacted violently, losing H₂O and forming 102 g. of hydrocarbon oils consisting of dipentene, p-cymene and dipinene. A. W. FRANCIS.

The terpene series. A. DUBOSC. Peintures, pigments, vernis 4, 336-8, 356-8, 380-2 (1927).—Brief review of work done on the constitution of terpenes during the last 100 yrs. A. PAPINEAU-COUTURE.

New terpene alcohol, C₁₅H₁₈O. O. ACHMATOWICZ. Roczn. Chem. 6, 804-14 (1926).—Bornyl acetate, prepd. in presence of H₂SO₄ or ZnCl₂, yields on hydrolysis a new alc., apparently a space isomeride of borneol, termed endoborneol, m. 186°, b. 203-204°, which on oxidation yields camphor. Its Et ether, b₂₀ 83-87°, b_{7M} 197-198°, phenylurethan, m. 138-139°, and benzoate, b₁₈ 186-187°, are described. B. C. A.

Factors influencing the production of terpineol from α -pinene in acid solution. F. G. GERMUTH. Am. J. Pharm. 99, 402-5 (1927).—Differences in temp. affect very markedly the % yield of terpineol from PhSO₃H and α -pinene in AcOH soln. Addition of H₂O, also, has a tendency to retard the production of this compd., more particularly at lower temps. When the amt. of H₂O added is increased from 1.0 to 5.5%, with increase in temp. of the soln., the effect upon the production of the substance sought is not proportional to the amt. of H₂O added; apparently, the differences existing in temp. compensate for the decided increase in the H₂O content. A temp. of about 95°, with a soln. containing the least possible amt. of H₂O, evidently insures the highest yield

of terpineol from PhSO_3H and α -pinene in AcOH soln., when mol. quantities are employed.

W. G. GAESSLER

δ -*d*-Bornylsemicarbazide and δ -*d*-neobornylsemicarbazide. J. A. GOODSON. *J. Chem. Soc.* 1927, 1997–2000.—*d*-Bornylamine and $\text{Me}_3\text{C}:\text{NNHCONH}_2$ at 75° give 76% of acetone- δ -*d*-bornylsemicarbazone, m. $141\text{--}8^\circ$ (all m. p. cor.), $[\alpha]_D^{20}$ 25.5° (EtOH, c 2.04); heating with 10% HCl on the H_2O bath for 1.5 hrs. gives 94% of the HCl salt, m. $190\text{--}8^\circ$, crystg. with $2\text{H}_2\text{O}$, $[\alpha]_D^{20}$ 2.6° (EtOH, c 5), of δ -*d*-bornylsemicarbazide, m. 75° , $[\alpha]_D^{20}$ 17° (EtOH, c 5); semicarbazones were prepd. of isopulegone, m. $224\text{--}6^\circ$, $[\alpha]_D^{18}$ 9.2° (CHCl_3 , c 5.04); 4-methylcyclohexanone, m. 145° , $[\alpha]_D^{20}$ 27.2° (EtOH, c 4.898); 3-methylcyclohexanone, m. $172\text{--}7^\circ$, $[\alpha]_D^{20}$ 27.4° (EtOH, c 4.85); recrystn. failed to resolve it into its components, even when seeded with the *d*-deriv., m. $173\text{--}9^\circ$, $[\alpha]_D^{20}$ 7.4° (EtOH, c 4.726). Acetone- δ -*d*-neobornylsemicarbazone, m. $175\text{--}9^\circ$, $[\alpha]_D^{20}$ -92.1° (EtOH, c 2.008); hydrolysis gives δ -*d*-neobornylsemicarbazide HCl, m. $198\text{--}202^\circ$, $[\alpha]_D^{20}$ -50.8° (EtOH, c 4.982), crystg. with $1\text{H}_2\text{O}$; the following semicarbazones were prepd.: 4-methylcyclohexanone, m. $151\text{--}5^\circ$, $[\alpha]_D^{20}$ -91.3° (EtOH, c 2.83); 3-methylcyclohexanone, m. $157\text{--}61^\circ$, $[\alpha]_D^{20}$ -91.2° (EtOH, c 4.772).

Chlorocamphoranilic acids and camphorochlorophenylimides. MAHAN SINGH AND RAM SINGH. *J. Chem. Soc.* 1927, 1994–7; cf. Wootton, *C. A.* 4, 2107.—Condensation of camphoric anhydride with *o*-, *m*- and *p*- $\text{ClC}_6\text{H}_4\text{NH}_2$ yields a mixt. of chlorocamphoranilic acid and camphorimide derivs.; W.'s in. ps. are low, because the acids contained the imides formed in the condensations. 2'-Chlorocamphoranilic acid, m. 165° ; 3'-Cl deriv., m. $216\text{--}7^\circ$; 4'-Cl deriv., m. 197° . The rotations of the acids and imides in MeOH, EtOH, Me_2CO and MeEtCO are given; there was no mutarotation.

C. J. WEST

Coumarin series. I. Action of the Grignard reagent upon substituted coumarins. I. M. HELLBRON AND D. WM. HILL. *J. Chem. Soc.* 1927, 2005–13.— PhMgBr and 4-hydroxycoumarin in $\text{Et}_2\text{O}-\text{C}_6\text{H}_6$ give 4-hydroxy-2,2-diphenyl- Δ^2 -chromene, m. $230\text{--}1^\circ$, sol readily in NaOH and Na_2CO_3 . 4-Methoxycoumarin gives the 4-MeO deriv., m. 135° ; hydrolysis gives $\text{Ph}_2\text{C}:\text{NOH}$. 4-Methoxy-2,2-dianisyl- Δ^2 -chromene, m. 155° . 1-Methylcoumarin and PhMgBr give 2,2-diphenyl-4-methyl- Δ^2 -chromene, m. 89° ; hydrolysis gives benzohydryl Ph ether, m. 56° . 2,2-Diphenyl-4,6-dimethyl- Δ^2 -chromene, m. 126° . Hydrolysis gives benzohydryl *p*-tolyl ether, m. 96° . 4,7-Dimethylcoumarin and PhMgBr give 10% of diphenyl-2-hydroxy- β ,4-dimethylstyrylcarbinol, m. 146° ; from the mother liquor are isolated 75% of 2,2-diphenyl-4,7-dimethyl- Δ^2 -chromene, m. 87° , also obtained by heating the carbinol in AcOH for 1 hr.; hydrolysis gives benzohydryl *m*-tolyl ether, m. 125° . 3-Methylcoumarin and PhMgBr give 2,4-diphenyl-3-methylchroman-2-ol, m. 149° ; boiling this with AcOH 1 hr. gives 2,4-diphenyl-3-methyl- Δ^2 -chromene, m. 91° . The primary reactions with the Grignard reagent follow a common course, the ultimate formation of a Δ^2 - or Δ^3 -chromene being influenced solely by the substituent in the pyran ring. Two possible explanations of this postulation are given.

C. J. WEST

Synthesis in the imidazole series: some derivatives of isoimidazole. P. C. MITTER AND N. N. SINHA. *Quart. J. Indian Chem. Soc.* 3, 401–4 (1926).—Aq. KOH added to aq. $\text{PhC}:(\text{NH})\text{NH}_2\cdot\text{HCl}$ followed by addn. of $(\text{CO}_2\text{Et})_2$ with occasional shaking for 3–4 days gives 2-phenyl-4,5-diketo-4,5-dihydroimidazole (I), m. 174° (decompn.). Extn. of $\text{PhC}:(\text{NH})\text{NH}_2$ from the neutralized salt with ether and treatment with $(\text{CO}_2\text{Et})_2$ drop by drop gives I. 2-Phenyl-4-chloro-5-ketoisoimidazole, prepd. by heating I with POCl_3 , pouring on ice, nearly neutralizing with Na_2CO_3 , evapg. to dryness and extg. with abs. alc., m. 215° (decompn.). 2-*p*-Tolyl-4,5-diketodihydroimidazole (II), prepd. from *p*- $\text{MeC}_6\text{H}_4\text{C}:(\text{NH})\text{NH}_2\cdot\text{HCl}$ by methods analogous to those for I, has no m. p. to 280° . Addn. of $\text{H}_2\text{NOCCO}_2\text{Et}$ to *p*- $\text{MeC}_6\text{H}_4\text{C}:(\text{NH})\text{NH}_2$ in Et_2O liberates NH_3 and after standing for a day gives II. POCl_3 and II were heated 15 min. and poured on ice, giving a cryst. HCl salt, which, filtered, dissolved in a small vol. of H_2O and poured into concd. AcONa , gives 2-*p*-tolyl-4-chloro-5-ketoisoimidazole, sublimes $260\text{--}5^\circ$. The ketochloro compds. represent the previously unknown isoimidazoles. Acetamidine did not yield analogous compds.

FOSTER D. SNELL

Pseudourethans. I. HEMENDRA KUMAR SEN AND CHITTARANJAN BARAT. *Quart. J. Indian Chem. Soc.* **3**, 405-14 (1926).—Negative results with chloralacetophenone, $\text{CCl}_3\text{CH}(\text{OH})\text{CH}_2\text{COPh}$ (I), indicate the importance of configuration in the theories of Sen (*Proc. 12th Indian Science Congress* 1925, 113) and of Graaff and Le Fevre (*C. A.* **20**, 218) which assume an intermediate oxide in alc. fermentation. Mixing I and excess ClCONH_2 in Et_2O , distn. of the Et_2O after 15 min. and decompn. of the excess ClCONH_2 with ice water gives a solid (II) having the compn. $\text{C}_{11}\text{H}_{17}\text{Cl}_2\text{NO}_2$. Dissolved in warm MeOH or EtOH and dild. with water II is pptd. as small prisms, m. 155° (decompn.). Boiled with abs. alc. 2 hrs., II is converted to $\text{CCl}_3\text{CH}:\text{CHCOPh}$. II, BzH and HCl do not give benzylidenediurethan. II probably is a *pseudourethan*, $\text{CCl}_3\text{CH}:\text{CH}_2$, $\text{CPh}(\text{OH})\text{NHC}(\text{O})\text{O}$, *i. e.*, a metoxazine. Condensation of 8 g. of CCl_3CHO

with 7 g. of $p\text{-MeC}_6\text{H}_4\text{COMe}$ in AcOH gives on recrystn from petroleum ether 4 g. of chloralacetolone, m. 100° . The *pseudourethan*, m. 160° , refluxed 3 hrs. in abs. alc. gives $\text{CCl}_3\text{CH}:\text{CHCOC}_6\text{H}_4\text{Me}$. α -Acetonaphthone and chloral refluxed in AcOH for 18 hrs. give a dark oil. This was washed with hot H_2O , dissolved in Et_2O , dried with Na_2SO_4 and filtered. Evapn. of the Et_2O and extn. of the oily residue with petroleum ether several times, decanting from the solid, gave chloralacetomaphthone, m. $90-2^\circ$. The *pseudourethan*, m. 125° , refluxed with abs. alc. for 2 hrs. gives tri-chloroethylidenacetomaphthone, m. $104-6^\circ$. The *pseudourethan* of chloralacetone, prepd. with poor yield, m. 98° (decompn.). α -Acetoveratrone condensed with chloral to give chloralacetoveratrone, m. $120-2^\circ$. The *pseudourethan* was not purified satisfactorily. Hydracetylacetone and ClCONH_2 gave ethylidenacetone. Similarly diacetone gave mesityl oxide. It appears that the CCl_3CHO group imparts stability to the aldol phase. In confirmation an attempt to prep. benzaldehydeacetophenone with AcOH as condensing agent gave benzylidenacetophenone.

FOSTER D. SNELL.

Derivatives of 1,3-diphenylhydrindene. RICHARD WEISS AND SAMI LUFT. *Monatsh.* **48**, 337-45 (1927).—Diphenylindene (2 g.) and 1.2 g. Br in Et_2O give 85-90% of the 2,3-dibromo deriv., m. $92-6^\circ$; with boiling MeOH this gives 1,3-diphenyl-2-bromo-1-methoxyhydrindene, m. $150-1^\circ$. Phenylhydrindone and Br in CHCl_3 give nearly quant. 2,3-dibromo-3-phenylhydrindone-1 (I), m. $123-4^\circ$; with MeOH at 150° for 6 hrs. this yields 60% of 2-bromo-3-phenylindone-1, m. $112-3^\circ$; this also results with $\text{C}_6\text{H}_5\text{N}$ or $\text{C}_6\text{H}_7\text{N}$. I and 2.5 mols. PhMgBr give 50% of 2-bromo-3-phenylhydrindone-1, m. $78-80^\circ$, the PhMgBr having only a reducing action. Bromophenylindene and PhMgBr , followed by acetylation, give 2-bromo-1-acetoxy-1,3-diphenylindene, yellow, m. $115-7^\circ$. 2,2-Dimethyl-1,3-diketohydrindene and PhMgBr give 20% of 3-phenyl-3-hydroxy-2,2-dimethylhydrindone-1, m. $139-41^\circ$; HCl gives the 3-chloro deriv., m. $107-8^\circ$, which reacts with MeOH to give the 3-methoxy deriv., m. $160-2^\circ$. The latter with PhMgBr gives 1,3-diphenyl-3-methoxy-1-hydroxy-2,2-dimethylhydrindene, m. $172-4^\circ$. C. J. W.

Isomeric hydroxybenzylidimethylamines. EDGAR STEDMAN. *J. Chem. Soc.* 1927, 1902 6.—The $\text{MeOC}_6\text{H}_4\text{CH}_2\text{Br}$ and excess Me_2NH in C_6H_6 were allowed to stand 24 hrs., the base was extd. with HCl and again liberated with NaOH and distd.; the phenol was then obtained with HBr . *m*-Methoxybenzylidimethylamine, b_{13} 105° ; HCl salt, m. 173° ; *m*-hydroxy deriv., m. 108° ; HCl salt, m. 152° ; *p*-MeO deriv., b_{13} 109° ; HCl salt, m. 152° ; *p*-HO deriv., m. 106° ; HCl salt, m. 185° ; *o*-methoxy deriv., b_{20} 113° ; HCl salt, m. 149° ; *o*-hydroxy deriv., b_{12} $99-100^\circ$; methiodide, m. 169° . *o*-Nitrobenzylidimethylamine- HCl , m. 221° ; *o*-amino deriv., b_{14} 107° , m. $36-7^\circ$; *di*- HCl salt, m. 205° . *p*-Nitrobenzylidimethylamine- HCl , pale yellow, m. 188° ; MeI gives *p*-nitrobenzyltrimethylammonium iodide, yellow, m. 198° ; the oxalate of the base, yellow, m. 155° . *Di*-*p*-nitrobenzylidimethylammonium chloride, m. about 176° . *p*-Aminobenzylidimethylamine *di*- HCl , m. 216° . *m*-Nitrobenzylidimethylamine- HCl , m. 230° ; *m*-amino deriv., b_{13} 129° , m. 46° ; *di*- HCl salt, m. 225° . C. J. WEST

Gold and mercury derivatives of 2-thiolglyoxalines. Mechanism of the oxidation of 2-thiolglyoxalines to glyoxalines. I. E. BALABAN AND HAROLD KING. *J. Chem. Soc.* 1927, 1858-74.—2-Thiol-4(or 5)-methylglyoxaline-5(or 4)-carboxylic acid (V), by hydrolysis of the Et ester (I) with Na_2CO_3 soln., m. $240-1^\circ$ with loss of CO_2 ; the acid gives a red color with Pauly's reagent in Na_2CO_3 soln.; an EtOH soln., satd. with HCl , gives the Et ester of the 2-Et deriv. (II), crystg. with $1.5\text{H}_2\text{O}$, m. $144-5^\circ$; picrate, yellow, m. $135-6^\circ$; II was also obtained from I, EtOH and HCl . Alk. hydrolysis of II gives 2-ethylthiol-4(or 5)-methylglyoxaline (III), m. $69-71^\circ$; picrate, m. $136-7^\circ$; chloroaurate, red, m. $130-1^\circ$. The alk. mother liquor after extn. of III by Et_2O , made acid and concd., gives 2-ethylthiol-4(or 5)-methylglyoxaline-5(or 4)-carboxylic acid semi- HCl (IV), m. $122-5^\circ$ (decompn.); the free acid (V), m. $179-80^\circ$ (decompn.) giving III; it is sol. in 10 parts boiling H_2O . III in hot 3 *N* HCl deposits the HCl salt, crystg. with $1\text{H}_2\text{O}$, m. $189-90^\circ$

(decompn.). Oxidation of I with 0.1 N I soln. gives 86% of 5(or 4)-carbethoxy-4(or 5)-methyl-2-glyoxaline disulfide, pale yellow, m. 222-3°; this is also obtained by alk. oxidation with $K_3Fe(CN)_6$ or with N oxides. Hydrolysis with Na_2CO_3 gives a mixt. of I and 2-thiol-4(or 5)-methylglyoxaline. I and 2-thiol-4(or 5)-methylglyoxaline gives VI. I (1.86 g.) in 100 cc. MeOH and 1 g. $AuCl_3$ in 30 cc. MeOH give the 2-*auro deriv.*, m. 252° (decompn.); attempts to prep. the free acid led to decompn. with the sepn. of Au, but the 2-*auro deriv.* of V was prepd. in 77% yield from V and $AuCl_3$ in MeOH, pale primrose-yellow powder, gives a pale yellow soln. in $NaHCO_3$, which can be boiled without decompn. Et glyoxaline-4(or 5)-carboxylate and $Hg(OAc)_2$ in EtOH give the 1-*acetoxymercuri deriv.*, shrinks at 222° and is not further changed at 300°; it crysts. with 1.5 H_2O ; NaOH gives orange-yellow HgO . I gives the 2-chloromercuri *deriv.*, m. 167-8°, sol. in 3 vols. boiling abs. EtOH. V also gives a 2-chloromercuri *deriv.*, m. 257° (decompn.), sol. in $NaHCO_3$ and pptd. unchanged by HCl. VI and H_2O_2 at 0 to -5° gives the unstable 4(or 5)-methylglyoxaline-2-sulfonic acid, changing in a few hrs. to a clear liquid, from which seps. the normal sulfite of 4-methylglyoxaline. If, after the sulfonic acid has crystd. out, 2 N NaOH is added till the soln. is alk., the soln. coned. at room temp. over H_2SO_4 *in vacuo* and then made acid, the 2-sulfonic acid, crystg. with 1 H_2O and m. about 280°, is obtained; Ca and Ba salts are very sol. in H_2O ; the NH_4 salt crysts. well. The action of SO_2 on 2-thiolglyoxalines is discussed, as well as quant. absorption expts. Various color reactions for thiolglyoxalines (SO_2 , $AuCl_3$, Sato's reaction for $SC(NH_2)_2$, Tschugaev's reaction, etc.) are also described. Tests of the action of the Au and Hg compds. on tubercle bacilli and toxicities for mice are briefly reported.

C. J. WEST

Cholesterol. III. E. MONTIGNIE. *Bull. soc. chim.* 41, 947-9(1927); cf. C. A. 21, 2477.—The I no. of cholesterol (I) varies according to time from 64.7 in 2.5 hrs. to 82.55 in 50 hrs. Complex I derivs. are formed. I with H_3PO_4 or $CuSO_4$ gives α -cholesterylene, $C_{27}H_{44}$ (II), which with alc.- H_2SO_4 regenerates I. I with P_2O_5 at 150-60° gives a mixt. of II, m. 78-80°, and another unsatd. hydrocarbon, $C_{26}H_{42}$, m. 66-7°, which forms a Br addn. compd., m. 61.2°. I boiled with $Ag_2Cr_2O_7$ and dil. H_2SO_4 is oxidized to oxycholestenone, $C_{27}H_{46}O_2$, m. 125°, which absorbs Br and whose semicarbazide m. 131°.

A. W. FRANCIS

The sterol of colt's foot (*Tussilago farfara*). LEOPOLD SCHMID. *Monatsh.* 48, 289-91(1927), cf. Zellner, C. A. 18, 3449.—The sterol of *Tussilago farfara*, m. 134°, is probably a mixt.; by use of the bromoacetate, an Et_2O -insol. fraction is obtained which appears to be identical with sitosterol.

C. J. WEST

Action of aminobenzyl alcohol on resorcinol. G. B. KAGAN. *J. Chem. Ind. (Russia)* 1927, 230.—If $p\text{-H}_2N\text{C}_6\text{H}_4\text{CH}_2\text{OH}$ is heated with an excess of $o\text{-C}_6\text{H}_3(\text{OH})_2$ in alk. soln., the soln. acidified with H_2SO_4 and boiled a short time, a cryst. substance, 4,2',4'- $\text{H}_2\text{NC}_6\text{H}_4\text{CH}_2\text{C}_6\text{H}_3(\text{OH})_2$, m. 212-5°, seps., which can be recrystd. from a small amount of hot H_2O in needles. It is sol. in EtOH, but with an excess of NaOH ppts. again. If the substance is filtered, the H_2SO_4 of the filtrate is neutralized with an excess of $NaC_2H_3O_2$, another cryst. NH_2 deriv. 1,3,4,6-(HO) $_2\text{C}_6\text{H}_3(\text{CH}_2\text{C}_6\text{H}_4\text{NH}_2)_2$, m. 162-3°, is obtained.

BERNARD NELSON

β -Chloroglutaconic anhydride. R. MALACHOWSKI AND T. KALINSKI. *Rocz. Chem.* 6, 768-73(1926); cf. C. A. 21, 1798.— β -Chloroglutaconic anhydride, m. 113-114°, is obtained from the corresponding acid. From it are prepd., by condensation with PhCH:CHCHO 4-chloro-6-hydroxy-5-cinnamylidene- α -pyrone, m. 171-172°, with PhN_2OH 4-chloro-6-hydroxy- α -pyrone-5-phenylhydrazone, m. 204°, and by bromination 3-chloro-bromo-6-hydroxy- α -pyrone, m. 107.5°, which on hydrolysis yields β -chloro- α -bromoglutaconic acid, m. 131-132°.

B. C. A.

Synthesis of 4-hydroxy-3-methoxystyryl butyl ketone. HIROSHI NOMURA AND SHUNJI TSURUMI. *Science Repts. Tôhoku Imp. Univ.* 16, 563-4(1927).—Vanillin (15.2 g) (I) is heated with 10 g. BuCOMe (II) in 150 g. 95% alc. with 30 g. 1:1 KOH for 6 hrs. under reflux. The product, evapd., extd. with Et_2O to remove II and acidified with concd. HCl yields an oil which is dissolved in Et_2O and freed from I by treatment with bisulfite. The resulting oil, recrystd. from dil. MeOH and dried *in vacuo*, gives 4-hydroxy-3-methoxystyryl butyl ketone (III), m. 39-40°. III by reduction with NaH and H_2O gives 4-hydroxy-3-methoxyphenylethyl butyl ketone.

D. H. POWERS

Unsaturated 1,4-diketones. III. Mode of addition of halogen to dibenzoyl-ethylene. R. E. LUTZ. *J. Am. Chem. Soc.* 49, 1106-11(1927); cf. C. A. 21, 82.—Br adds very nearly quant. at low temps. to *cis*- and *trans*-(BzCH:) $_2$ to give exclusively in the 1st case α - and 2nd case β -(BzCHBr) $_2$. The α -dihalides are obtained exclusively from *dl*-(CHClCO_2H) $_2$ and (CHBrCO_2H) $_2$ by the Friedel-Crafts reaction upon the acid chlorides and the β -halides are obtained from the *meso*-acids. *dl*-Dichlorosuccinyl dichlor-

ide, b_r 78.5°, m. 39°; the dibromo chloride, b_r 85°. The α -dihalides are *dl*- and the β , *meso*-derivs.; the mode of addn. of halogen to the 2 isomers of $(BzCH_2)_2$ is *trans*. α, β -Dichloro- γ, γ -diphenylbutyrolactone, m. 141-2°, is obtained when $AlCl_3$ is added to *meso*-($CHClCOCl$)₂ in C_6H_6 . C. J. WEST

New diketone from phenyl *p*-tolyl ketone. T. W. JEZERSKI. *Rocz. Chem.* 6, 738-40(1926).—The main product of the reaction between p - MeC_6H_4Bz and S is *s-di* p, p' -dibenzoyldiphenylthane ($BzC_6H_4CH_2$)₂, m. 239-240°. B. C. A.

Nitration of β -naphthyltrimethylammonium nitrate. B. H. INGHAM. *J. Chem. Soc.* 1927, 1972-5.— β -Naphthyltrimethylammonium iodide, m. 193° (decompn.); *nitrate*, m. 190° (decompn.); *picrate*, golden yellow, m. 194-5° (decompn.). Nitration of the nitrate at room temp. (3 times its wt. of 99% HNO_3) for 2 hrs. gives almost quant. the 5-nitro deriv., orange yellow, m. 231° (decompn.); *iodide*, golden yellow, m. 194° (decompn.); *picrate*, canary-yellow, m. 254° (decompn.). Since the constitution could not be detd. by oxidation the product was synthesized from 5- $O_2NC_{10}H_6NH_2$ and Me_2SO_4 . The *iodide* of the corresponding 8-nitro salt m. 180°; *picrate*, m. 221-3°. C. J. WEST

Naphthalenesulfonic acids. VIII. Hydrolysis of naphthalene-1,5-disulfonic acid. D. F. J. LYNCH AND JOHN T. SCANLAN. *Ind. Eng. Chem.* 19, 1010-12(1927); cf. C. A. 21, 1466.—1,5- $C_{10}H_6(SO_3H)_2 \cdot 4H_2O$ (I) is prepd by heating $C_{10}H_8$ with 30% oleum on a steam bath for 18 hrs. The hydrolysis of I is studied at temps. from 100° to 220° with 1 to 85% H_2SO_4 . Results obtained indicate that the 1,5-isomer is similar in its behavior to the 1,6-isomer and somewhat less stable. When other sulfonic acids are formed from I complete hydrolysis and subsequent resulfonation undoubtedly occur.

Oxidation of β -naphthol. OTTO DISCHENDORFER AND WERNER DANZIGER. *Monatsh.* 48, 315-36(1927); cf. *Ehrlich, Monatsh.* 9, 527; 10, 115.—Oxidation of β - $C_{10}H_7OH$ according to E. gives 4-(2-carboxyphenyl)-5,6-benzocoumarin (I), m. 281-2°, decompn. at about 320°; the yield is about 2.5%; *Et ester*, m. 123-4°; *Me ester*, m. 152-3°; I does not give an oxime, a Bz or Ac deriv. The 3-bromo deriv., yellow, m. 250-2°, decompn. 274°, crystals with 1EtOH; its *Et ester*, yellow, m. 134°. I is reduced by Na-Hg, giving the 3,4-dihydro deriv. (II), m. 221°. decompn. 250-60°; *Et ester*, m. 147-9°. While I dists. without decompn. at 14 mm., at the ordinary pressure it splits off CO_2 , giving 4-phenyl-5,6-benzocoumarin (III), pale yellow, m. 161-2°; 3-bromo deriv., yellow, m. 198°. II likewise splits off CO_2 on distn., giving 4-phenyl-3,4-dihydro-5,6-benzocoumarin, m. 264°. I has been synthesized from phthalylacetic acid and β - $C_{10}H_7OH$ with concd. H_2SO_4 . 1-Benzoyl-2-hydroxynaphthalene, yellow, m. 138°, from β - $C_{10}H_7OH$, $BzCl$ and $AlCl_3$ in CS_2 ; *acetate*, m. 90-1.5°; heating the acetate at 140-60° for 0.5 hr. gives III. The mechanism of the formation of I is discussed. C. J. WEST

Crystallography of phenyl α -naphthyl ketone. T. J. WOYNI. *Rocz. Chem.* 6, 653-60.—The crystallographic and optical constants of crystals of α - $C_{10}H_7Bz$ were detd. by the theodolite method. B. C. A.

Fluorene series. CH. COURTOT AND C. VIGNATI. *Compt. rend.* 184, 1179-81 (1927); cf. C. A. 21, 1810.—2-Chlorofluorene (I), m. 96-7°, is prepd. from diazotized 2-aminofluorene. Direct chlorination of fluorene in $CHCl_3$ at 0-5° gives a mixt. (II), m. 86°, of I and 2,7-dichlorofluorene, difficult to sep. Oxidation of II with $Na_2Cr_2O_7$ in $AcOH$ gives 2-chlorofluorenone (III), orange-yellow needles, m. 123° (phenylhydrazone, m. 145°) (cf. Geffroy, Univ. Nancy, *Thesis*, 1925), together with 2,7-dichlorofluorenone (IV) (Schmidt, Wagner, C. A. 6, 1146). Reduction of III by Zn in NH_3 alc. gives 2-chlorofluorenol, colorless silky needles, m. 142°. In the same way IV gives 2,7-dichlorofluorenol, fine brilliant needles, m. 154-5°. Nitration of II in $AcOH$ at 70-80° gives 2,7-chloronitrofluorene (V), yellow, m. 237°. The dichlorofluorene is not attacked. V is reduced by Zn in alc.- NH_3 to 2,7-aminochlorofluorene (VI), white lamellas, m. 134°. V is oxidized to 2,7-chloronitrofluorenone (VII), yellow needles, m. 230°, slightly sol. in $AcOH$. Reduction of VII by $(NH_4)_2S$ gives 2,7-aminochlorofluorenone, bluish red, m. 203.5°, reduced by Zn to 2,7-aminochlorofluorenol, colorless, m. 198-200°.

Studies in colored hydrocarbons. IV. The preparation of bifluorenes by the dehydrogenation of hydrocarbons of the bifluorenyl type. A. A. VANSHEIDT. *J. Russ Phys.-Chem. Soc.* 58, 249-69(1926).— $C_{18}H_{12}N$ solns. of bifluorenyl and its analogs become colored in presence of EtOK and absorb atm. O probably according to the scheme $Ar_2CH.CHA_{r_2} + 2KOH \rightleftharpoons Ar_2CK.CKA_{r_2} + 2H_2O$; $Ar_2CK.CKA_{r_2} + O_2 \rightarrow Ar_2C:CA_{r_2} + K_2O_2$ (cf. C. A. 8, 1580). Na substitutes in a similar manner when a PhMe soln. of bifluorenyl is refluxed over the metal, forming a dark ppt., which on shaking with air is transformed into sol. bifluorenes and Na_2O_2 ; it also adds on to the

FREDERICK C. HARN

double bond in *dibinaphthylene* to form a violet ppt., which is oxidized by air to the same hydrocarbon. The autoxidation of bifluorenyls was used in the following preps. To 0.1 g. dibiphenyleneethane in 10 cc. boiling C_6H_6N was added 3–4 drops of 5 N MeOK, the mixt. shaken until bright orange-yellow and while still hot dild. drop by drop with 3 vols. of NH_4OH . *Dibiphenyleneethane*, m. 188°, sepd. on standing. A similar procedure was followed with pure bischrysofluorenyl, NH_4OH being immediately added on the development of a purplish red color; *sym. di- α -naphthodibenzo-bifulvene*, dark red, m. 317–8°, seps., sol. in warm H_2SO_4 (dark violet, purplish on dild. with H_2O), decolorized by oxidizing agents. Graebe's product (m. 180–90° C 94.96%) was probably impure bischrysofluorenyl. *unsym. Di- α -naphthylenediphenyleneethane*, dark red, m. 315° in CO_2 , was obtained similarly, NH_4OH being added to the dark purple soln.; soly. and behavior toward oxidizing agents are like those of the *sym.* compd., except that H_2SO_4 dissolves it only at 90–100°, the soln. being violet-red (violet-blue for the *sym.*); gives off HBr when treated with Br_2 , then forms a colorless addn. compd. H converts it into *unsym.* hydrobifulvene. A dark blue soln. results with chrysofluorenyldi- α -naphthofluorene; NH_4OH causes the sepn. of tri- α -naphthylphenyleneethene, in small dark blue rods, m. 300° (not sharply); the solns in org. solvents are intense blue and show a single absorption band in the red portion of the spectrum; dissolves in H_2SO_4 at 50–60° with a bright green color. The behavior toward oxidizing and reducing agents resembles that of dinaphthobifulvenes. On the addn. of a large amt. of MeOK to a C_6H_6N soln. of dibinaphthyleneethane an ochre-red color develops and an amorphous green powder can be isolated whose properties resemble those of dibinaphthyleneethene. The red color of the soln. turns to green on the neutralization of alkali or on dild. All the hydrobifulvenes mentioned above form brown ppts. when their $C_{11}H_8Me_2$ solns. are boiled with Na, from which the corresponding bifulvenes result on shaking with air. Dibinaphthyleneethene forms a violet-brown product on second heating (probably a disubstituted Na compd.). The action of Ag oxide and salts.— Ag_2O (in concd. NH_4OH) + 3 vols. of pyridine acts on dibinaphthyleneethane in the cold, and on the other hydrobifulvenes upon warming, to form the colored bifulvenes. AcOAg in pyridine reacts almost quant. in the cold: $Ar_2CHCHAr_2 + 2AcOAg \rightarrow Ar_2C:CAr_2 + 2Ag + 2AcOH$, AcOH being bound by C_6H_6N . The following preps. make use of this reaction. A soln. of 0.8 g. bisdinaphthofluorenyl in 30 cc. C_6H_6N + 0.5 g. AcOAg in 10 cc. C_6H_6N was refluxed for 1 hr. (reaction incomplete), 0.5 g. AcOAg more added and the mixt. heated for 0.5 hr. more. It was filtered on cooling, 50 cc. of concd. NH_4OH slowly added with shaking, then 50 cc. H_2O ; *dibi- α -naphthyleneethene* seps. as a black powder; from xylene very dark green with metallic luster; m. 357° in CO_2 . Microscopic examn. forms the only criterion of purity, since m. p. and compn. are close to those of the hydro compd. The bifulvene is sol. in H_2SO_4 at 50° with a violet-brown coloration; its C_6H_6N soln. is colored, brownish red by the addn. of MeOK (if the soln. was hot it assumes a violet tinge on cooling), while the addn. of acids or ammonia restores the green color of the hydrocarbon. It is the most reactive of all the naphthobifulvenes, the solns. being readily discolored on standing or treatment with H_2O_2 ; reducing agents convert it into dibinaphthyleneethane. Br_2 does not enter the double bond, but displaces the H of aromatic nuclei. Magidson (C. A. 19, 1859) did not obtain the pure product, judging by his analytical, etc., data. *unsym. Di- α -naphthylenediphenyleneethene* prepd. from fluorenyl- α -naphthofluorene and 3 mols. of AcOAg was identical with the autoxidation product (see above). *Tri-naphthobifulvene* from chrysofluorenyldi- α -naphthofluorene and AcOAg was less pure than the same substance obtained by autoxidation. *Bischrysofluorenyl* reduces AcOAg, but does not form the corresponding bifulvene. The method failed also for dibiphenyleneethane. V. The properties of bifulvenes and their hydro derivatives. *Ibid* 269–88.—Hydrobifulvenes possess an affinity toward alkalis and oxidizing agents while bifulvenes are reduced easily and behave like quinones toward H_2SO_4 . Br has dehydrogenating action on bifluorenyl and its naphtho derivs.; with bifulvenes, it enters the nucleus. The color of bifulvenes in C_6H_6 soln. deepens with additional naphtho groups and as we pass from *sym.* to *unsym.* compds. Bifulvenes, unlike ordinary hydrocarbons, are hardly sol. in benzene, EtOH or Et $_2O$; they crystallize with difficulty and tend to retain impurities. Their affinity toward unsatd. solvents (C_6H_6 , C_6H_5N) is detd. by the partial valences. M. p. in general increases with mol. complexity and is higher for bifulvenes than their hydro derivs. Bifulvenes are reduced on boiling with Na and AmOH or with Zn dust and fatty acids, but C_6H_6N affords the best medium, because of the difference in soly. Thus in C_6H_6N reduction takes place in presence of H_2 and $H_2N.NH_2$ (with Pt as the catalyst), SbH_3 , H_2S and $(NH_4)_2S$. The susceptibility to reduction increases with the no. of naphtho groups. Dehydrogenation also

proceeds more readily in the case of more complex mols. Dibinaphthyleneethane was slowly converted into the bifulvene by boiling with the acetates of Cu and Hg. Quinone dehydrogenates bisdinaphthofluorenyl in C_6H_5N . Cl_2 and Br_2 according to Graebe, convert fluorene into dibiphenyleneethene; the author notes similar behavior of I_2

toward hydrobifulvenes dissolved in boiling α - $C_{10}H_7Br$: $2 Ar_2CHI \xrightarrow{150^\circ} Ar_2CH-$
 $\xrightarrow{279^\circ} Ar_2C:CAr_2 + 2HI$.

• The reaction also proceeds in boiling C_6H_6N because of its catalytic properties. I_2 and Ag_2O do not act on bifulvenes in C_6H_5N , while atm. O_2 breaks the double linkage. Light and $MeOK$ accelerate the oxidation of bifulvenes by air. H_2O_2 and BzO_2H act upon dibiphenyleneethene only. $AmNO_3$ and NO_2 instantly decolorize solns. of all bifulvenes, addn. products being formed with NO_2 . Br_2 forms addn. product with dibiphenyleneethene which decomposes on heating; with the naphtho derivs. Br_2 enters the aromatic nuclei in the cold, the chromophore group remaining intact. VI. The absorption spectra of bifulvenes and the chromophore of indigo. *Ibid* 289-306.—The absorption spectra of 0.0003 and 0.00003 N bifulvene solns. in C_6H_6 were studied; $1/\lambda$ was plotted against \log_{10} of the thickness of layer at which absorption occurred. The bifulvene chromophore exhibits an absorptive capacity 200 times or more greater than that of the quinoid group, and can best be compared with the indigoids. The introduction of naphtho groups into dibiphenyleneethene shifts the absorption max toward the longer waves. This cannot be explained on the basis of Nitzky's rule, since the coloration disappears with additional benzo nuclei. Bifulvenes and the structure of indigoids.—There is a similarity between the synthesis of indigoids and bifulvenes, billuorenyls serving as the leuco compds. of the latter. The introduction of a substituent group results in similar color changes in the thionaphthene and fluorene series. The structural formulas of indigoids according to Claasz contain

groups $\dot{C}:C:C:N:C:N:C:C:C$ and $C:C:C:S:C:C:S:C:C:C$ resembling the bifulvene

$\dot{C}:C:C:C:C:\dot{C}:C:C:C:\dot{C}$; on the assumption that the substitution of N or S does not destroy the color properties of bifulvene, this system of 5 double bonds becomes the chromophore of the simplest indigoids

BASIL C. SOYENKOFF

Isomerism of oximes. XXXI. The furfuraldoximes and 2-methoxy- and 4-methoxy-1-naphthaldoximes. O. L. BRADY AND R. F. GOLDSTEIN. *J. Chem. Soc.* 1927, 1959-64, cf. *C. A.* 21, 2257.—Furfuraldehyde (I) (13.5 g.), added slowly to a cold mixt. of 14 g. $NaOH$ in 15 cc. H_2O and 12 g. $NH_2OH \cdot HCl$ in 30 cc. H_2O , the soln. filtered after 1 hr., cooled and a slight excess of ice-cold satd. NH_4Cl soln. added, give 11.5 g. crude oxime, m. $51-64^\circ$, from which 3 crystals from C_6H_6 and light petroleum give 4 g. pure α -furfuraldoxime, m. $75-6^\circ$; boiled with C_6H_6 4 hrs., there results a mixt. of the α - and β -oximes; Ac deriv., m. $34-5^\circ$ and gives nearly pure α -oxime on hydrolysis; Bz deriv., m. $128-9^\circ$. $NH_2OH \cdot HCl$ (10 g.) in 40 cc. $MeOH$, treated with 19.5 g. cryst. $AcONa$ in 40 cc. dil. $EtOH$ and 12 g. I added, gives nearly quant. the β -oxime, m. $91-2^\circ$. $NH_2OH \cdot HCl$ (7.5 g.) and 10 g. $NaOH$ in 110 cc. H_2O treated with 14 g. 2- $MeOC_{10}H_7CHO$ in 20 cc. hot $EtOH$ gives almost quant. α -2-methoxynaphthaldoxime, m. $154-5^\circ$; Ac deriv., m. $79-80^\circ$, hydrolyzed to the α -oxime; the HCl salt is a bright yellow powder, m. $145-7^\circ$ (decompn.). MeI and $EtONa$ give mainly the O-ether, but a little N -methyl ether, m. $118-9^\circ$; hydrate, m. $88-9^\circ$; the O-Me ether, m. 65° . α -4-Methoxynaphthaldoxime, m. $107-8^\circ$; Ac deriv., m. 102° ; HCl salt, yellowish green, m. $144-5^\circ$ (decompn.); O-Me ether, m. $38-9^\circ$; N-Me deriv., yellow, m. $158-9^\circ$, changing to gray on standing in the mother liquor for 2 hrs.

C. J. WEST

Digitoxose and anhydro-digitoxose. A. WINDAUS AND G. SCHWARZE. *Nachr. Ges. Wiss. Göttingen. Math. Physik Klasse* 1926, 1-7.—By sublimation at 0.03 mm. and $260-70^\circ$ digitoxin (I) yields anhydrodigitoxose (II) and an oily product, insol. in H_2O . II is purified by taking up the sublimate in H_2O and extg. I from the aq. layer with Et_2O ; long needles, m. 114° , yield 0.03 g. II from 1 g. I. By shaking with Pt and H_2 , II takes up 1 mol. H_2 , forming the dihydro deriv. (III), a colorless oil. By oxidation with perbenzoic acid in $AcOEt$ soln. at 25° a soln. of 0.38 g. II in 12 cc. $AcOEt$ gave 20% of methylpentose (IV), $C_5H_{12}O_6$, m. 116 , which reduced Fehling soln. and took up 1 mol. I_2 ; it formed a levo-optically active osazone with $PhNHNH_2$, m. 178° . The structural formulas given to these compds. are:

(II)

(IV)

-O--

The osazone of IV is not identical with that from *d*- or *l*-rhamnose, *d*- or *l*-isorhamnose, fucose (rhodose), or epifucose (epirhodose). Digitoxose is thus given the formula IV. The metho-half-acetal of digitoxose Me ether (V) was prepd. by treating a soln. of 3 g. IV in a small amt. of H₂O with 30 g. Me₂SO₄ under const. agitation at 45° and with const. addn. of 30% NaOH to hold the soln. alk. to phenolphthalein; the temp. was then raised to 90° for a short time, the mass cooled and extd. with CHCl₃; the CHCl₃ was evapd. off from the ext. and residue distd. at 0.05 mm. at 100°; yield 2 g. of a clear oil (V). Digitoxitol (VI) is prepd. from IV by hydrogenation under cooling with 2.5% NaHg and dil. H₂SO₄; m. 88°, distils without decompn. in a high vacuum. The dibenzal deriv. of VI is prepd. by treating 0.5 g. VI with 1 g. PhCHO and 3 cc. 50% H₂SO₄; the violet soln. is treated with 5 cc. H₂O and after 3 hrs. at 15° the ppt. is filtered, taken up in hot MeOH and recrystallized; yield 1 g. colorless crystals, m. 142°.

C. D. INGERSOLL

The polymerization of pyrrole. B. V. TRONOV and P. P. POPOV. *J. Russ. Phys.-Chem. Soc.* **58**, 745-58(1926).—Analysis of tripyrrole repptd. with ligroin from dry benzene, resulted in the formula C₁₂H₁₇N₃O; earlier investigators have also failed to isolate an O-free base. T. and P., therefore, offer a new structure for the HCl salt as a product of condensation of HCl and 3 pyrrole mols. in which Cl is attached to the H-free N. Liquid pyrrole is associated, possibly through the combination of the acid imino and a basic α or β form. The action of HCl can be represented as follows:

After examining a no. of other possibilities (since pyrrole can react in any of the 3 forms) 3 more formulas were found

which agreed with the chem. behavior of tripyrrole, *i. e.*, the formation of 2 mols. of α - α' azo compd. with azoxycarboxamides, and of (CH₂CO₂H)₂ upon oxidation. Furthermore, not more than 2 pyrrole nuclei can be recovered on breaking up tripyrrole. By the action of alkalis or NH₄OH upon the HCl compd. there is obtained a quaternary base which in faintly alk. soln. is rapidly transformed into red pyrrole (C₁₂H₁₄N₃O); red pyrrole was produced also on heating with 20% HCl besides a smaller amt. of brownish ppt. The decompn. is assumed to be analogous to the hydrolysis of pyridinium salts. When the soln. is shaken with CHCl₃ during the neutralization with NH₃, no red pyrrole seps. The free base recrystd. for analysis did not yield red pyrrole; its mol. wt. was 270 instead of 219 and reached 370 in a month. Soly. also varied on standing. •A migration of H to the α -carbon possibly takes place:

BASIL C. SOVENKOFF

Some derivatives of di(2-pyridyl)amine: tri(2-pyridyl)amine. J. P. WIBAUT and G. LA BASTIDE. *Verslag. Akad. Wetenschappen Amsterdam* **36**, 514-9(1927).—Nitration of di(2-pyridyl)amine by warming with H₂SO₄ and HNO₃ gives a yellowish brown *dinitro* deriv., m. 195-6°, which has very weak basic properties. Bromination in AcOH gives a yellowish orange *dibromo* deriv. *di-HBr* salt, m. 253-4°; *free base*, m. 191°. The position of the substituent groups was not detd. New halogenated

pyridines prepd. were 2-iodo-5-bromopyridine, m. 117°, by treatment of 2-amino-5-bromopyridine in 50% AcOH with KI and NaNO₂; 5-iodo-2-bromopyridine, m. 122.5°, by treating 2-amino-5-iodopyridine in concd. HBr with NaNO₂; 2,5-diiodopyridine, m. 154°, from 2-amino-5-iodopyridine with HI and NaNO₂; 2-iodo-3,5-dibromopyridine, m. 70.5°, from 2-amino-3,5-dibromopyridine, HI and NaNO₂. Attempts to prep. substituted dipyriddyamines by condensation of 2-amino-5-nitro- or 2-amino-5-bromopyridine with 2-halopyridines were unsuccessful. *Tri(2-pyridyl)amine*, m. 132.5° (*picrate*, m. 149°; *HgCl₂ salt*, m. 180°), was obtained in 10-20% yield by heating 1 mol. 2-aminopyridine with 2 mols. 2-iodopyridine in mesitylene with anhydrous KOH, Cu powder and KI, 14 hrs. at 150-60°. The Na deriv. of dipyriddyamine does not react with chloropyridine. Of the primary, secondary and tertiary pyridylamines, the secondary is the strongest base. In 15% EtOH, 0.01 *N* solns. of the 3 bases gave *p_H* values of 9.07, 9.41 and 7.40, resp. In its weak basicity the tertiary amine contrasts sharply with tertiary aliphatic amines.

A. W. DORR

The solubility of 1-phenyl-2,3-dimethyl-4-dimethylamino-5-pyrazolone in water. RAYMOND CHARONNAT. *Compt. rend.* 185, 284-6(1927).—The soly. diagram for this compd. (I) in H₂O is given. A second or β form of I exists at temps. above 70°, which presents a reciprocal soly. with H₂O with two crit. temps., a max. and a min. *sec.*-BuOH is the only similar example. The transformation into this β form of I at 65-70° explains the marked increase in the apparent soly. of the α form in this range. The pure β form has not been isolated.

D. H. POWERS

Triazoles. KARL BRUNNER. VIII. 1-Phenyl-3,5-dimethyl-1,2,4-triazoles substituted in the phenyl nucleus. FRANZ HERNLER. *Monatsh.* 48, 391-403(1927); cf. C. A. 21, 3200.—*p*-BrC₆H₄NHNH₂ (1 mol.) and 3 mols. Ac₂NH in AcOH, heated 20 hrs. on the H₂O bath, give after extensive purification 77.7% of 1-(*p*-bromophenyl)-3,5-dimethyl-1,2,4-triazole (I), b_p 176-8°, m. 93-4°; *picrate*, m. 166-7°. Heating I with excess concd. NH₄OH and Cu bronze 10 hrs. at 200-20° or reduction of the *p*-NO₂ deriv., gives the *p*-amino deriv. (II), m. 182.75-3.5°; *picrate*, m. 176.5-7.5°. II is converted into I through the diazo reaction (58.8% yield). The *p*-cyano deriv., obtained through the diazo reaction from II, or by heating I with KCN, CuCN and Cu bronze 10 hrs. at 230°, m. 68-70° (50% yield); *picrate*, yellow, m. 143.5-4°; sapon. with EtOH-KOH gives the *p*-carboxy deriv., m. 293-4° (64% yield); 1 part dissolves in 6300 parts cold and 1200 parts boiling H₂O; it does not give a ppt. with picric acid; the Na salt is easily sol. in H₂O. I does not react with the Grignard reagent; in 1 expt., from activated Mg and MeI there was obtained a product analyzing for a methiodide but having the properties of an HI salt.

C. J. WEST

Synthesis of pyrylium salts of anthocyanidin type. XII. D. D. PRATT, ALEX ROBERTSON and ROBT. ROBINSON. *J. Chem. Soc.* 1927, 1975-83; cf. C. A. 20, 3456.—BzCH₂CHO (2.9 g.) and 2.5 g. 1,3,5-C₆H₃(OH)₃ in 55 cc. HCO₂H give 5.1 g. of *tri-anhydrobenzoylacetalddehyde*phloroglucinol (I), orange-red, darkens 210-80° and then chars. Condensation of BzCH₂CHO and anhydrous 1,3,5-C₆H₃(OH)₃ in Et₂O by HCl gives poor yields of *chrysinidin chloride*(5,7-dihydroxyflavylium chloride) (II), reddish brown, crystg. with 2H₂O, darkens 250°, does not m. 300°; the yellow concd. H₂SO₄ or orange-red EtOH solns. do not fluoresce; II also results by boiling I for 6 hrs. with 2 vols. AcOH and 1 vol. concd. HCl; the anhydrous chloride results by carrying out the condensation in glacial AcOH; II also results from *O*-benzoylphloroglucinolaldehyde (III) and PhAc in AcOEt with HCl and satg. the soln. of the ppt. in MeOH with NH₃. *Chrysinidin perchlorate*, red, darkens 208°, m. 244° (decompn.). III and *p*-MeOC₆H₄Ac in AcOEt, satd. with HCl, give *O*-benzoylacacetinidin chloride, orange-red, crystg. with 1 H₂O; the EtOH soln. is orange or orange-red and exhibits strong green fluorescence. With MeOH and NH₃ it gives acetinidin chloride; with HI and PhOH this splits off MeI, giving *apigenidin chloride*(5,7,4'-trihydroxyflavylium chloride), light orange-yellow by transmitted light; the mass is bright salmon-red; crystg. with 1 H₂O, turns green at 230°, chars above 350°; *mercurichloride*, orange needles; *perchlorate*; *periodide*, dark brown. *Hydroxymethylenacetoveratrone*, oily (Cu salt, pale green, decomp. 188°) and 1,3,5-C₆H₃(OH)₃ with HCl give 5,7-dihydroxy-3',4'-dimethoxyflavylium chloride, reddish brown, decomp. 272°, crystg. with 1.5H₂O; aq. Na₂CO₃ gives an intense blood-red soln. With PhOH and HI for 30 min. there results a *mono-Me ether*, orange-red, decomp. 282°, crystg. with 0.5H₂O; it gives a Bordeaux-red to reddish purple soln. in aq. Na₂CO₃. Further heating with HI gives luteolinidin chloride. 7-Hydroxy-3,2',4'-trimethoxyflavylium chloride, crimson, darkens 140°, decomp. 185°; the color base is bluish red, a pseudo-base is readily formed and the yellow concd. H₂SO₄ soln. exhibits bright apple-green fluorescence. The corresponding tetrahydroxy deriv. (*resomarinidin chloride*), red decomp. 216°, crystg. with 1.5 H₂O. The Cu deriv. of *hydroxymethylene-*

2,4-dimethoxyacetophenone, pale green, m. 190° . *Et 2,4,6-trimethoxybenzoylpyruvate*, pale yellow, m. 84° ; in the solid state it forms a blue compd. with I. C. J. WEST

Factors controlling the formation of some derivatives of quinoline and a new aspect of the problem of substitution in the quinoline series. ELWYN ROBERTS AND E. E. TURNER. *J. Chem. Soc.* 1927, 1832-57.—The ease of condensation of substituted PhNH_2 with Ac_2CH_3 appears to be affected most by the basicity of the PhNH_2 used. The 2nd stage of the Combes quinoline synthesis (the intramol. condensation of an anil of Ac_2CH_3) is much more definitely affected by the nature of the substituents present. When a strongly *o-p* directing group is present in the *m*-position to the N atom in $\text{PhN}:-\text{CMeCH}_2\text{Ac}$, condensation proceeds readily, even if a similar group is present in an unfavorable position; on the other hand, a strongly *o-p* directing group present in position 4, in absence of other substituents in favorable positions, appears to be sufficient to prevent quinoline formation. In the condensation of the PhNH_2 with Ac_2CH_3 , 1 mol. of the PhNH_2 and 1.1 mols. Ac_2CH_3 were boiled gently for 1-2 hrs., H_2O was added to the cooled product and the condensation product isolated by extrn. with C_6H_6 . *p*- $\text{MeC}_6\text{H}_4\text{N}:\text{CMeCH}_2\text{Ac}$ m. $68-9^{\circ}$ (C. gives $39-40^{\circ}$, DRP 363,582, 65.5°); *β*-*o*-chloroanilinopropenyl *Me ketone*, m. $66-7^{\circ}$; the *β*-*p*-chloro deriv., m. $60-1^{\circ}$; the *β*-*m*-chloro deriv. (I), b_{11} 187° , m. 42° ; *o*-hydroxybenzylidene-3-chloroaniline, bright yellow, m. 99° ; *β*-2,4-dichloroanilinopropenyl *Me ketone*, m. 100.5° ; *o*-hydroxybenzylidene-2,4-dichloroaniline, brilliant yellow, m. 90.5° . *β*-2,5-Dichloroanilinopropenyl *Me ketone*, m. 46° (yield, very small); the *β*-3,5-dichloro deriv.* was not obtained crystd.; the *β*-3,4-dichloro deriv. (II), m. 73° ; *o*-hydroxybenzylidene-3,4-dichloroaniline, yellow, m. 113° . In the conversion of the anils into quinoline derivs., they were added slowly, as a fine powder or as a thin stream of liquid, to 6 times their wt. of concd. H_2SO_4 , cooled below 5° ; after soln. the mixt. was heated 0.5 hr. on the boiling H_2O bath. The anils from *o*- and *p*- $\text{ClC}_6\text{H}_4\text{NH}_2$, 2,4-, 2,5- and 3,5- $\text{Cl}_2\text{C}_6\text{H}_3\text{NH}_2$, *o*- $\text{MeOC}_6\text{H}_4\text{NH}_2$ and 3,6- $\text{Cl}(\text{AcNH})\text{C}_6\text{H}_3\text{NH}_2$ were not converted into quinoline derivs. I and H_2SO_4 , heated at $130-40^{\circ}$, give almost quant. 7-chloro-2,4-dimethylquinoline, m. $46.5-8.5^{\circ}$; hydrate, m. 61° ; *HCl* salt, m. 277° (decompn.); sulfate, rhombohedra; dichromate, brilliant yellow needles; AgNO_3 addn. compd., needles, m. 197° (decompn.); various attempts to synthesize this deriv. failed. 2,4-Dichloroacetophenone, b_{11} $140-50^{\circ}$, m. $33-4^{\circ}$. In only 1 expt. could II be converted into 6,7-dichloro-2,4-dimethylquinoline (IIa), m. $119-20^{\circ}$; *HCl* salt, m. 235° ; dichromate, yellow needles; chloroaurate, needles; AgNO_3 addn. compd., m. $218-9^{\circ}$; 8(?)*-nitro* deriv., m. 197° . Using the Beyer synthesis (*J. prakt. Chem.* 33, 393(1886)), which consists in heating the aniline with a suitable aged mixt. of paraldehyde, Me_2CO and *HCl* at 100° in the presence of PhNO_2 , *o*- $\text{ClC}_6\text{H}_4\text{NH}_2$ gives 25% of 8-chloro-2,4-dimethylquinoline (III), m. 74° ; it is unaffected by heating with piperidine for 1 hr. at 100° ; 5-nitro deriv., pale yellowish brown, m. $107-8^{\circ}$ (sulfate); 5-amino deriv., brown, m. $170-2^{\circ}$; through the diazo reaction, it is converted into the 5,8-di-*Cl* deriv.; chlorination of III gives a tetrachloro deriv., m. $150-2^{\circ}$. 6-Chloro-2,4-dimethylquinoline, m. $98-9^{\circ}$ (16% yield); hydrate, m. $84-5.5^{\circ}$; dichromate, orange-yellow; 5-nitro deriv., canary-yellow, m. $132-3^{\circ}$; 5-amino deriv., pale yellow, m. $131-3^{\circ}$; 5,6-dichloro deriv. (IV), through the diazo reaction, m. $119-20^{\circ}$; tetrachloro deriv., m. $75.5-81^{\circ}$. Nitration of IV gives the 8(?)*-nitro* deriv., m. $151-2.5^{\circ}$; 8(?)*-amino* deriv., m. $118-20^{\circ}$; this could not be converted through the diazo reaction into a tri-*Cl* deriv. Chlorination of III gives a tetrachloro deriv., m. $157-8^{\circ}$. 7-Chloro-2,4-dimethylquinoline is obtained in 36% yield by the Beyer method; 8-nitro deriv., m. $189-9.5^{\circ}$ (heated with piperidine for 0.5 hr., there results the 7-piperidino deriv., m. $168-70^{\circ}$); 8-amino deriv., pale yellow, m. $51-3^{\circ}$; through the diazo reaction there results the 7,8-dichloro deriv., m. $104-4.5^{\circ}$ (20% yield or less); trichloro deriv., m. 195° . 6,8-Dichloro-2,4-dimethylquinoline, 20% yield; 5(?)*-nitro* deriv., pale yellow, m. $122-3^{\circ}$; 5(?)*-amino* deriv., m. $194-5^{\circ}$; pentachloro deriv., m. $124-5^{\circ}$. 5,8-Dichloro-2,4-dimethylquinoline is obtained in 29% yields; 6-nitro deriv., m. $155-7^{\circ}$ (90% yield); 6-amino deriv., m. $192-3^{\circ}$ (40% yield); the diazo reaction gives a small amt of the 5,6,8-trichloro deriv. (V), m. $111-2.5^{\circ}$; direct chlorination gives the pentachloro deriv., m. $127-8^{\circ}$. In the prepn. of 5,7-dichloro-2,4-dimethylquinoline by the Beyer method, with a reagent 2 mos. old, there resulted a yellowish brown solid with 42% *Cl*, m. $168-9^{\circ}$, converted by NH_4OH into a 2nd substance contg. 35.6% *Cl* and m. $69-70^{\circ}$, which are being investigated. 2,4,5- $\text{Cl}_3\text{C}_6\text{H}_3\text{NH}_2$ in the Beyer method gives V. *o*- $\text{O}_2\text{NC}_6\text{H}_4\text{NH}_2$ gives a compd., m. $145-7^{\circ}$; *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{NH}_2$ gives a compd., brown leaflets, m. $159-62^{\circ}$; *m*- $\text{O}_2\text{NC}_6\text{H}_4\text{NH}_2$ does not react; 3,6- $\text{Cl}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{NH}_2$ and 3,4,6- $\text{Cl}_3(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{NH}_2$ give only tarry products. 3,4-Dichloroacetophenone, b_{11} 135° , m. 76° , in 40% yield from *o*- $\text{C}_6\text{H}_4\text{Cl}_2$, AcCl and AlCl_3 ; 2-nitro deriv., pale yellow, m. $100-2^{\circ}$; 2-amino deriv., yellow, m. $154-6^{\circ}$; heated with Me_2CO and NaOH 6 hrs. at 185° , IIa results. Nitration of 2,4-dimethylquinoline gives the 8-nitro deriv., brown, m. $118-9^{\circ}$ (98%

yield); *8-amino deriv.*, brownish yellow, m. 89–92°; *picrate*, yellow; *sulfate*, bright yellow; the diazo reaction gives the 8-Cl deriv. Bz_2CH_2 and freshly distd. PhNH_2 , boiled 9 hrs., give PhNHBz and a bright yellow compd., m. 102–3°.

C. J. WEST

Some new derivatives of 2-phenylquinoline-4-carboxylic acid (atophan). T. KAKU. *J. Pharm. Soc. Japan* No. 545, 577–84 (1927).—Some new derivs. of atophan were prepd. by Dobner and Gisek's method (*Ann.* 242, 265), and their physiol. action, chiefly that of uric acid elimination, was studied. For aldehydes, $\text{C}_6\text{H}_5\text{CHO}$ or *p*- $\text{MeOC}_6\text{H}_4\text{CHO}$ and for amines, $\text{Me}_2\text{C}_6\text{H}_4\text{NH}_2$ or $\text{Me}_2\text{C}_6\text{H}_3\text{NH}_2$ were condensed with AcCC_6H_4 in alc. soln. By decarboxylation of the resulting compds. by heating with soda-lime, the corresponding quinolines were prepd. The following are the new atophan derivs.: *6,8-dimethyl-2-phenylquinoline-4-carboxylic acid*, m. 237–8°; *6-methyl-2-p-methoxyphenylquinoline-4-carboxylic acid*, m. 230–1°; *7-methyl-2-p-methoxyphenylquinoline-4-carboxylic acid*, m. 200°; *8-methyl-2-p-methoxyphenylquinoline-4-carboxylic acid*, m. 233–4°; *6,8-dimethyl-2-p-methoxyphenylquinoline-4-carboxylic acid*, m. 239°. The highest uric acid eliminating power is possessed by the 8-Me deriv. followed by ordinary atophan, then decreases in the order 7-Me, 6-Me, 6,8-di-Me deriv. The following are the new quinoline derivs.: *7-Methyl-2-phenylquinoline*, m. 100.5°, *Pt salt*, decomps. 243–4°; *picrate*, m. 192°; *6,8-dimethyl-2-phenylquinoline*, m. 38.5°, *Pt salt*, decomps. 204–5°; *picrate*, m. 186–7°; *2-p-methoxyphenylquinoline*, m. 124°, *Pt salt*, decomps. 214°; *picrate*, m. 195°; *6-methyl-2-p-methoxyphenylquinoline*, m. 136°, *Pt salt*, decomps. 242–3°; *picrate*, m. 209°.

NAO UYEI

The destruction of amino acids and of amino purines by methylglyoxal and related substances. CARL NEUBER AND MARIA KOBEL. *Biochem. Z.* 185, 477–9 (1927).—If a mixt. of amino acid (alanine) and methylglyoxal is digested and distd., there is a violent production of CO_2 and of AcH resulting from deamination. This reaction takes place equally well in a H_2 or N_2 atm. as well as in air, and is therefore not dependent upon O_2 . The methylglyoxal is thereby used up.

S. MORGULIS

Lycoris bases. I. Sekisanine. I. H. KONDO AND K. TOMIMURA. *J. Pharm. Soc. Japan* No. 545, 545–9 (1927). Morishima (*Arch. exp. Path. u. Pharm.* 40, 221) has previously isolated 2 bases, lycorine and sekisanine (I) from the bulb of *Lycoris radiata* Herb. K and T have now made a detailed study of the properties of I, which were as follows: Mol. formula $\text{C}_{16}\text{H}_{19}\text{NO}_4$, colorless, m. 207–9°, $[\alpha]_D^{25}$, 114.6°; *hydrochloride*, silky luster, m. 211°, $[\alpha]_D^{25}$, 106.4°; *chloroplatinate*, m. 194°; *chloroaurate*, unstable; *diacetyl deriv.*, m. 72°; *methiodide*, m. 287°. Herzog and Meyer's method gives indication for the presence of 1-N-Me, but its presence is doubtful. H_2SO_4 soln. of I decolorizes Br soln. Gaebel's reaction for CH_2O_2 group is positive. Lycorine with Pt black and H_2 gives dihydrolycorine (II), m. 250°, $[\alpha]_D^{16}$, –57.14°; *hydrochloride*, m. 261°, $[\alpha]_D^{16}$, –16.4°; *nitrate*, m. 250°. I and II have the same compn., but are not identical.

NAO UYEI

Studies on sparteine. R. WOLFFENSTEIN AND J. REITMANN. *Biochem. Z.* 186, 269–77 (1927).—Expts. indicate that sparteine must be regarded as an unsymmetric base, probably of the following constitution.

S. MORGULIS

Synthesis of rutecarpine. II (Supplement). Y. ASAHINA, T. IRIE AND T. OHTA. *J. Pharm. Soc. Japan* No. 545, 541–5 (1927); cf. C. A. 18, 1667; 21, 3054.—Norharman (C. A. 21, 2134) with EtOH and Na gives *tetrahydronorharman* (I), colorless, m. 204–5°. *Picrate*, yellowish brown, m. 250–1°. I and *o*- $\text{O}_2\text{NC}_6\text{H}_4\text{COCl}$ in $\text{C}_6\text{H}_5\text{N}$ give *N-o-nitrobenzoyltetrahydronorharman* (II), bright yellow, m. 204°. Reduction of II by Zn dust to the hydroxylamine deriv. with the view of converting the latter into dihydro-rutecarpine was unsuccessful.

NAO UYEI

Constitution of coptisine, a new alkaloid from Coptis japonica. ZENJIRO KITASATO. *Bull. Imp. Acad. (Japan)* 2, 124–5 (1926).—Coptisine, $\text{C}_{19}\text{H}_{19}\text{NO}_6$, is best purified through the *tetrahydro deriv.*, m. 214–5°, from which it is recovered by oxidation with I. Oxidation with KMnO_4 gives hydrastatic acid. Coptisine, converted into a phenol base, fully methylated with Me_2SO_4 and then reduced with Zn and H_2SO_4 , gives palmatine. Therefore, coptisine is probably bismethylenedioxypseudoberberine.

C. J. WEST

Alkaloids of *Picralima klaineana*. T. A. HENRY AND T. M. SHARP. *J. Chem. Soc.* 1927, 1950-9.—The ground seeds were first extd. with petrol. ether and then with 96% EtOH; the dry alc. ext. was then extd. with 2% HCl and the mixed acid liquors shaken out with Et₂O and then diluted with H₂O as long as pptn. occurs, giving a weakly basic alkaloid or mixt. of alkaloids (A), from which no cryst. material has been obtained. The filtrate was then decolorized and treated with excess satd. Na₂CO₃ soln.; the dry ppt. was extd. with Et₂O, leaving some A; the Et₂O residue, extd. with twice its wt. of EtOH, gave a soln. of a 2nd amorphous alkaloid (B) and a partly crystd. residue (C). From another sample of seeds there was obtained a 2nd crystn. alkaloid (D). C is purified through the sulfate, from which excess Na₂CO₃ gives the free alkaloid, termed *akuamine* (I), C₂₂H₂₈O₄N₂, which contains 1OH, 1MeO and 1MeN group; I m. 255°, [α]_D²⁰ -66.7° (EtOH, ϵ 0.504), -73.4° (CHCl₃, ϵ 0.8716); the HBr salt crystals, with 1 H₂O, m. 228°, [α]_D²⁰ -26.05° (H₂O, ϵ 0.6076); the HCl salt crystals, with 1 H₂O, m. 227°, [α]_D²² -26.6° (H₂O, ϵ 0.8769), -32.8° (EtOH, ϵ 1.716); sulfate, (C₂₂H₂₈O₄N₂)₂·2H₂SO₄, crystals, with 10 mols. H₂O of which 9 are lost at room temp. *in vacuo* over CaCl₂, m. 221°, [α]_D¹⁹ -40.3° (H₂O, ϵ 2.0868); III salt, pale gray, m. 226°; nitrate, pale cream, m. 224°; thiocyanate, pale gray, m. 218°; perchlorate, m. 215°; picrate, brilliant yellow, m. 199°; picrolonate, yellow, decomp. 194°; on soln. in EtOH it deposits a deep blue dye. I.HCl reduces AuCl₃, PtCl₄ and AgNO₃ in the cold and Fehling soln. on warming. I.HCl gives a rose-red color with vanillin or piperonal and HCl, a yellowish brown color with Me₂NC₆H₄CHO, changing on long standing to red with a green fluorescence and with Br·H₂O a pink color. I and MeI in about 2 days gives a *methiodide*, m. 274°; the action of MeI and M-MeONa in MeOH gives an oily base, whose *picrate*, C₂₂H₂₇O₄N₂·Me·C₆H₄(O)₂N₃, bronze tinted prisms or canary yellow needles, m. 205°; I is apparently first hydrated by the alkali and the hydrate undergoes *O*-methylation. The *Ac* deriv. of I m. 226°, [α]_D²⁰ -52.08° (EtOH, ϵ 0.64); HBr salt, m. 236°; *picrate*, yellow, m. 168°. The action of alkali on I appears to give a *hydrate*, does not m. at 310° (15-41% yields). The alkaloid D m. 177.5°, [α]_D¹⁹ -737.5° (EtOH, ϵ 0.4932), -737.5° (CHCl₃, ϵ 0.3504); sulfate, m. 161°, [α]_D^{14.5} -594.1° (H₂O, ϵ 0.4226), -539.8° (H₂O, ϵ 0.2860), contg. 8.9% H₂O of crystn., of which 2.4% is lost *in vacuo*; nitrate, m. 180-1°; *picrate*, dull yellow, m. 169°; D gives a grass-green color when a mere trace is added to a drop of concd. HNO₃; it gives an indigo blue color with vanillin and a magenta color with piperonal, both changing to bright ultramarine blue after a few days and remaining stable for at least 14 days. The alkaloid gives no color with Gacbel's test for CH₂O₂ groups.

C. J. WEST

Synthesis of the homologs of zingerone. II. HOROSHI NOMURA AND SHUNJI TSURUMI. *Science Repts. Tohoku Imp. Univ.* 16, 565-79(1927).—The authors prepd. a series of 4-hydroxy-3-methoxyphenylethyl alkyl ketones and thci¹ derivs. in the course of studying the constitution of dihydroshogaol. Condensing C₆H₅COMe (26 g.) and vanillin (I) (30 g.) in 500 g. of alc. and 60 g. of KOH (1:1) for 6 hrs. under reflux, acidification and extrn. with Et₂O, gives by crystn. from Et₂O and ligroin 4-hydroxy-3-methoxystyryl hexyl ketone (II), m. 48-9°. Reducing II with Na-Hg in aq. soln. gives 4-hydroxy 3-methoxyphenylethyl hexyl ketone (III), b_p 193-4°. The derivs. prepd. were: Bz, m. 74-5°; the 3,4-dimethoxy, m. 32.7-33.7°; the oxime, m. 88-9°; and semicarbazone, m. 97.5-99°. 4-Hydroxy-3-methoxyphenylethyl heptyl ketone (IV), m. 30-31°, was prepd. in a manner similar to III by condensing I with C₇H₁₅COMe to give 4-hydroxy-3-methoxystyryl heptyl ketone, m. 42-3°, which was reduced to IV. The following derivs. were prepd.: Bz, m. 63-4°; semicarbazone, m. 103.5-4.5°; 3,4-dimethoxyphenylethyl heptyl ketone (V), m. 34-5°; oxime of V, m. 79.5-80.5°; semicarbazone of V, m. 82.5-3.5°. C₈H₁₇COMe with I gives 4-hydroxy-3-methoxystyryl octyl ketone, m. 45.5-6.0°. On reduction it gives 4-hydroxy-3-methoxyphenylethyl octyl ketone (VI), m. 35.5-36.5°; Bz deriv., m. 45-6°; 3,4-dimethoxy deriv. (VII), m. 45-6°; oxime of VII, m. 79.5-80°; semicarbazone of VII, m. 86-7.5°; 4-hydroxy-3-methoxyphenylethyl nonyl ketone (VIII), m. 42.5-3.5°, was reduced from the styryl deriv., m. 55.5-6.5°. Bz deriv. of VIII, m. 51-2°; 3,4-dimethoxy deriv. (IX), 33.5-5°; oxime of IX, 73.5-4.5°. D. H. P.

Constitution of gentisin. JUNZO SHINODA. *J. Chem. Soc.* 1927, 1983-5; see C. A. 21, 2270.

C. J. WEST

Vegetable coloring matters. I. Constitution of some anthocyanidins. P. KARRER AND R. WIDMER [in part with H. HÜRLIMANN AND O. NIEVERGELT]. *Helv. Chim. Acta* 10, 5-33(1927).—Hydrolysis of anthocyanins with 10-15% NaOH or Ba(OH)₂ proceeds readily on boiling, and the acid product of fission, with MeO groups intact, may be isolated in the usual way. When enin, myrtillin, althein, ampelopsin and

malvin, or the corresponding anthocyanidins (cf. Willstätter, *C. A.* 9, 1302), are treated in this way, pure 4,3,5-HO(MeO)₂C₆H₂CO₂H is obtained in each case in 10-35% yield. Accordingly, these substances must all be derived from the anthocyanidin, 5,7,4'-trihydroxy-3',5'-dimethoxyflavylium chloride, for which the name *syringidin* is proposed, and the differences in their properties must be due to the presence of impurities. Malvidin is shown by analysis to be a pure compound, identical with syringidin. Enin, which is conveniently purified by repeated recrystn. of the picrate from boiling H₂O, contains less than the theoretical amt. of MeO, and is, therefore, not a pure compd. Enidin chloride can be sepd. by fractional crystn. from 7% H₂SO₄ into more and less sol. fractions, of which the latter has a higher MeO content than the original material and a soly. of the same order as that of malvidin chloride. The dark red blooms of *Cyclamen persicum*, Mill., contain a monoglucoside, *cyclamin*, isolated as the *picrate*, C₂₈H₂₇O₁₉N₃, which yields enidin on hydrolysis with acids and is probably identical with enin. Penoidin is hydrolyzed by 16% NaOH, giving cryst. vanillic acid. This confirms the formula of Nolan, Pratt and Robinson (*C. A.* 20, 3457). Since cyanilidin also yields vanillic acid on hydrolysis, it must be identical and not isomeric with peonidin. Myrtillin, regarded by Willstätter as a galactoside of delphinidin Me ether, is resolved by means of its picrate into two fractions. The more sol. is MeO-free, and is hydrolyzed by acids to delphinidin and a mixt. of dextrose and galactose. The less sol. fraction increases in MeO content on repeated recrystn. and corresponding changes take place in its cryst. form and FeCl₃ reactions. After 31 crystns., the product contains dextrose, but no galactose, and has a MeO content of 7.7% [1(OMe) = 6.3%]. Although apparently homogeneous, it is undoubtedly a mixt. of the glucosides of syringidin and delphinidin. Whether a delphinidin Me ether is also present is not certain. The great difficulty encountered in sepg. this mixt. accounts for its being previously regarded as a pure compd. On acid hydrolysis, it affords myrtillidin, which is identical in every respect with an artificial mixt. of syringidin and delphinidin. Althein is hydrolyzed to dextrose and altheidin, which, although it corresponds in compn. with a delphinidin Me ether, is actually, like myrtillidin, a mixt. or loose mol. compd. of delphinidin and its di-Me ether. When ampelopsin is purified through the picrate, its MeO content becomes much higher than that of the product described by Willstätter, and it is indistinguishable from enin. The various reactions which these substances show with alc. FeCl₃ may now be correlated with their syringidin content; thus malvin, a pure syringidin deriv., gives no reaction, enin, cyclamin and ampelopsin (80-90% pure) give a reddish violet color while the diff. fractions of myrtillin (50% or less pure) give colors ranging from wine-red to pure blue as the MeO content decreases.

B. C. A.

Oxazinesulfonic acids. J. S. TURSKI, J. BOJANOWSKI, K. MONIUSZKO AND J. VOGELGARN. *Rocz. Chem.* 6, 747-55(1926).—An acid dye, staining wool indigo-blue, (6-naphthylphenoxazinesulfonic acid, is prepd. by the action of Schaeffer's salt on nitroso dimethylaniline-HCl, while a pure blue dye with similar properties is obtained by condensation of the latter substance with β -naphthol-8-sulfonic acid, and with Na *p*-phenylsulfonate a gray dye, fast for mordanted cotton, but not for wool, is obtained.

B. C. A.

Porphyrins. XIII. The chemism of porphyrin formation and the constitution of hemin. WM. KÜSTER AND KARL SCHLAYER. *Z. physiol. Chem.* 168, 294-314(1927); cf. *C. A.* 21, 385.—Two possibilities have been suggested for the arrangement of the unsatd. side chains in hematoporphyrin, Py' and Py'' representing adjacent pyrrole groupings:

II is now shown to be the more probable for the following reasons: the substance adds 2 halogen acids instead of 3; after addn. of 2 halogen atoms 2 halogen acids may still be added; if Cl is added first and then HBr and half of the halogen replaced by MeO, oxidation by CrO₃ then yields 2 imides, one contg. Cl and the other Br. A. W. DOX

Jegosaponin. C. MATSUNAMI. *J. Pharm. Soc. Japan No.* 545, 557-71(1927).—Asahina and Momoya (*C. A.* 8, 3614) obtained by the hydrolysis of jegosaponin (I), jegosapogenin (II) glucuronic acid (III), and glucose (IV). M. shows that the amt. of III estd. by the 1,3,5-C₆H₃(OH)₃ method gives approx. double the amt. obtained by CO₂ method, the excess being due to the presence of rhamnose (V). The hydrolytic products were II 48.8, III 15.42, V 13.03, and IV 28.61%. Zn distn. of I gave a ter-

pene, $C_{10}H_{16}$, b_{18} 100–25°, a sesquiterpene, $C_{15}H_{24}$, b_{18} 160–7° and a polyterpene. Boiling I in HNO_3 gave a compd. $C_6H_{10}O_4$ which resembles *sym.*-dimethylsuccinic acid.

Anthraquinone derivatives. I. G. FARBENINDUSTRIE AKT.-GES. Brit. 262,191, Nov. 28, 1925. 1-Diazoanthraquinone-2-carboxylic acids are made by treating the nitrogenous anthraquinone derivs. obtainable by the process described in Brit. pat. 147,001 (*C. A.* 14, 3675) with HNO_3 or compds. liberating HNO_3 in the presence of H_2O ; *e. g.*, anthraquinone-1,2-isoxazole and its 5-nitro deriv. are treated with nitrosylsulfuric acid and H_2O is added, or with N oxides in concd. HCl or is suspended in $NaNO_2$ soln. and HCl added. Solns. of the diazonium sulfates or chlorides are thus obtained. Anthraquinone-2-carboxylic acid derivs. can be obtained from the diazonium compds. by the use of HCl and Cu_2Cl_2 and the diazo compds. may be used for producing dyes. Cf. *C. A.* 21, 1273.

Diarylguanidines. CHEMISCHE FABRIK AUF AKTIEN VORM. E. SCHERING. Brit. 262,155, Nov. 30, 1925. Sym. diarylguanidines are prepd. by reacting with an excess of an arylamine such as aniline or *o*-anisidine on a salt of an isothiourea ether; *e. g.*, *S*-ethylisothiourea-HBr or *S*-methylisothiourea-HI or *S*-benzylisothiourea-HCl is heated with $PhNH_2$ in excess in the presence of a little H_2O until mercaptan is no longer evolved; on rendering the soln. alk., sym.-diphenylguanidine seps. Sym.-di-(*o*-methoxyphenyl)-guanidine-HBr is similarly obtained from *S*-ethylisothiourea-HBr and *o*-anisidine.

Organic acids. I. G. FARBENINDUSTRIE AKT.-GES. Brit. 262,101, Nov. 27, 1925. Monocarboxylic acids are obtained by passing the vapors of dicarboxylic acids, alone or with H_2O vapor, or the vapors of dicarboxylic acid anhydrides together with H_2O vapor, at an elevated temp. over catalysts capable of splitting off CO_2 . Among the catalysts which may be used are: Na_2CO_3 , $CaCO_3$, oxides of Zn, Cd, Pb, Bi, Si, Al, Ti, Fe and Ni, granulated Al and bauxite. Temps. of 300–450° are preferable. Benzoic acid is obtained by blowing superheated steam through fused phthalic anhydride and conducting the resulting gaseous mixt. over $CaCO_3$, or by passing N satd. with H_2O vapor and phthalic anhydride vapor over a mixt. of the oxides of Bi and Al deposited on pumice, or over activated Fe oxide. Maleic anhydride vapor together with H_2O -satd. N, when passed over active silica gel, yields acrylic acid. Propionic acid is similarly obtained from succinic acid. Products of oxidation of C_6H_6 vapor with air and V oxide, mixed with N and steam and passed over active silica gel or activated ZnO, yield a mixt. of benzoic acid and phthalic acid and anhydride. The "activated ZnO" may be prepd. by spraying a soln. of $Zn(NO_3)_2$ with nitrates of other metals on pumice and heating the product in a current of air.

Insoluble aliphatic acids. J. LEFRANC. Can. 273,539, Aug. 30, 1927. Aliphatic acids are obtained from their alkali and alk. earth salts by treating such salts with HCl, the aliphatic salt being in slight excess, and sepg. by a decantation process the soln. of chloride produced from the major part of the insol. aliphatic acids.

Sulfonic acids. K. DACHLAUER and E. THIEL. Can. 271,591, June 14, 1927. Aromatic sulfonic acids with ethyl or methyl substituted in the ring are prepd. by causing $EtOH$ or $MeOH$ and a strong sulfonating agent (oleum and chlorosulfonic acid) to act upon aromatic hydrocarbons at an elevated temp.

2-Hydroxy-3-bromo-5-pyridinearsonic acid. A. BINZ and C. RÄTH. Can. 273,-098, Aug. 16, 1927. 2-Hydroxy-5-pyridinearsonic is directly brominated.

Catalytic dehydrogenation processes. I. G. FARBENINDUSTRIE AKT.-Ges. Brit. 262,120, Nov. 30, 1925. Sulfides such as those of Cu, Ni, Co, Fe, Al, Cd, Ca and Mg are used as catalysts, *e. g.*, in the production of isobutyraldehyde from isobutyl alc., isovaleraldehyde from isoamyl alc., cymene from turpentine, isobutyronitrile from isobutylamine, or in other similar dehydrogenations.

Dehydrogenating alcohols. I. G. FARBENINDUSTRIE AKT.-Ges. Brit. 262,086, Nov. 27, 1925. In dehydrogenating isobutyl alcs or other "higher aliphatic alcs.," as by passage over heated ZnO, most of the resulting aldehydes or ketones are first condensed from the gaseous product and the latter is then washed with the alc. to be dehydrogenated to free the H from other products.

Methanol. C. L. GABRIEL and B. K. BROWN. Can. 271,569, June 14, 1927. MeOH is produced by passing a gaseous mixt. consisting of 1 vol CO and 5 vols. H₂ over a Cu-Zn alloy catalyst contg. some oxides, at 280° and at a pressure of about 20 atms.

Methanol. H. DREYFUS. Brit. 262,494, June 13, 1925. Water gas or other suitable gas mixt. contg. CO and H₂ in equimol. proportions is passed at high temp. and pressure over ZnO without addn. of other MeOH-forming catalysts. A pressure of 50-150 atm. is preferred and a temp. of 200-300° but the pressure and temp. may rise as high as 200 atm. and 450°. A Cu line or Al app. is preferably used. If the gases are passed through the app. at too low a speed, hydrocarbons and higher alcs. predominate in the product.

Dinitroperylene-3,10-quinone. A. ZINKE. U. S. 1,642,263, Sept. 13. This compd., which dyes cotton from the vat violet, is made by further nitration of mononitroperylene-quinone.

Ketene. H. DREYFUS. Brit. 262,364, June 13, 1925. A mixt. of CO and H₂ in the proportions of 3:1, resp., is passed over a MeOH-forming catalyst such as ZnO, Cu oxide, Cu chromate, Zn chromate, Zn aluminates, K zincate or various specified mixts. which may contain KOAc or K₂C₂O₄ or similar compds. Pressures of about 50-150 atm. and temps. of 200-300° are preferred.

Methyl formate. MARTIN MUGDAN and JOSEPH WIMMER. U. S. 1,642,689, Sept. 20. CH₂O vapors are passed in contact with finely divided Cu heated to 110-250°.

Benzene hydrocarbons. R. WIETZEL and C. PFAUNDLER. Can. 273,210, Aug. 16, 1927. Hydrocarbons of the benzene series are produced by converting gaseous olefins under elevated pressure and at a temp. of 300-500° into liquid hydrocarbons and subjecting the latter to catalytic dehydrogenation at temps. above 500°.

Cobalt and nickel acetates. I. G. FARBENINDUSTRIE AKT.-Ges. Brit. 262,075, Nov. 27, 1925. Co(OAc)₂ is made from "cobaltic oxyhydrate" and HOAc by the addn. of reducing agents and heating in a closed vessel to above the b. p. Alc. and Co are suitable reducing agents. Ni acetate can be similarly formed.

Nitro compounds. A. RASOUMEEFF. Brit. 262,097, Nov. 24, 1925. In producing PhNO₂ from C₆H₆ or in other nitrations of aromatic hydrocarbons or their substitution products, nitration is effected by the use of N peroxide in the presence of H₂SO₄.

Condensation products of methylolureas, etc. G. WALTER. Brit. 262,148, Nov. 28, 1925. Methylol compds. of acids amides such as acetamide, urea or thiourea are prep'd by the interaction of non-aq. CH₂O with the acid amide in an org. solvent such as MeOH, EtOH or benzyl alc. The presence of a base is necessary if the CH₂O is not acid-free and is otherwise advantageous as an accelerator of the reaction. The product is ppt'd. by ether or CCl₄. Several detailed examples are given.

Symmetrical carbonyl urea of *m*-(*m*-aminobenzoylamino)-*p*-hydroxybenzene-*arsonic* acid. W. SCHOELLER and M. GEHRKE. U. S. 1,642,830, Sept. 20. This compd., a yellow amorphous powder sol. in alkalies but insol. in the usual org. solvents, is made by aminobenzoylating *p*-hydroxy-*m*-aminobenzene-*arsonic* acid and treating the reaction product, in alk. soln., with phosgene, without cooling.

Primary amine. W. REPPE. Can. 273,516, Aug. 30, 1927. Primary amines are produced by passing a vaporized NH₃ compd. of an aldehyde mixed with H₂ and gaseous NH₃ at an elevated temp. over a hydrogenation catalyst.

Cyclohexylamines. I. G. FARBENINDUSTRIE AKT.-Ges. Brit. 261,764, Nov. 19, 1925. Primary or secondary amines are subjected to reaction with halogen cyclohexanes, preferably in the presence of a catalyst or an acid-binding substance. Aniline, 2 mol. proportions, is boiled in the presence of a little Cu with bromocyclohexane or chlorocyclohexane 1 mol. proportion. On cooling and acidifying with HCl, a ppt. of monocyclohexylaniline-HCl is formed. Toluidine, naphthylamine, chloroaniline, mono-

methylaniline, diphenylamine and carbazole may be similarly treated. By using 2 mol. proportions of bromocyclohexane and adding 1 mol. proportion of NaOAc, a dicyclohexylaniline is produced. Several other examples are given.

Cyclohexylamines. I. G. FARBENINDUSTRIE AKT.-GES. Brit. 261,747, Nov. 17, 1925. Cyclohexylethylaniline or other tertiary amines contg. a cyclohexyl group and an alkyl group are obtained by the action of alkylating agents on cyclohexylarylamines, e. g., by the action of Et_2SO_4 on cyclohexylaniline.

11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

A—GENERAL

FRANK P. UNDERHILL

Gastric secretion during "Chloralose" narcosis. A. ELKELES. *Arch. Verdauungs-Lehrh.* 40, 380-93(1927).—The stimulation usually caused by histamine is checked by "Chloralose." It did not interfere with the action of alcohol, pilocarpine or "Hydrophepin."

FRANCES KRASNOW

Hydrolysis of peptone, albumin and casein with normal sodium hydroxide. I. S. YAICHNIKOV. *J. Russ. Phys.-Chem. Soc.* 58, 1374-6(1926).—One % solns. of peptone, albumin and casein in N NaOH were decompd. in 25 days at 10° and 9-12 hrs. at 37° , 70° and 100° . Samples of 5 cc. were taken on certain days (at 10°) or hrs. They were first neutralized with N HCl, later with $0.2 N$ HCl, with phenolphthalein as indicator and finally titrated by "Sorensen's" method. Results were calculated to one cc. Peptone and casein are decompd. faster by NaOH than by acid (cf. *C. A.* 19, 3100). Albumin is decomposed by both alike. The decompn. of peptone agrees more or less with the rule of Schütz and Borisov, albumin only at 37° , casein only at 37° and 70° .

A. A. BOEHLINGK

The behavior of salivary diastase of man and various domestic animals toward glycogen. WILHELM LÜCKING. *Deut. tierarztl. Wochschr.* 34, 257-9; *Chem. Zentr.* 1926, I, 3404.---Glycogen is subjected to an amylolytic action only by the salivary diastase of omnivorous animals (man and swine), no evidence of a diastatic action of the saliva of herbivorous animals being found. The diastatic power of the saliva was greatest in a slightly acid medium.

C. C. DAVIS

The saproporphyrins. Copratoporphyrin, a frequent product of putrefaction of flesh and organs rich in blood. O. SCHUMM. *Z. physiol. Chem.* 169, 3-9(1927).—According to H. Fischer (*C. A.* 18, 2717), putrid meat and animal organs contain coproporphyrin, a substance derived from a hypothetical hemoglobin B. Expts. are now described in which horse meat and beef hearts were allowed to putrefy spontaneously for weeks and months. Considerable quantities of saproporphyrins developed, but in only 1 case was there the slightest suggestion of a positive coproporphyrin test. Copratoporphyrin, on the other hand, was uniformly present in considerable amt. This substance was probably mistaken by Fischer for coproporphyrin. Neither copratoporphyrin nor saproporphyrin D was known at the time of Fischer's work. The hypothetical hemoglobin B lacks all exptl. support.

A. W. DOX

Saproporphyrins. A new saproporphyrin. I. O. SCHUMM. *Z. physiol. Chem.* 169, 52-8(1927).—A hitherto unknown natural porphyrin was obtained from putrefied meat and beef heart as well as from putrefied blood, and designated *saproporphyrin D*. In Et_2O it gives approx. the same spectrum as coproporphyrin, Nencki's hematoporphyrin, acetylhematoporphyrin and the Me ether of Nencki's hematoporphyrin. In its chem. behavior it shows considerable similarity to copratoporphyrin but differs spectroscopically from the latter. Its soly. in CHCl_3 and its unusual color reaction with Br distinguish it from coproporphyrin. Its solns. in CHCl_3 , $0.1 N$ NaOH or 25% HCl rapidly fade in sunlight—a distinction from mesoporphyrin, coproporphyrin and copratoporphyrin. It has not yet been obtained in cryst. form, but little doubt remains that the substance represents a new natural porphyrin.

A. W. DOX

The catalytic hydrogenation of hemateric acid and hemin. ARNO PAPENDIECK. *Z. physiol. Chem.* 169, 59-63(1927).—When hydrogenated in AcOH soln. in the presence of colloidal Pd, hemateric acid takes up 6 H and yields mesoporphyrin. By similar treatment of hemin in AcOH addn. of 6 H occurs and at the same time a partial removal of Fe so that both mesohemin and mesoporphyrin are formed. In $0.1 N$ KOH, however, hemin gave in some expts. a complete conversion into mesohemin, in others

a product which was converted by the $\text{AcOH-N}_2\text{H}_4$ treatment into hemateric acid instead of mesoporphyrin. A. W. DOX

Pyridine-hemins. ANT. HAMSÍK. *Z. physiol. Chem.* 169, 64-72(1927).—When chlorohemin is dissolved in pyridine an addn. of the base to the halogen-Fe group occurs. Other hemins, e. g., acetyl-, formyl-, oxalyl- and sulfate-hemin, behave in the same way, yielding addn. products which may be designated by the general term pyridine-hemins. The pyridine soln. of chlorohemin when treated with Et_2O gives a sepn. of large crystals which on washing with Et_2O or EtOH break up into smaller crystals, the final product being the original chlorohemin. Treatment of the pyridine soln. of acetylhemins with Et_2O gives a sepn., partly amorphous and partly cryst., consisting of a mixt. of hydroxyhemins and hydroxyhemins anhydride. Oxalyl- and sulfate-hemin undergo a similar cleavage and for that reason cannot be obtained pure. These acylhemins in pyridine soln. differ from chlorohemin in their behavior on boiling. They give a cryst. sepn. of hydroxyhemins and its anhydride, whereas chlorohemin remains in soln. A. W. DOX

Comparative measurements of oxido-reduction and of carbon dioxide evolution by yeast enzymes. RAGNAR NILSSON AND BRITA JANSSON. *Z. physiol. Chem.* 169, 73-90(1927).—The ratio of ymase activity to reductase activity was detd. by comparing the no. of cc. of CO_2 evolved per hr. with the no. of min. required for decolorization of methylene blue. It was already known that fermenting power may drop to zero without any considerable decrease in reducing power. The problem consists therefore in establishing conditions under which the above ratio reaches a max. One of these conditions is the maintenance of cozymase factors in adequate amt. For 4 preps. of the same yeast the ratio was by no means const., but varied from 11.2 to 20.8. Correction being made for the difference in temp. at which the 2 detns. were made (20° and 30° , resp.) the actual ratios become half these values. Neither the fermentation nor the methylene blue reduction is activated by very small concns. of adrenaline. Catalase is present in the yeast preps. but probably has no influence on the reduction. Activation of the reduction by tetrahydro- β -naphthylamine occurs only with fresh yeast. The effect is greater at pH 8.2 than at pH 5, i. e., the free base is more effective than its HCl salt. The concn. producing the max. acceleration is 2×10^{-2} with fresh yeast, whereas the optimum concn. for activation of rabbit muscle is 10^{-4} . Fermentation, on the other hand, is not activated in either fresh or dried yeast. The amine is not utilized as a H-donor by the mutase nor can it replace the coenzyme. Small concns. of *o*- and *m*- $\text{C}_6\text{H}_4(\text{NH}_2)_2$ did not activate the methylene blue reduction by washed dried yeast. Fermentation is not affected by 0.000125 *M* picric acid, but higher concns. are inhibitory. A. W. DOX

Chemistry of the blood pigment. VI. The relations between hemin, hemochromogen and porphyrin. FELIX HAUROWITZ. *Z. physiol. Chem.* 169, 91-101(1927); cf. C. A. 21, 1661.—In the presence of AcOH both Fe^{++} and Fe^{+++} salts convert porphyrins into the corresponding hemins. On the other hand, if PrCO_2H or BuCO_2H is used in place of AcOH , only Fe^{++} can be introduced. The change from the hemochromogen spectrum to the hematin spectrum when a hemochromogen soln. is acidified does not occur in the complete absence of oxidizing agents. The formation of hemochromogen from chlorohemin is brought about by reducing agents even in the complete absence of O-contg. substances. Loss of OH rather than addn. of H accounts for the conversion of hemin into hemochromogen, and the latter should therefore contain only the 4 carboxyl-O atoms and not a 5th O atom. A. W. DOX

Origin of substances produced by irradiation of the heart. H. ZWAARDEMAKER. *Verlag Akad. Wetenschappen Amsterdam* 36, 448-50(1927).—By Ra or Po irradiation of an isolated heart which has stopped beating for lack of K, substances are produced which may be made to pass over into a perfusion liquid and which have the power of starting the beating of another heart similarly treated. These substances may be designated *automatins*. The β -automatin is the naturally occurring product which is formed from a parent substance, *automatinogen*, by the activation. The perfusion liquid obtained from a non-beating heart acquires the same activity when irradiated separately as that obtained from an irradiated heart. The substances are also present in skeletal muscle, since alc. exts. after adsorption on talc and subsequent extn. by EtOH show a similar activity, which is still further increased by irradiation, i. e., by activation of the parent substance simultaneously present. A. W. DOX

Studies on the action of rennet. E. MUNDINGER. *Milchwirtschaft. Forsch.* 4, 369(1927).—Three rennets were studied with variation in acidity and pH . The results check with the calcn. by the formula of Grimmer and Kruger (C. A. 20, 1998).

G. R. GREENBANK

Organic matrix in dental enamel of the guinea pig and rabbit. T. D. BECKWITH AND ADRIENNE WILLIAMS. *Dental Cosmos* 69, 912-20(1927).—The enamel of the incisor teeth of the rabbit and guinea pig contains an org. matrix which is characterized by certain microchemical reactions, e. g., staining by either picric acid or hematoxylin.

JOSEPH S. HEPBURN

Effect of γ -irradiation on cell division in tissue culture in vitro. R. G. CANTI AND F. G. SPEAR. *Proc. Roy. Soc. (London)* B102, 92-101(1927).— γ -Radiation lacks stimulating action on cell division, but has a definite effect in reducing the number of cells in mitosis in tissue cultures in vitro. However, the action of Ra is not purely cumulative, and there is a min. threshold of intensity, below which a given biological effect will not occur however long the period of exposure.

JOSEPH S. HEPBURN

The distribution of lymphatics defined by fatty acid compounds developed in the autolysis of their contents. J. L. SMITH AND THEODORE RETTIE. *Proc. Roy. Soc. (London)* B102, 102-9(1927).—The anatomical form and arrangement of the lymphatics of the liver are revealed by the post-mortem autolytic changes in the lymph, as a result of which doubly refractile globules of "soap" are formed from the lipins of the lymph, frequently in such quantity that they fill the lumen of the channel completely.

JOSEPH S. HEPBURN

The lipolytic and liposynthetic actions of dried pancreatic juice. C. ARTOM. *Arch. fisiol.* 24, 24-69(1926); *Physiol. Abstracts* 11, 590.—The desiccated secretion of dog pancreas has a distinct lipolytic and liposynthetic activity if redissolved in the proportion of 5% in water and glycerol. Both activities are favored by an excess of glycerol. The same desiccated secretion is affected by heat only when exposed for 30 min. to temps. a little above 82°.

E. H.

The lipolytic and liposynthetic actions of pancreas extract. S. DI FRISCO. *Arch. fisiol.* 24, 70-86(1926); *Physiol. Abstracts* 11, 590.—Dog pancreas can be extd. by means of a mixt. of water and glycerol; after desiccation an ext. so prepd. preserves a considerable lipolytic and liposynthetic activity corresponding to 20% free oleic acid and 80% esterified oleic acid.

E. H.

The behavior of maggots against poisons. K. FRIST. *Z. Untersuch. Lebensm.* 52, 466-9(1926).—The occurrence of maggots in forensic material contg. strychnine led to a further study. Finely ground horse meat was exposed. The maggots, which developed were then transferred to other portions of horse meat treated with various poisons. The following compds. were non-poisonous to maggots: chrome alum $\text{Sn}(\text{NH}_4)_2\text{Cl}_6$, atropine sulfate, colchicine, morphine-HCl, CH_3OH , phenol, $(\text{NH}_4)_2\text{C}_2\text{O}_4$, strychnine-HCl. The following compds. were poisonous: $\text{Pb}(\text{AcO})_2$, $\text{K}_2\text{Cr}_2\text{O}_7$, CuSO_4 , ZnSO_4 , As_2O_3 , $\text{K}(\text{SbO})\text{C}_4\text{H}_4\text{O}_6$, KCN, BaCl_2 , P, veratrine, cocaine-HCl, novocaine, cresol, Na salicylate, picric acid, resorcinol, chloral hydrate.

W. J. H.

The sugar-albumin condensation. S. P. L. SÖRENSEN AND L. LÖRBER. *Ber.* 60B, 999-1006(1927).—S. and L. criticize the results of Pringsheim and Winter (cf. following abstr.) at length and offer extensive experimental evidence to show that the analytical methods of P. and W. did not give correct results for the amt. of sugar albumin condensation taking place.

C. D. INGERSOLL

The sugar-protein condensation. HANS PRINGSHEIM AND MARGOT WINTER. *Ber.* 60B, 278-84(1927).—Glucose, added to NaCl soln. or lime water, contg. various proteins, or digestion products of proteins, also in soln., was no longer detectable quant. by Fehling's titration. A condensation product, of which glucose comprised 3 to 4% of the total wt., is postulated. The condensed glucose was still fermentable with yeast. Neither gelatin nor amino acids formed such condensation products. Fructose, galactose, maltose and lactose were able to replace glucose. About twice as much disaccharide condensed as monosaccharide, indicating a stoichiometric relationship. When the condensate was pptd. with $(\text{NH}_4)_2\text{SO}_4$ there was no titratable glucose in the protein-free filtrate. When HCl and heat were used to ppt. the compd., the glucose appeared in titratable form; it also appeared after HCl hydrolysis of the condensate. A blank expt. with protein and Cu_2O showed that the latter could be titrated. Perhaps the titratable glucose of the blood represents only a small part of the total glucose, most of which is condensed with protein.

G. E. SIMPSON

Amino derivatives of sugars. II. H. v. EULER AND EDV. BRUNIUS. *Ber.* 60B, 992-7(1927); cf. C. A. 20, 3286.—The reactions of Witte peptone, blood serum and serum albumin with glucose and fructose are investigated from the point of view of the effect of the nature of the amino compd. and of the sugar on the condensation that takes place. The results are reported on the basis of the decrease in the no. of mols. as evidenced by the difference in lowering of the f. p. between a soln. contg. both sugar and amino components and the sum of the f. p. lowerings of solns. of the individual

components. The reaction of peptone with fructose proceeds more rapidly than with glucose; a small reaction is evidenced between blood serum and fructose but none when glucose is used; a small reaction between fructose and serum albumin is noted. All of these condensations tend toward a condition of equil. Addendum. *Ibid* 997-9.—The condensation of amino bodies and sugars cannot be correctly detd. by the method of Bertrand due to the increased soly. of CuO in the presence of albumins or like amino compds. Polarimetric measurements are also inconclusive. This is in criticism of the investigational method employed by Pringsheim and Winter (cf. preceding abstr.).

C. D. INGERSOLL

The determination of sugar in the presence of protein and the supposed condensation of carbohydrates and protein. C. NEUBERG AND E. SIMON. *Ber.* 60B, 817-24 (1927).—The authors disprove the contention of Pringsheim and Winter (cf. 2nd preceding abstr.) that sugars condense with proteins to form a stable compd., claiming that the latter were misled by the methods employed. Mixtures of sugars and proteins were separated by dialysis, by colloidal Fe hydroxide, and by alc. pptn., with no evidence of a stoichiometric union between them.

J. J. WILLAMAN

The enzymes in the digestive tract of the bee. JOACHIM EVENTUS. *Arch. Bienenkunde* 7, 229-44 (1926); *Ber. ges. Physiol. expil. Pharmacol.* 40, 363.—Diastase, glycogenase and invertin are contained in the salivary glands (I) and in the middle (II) and lower (III) intestine, protease in I and II, lipase and catalase in II and III, pepsin, trypsin and chymosin (perhaps also tyrosinase) in II. Inulase, cellulase, lactase and emulsin are absent. I, III and the honey stomach are acid; II is alk. The malpighian bodies contain no enzymes. The enzymes are secreted by I and II only, catalase also secreted by III.

MARY JACOBSEN

Relative hypotension of foreigners in China. C. L. TUNG. *Arch. Internal Med.* 40, 153-8 (1927).—The av. systolic pressure of 58 Americans in China was 109, the av. diastolic pressure 65, against 118 and 76 in America. The blood pressure of Americans detd. after 3 years sojourn in China was lowered in 64-72% cases.

M. J.

Animal poisons in chemistry. P. LATZER. *Boll. chim. farm.* 66, 353-9, 385-90 (1927).—Pure lecithin reacts with venoms very slowly. Lecithin CdCl₂ was used for the expts. Lecithin ZnCl₂ reacts in the same way but is more difficult to prep. When incubated with cobra or *Crotalus* venom at 50° a 1% soln. of egg lecithin. CdCl₂ seps. an oily layer of satd. and unsatd. fatty acids (I no. 44.21, original I no. 65.34), while the hemolytic power of the aq. soln. increases. The lysocithin thus formed is not materially changed when subjected to an even prolonged action of snake, viper or bee poison. Pancreas lecithin behaves similarly, but the I no. of the sepd. fatty acids is only 11.74 in accordance with its compn. Of all venoms, wasp poison alone causes complete decompn. of egg lysocithin to fatty acids (I no. 58.55), choline, glycerol, H₃PO₄ and CdCl₂. Lysocithin made from Belfanti's γ substance behaves in the same manner. The I no. of the fatty acids is 31.7. If, however, the purified lysocithin of Delezenne or Fourneau is applied the I no. is zero. It follows that the venom of ophides has no selective saponifying action on glycerides of unsatd. fatty acids and that lysocithin does not necessarily contain satd. acids only. Egg lecithin CdCl₂ is completely hydrolyzed by wasp poison. The hydrolysis apparently takes place over lysocithin, since a transient hemolytic effect of the aq. layer may be observed. None of the animal poisons examd. had any effect on neutral fat or even triacetin. Unlike the other poisons wasp poison hydrolyzes Ca glycerophosphate (the Poulenc brand as well as the com. products which are probably mixts. of the α and β forms), and Na glycerophosphate. Common phytin and the phytin of *Hevea brasiliensis* (quebracic pentaphosphate) are not attacked. Short heating to 80° destroys the hydrolytic power for lysocithin and glycerophosphates. This difference between the wasp and other hymenoptera is apparently attributable to the fact that wasp larvae are fed on insects and the poison serves not only for defense but also for a preliminary digestion of the food. Since animal poisons have apparently no selective action on glycerides of unsatd. fatty acids the question arises whether the selective hydrolysis is detd. by the α - β positions of the fatty acids. If this is the case then lysocithin could only form from α -glycerophosphates. The quant. conversion of lecithin into lysocithin would consequently preclude the presence of a larger proportion of β -glycerophosphate in it. Grün and Limpacher's synthetic distearolecithin resisted the action of snake venom. Knowledge of the enzyme of snake poison is at the present limited to the fact that it is a phosphatidase, inducing a bimolecular reaction. Snake poison is remarkably stable. A sample of *Crotalus* venom kept in the dark since 1883 has preserved its full activity. The solns. of venoms used in the above expts. were inactivated only by ultra-violet rays.

MARY JACOBSEN

The enzymes of human skin. M. MELCZER. *Dermatol. Z.* 49, 252-61(1926); *Ber. ges. Physiol. expl. Pharmakol.* 40, 286; cf. C. A. 21, 1485.—All strata of skin completely freed from blood contain diastase, phenolase, catalase, peroxidase and glycolytic enzyme. The lipase, which is produced mainly by the epidermis, not by the sebaceous glands, is quinine- and atoxyl-fast, but the rate of lipolysis is lowered in the presence of these poisons. In severe pulmonary and peritoneal tuberculosis the skin lipase may be entirely absent.

Iodine content of thyroid in various animals. T. NOSAKA. *Folia endocrinol. japon.* 2, 878-933(1926); *Ber. ges. Physiol. expl. Pharmakol.* 40, 562.—The thyroid has the highest relative weight in man, the lowest in cattle and horses. In chickens and monkeys it has the highest, in horses, cattle, cats, rabbits and guinea pigs the lowest abs. I content. The I content/kg. shows the highest value in the chicken, the lowest in the monkey, horse, cattle, dog, cat, rabbit, guinea pig and snake.

The glucosides of *Fatsia japonica* DCne. et Planc. I. *Fatsia* sapotoxin. KENICHIRO OHTA. *Kitasato Arch. Expl. Med.* 7, 301-13(1926); *Ber. ges. Physiol. expl. Pharmakol.* 40, 348.—*Fatsia* sapotoxin, $C_{27}H_{42}O_{10}$, a white, amorphous, tasteless, hygroscopic powder was obtained by extg. the air-dried comminuted leaves with warm alc., purifying the ext. with Pb acetate and treating the alc. residue with 98% MeOH. Unlike the other saponins from which it also differs by its formula the sapotoxin froths only on addn. of a little alkali or alc. An attempt at the prepn. of a cryst. cholesteride was unsuccessful. Heating with 1% H_2SO_4 in 50% alc. yielded a clear yellow soln. and an insol. *sapogenin* I, $C_{22}H_{34}O_4$. **II. *Fatsin*.** *Ibid* 315-24.—*Fatsin*, $C_{31}H_{54}O_{20}$, a white, hygroscopic amorphous powder, easily sol. to a bitter soln., was prepd. by the alc.-ether method of Buchholz and by Greene's MgO method. Heating with excess 2% H_2SO_4 effects hydrolysis to insol. *sapogenins*, sugar and a volatile org. acid. The crude *sapogenin* consists of an ether-sol. α -*sapogenin*, $C_{18}H_{30}O_8$, and the ether-insol. β - $C_{10}H_{18}O_6$. **III. Biological study of *Fatsia* sapotoxin and *fatsin*.** *Ibid* 325-39.—The hemolytic effect of *Fatsia* sapotoxin by far exceeds that of all saponins known (tables of Schulz and Heyl), while that of *fatsin* is only slight. Cholesterol delays the hemolysis. Neither glucoside splits sugar off under the action of Takadiastase. *Fatsin* solns. became turbid on standing and acquired a fatty acid odor.

Atropine excretion in cow and goat milk. A. NAVRÁTIL. *Klinické spisy vys. školy zverolekarské Brno* 4, 75-94(1926); *Ber. ges. Physiol. expl. Pharmakol.* 40, 459.—The subcutaneous injection of 0.1 g. (I) atropine H_2SO_4 produced a violent reaction in a cow, while 0.05 g. (II) had hardly any effect. Milk I revived the frog heart in muscarine standstill in a diln. of 1:30, II in a diln. of 1:20. Since the atropine applied was effective in a concn. of $1:14^{-6}$ milk I must have contained 0.0021, II 0.0015 g. per l.

New method of activation. Preliminary report. OTTOKAR SCHULTZ. *Milch-wirtschaftl. Forschung* 4, 37-40(1927); *Ber. ges. Physiol. expl. Pharmakol.* 40, 479.—The deterioration of taste produced by ultra-violet irradiation of milk is caused by the action of H_2O_2 on the proteins and does not run parallel with the activation. The taste of protein-free cream or animal oils is not affected by prolonged irradiation.

The viscosity of protoplasm. L. V. HEILBRUNN. *Quart. Rev. Biol.* 2, 230-48 (1927).—A review with 64 references.

The electric capacity of animal tissues under normal and pathological conditions. G. W. CRILE, AMY F. ROWLAND and G. H. CRILE. *Am. J. Physiol.* 76, 320-4(1926).—The elec. capacity of each tissue appeared to be a characteristic const. but was subject to change under varying conditions, e. g., the injection of HCl, adrenaline, ether or $NaHCO_3$ caused more or less change in the elec. capacity of the liver, cerebrum, cerebellum and medulla oblongata.

Carbohydrate tolerance and its relation to the endo- and exogenic hyperglucemia curves. ALEXANDER OSZACKI. *Acta med. scand.* 66, 311-36(1927). S. MORGULIS

The effect of monoses and of magnesium ions on the formation of sugar from formaldehyde. HANS SCHMALPUSZ. *Biochem. Z.* 185, 70-85(1927).—In the process of condensation of HCHO under pressure in the presence of MgO there appear MeOH, HCOOH, triose, pentose and hexose; also diacetyl and furfural are found, but no glycol- or glycerol-aldehyde. The triose was identified as dihydroxyacetone. In the condensation of a 2% HCHO soln. 1.33% glucose appears on the av. Evidently, an equil. is produced soon between HCHO, triose, pentose and hexose, but this is upset by further production of these substances. The same reducing substances are formed at 100° and 120° and 2 atm. of pressure. At 95° there is no condensation, the rate of which increases with the rising temp. The rate of condensation increases with the

MgO concn., but not beyond the amt. necessary to neutralize the inhibiting acids produced. The condensation in the presence of $\text{Ca}(\text{OH})_2$ or NaOH proceeds more rapidly but the sugar also undergoes rapid destruction. $\text{Al}(\text{OH})_3$ is too weak an alkali to promote the condensation. MeOH does not influence the condensation; Mg formate enhances it greatly, which can also be accomplished with equiv. amts. of $\text{Mg}(\text{OAc})_2$ or MgCl_2 . On the contrary, Na, K or Ca formate does not affect the rate of condensation; and Cu formate actually inhibits it very much. Therefore, in Mg formate it must be the Mg ion which has the stimulating effect. Acids inhibit the condensation, this effect being greatly increased by the addn. of furfural. Sugar affects the condensation rate so strongly that often the condensation is completed before the necessary temp. has been attained.

S. MORGULIS

The solubility of uric acid in carbonate salts and the effect upon it of carbonic acid. S. LANG AND H. LANG. *Biochem. Z.* 185, 88-112(1927).—The soly. of uric acid in bicarbonate solns is not parallel to the bicarbonate content, but corresponds to an exponential function provided the liberated CO_2 cannot escape. The same also holds true with some modification for the soly. in carbonate solns. In low salt concns. there is complete salt formation but in high concns. (above $N/30$) there is a direct but not complete proportionality of the uric acid salt formation. Absorption of small amts. of CO_2 inhibits the formation of the uric acid salt.

S. MORGULIS

Preparation of sepia melanin from sepia melanic acid. OSKAR ADLER. *Biochem. Z.* 185, 169-72(1927).—Twenty g. of dried sepia ink is extd. with a 15% alc. in benzene. The ext. is washed with alc. and ether, and after drying off the ether, the mass is boiled first with H_2O then with 5% HCl ; it is washed Cl -free with boiling water, and finally with alc. and ether. The material is carefully fused with KOH for 30 min., dissolved in H_2O , and the soln. is decanted through a filter. The sepia melanic acid is pptd. from the filtrate on adding HCl . The substance contains 2.66% H, 1.08% S and 8.62% N.

S. MORGULIS

Studies on the influence of arsenic and antimony compounds on the enzymic functions of the organism. IV. The cause of the inhibitory action of tartar emetic on salivary amylase. I. A. SMORODINTZEV AND E. A. ILIIN. *Biochem. Z.* 185, 328-33(1927).—The inhibitory effect of tartar emetic is due to the acid reaction of its solns. which displaces the p_{H} of the digestion mixt. from the opt. In a properly buffered medium tartar emetic neither accelerates nor retards the amylase activity of saliva.

S. MORGULIS

Proteolytic enzymes of serum. VIII. Investigations on the possibility of a fundamental unit of blood enzyme. M. VON FALKENHAUSEN. *Biochem. Z.* 185, 334-43(1927); cf. *C. A.* 21, 2308.—The "fundamental enzyme" is prepd. according to Galwialo from a 1:10 or 1:15 dil. cold oxalated plasma, through which CO_2 is passed for 10 min. A ppt. settles out on standing for 24 hrs. The ppt. is ground with sand and extd. with ice cold water, and filtered. The filtrate is supposed to show diastatic, proteolytic or lipolytic action upon the addn. of the electrolytes of saliva, gastric or pancreatic juice. It is thought that Galwialo's soln. is really an isolated mixt. of the known blood enzymes.

S. MORGULIS

The possibility of changing one enzymic property into another depending upon the experimental conditions. M. J. GRAMENITZKI. *Biochem. Z.* 185, 433-7(1927).—From the fact that the blueing of a tincture of guaiac by blood in the presence of H_2O_2 depends upon proper quant. relationships between the blood and H_2O_2 , disappearing when the blood is in excess in the system, it is attempted to develop the view that the peroxidase or catalase reactions of the blood are simply different manifestations of the same fundamental property of the blood regulated by mass action.

S. MORGULIS

The enzymes of the skin. VIII. Lactic acid formation in the skin and the effect of various lights on it. J. WOHLGEMUTH AND TOSHISUKE IKEBATA. *Biochem. Z.* 186, 43-53(1927); cf. *C. A.* 21, 457.—The skin from cadavers can produce lactic acid with or without the addn. of carbohydrate, but the fresh human skin has a much greater ability for lactic acid production. The skin from severe diabetics forms lactic acid as well as that from normal individuals. Insulin does not affect the lactic acid production of fresh skin, but it does increase the production by the dead skin or diabetic skin. Natural sunlight injures somewhat the ability of the skin to produce lactic acid, while artificial sunlight (ultra-violet) is more injurious and x-rays are the most injurious. Levulose is the best source of lactic acid.

S. MORGULIS

The arginine content of some proteins and of both normal and amyloid organs. OTTO FÜRTH AND OTTO DEUTSCHBERGER. *Biochem. Z.* 186, 139-54(1927).—Kossel and Gross' method for detg. the arginine in pure proteins which depends upon the formation of an insol. cryst. compd. with flavianic acid is not applicable to hydrolysates

obtained from various organs because of the presence of interfering substances. The procedure was therefore modified in that the basic N in the hydrolysate is detd. by pptn. with phosphotungstic acid. The ppt. is then decompd. and the fraction of basic N pptd. by flavianic acid is detd. The proportion of arginine N to the total base N is thus measured and by calculation the arginine content of the original organ is

cent. 10/100. The arginine content of human and animal organs was 6.5–8.1% for the kidney, liver and spleen. There was no difference in the arginine content of normal organs and organs with amyloid degeneration. S. MORGULIS

The absorption of porphyrins in the region of the ultra-violet spectrum. W. HAUSMANN AND O. KRUMPEL. *Biochem. Z.* **186**, 203–12(1927).—Hematoporphyrin-HCl in alk. or acid soln., the tetramethyl esters of hematoporphyrin, octamethyl ester of uroporphyrin and tetramethyl coproporphyrin were studied in CHCl_3 soln. Uroporphyrin and coproporphyrin show absorption in the range of $\lambda = 300\text{--}400\mu$, which may account for their sensitizing action in the ultra-violet light. S. MORGULIS

The effect of different carbohydrate-phosphoric acid esters on the fermentation of glucose. PAUL MAYER. *Biochem. Z.* **186**, 313–6(1927).—Expts. with various natural and synthetic glucose-mono-phosphoric esters show that they all possess the ability to accelerate the beginning of fermentation. S. MORGULIS

Keto-aldehyde mutase in wheat, rye and soy bean seeds. LUDWIG KLAR. *Biochem. Z.* **186**, 327–30(1927).—Phenylglyoxal hydrate is quant. converted to optically active mandelic acid by wheat, rye or soy-bean meal. S. MORGULIS

Fermentation of glucose and pyruvic acid. A. LEBEDEV. *Biochem. Z.* **186**, 376–7(1927). S. MORGULIS

Studies on the composition of the cell membrane by a new method of determining surface tension. STUART MUDD AND EMILY B. H. MUDD. *Biochem. Z.* **186**, 378–90(1927). The method consists in studying the degree to which the cell surface is wetted when the cells are distributed in the interface between 2 liquids. By proper choice of liquids and other exptl. conditions important information is derived regarding the nature of the surface layer. Red blood cells, leucocytes, blood platelets, bacteria and spermatozoa have thus been investigated. S. MORGULIS

Studies on protein coagulation in drops. IX. Synergism of mixtures of protein. F. BEHM. *Biochem. Z.* **187**, 84–91(1927).—Studies made on mixtures of albumin and globulin show that the type of coagulation is detd. by the globulin, while the pptn. value of the mixt. is the arithmetical mean of the values for each component. The av. pptn. value for various globulins varies in the order: edestin > egg globulin > serum globulin; similarly with albumins, serum albumin > egg albumin. But the av. pptn. values for serum and egg protein are practically the same (25:24). S. M.

Studies on the catalase content of blood of mid-Asiatic mountaineers. A. I. ALEXEEV. *Biochem. Z.* **187**, 92–7(1927).—The catalase activity of the blood of mountaineers diminishes markedly toward evening. The catalase activity as well as the no. of red cells and the hemoglobin index are greater than in normal individuals. The coeff. of correlation between catalase activity and viscosity of the blood is 0.87. The coeff. of correlation between catalase activity and the no. of red cells is 0.9 in the morning and only 0.72 in the evening. The catalase index (catalase activity/no. of red cells) = 3.75. Similar relationships exist between the hemoglobin index and catalase activity. S. MORGULIS

The fermentation of α -ketobutyric acid and oxalacetic acid. VII. The dependence of the alcohol fermentation on hydrogen ion concentration. ERIK HÄGGLUND AND ANDERS RINGBOM. *Biochem. Z.* **187**, 117–9(1927).—Studies on the relative velocity of fermentation of oxalacetic and α -ketobutyric acids at different p_H values show that the carboxylase is fully active only within a definite p_H range, which varies with the nature of the substrate. S. MORGULIS

The nature of the pyruvic acid fermentation. CARL NEUBERG AND ERNST SIMON. *Biochem. Z.* **187**, 220–53(1927).—An extensive discussion of the role of pyruvic acid in the process of fermentation. S. MORGULIS

The effect of illumination on tyrosine and tryptophan in the protein compound. FRITZ LIEBEN. *Biochem. Z.* **187**, 307–14(1927).—Tyrosine and tryptophan undergo oxidative decompn. in protein exposed to diffuse daylight or to the Hg lamp, but in the first instance the presence of a sensitizer is necessary. The destruction of these 2 amino acids in the protein mol. proceeds slower than when the free acids are submitted to the same treatment. The velocity is increased by alkyl. and with trypto-

phan, by formaldehyde. Even the minutest trace of H_2O_2 destroys the color reaction of Voisenet and Hopkins, but if the H_2O_2 is removed by spongy Pt the reaction reappears. The Millon reaction for free tyrosine is less easily affected and is obtained even when the H_2O_2 is definitely pos. S. MORGULIS

Sensitization of cholesterol hydrosols. RUDOLF STERN. *Biochem. Z.* **187**, 315-23 (1927).—The mutual relations between cholesterol, protein and H-ion concn. in the pptn. of cholesterol are discussed. S. MORGULIS

Photoactivity of cholesterol. JAN STŘEŠKÝ. *Biochem. Z.* **187**, 388-97 (1927).—Sunlight has the ability to photoactivate cholesterol to a certain extent. The effect produced by ultra-violet rays is much stronger, the photochem. effect depending upon the distance of the lamp and the exposure time. The photoactivity of the cholesterol, however, diminishes with time, disappearing entirely after 3 days. X-rays have a much weaker influence than ultra-violet rays. Expts. show that the presence of O_2 is necessary in order to produce the photoactivity of cholesterol. However, no trace of H_2O_2 could be detected in the reaction, but the Arnold test for ozone indicates the presence of the latter. It is concluded, therefore, that the ozone is the direct product of the action of the rays on cholesterol in the presence of O_2 , and that the process involves a more profound alteration of the structure of the cholesterol than a mere satn. of its double bonds. It was further found that higher temps. tend to increase the influence of radiation on cholesterol. In fact, very high temps., such as that of the m. p. of cholesterol, themselves induce photoactivity, which must thus be regarded as a manifestation of the oxidation of cholesterol. S. MORGULIS

Electrodialysis of proteins. WOLFGANG PAULI. *Biochem. Z.* **187**, 403-9 (1927). S. MORGULIS

Cadaver wax. S. GOY. *Biochem. Z.* **187**, 470-1 (1927).—The most striking change between cadaver fat and cadaver wax is the extraordinary increase in amt. of free fatty acids. The other fact worthy of note is the diminution of the iodine number indicating an increase in the satd. acids. Likewise, the Reichert-Meissl number changes from the low value (1.3) in the fresh fat to a value nearly $1/2$ that of butter (=13). S. MORGULIS

The enzymic transformation of hexosediphosphate into hexosemonophosphoric acid ester and the enzymic synthesis of hexosediphosphate from hexosemonophosphate. C. NEUBERG AND J. LEIBOWITZ. *Biochem. Z.* **187**, 481-90 (1927). S. MORGULIS

Effect of light on the process of decoloration in a dehydrogenase methylene blue system. A. KRESTOWNIKOFF. *Skand. Arch. Physiol.* **52**, 199-208 (1927).—Even moderate illumination causes an increased rate of decoloration in a dehydrogenase (H-donor)-methylene blue system. A pure water soln. of methylene blue or a soln. in phosphate of the same p_H as the enzyme mixt. is not affected in such a way by the light. S. MORGULIS

The electrostatic charge of cells of human blood, a contribution to the question of acidophiles and basophiles. HELMUT MOMMSEN. *Folia Hematol.* **34**, 50-64 (1927).—The H-ion concn. is important in blood stains. All parts of a cell stain with an acid stain in an acid medium, and with an alk. stain in an alk. medium. The conception of acidophile and basophiles has no abs. significance. The change in staining reaction occurs at the isoelec. point. The isoelec. point can be detd. by staining in a series of buffered stains. At a p_F of 5.3, normal neutrophilic granules will not stain, but in many acute infections they will. JOHN T. MYERS

Proteolytic activity of pancreatic extracts. I. A. SMORODINTZEV AND A. N. ADOVA. *Russ. acad. sci. union rep. soviet. social.* **20**, 1491-1502 (1926).—The natural pancreatic juice of a dog obtained by I. P. Pavlov's method is $1\frac{1}{2}$ -2 times as powerful as the most active tryptic preps. The proteolytic activity of the latter is weakened by various treatments to which pancreatic exts. are subjected according to A. Danilevskii's method modified by S. Fränkel and by Wittich's method. Wittich's prepn. is 10 times as active as Danilevskii's prepn. and yields more trypsin. The treatment of the aq. pancreatic ext. with phosphoric acid and with milk of lime reduces its proteolytic activity almost to a half of its former value. Ca phosphate partly adsorbs the protease of pancreatic exts. Prolonged evapn. of exts. *in vacuo* is accompanied by a reduction of proteolytic activity up to $1/7$ of its original value. On filtering the aq. glycerol ext. of the tissue through paper the residue remaining on the filter possesses a considerable digestive capacity. Filtration of the glycerol pancreatic ext. through paper followed by pptn. with alc. yields ppts. easily sol. in alkalies and possessing a high proteolytic activity, whereas the liquid remaining after the alc. pptn. possesses no proteolytic value. BERNARD NELSON

Study of an amylase of bacterial origin. WANAUVERBECQ. *Bull. assocn. élèves inst.*

sup. fermentations Gand 28, 300-14(1927).—Effront's "achrodeextrinase" (C. A. 11, 1841) is shown to produce notable amts. of glucose and of an unidentified unfermentable sugar, probably isomaltose, in the saccharification of starch. Its action is almost unaffected by variations in temp. from 35° to 75°, and by variations in p_H from 4 to 8.

Some recent work on amyloid. S. DOUBROW. *Bull. histol.* 3, 1(1926); *Colloides biol. clin. therap.* 1, 81(1927).—A crit. review.

A. PAPINEAU-COUTURE

Chemical conception of acid de-albuminization. P. CRISTOL. *Bull. soc. sci. méd. biol.* March, 1926; *Colloides biol. clin. therap.* 1, 40(1927).—Instead of considering the pptn. of proteins as a purely phys. phenomenon due to the lowering of the p_H below the isoelec. pt., the pptg. action of certain acids towards proteins may be explained by the usual laws of chemistry. An acid de-albuminizing agent may therefore be defined as one which, at an acidity above the isoelec. pt., reacts with proteins to form insol. protein salts.

A. PAPINEAU-COUTURE

Modifications of the colloidal state of the plasma by certain fluorescent dyes. PIERRE GIRARD. *Colloides biol. clin. therap.* 1, 47-50(1927).—See C. A. 20, 3506; 21, 2318.

A. PAPINEAU-COUTURE

The influence of salts upon the ionization of egg albumin. S. P. L. SPØRENSEN, K. LINDERSTRØM-LANG AND E. LUND. *J. Gen. Physiol.* 8, 543-99(1927).—The principle followed in the exptl. detn. of the ionization of egg albumin, its capacity to combine with acids and bases, is described. Egg albumin⁹ is regarded as an ampholyte which combines with acids and bases according to the following theoretical equation: $B_H = Y - a_H/f_H + C_{BHS}.k_B f_{BH}^+/f_B a_H$, when B is a weak base, B_H = equivs. of H ion taken up or given off by egg albumin, Y = equivalents of acid or base, positive in the first case, negative in the latter, a_H = the activity of the H ion (cf. Lewis and Randall, Thermodynamics and the Free Energy of Chemical Substances, N. Y. and London, 1923), f_H , f_B , f_{BH}^+ , the activity coeffs., resp., of the H ion, uncharged base and positive ion, C_{BHS} , the concn. of salt. Where B is not a weak base, k_B can be taken = 0, and the equation becomes: $\beta_H = Y - a_H/f_H$. f_{BH}^+ , f_B and k_B values were detd. for NH_4Cl solns. and for solns. of NH_4Cl and NH_4OH . The capacity of egg albumin to combine with acids and bases was studied in solns. of $NH_4Cl + HCl$, $KCl + HCl$ and $(NH_4)_2SO_4 + H_2SO_4$. A distinction between the isoelectric and isoionic reaction of an ampholyte is suggested. The isoelec. reaction is defined as the H-ion activity (pa_H) at which the mean valency of the ampholyte is 0. The isoionic reaction is the H-ion activity at which the quantity of acid or base combined with the ampholyte is 0. If the ampholyte does not combine with ions other than the H ion, the isoelec. and isoionic reactions coincide. The effect of salt on the ionization of egg albumin consists in a turning of the ionization curves, indicating the relation between the quantity of combined acid (isoionic reaction) and pa_H . The turning of the curves, which leaves the isoelec. reaction unaltered, tends in such a direction that the quantity of combined acid at const. ampholyte concn. and const. pa_H increases with increasing salt concn. The quantity of combined Cl ions is insignificant in comparison with the combined H ions except in the vicinity of the isoionic reaction. The isoionic reaction is independent of the NH_4Cl concns. On the basis of the theoretical considerations given ionization curves can be calcd. which are in approx. quant. agreement with exptl. results.

Post-mortem variations of the p_H of the tissues. P. REISS AND C. SIMONIN. *Compt. rend. soc. biol.* 97, 306-8(1927).—By potentiometric measurement it was found that after death the variations of p_H of the tissues generally pass through 2 phases: that of increased acidification of intrinsic origin, followed by a phase of alkalization from putrefactive causes.

L. W. RIGGS

Active substance of the Bareges waters. RENÉ ROBINE AND M. DEJUSSIEU. *Compt. rend. soc. biol.* 97, 313-6(1927).—The active substance, *baregin*, of the Bareges springs is a viscous unctuous material, the product of certain algae in the thermal S waters. Analysis of dry baregin by Filhol (1865) showed N 3.5%, ash 49%. The ash was made up of $CaCO_3$ 28%, SiO_2 16.2, FeO 4, $NaCl$ 0.6, $Ca_3(PO_4)_2$ 0.2, sum 49. Later analyses have shown the presence of As, Al, Cu, Mn and of larger percentages of chlorides, sulfates and phosphates. Thirteen different microbic organisms were isolated from baregin, which is considered a waste product formed by the hydrated cadavers of the microbic organisms.

L. W. RIGGS

Apropos the mechanism of the passage of various substances from the blood into the cerebrospinal fluid. L. STERN AND J. RAPOPORT. *Compt. rend. soc. biol.* 97, 366-8(1927).—A general discussion. L. W. RIGGS

Effect of certain substances on anticalalasic action. E. M. RIAKHINA AND S. R. ZUBKOWA. *Compt. rend. soc. biol.* 97, 479-80(1927).—The solns. of catalase used were such that 1 cc. would decomp. 4 g. of H_2O_2 in 5 min. at ordinary temp. The anticalalase was obtained from aq. exts. of the spleen treated with HCl in the proportion of 2 cc. of acid (d. 1.19) to 1 l. of ext. Acidity should not exceed a p_H of 5.2. The anticalalase was added to the soln. of catalase in the proportion of 1 to 2, the anticalalase having been brought previously to a p_H 6.25. The anticalalasic power is measured by detg. the diminution of catalase in the mixt. after standing 20 min. in the thermostat at 38° . In the tests the anticalalase diminished the power of the catalase by $\frac{2}{3}$. The substances studied were added to the mixt. of catalase and anticalalase, and after standing 20 min. in the thermostat in the presence of O_2 , the catalytic power was measured with H_2O_2 . In this manner 10 alcs., 3 aldehydes, 4 sugars, 9 acids, 3 amino acids, acetone and urea were tested. All of the alcs., except EtOH and $C_2H_5(OH)_2$, completely prevent the anticalalytic action. HCHO and CH_3CHO totally prevent both catalytic and anticalalytic actions. C_6H_5CHO and Me_2CO were incomplete in their action. The sugars and acids except HCOOH were without action. L. W. RIGGS

The system catalase-anticalalase in the blood and various organs of animals in different physiologic and pathologic conditions. E. D. GAGARINA AND W. D. JANKOWSKY. *Compt. rend. soc. biol.* 97, 481-2(1927).—Expts by the method of Battelli and Stern were made with rabbits, guinea pigs and rats. In animals poisoned by a subcutaneous injection of morphine there was an increase of catalase in all of the tissues but especially in the liver and muscles. At the same time the catalase was much diminished in the blood. The anticalalase was diminished in all tissues except muscle and lung, where it was slightly increased. Animals poisoned by a subcutaneous injection of As showed an increase of catalase and anticalalase in the liver and muscles and a diminution in the blood. Animals poisoned by alc. gave a diminution of catalase and anticalalase in the liver and blood, but a slight increase in the other organs. L. W. RIGGS

Calcium carbonate and calcium bicarbonate. Hydrogen-ion concentration of saturated solutions in water. J. W. WILLIAMS AND J. A. CHUCKA. *J. Am. Med. Assoc.* 89, 445-6(1927).—The p_H value at 25° of satd. $CaCO_3$ suspensions by potentiometric methods with H electrode ranged from 8.64 to 8.86, av. 8.78. $Ca(HCO_3)_2$ was prepd by passing CO_2 through the $CaCO_3$ suspension until equil. was reached. The p_H value of $Ca(HCO_3)_2$ soln. detd. with the quinhydrone electrode gave 5.98 when CO_2 was passing through the soln., and 6.19 without excess of CO_2 . Suspensions of $CaCO_3$ taken internally would seldom if ever produce alky. of the gastric juice. L. W. RIGGS

Further studies on the antirachitic activation of substances by cathode rays. ARTHUR KNUDSON. *Science* 66, 176-8(1927).—Com. cholesterol exposed to cathode rays for 30 sec. is effective in curing rickets in doses of 1 to 2 mg. per day in rats. Cholesterol purified by the dibromide method is not rendered antirachitic by either cathode or ultra-violet radiation. Yeast, starch and cottonseed oil can also be activated by exposure to cathode rays. Yeast previously extd. in a continuous type of Soxhlet app. for one week with Et_2O was still rendered strongly antirachitic by cathode rays. L. W. RIGGS

Limitations of Warburg's theory of the role of iron in respiration. J. WILLIAM BUCHANAN. *Science* 66, 238-9(1927).—Warburg's theory of cellular oxidations is criticized as inadequate to explain many of the facts that are assocd. with changes in the rate of oxidations in the living organism. L. W. RIGGS

Enzymic mutation of xanthine and hypoxanthine without the participation of an external hydrogen acceptor. A. BACH AND D. MICHLIN. *Ber.* 60B, 82-6(1927).—By the action of purified milk enzyme (for prep. see C. A. 19, 3277) under an atm. of N, in a NaOH- KH_2PO_4 soln. of $p_H = 7.8$, uric acid was obtained from xanthine or hypoxanthine. For a similar effect with salicylaldehyde as the substrate cf. C. A. 20, 3302. Thus the O_2 absorption, which Hopkins and his pupils have found to accompany the action of the Schardinger enzyme on these purines, has no direct relation to the oxidation. Reasons are presented for preferring the name perhydridase for the Schardinger enzyme, to the name aldehyde-dehydrase, which Oppenheimer (C. A. 20, 3468) gives it. GEORGE ERIC SIMPSON

Protein storage in protoplasmic tissue. A. G. HOGAN, W. S. RITCHIE AND J. E. HUNTER. Missouri Agr. Expt. Sta., *Bull.* 236, 27 pp.(1926).—A progress report in

which data are given on the amt. of globulin pptd. from soln. by various methods. The results obtained by electro dialysis corresponded closely with those obtained by satn. with Li sulfate and half satn. with $(\text{NH}_4)_2\text{SO}_4$. J. J. SKINNER

The activities of a constructed colloidal cell. D. T. MACDOUGAL and VLADIMIR MORAVEK. *Protoplasma* 2, 161-88 (1927).—By a new method it has been found possible to dissolve cholesterol in lecithin and incorporate the mixt. in hydratable gels. The cholesterol is first dissolved in Et_2O , passes into soln. in lecithin, after which the Et_2O is evapd., giving a lecithin-cholesterol solp. and also cholesterol particles with a protective layer of lecithin. Constructed cells with lecithin-cholesterol incorporated in the gelatin and agar display differential action in endosmosis, permeability and p_H strikingly similar to those of living cells. Constructed cells with lecithin-cholesterol constituting 1 part in 1000 of the material of the layers and with contents of 20% sugar soln. showed an increasing endosmotic series in $\text{Na}|\text{K}|\text{Ca}$, implying a decreasing series in permeability under the influence of these cations in the presence of Cl. The addn. of Ca to Na or to K in immersion solns. lessens permeability and results in greater endosmosis than in Na or K alone. The inclusion of lecithin-cholesterol in the walls of constructed cells lessens the rate of penetration of Cl. One max. of rate of penetration of Cl is from immersion solns. at p_H 4.5 and a second at 5.4. Permeability of a complete cell including lecithin-cholesterol was greatest at p_H 2.9 of the immersion liquid, lessens toward p_H 4.65, and changes but slowly with variations in p_H until neutrality is passed, when it rises to a second lesser max. at p_H 7.25. The omission of lecithin-cholesterol from the layers of constructed cells causes permeability to decrease as the acidity is reduced in the immersion liquid to p_H 5.4, then an increase to 6.5, a decrease to 7.3 and a rise as alk. becomes greater. The zones of lesser permeability would be a resultant of the least hydration capacities of gelatin and agar included in the layers. Colloidal cells with lecithin-cholesterol in the layers showed no variation in the p_H of the contents, 20% sugar soln. greater than 0.25, although the immersion soln. might vary between p_H 3.05 and 8.2. Endosmosis, penetration of Cl and K ions and outward diffusion of sugar, did not affect the acidity of the contents. This stabilization is similar to that of the living cell and is seen to depend upon the presence of lecithin-cholesterol in the walls. Stabilization of the p_H of the contents of colloidal cells is due to the fact that the cholesterol component is satd. as to OH and repels them, while adsorbing H and facilitating its penetration. Lecithin on the other hand adsorbs and holds OH and retards the penetration of H ions. Auxographic measurements of sections of the layers of constructed cells, which already hold about 90% of their total water of hydration, form the increasing series $\text{Ca}|\text{Na}|\text{K}$. Interferences between Na and Ca resulted in swellings of the layers of the complete cell greater than those in Na alone, but no greater than the changes in Ca alone. M. H. SOULE

The optical behavior of protein solutions. C. V. RAMAN. *Nature* 120, 158 (1927).—Around the isoelec. point of gelatin its Tyndall effect increases considerably (cf. Kraemer, *C. A.* 21, 2210). On applying to this phenomenon the thermodynamic theory of light scattering as a function of osmotic pressure P of the particles (Tyndall effect considered as due to local fluctuations in optical d.) in the equation for scattering power $= (\pi^2 RT/2 N \lambda^4) [k(\partial\epsilon/\partial k)^2(\rho/m)/(\partial P/\partial k)]$ (k is concn., ϵ optical dielec. const., ρ/m is practically one for dil. solns.) the Tyndall effect becomes related to P changes around the isoelec. point. B. J. C. VAN DER HORVEN

Establishment of the optimal hydrogen-ion activities for the enzymic hydrolysis of starch by pancreatic and malt amylases under varied conditions of time and temperature. H. C. SHERMAN, M. L. CALDWELL AND MILDRED ADAMS. *J. Am. Chem. Soc.* 49, 2000-5 (1927).—As the temp. of hydrolysis is increased from 30° to 70°, malt amylase exerts its optimal activity at different H-ion activities when acting in the presence of 0.06 M phosphate mixts.; whereas in the presence of 0.01 M acetate-AcOH mixts., this amylase exerts its optimal activity in solns. of the same H-ion activity at the different temps. In the presence of 0.06 M phosphate, the H-ion activities of the solns. affording optimal activity of the enzyme did not show appreciable change as the exptl. period was lengthened from 0.5 to 2 hrs. at any given temp. (30-60°) while in the presence of 0.01 M acetate there is a tendency for the enzyme to exert its optimal activity in slightly less acid solns. as the period of hydrolysis is increased. This difference in behavior is not due to the influence of heat or of the products of hydrolysis upon the H-ion activities of the solns. themselves. Whether in the presence of phosphate or acetate, a higher temp. seems to render malt amylase more sensitive to changes in the H-ion activity of its environment. Pancreatic amylase, in expts. of 0.5 to 2 hrs. at 30-50°, exerted its optimal activity at p_H 7.0-7.2; but in expts. at 60° the optimal activity for 0.5-hr. periods was found at p_H 6.9 and for 2-hr. periods at 6.7. The results

indicate that the factors which induce optimal enzymic activity are even more dependent upon each other than has previously been realized and that none of them should be regarded as fixed if any of the others is changed.

C. J. WEST

Enzyme studies. I. Stomach lipase and its optimum. KENSUKE GYOROKU. *Proc. Imp. Acad. (Japan)* 3, 242-4(1927). (In German.)—The optimum reaction of the stomach lipase of rabbit, dog and man is ordinarily at p_H 5.7-6.5; this is not changed by treatment with AcOH but after purification with kaolin it lies at 7.6-7.8. The p_H optimum of hog stomach lipase is ordinarily between 7 and 8; if the stomach powder is allowed to stand several weeks, it shifts to p_H 6.0-6.5 but this is not the case with other animals (rabbit, dog). However, if the rabbit or dog lipase, mixed with PhMe, is allowed to stand several days, the change to the alk side takes place. If the purified lipase is mixed with an impure lipase inactivated by heat, the mixt. shows the alk. max. (p_H 7.6-7.8). **II. Organ lipases and their stability toward acids and alkalies.** *Ibid* 245-6.—Stomach lipase is more resistant to acids than to alkalies, and has a greater stability toward chemicals than other organ lipases. The purified stomach lipase loses its great resistivity toward acids, and is not more resistant than pancreas lipase. Similarly, the pancreas and liver lipases lose their great stability toward alkalies when completely purified. Strong acids or alkalies exert greater injury upon lipases than weaker ones. Addn. of acid- or alkali-binding substances (proteins or peptone solns.) protects the lipase against this injury to a certain degree, although the abs. amt. of the acid or alkali remains unchanged.

The use of aminophenols as reagents for uric acid and other substances of this group. E. PITTARELLI. *Arch. farmacol. sper.* 43, 142-4(1927).—An alk. soln. of uric acid or other purine when treated with $p-HOC_6H_4NH_2$ or $p-HOC_6H_4NHMe$ (metol) and $K_2S_2O_8$ gives a yellow color which appears in a few seconds and reaches its max. in 0.5 hr. In the absence of purine $p-HOC_6H_4NH_2$ gives a red color after several hrs., and metol an intense blue within a few min., the latter color changing to red on addn. of acid. The uric acid reaction is sensitive 1:100,000, and is claimed to be applicable to the colorimetric detn. of uric acid in urine. No other normal constituent of urine gives this reaction. The colored product is insol. in org. solvents in the presence of alkali, but in the presence of acid it dissolves in $AmOH$ and $AmOAc$.

A. W. DOX

The spectrophotometric determination of hemoglobin. G. E. DAVIS AND CHARLES SHEARD. *Arch. Internal Med.* 40, 226-36(1927).—The Dare, Sahli and Tallqvist methods are unreliable as shown by comparative literature data, while the evidence is divided for the Newcomer, Smith and Cohen methods. The spectrophotometric method is recommended as highly accurate, simple and fairly rapid. A simple and inexpensive spectrophotometer (Keuffel and Esser) with color filter and neutral density wedge is described.

MARY JACOBSEN

The apparent neutral reaction of certain ampules for hypodermic use and Sørensen's p_H . ARNALDO MAURI. *Quim. ind.* 4, 214-8(1927).—The presence of only 1% fluorite or other F compds. in the glass gives rise to acidity p_H 5, which is obviously caused by free HF, since the max. amt. of B_2O_3 employed never gives a p_H below 5.8-6.

and borosilicate alone is never acid. The official (autoclave) test is inadequate, since alkali is liberated, giving the false impression of neutrality. The following test is recommended: Shake the ampule with twice-distd. water and det. the p_H colorimetrically. If the result is satisfactory sterilize with twice-distd. water for 1 hr. at 135° and repeat the p_H detn.

Acidity of urine. G. TELLERA. *Boll. chim. farm.* **66**, 449-56(1927).—The colorimetric detn. with Guillaumin's methyl red-bromothymol blue indicator as recommended by Fleury (*C. A.* **19**, 2350) is satisfactory for approx. detns. within the range of p_H 4.6-7.

MARY JACOBSEN

MARY JACOBSEN

A densimeter for the rapid determination of the specific gravity of small quantities of liquids and solids. P. LECOMTE DU NOÛY. *J. Biol. Chem.* **74**, 443-8(1927).—An app. has been devised for the rapid detn. of the sp. gr. of 1 cc. of liquid to the 3rd decimal place and of solids and powders with an error not more than 5 units in the 4th place with 0.1 g. of substance. The principle adopted is exactly the same as that used in the author's tensiometer, namely, a torsion balance fitted with a dial and vernier. It is absolutely necessary to remove the air from powders and this preliminary technic is lengthy although the measurement takes only a few secs.

A. P. LOTHROP

A gasometric micro-method for the determination of iodates and sulfates, and its application to the estimation of total base in blood serum. D. D. VAN SLYKE, ALMA HILLER and K. C. BERTHESEN. *J. Biol. Chem.* **74**, 659-75(1927).—"A rapid and precise gasometric micro-detn. of iodates in the manometric app. of Van Slyke and Neill (*C. A.* **18**, 3615), by the reaction, $2NaIO_3 + 3N_2H_4 = 2NaI + 6H_2O + 3N_2$, is described. Sulfates are detd. by the gasometric estn. of the iodate dissolved when the sulfate soln. is equilibrated with excess of solid $Ba(IO_3)_2$. The reaction, $Ba(IO_3)_2 + Na_2SO_4 = 2NaIO_3 + BaSO_4$, does not go completely from left to right, but reaches an exactly reproducible equil., fixed by the relative solubilities of $BaSO_4$ and $Ba(IO_3)_2$. For the detn. of the total base in the serum, the latter is ashed with HNO_3 and H_2SO_4 and the bases are converted into sulfates. The SO_4 is then detd. by the above procedure. The base from 0.16 cc. of serum suffices for a detn., with an av. error of 0.8% of the amt. detd."

A. P. LOTHROP

An electrolytic method for the determination of sodium plus potassium. J. L. STODDARD. *J. Biol. Chem.* **74**, 677-88(1927).—The method is designed for the detn. of Na + K, and thus of Na by difference if K is detd. The material is ashed, dissolved and Mg and Ca are removed by pptn. Part of the remaining soln. is electrolyzed in an app. consisting mainly of one test tube fused inside another with Hg in each tube and a passage through the wall of the inner tube. Under an e. m. f. of 110 v. the negative ions migrate to the Hg in the outer tube; the positive ions migrate to the Hg in the inner tube where an amalgam is formed which is removed and titrated. Results check within 2% when the quantity of Na + K is equal to at least $\frac{1}{4}$ that contained in 1 cc. of plasma. The method was designed primarily for use with the new and accurate method of Fiske for the detn. of K. The method may be used with whole blood, plasma and urine.

A. P. LOTHROP

The application of the ethyl iodide method to the determination of the circulation rate in women. WINIFRED C. CULLIS, OLIVE RENDEL and ELLEN DAHL. *J. Physiol.* **62**, 104-14(1926).—Av. values for 11 women (19 to 25 yrs.) were: circulation l. per min. 7.5; stroke vol. cc. 100; stroke index, cc. per kg. 1.67.

Colorimetric tryptophan determination in proteins. J. TILLMANS and A. AET. *Biochem. Z.* **178**, 243-4(1926); cf. *C. A.* **22**, 1251.—Reply to Fürth (*C. A.* **20**, 3306).

S. MORGULIS

Cell respiration. VI. The function of the adrenal cortex and the substance Cxii. A. V. SZENT-GYÖRGYI. *Biochem. Z.* **181**, 433-7(1927); cf. *Nature* **119**, 782-3; cf. *C. A.* **21**, 2293.—The cortices of adrenals were finely chopped and extd. with $2\frac{1}{2}$ vol. of MeOH for 1 hr. while the material was mixed by passing CO_2 through it. The material was then pressed quickly through linen and finally filtered through a Büchner funnel. The filtrate was at once placed on ice and treated with $\frac{1}{10}$ vol. of 25% $Pb(OAc)_2$. The ppt. was centrifuged off after $\frac{1}{2}$ hr., suspended in about $\frac{1}{4}$ of the original vol. of MeOH, and again centrifuged, whereby most of the adrenaline was left in soln. The ppt. was then suspended in $\frac{1}{8}$ vol. ice-cold water and acidified with 50% H_2SO_4 until Congo turned blue, the excess of acid being neutralized with $NaHCO_3$. The fluid was centrifuged and preserved in a thermos bottle with a mixt. of CO_2 snow and petroleum ether. A method is described also for further purification of the $Pb(OAc)_2$ ppt. The purified Cxii substance is easily sol. in H_2O and MeOH, fairly sol. in dry acetone, less so in ether and entirely insol. in petroleum ether. It seems to be of the nature of a thiophenol, readily reduces I but not permanganate.

S. MORGULIS

Method for determining the catalase content of the blood. P. J. GOLZOW AND W. D. JANKOWSKY. *Biochem. Z.* **185**, 63-9(1927).—The KMnO_4 method of Bach and Zubkova for detg. the blood catalase must be modified in order to obtain reliable results, the amt. of H_2O_2 used being increased from 20 mg. to 40-60 mg. Furthermore, to avoid loss of catalase activity the dild. blood soln. should contain a trace of EtOH (1:5000). The results of numerous investigators who made use of the original Bach and Zubkova method must therefore be submitted to a critical examn. S. M.

Colorimetric method for determining the degree of saturation of blood with oxygen. GYULA HOLLÓ AND ISTVAN WEISS. *Biochem. Z.* **185**, 373-8(1927).—A special colorimeter is described by means of which the relative proportion of oxy-hemoglobin (yellowish red) and hemoglobin (violet) can be detd. by the color nuance of a layer of hemolyzed blood. S. MORGULIS

Note on the Hagedorn-Jensen microchemical sugar determination in blood. F. MARTINSON. *Biochem. Z.* **185**, 400-4(1927).—The pipet used for measuring the $\text{K}_3\text{Fe}(\text{CN})_6$ soln. must be drained 5 min. or else rinsed with H_2O to reduce the error of the method to 2%. S. MORGULIS

Contribution to the method of Hagedorn-Jensen for blood sugar determination. L. CSIK AND A. JUHÁSZ. *Biochem. Z.* **185**, 420-2(1927).—A small quantity of blood (30-120 mg.) is weighed on a torsion balance in a glass dipper 0.5 cm. deep and 0.7 cm. diam. whereby the shortcomings of the absorption of blood with filter paper are avoided. S. MORGULIS

Precipitation of diamino acids with mercuric acetate and sodium carbonate. GÜNTER NAGELSCHMIT. *Biochem. Z.* **186**, 322-6(1927).—An appropriate mixt. of 25% $(\text{AcO})_2\text{Hg}$ and satd. Na_2CO_3 causes practically the complete removal of all amino acids obtained from protein. S. MORGULIS

Vital staining and adsorption. H. A. KREBS AND DAVID NACHMANSOHN. *Biochem. Z.* **186**, 478-84(1927).—A parallelism is shown between the vital-staining capacity of a number of dyes and their adsorption by kaolin. S. MORGULIS

Method for determining copper and iron and the copper content of blood serum. OTTO WARBURG. *Biochem. Z.* **187**, 255-71(1927).—Cu is detd. by its effect on the oxidation of cysteine. The latter is, of course, also promoted by Fe or Mn, but the last-mentioned metals are inhibited by pyrophosphoric acid, which has no effect on the Cu. The detn. is carried out in a special 15-cc. vessel which consists of 2 compartments and is provided with a manometer. The larger compartment contains 2 cc. of 0.2 M $\text{Na}_4\text{P}_2\text{O}_7$ of definite p_{H} , while into the adjacent smaller compartment are placed 5-6 mg. cysteine-HCl dissolved in 0.1 cc. H_2O and 0.1 cc. of the fluid, the Cu content of which is to be detd. The flask is connected with a H_2O manometer and is shaken in a thermostat at 20° for 10 min. when the contents of the 2 compartments are allowed to mix. Directions are given for the prepn. of the $\text{Na}_4\text{P}_2\text{O}_7$ soln. as well as for the purification of cysteine; also the prepn. of the Cu standard and the method for cleaning the glassware are fully discussed. In the oxidation 1 mg. cysteine uses up 37-38 cu. mm. O_2 and the first half of the process proceeds with const. velocity. It is this part of the oxidation process which is important for the Cu detn., the initial velocity being almost exactly proportional to the Cu concn. The detn. is made in 3 vessels: one, control, contg 0.1 cc. H_2O ; the second, 0.1 cc. of the analyzed soln. and the third 0.1 cc. of the Cu standard ($= 2 \times 10^{-4}$ mg Cu). Designating the initial velocities as a_1 , a_2 and a_3 , the Cu content of 0.1 cc. soln. $x = ((a_2 - a_1)/(a_3 - a_2)) \times 2 \times 10^{-4}$ mg. The oxidation velocity depends upon the p_{H} , the Cu value at p_{H} 7.63 being 900,000. The influence of Cu on the oxidation of cysteine is affected by Fe but not by Mn. Provided the pyrophosphate soln. is free from Cu, the method is sensitive to the extent of detg. 10^{-8} mg. Cu. For the Fe detn. the same principle is followed but the buffering is with borate instead of pyrophosphate. Where both Cu and Fe are present in the ash soln. (which should have an acidity of 0.1-0.05 N) the Fe is detd. from the difference in the results by the borate (Cu + Fe) and pyrophosphate procedure (Cu). Mn is also active in the borate buffer, but the 3 metals can be differentiated by the p_{H} of the mixt. However, the sep. detn. of these metals in a mixt. of all has not yet been accomplished. S. MORGULIS

The determination of guanidine and its supposed occurrence in the tetany urine. F. M. KUEN. *Biochem. Z.* **187**, 283-306(1927).—The older methods for detg. methylguanidine are not suitable for quant. analysis. The methylguanidine is oxidized to creatine. The pptn. of the guanidine with picric acid is likewise unreliable especially as creatinine cannot be quantitatively removed from urine by a preliminary ZnCl_2 pptn. The pptn. of guanidine with picrolonic acid is the method of choice, and this is not contaminated with creatinine. The presence of the methylguanidine could

be demonstrated by the color reaction of Sagakuchi after the ppt. was decompd. with H_2SO_4 and the picrolonic acid extd. with ether. Likewise, added quantities of guanidine were recovered from normal urine as picrolonate to the extent of 50–90%. The color reaction of Sagakuchi, which consists in the development of a red coloration when methylguanidine in alk. soln. is treated with α -naphthol and NaOCl , can be used as a basis of a colorimetric detn. provided the concn. is more than 50 mg. per l., while smaller quantities can be closely estd. Tests for methylguanidine made on normal and tetany urine by means of the nitroprusside, the Sagakuchi or the gravimetric picrolonic acid reaction have all given neg. results.

S. MORGULIS

A new colorimetric method for the determination of lactic acid in the blood. ZACHARIAS DISCHE AND DANIEL LASZLO. *Biochem. Z.* **187**, 344–62(1927).—The reaction of lactic acid with hydroquinone and H_2SO_4 is utilized for the detn. The mixt. is boiled 15 min. in the water bath when max. color intensity is attained. The optimum H_2SO_4 concn. is such that lactic acid/ H_2SO_4 is 1.4 or 1.5; with higher concns. of H_2SO_4 the color begins to fade out. As for the color of the hydroquinone soln. itself, it was found to be present only in a mixt. contg. Cu and Ca ions, but varies inversely with the concn. of the hydroquinone. This source of error is therefore easily removed by the proper adjustment of the concn. of the color reagent. The color reaction is proportional to the lactic acid concn. within the limits of 0.001 to 0.020%. The color undergoes little change with time, but the relative color intensities of a series remain the same even after 24 hrs. Though the reaction is not specific for lactic acid, and is also produced by aldehyde, methylglyoxal, diacetone or glucose, it is neg. with acetone, diacetic acid, amino acids, urea, uric acid, creatine, creatinine, casein or casein-hydrolyzate. In this respect, however, this method is less open to objection than all other previously described methods for detg. lactic acid. For detg. the lactic acid in blood, this is deproteinized according to the procedure of Servant. To 0.5 cc. blood are added 2.5 cc. H_2O , then 0.5 cc. concd. H_2SO_4 and 0.5 cc. of 5% NaPO_3 . The ppt. is centrifuged off, and 2.5 cc. of the supernatant liquid is put into a centrifuge tube and treated with 0.5 cc. 2.5% CuSO_4 and enough $\text{Ca}(\text{OH})_2$ to change the color to a deep turquoise blue. After centrifuging again 1 cc. of the liquid is used for the lactic acid detn. The standard is prepd. by dissolving 0.108 g. Li lactate in 100 cc. H_2O (1 cc. = 1 mg. lactic acid), which is dild. to give approx. the same concn. as the unknown (for normal blood about 0.02 mg. = 1 cc.). To 1 cc. of the dild. standard, 1 cc. of H_2O and 1 cc. blood filtrate in sep. test tubes are added 0.1 cc. 10% CuSO_4 , 4 cc. concd. H_2SO_4 (cooling) and 0.1 cc. of 20% alc. soln. of hydroquinone. The tubes are now immersed for 15 min. into a boiling water bath. The colorimetric comparison is made by the following procedure. Thirty-five cc. of the standard and of the blood are transferred to clean tubes of a Walpole comparator and enough of the blank is added with a graduated pipet to the darker soln. until both tubes match in color. The lactic acid concn. is then calculated from the dild. data. The blood lactic acid is obtained by further multiplication by 10, since the blood filtrate represents a final dild. of 1:10. S. M.

Studies on the preparation of succindehydrogenase. NILS ANDERSON. *Skand. Arch. Physiol.* **52**, 187–98(1927).—About 100 g. of ground muscle is put on a piece of cloth spread over a shallow dish, and to this is added 100 cc. 0.25% NaCl soln. After rubbing for a few min. with a pestle the muscle substance is squeezed out by tightening the cloth, and the liquid is discarded. The cloth with the muscle substance is again spread out over the dish and covered with fresh 0.25% NaCl , and this washing process is continued until the muscle substance becomes colorless. This usually requires about a liter of NaCl soln. and takes up 20 min. Then the muscle is treated with an equal wt. of $M/15 \text{ Na}_2\text{HPO}_4$ or K_2HPO_4 , thoroughly triturated and shaken slowly for an hr. The liquid which is now obtained by centrifuging contains the succindehydrogenase.

S. MORGULIS

Errors in the iodometry of Bang's method for the determination of lipoids in the blood. H. HECKSCHER AND O. K. MÜLLER. *Skand. Arch. Physiol.* **52**, 222–33(1927).—In Bang's method the analysis of lipoids depends upon the oxidation with $\text{K}_2\text{Cr}_2\text{O}_7 + \text{H}_2\text{SO}_4$ and the detn. of residual $\text{K}_2\text{Cr}_2\text{O}_7$ by means of I_2 titration. The I_2 required in titrating the blank is invariably less than the calcd. amt., the loss representing 5–13% of the added $\text{K}_2\text{Cr}_2\text{O}_7$. This loss is caused by a reduction of $\text{K}_2\text{Cr}_2\text{O}_7$ in the greatly overheated soln. when H_2SO_4 is added and is associated with impurities both in the acid and in the $\text{K}_2\text{Cr}_2\text{O}_7$. The reagents must be therefore selected with great care as to their chemical purity, and blanks must be run every time fresh solns. are made up. To avoid overheating, the dild. with H_2O is made before the addn. of the H_2SO_4 . Unless these conditions are carefully observed the results of the analyses are too high and altogether unreliable.

S. MORGULIS

Micro-estimation of carbon. Application to the determination of urinary carbon. MAURICE NICLOUX. *Bull. soc. chim. biol.* 9, 639-76(1927); cf. *C. A.* 21, 1945, 3211.—Particular directions are given for the detn. of urinary C by the argento-sulfochromic method. L. W. RIGGS

Improvement in the method of destroying organic matter in the micro-estimation of phosphorus in the blood. MICHEL MACHEBOEUF AND (Mlle.) GENEVIEVE ZWILLING. *Bull. soc. chim. biol.* 9, 697-9(1927).—The nitromagnesian method was abandoned as inexact. The sulfo-nitric method, for the destruction of org. material was performed as follows: In a 50-cc. Kjeldahl flask was placed exactly 2 cc. of serum and 1 cc. of H_2SO_4 , the mixt. was heated until white fumes ceased to be evolved (about 10 min.), was cooled and 2 cc. of HNO_3 was added and boiled to expel the nitrous gases when the liquid was cooled and 0.2 g. of pulverized $KMnO_4$ was added and gently heated. If after several min. the liquid turned brown an additional 0.2 g. of $KMnO_4$ was added and the mixt. again gently heated. If the resulting liquid is nearly colorless, it is ready for pptn. by molybdate. If the liquid is violet or violet-brown in color, it is dild. with 6 cc. of H_2O and is heated to boiling when sufficient satd. soln. of $(NH_4)_2C_2O_4$ is added drop by drop to decolorize the excess of $KMnO_4$ before pptg. with molybdate. L. W. RIGGS

Micro-method for determining phosphoric acid in combination as organic esters in blood and serum. M. MACHEBOEUF. *Bull. soc. chim. biol.* 9, 700-2(1927); cf. *C. A.* 21, 2005.—The pptn. of proteins by CCl_3CO_2H leaves the mineral and ethereal phosphates in soln. Ten cc. of the filtrate from the protein ppt. is warmed on the water bath exactly 5 min. with 1 cc. concd. H_2SO_4 and 2 cc. satd. NH_4NO_3 soln., when 6 cc. of a 20% $(NH_4)_2MoO_4$ soln. is added and the mixt. is kept on the water bath for 10 min. Under these conditions the mineral phosphates are pptd. but not the ethereal phosphates. By detg. the total phosphate in a sep. portion of the filtrate from the protein ppt. the ethereal phosphate is found by difference. L. W. RIGGS

Estimation of glutathione. A. BLANCHETIERE AND L. MELON. *Compt. rend. soc. biol.* 97, 242 4(1927).—Starch paste was retained as an indicator of the end reaction instead of the nitroprussiate recommended by Thompson and Voegtlin (cf. *C. A.* 21, 607, 954.) L. W. RIGGS

Measure of complex albumins by their "protein error." R. GOIFFON AND HANDIQUET. *Compt. rend. soc. biol.* 97, 311-3(1927); cf. following abstract.—The colorimetric measure of H-ion concn is modified by the presence of proteins (the protein error of Sørensen). If a definite quantity of a colored indicator is added to a very stable buffer soln., of which the p_H is within the zone of sensibility of the indicator, a color characteristic of the p_H is obtained. If now a drop of 1% egg albumin is added there is a modification of the tint indicating a different p_H . But the small quantity of albumin introduced is incapable of making the p_H of a stable buffer change and electromeasurement shows that it does not change. This error is proportional to the quantity of added protein and its measure may be used to est. the amt. of protein. Directions are given for estg. proteins by this method. L. W. RIGGS

Denaturation of albumins and "protein error." R. GOIFFON AND HANDIQUET. *Compt. rend. soc. biol.* 97, 434 5(1927), cf. preceding abstr.—The protein error is detd. as follows. Of 2 portions of equal vols. of 5% egg albumin, one is heated 5 min. in the boiling water bath, the other is not. The first portion requires a much greater quantity of HCl (index of denaturation) to give the same tint with Orange IV. Solns. of albumin heated for 30 min. in the boiling water bath do not require more HCl than if heated 5 min. The increased quantity of HCl required to neutralize not overheated solns. of albumin is at first apparent after heating for 15 min. at 60° ; a large and sudden increase in the index occurs between 70° and 80° and the max. at 85° . The presence of electrolytes in the soln. of albumin does not modify the index of denaturation. Slight variations of p_H between 7 and 8 do not modify the figures obtained. L. W. RIGGS

Arrangement of apparatus for measuring the velocity of coagulation of the blood. R. FEISLY. *Compt. rend. soc. biol.* 97, 467-8(1927).—The app. is illustrated and the procedure is described. L. W. RIGGS

Microelectrode for determining the true c_H . HANS WINTERSTEIN. *Arch. ges. Physiol.* (Pflüger's) 216, 267 70(1927).—An app. for use with minute amounts of material is described and illustrated. G. H. S.

A conductivity cell for continuous measurements of respiratory rate. R. B. HARVEY AND L. O. REGEUMBAL. *Plant Physiology* 1, 205-6(1926).—Description (with figure) of a cond. cell that has some advantages over former types for measuring quick changes in the rate of CO_2 production when rapid fluctuations in the rate of respiration of tissues are under investigation. WALTER THOMAS

Estimation of bismuth in urine. H. B. RASMUSSEN, K. A. JACKEROTT AND S. A. SCHOU. *Dansk. Tids. Farm.* 1, 391-403(1927).—The reliability has been investigated of the various methods employed in the estn. of the small amts. of Bi present in the urine and organism during treatment of syphilis with Bi salts. The methods of Cuny and Poirer (*C. A.* 18, 208) and Laporte (*C. A.* 18, 1259) were not found reliable. Also the 2 methods proposed by Kürthy and Müller (*C. A.* 19, 529, 2218) were not considered suitable. The method of Leonhard (*C. A.* 20, 3044), employing the observation by Strone, that Bi salts and iodides in acid soln. give a yellow, in concd. solns. a brownish, colored complex BiI_3 , was found most practical. This method was systematically investigated by measurements of the light absorption of the complex with the aid of a spectrophotometer and light of detd. wave length. A soln. of 0.1 g. Bi per l. was used as a standard, prepd. by dissolving 0.115 g. Bi_2O_3 in 1 l. *N* H_2SO_4 . 0.5-2.5 cc. of this soln. (0.05-0.25 mg. Bi) and 1 cc. 10% KI soln. were dild. to 25 cc. with *N* H_2SO_4 . These mixts. were distinctly yellow colored. Preliminary expts. showed that a liquid layer, 6.5 cm. high, of a soln. contg. 0.1 mg. Bi in 25 cc., absorbed blue light up to a wave length of 4500 Å. U. The blue line 4359 Å. U. obtained with a quartz Hg lamp was therefore chosen for the quant. estn. of Bi. The measurements showed that the light absorption was proportional to the concn. of Bi and that a variation in the acid concn. from 1 to 2*N* and even a large excess of KI had no influence. The amts. of ferric salts normally present in urine caused too high results, but this error could be compensated for by addn. of citric acid. Hg salts did not influence the accuracy of the method. The estns. in urine were carried out as follows: Mix 100 cc. urine with 50 cc. 68% HNO_3 in a Kjeldahl flask. Place the flask in an inclined position on a wire gauze and evap. nearly to dryness, care being taken toward the end of the destruction in respect to the considerable amts. of NH_4NO_3 in the residue, which occasionally may cause small explosions. When cold add 3 cc. concd. H_2SO_4 and boil until the mixt. is fuming. Add 1-2 cc. concd. HNO_3 , drop by drop, and evap. again. After cooling, the mixt. should now be colorless; if not, add more HNO_3 and repeat the boiling. (If the urine contains Ag salts, ppt. with a few drops of HCl and filter.) Add 10 cc. of a satd. soln. of oxalic acid to the cold mixt. and boil until fumes appear. This is necessary to remove the last trace of HNO_3 , which otherwise causes too high results. Dil. the cooled mixt. with hot water to about 20 cc. and filter. Add 1 cc. 10% KI soln., 1 cc. 10% Na_2SO_3 soln. and 1 cc. 15% sodium citrate soln. and dil. to 25 cc. If pptn. of salts takes place increase the vol. to 50 cc. The color intensity is now measured with a colorimeter. A soln. prepd. by diluting 1.0 cc. Bi standard soln., 1 cc. 10% KI soln. and 1 cc. 10% Na_2SO_3 soln. to 25 cc. with *N* H_2SO_4 is used for comparison. Calcn.: (h_{stand}/h_x) ; 0.1 = mg. Bi per 100 cc. urine, where h_{stand} is the height of the liquid used for comparison and h_x the height of the liquid to be tested. At low concns. of Bi in the urine, 0.5 cc. standard Bi soln. may be used in the prepn. of the comparison liquid; at higher concns. up to 4 cc. On standing, particularly in sunlight, the solns. liberate I. In diffuse daylight the mixts. may be kept unchanged for some time. The results obtained colorimetrically proved to be in agreement with the spectrophotometric measurements and the method is sufficiently accurate for clinic use. A summary in English is given.

D. THUMSEN

The gravimetric determination of basal metabolism. H. S. HALCRO WARDLAW. *Med. J. Australia* 1, 506-9(1927).—The patient who has been fasting for 12-16 hrs. inhales air from the outside, exhaling into a Douglas bag. After the allotted time has expired, the bag is connected to a train contg. CaCl_2 , moist soda-lime and CaCl_2 bottles, water trap and lime-water, resp., to which a suction pump is affixed. The increase in the weight of the moist soda-lime and second CaCl_2 bottles is the weight of the CO_2 absorbed.

R. C. WILLSON

A rapid quantitative estimation of sugar in urines. T. J. F. MITSCHKE. *Virginia Medical Monthly* 54, 251-2(1927).—M. advocates the titration of 5 cc. of Benedict's quant. soln. with undild. urine.

R. C. WILLSON

C—BACTERIOLOGY

A. K. BALLS

Cytochrome in yeast cells. II. HANS V. EULER, HERMANN FINK AND HARRY HELLSTRÖM. *Z. physiol. Chem.* 169, 10-51(1927); cf. *C. A.* 21, 2009.—The absorption spectrum of the respiratory pigment cytochrome was photographed in suspensions of top and bottom yeast in both oxidized and reduced form. In top yeast *R* the selective absorption of the reduced form is much more pronounced than in bottom yeast. Dried preps. of top yeast are almost as rich in cytochrome as the fresh yeast itself,

while dried bottom yeast shows a more feeble selective absorption than the fresh cells. A relationship seems to exist between catalase action and cytochrome content as shown by a more energetic decompn. of H_2O_2 by dried top yeast rich in cytochrome than by dried bottom yeast of insignificant cytochrome content. By means of the spectrographic method the absorption curves of pyridine-hemochromogen and of the unstable yeast hemochromogen were detd., and a quant. estn. of the hemochromogen content of pyridine exts. from yeast was undertaken, especially the calcn. of concn. from the selective absorption at the max. at 557μ . Hemochromogen-pyridine solns. of known content served as the standard. In contrast to the cytochrome content, the hemochromogen content of top and bottom yeasts showed only slight variations. The ratio of hemochromogen-Fe to total Fe, previously reported to be $1/160$, is now shown to be $1/80-1/120$. It is noteworthy that top yeast, which gives a much stronger cytochrome spectrum, showed lower hemochromogen content than bottom yeast in which cytochrome appears less distinctly. The hemochromogen is therefore no direct index of cytochrome content. In bottom yeast the reduced cytochrome spectrum lacked the A band at 6040 A. U., suggesting a partial replacement by a "hemochromogen-like complex" or Keilin's "modified cytochrome." Copro-yeast gave the highest value for hemochromogen.

A. W. DOX

The growth of *Bacillus coli* in a chemically defined medium. E. AUBEL. *Ann. physiol. physicochem. biol.* 2, 73-94(1926); *Physiol. Abstracts* 11, 402. Pyruvic acid is formed from glucose, and at this stage H is set free in anaerobic culture. The process of oxidation amounts to departure of II where there is no H acceptor. Butyraldehyde undergoes a process of oxidation reduction; it yields acid as well as alc. This is the effect of the loose II. Pyruvic fermentation is distinct from lactic acid fermentation. The stage $1/2\text{C}_6\text{H}_{12}\text{O}_6 = \text{CH}_3\text{COCOOH} + \text{H}_2 - 7.800$ cal. furnishes the material necessary for living matter; whereas $1/2\text{C}_6\text{H}_{12}\text{O}_6 = \text{CH}_3\text{CHOHCOCOOH} + 14.500$ cal. by coupling permits the preceding reduction in anaerobic conditions. The role of O in aerobic culture is discussed and a new conception of respiration is considered. H. G.

Anaphylaxis in microbes. E. BACHRACH. *Arch. intern. physiol.* 26, 147-54 (1926); *Physiol. Abstracts* 11, 504.—Preliminary expts. are made with a strain of lactic acid enzyme poisoned by a trace of TI salts. H. G.

Influence of the medium on lactic acid bacillus. E. BACHRACH AND H. CARDOT. *Arch. intern. physiol.* 26, 155-68(1926); *Physiol. Abstracts* 11, 504.—Temps. above 40° cause the bacilli to group themselves in long chains, the culture returning to normal at 36° . Prolonged poisoning gradually produces immunity, increased resistance to high temps., and elevation of optimum temp.; since these variations are stable on transmission, new strains can be produced with distinct physiol. characteristics. Thus the previous history of the strain must be considered as well as the external medium when investigating the physiol. reaction. H. G.

Some physico-chemical experiments on the effect of organo-therapeutic substances on fermentation. L. P. ROSENOW. *Fermentforschung* 8, 533(1926); *Physiol. Abstracts* 11, 262.—The accelerating action on yeast fermentation of various thyroid prepn. runs parallel to their electrolyte content. H.-G.

Hexylresorcinol in oral antisepsis with special reference to solution S.T. 37. WM. A. FEIKER AND VERAER LEONARD. *Dental Cosmos* 69, 882-92(1927); cf. C. A. 20, 3780.—A soln. of hexylresorcinol in a mixt. of 30% glycerol and 70% H_2O and contg. 1 mg. of solute per cc. has a surface tension of 37 dynes per cm. (S. T. 37). This soln. is chem. stable, non-toxic, free from objectionable taste, non-irritating, and highly penetrating as a result of its powerful surface tension reducing properties. It does not stain, and exerts a marked bactericidal action within 15 sec., being unaffected by the presence of org. matter. At body temp the usual pathogenic bacteria are destroyed completely in less than 15 sec., spirochetes, ameba and flagellates in less than 5 sec. Practically complete disinfection of the gum margin is attained in 5 min. J. S. H.

Propionic acid fermentation. II. A. I. VIRTANEN. *Soc. Sci. Fennica, Commentationes Phys.-Math.* 2, No 19-30, 13 pp.—Expts. show that glucose is esterified with phosphates during a propionic acid (I) fermentation. A dry bacterial prepn. was made by growing in a culture medium of 20 g. peptone, 10 g. Na lactate, 1.5 g. K_2HPO_4 , 1000 cc. H_2O at p_{H} 6.8 and 35° , centrifuging, suspending the pptd. bacteria in H_2O , again centrifuging and drying in thin layers on a porous plate; fermentations of glucose (II) inoculated with this dry bacterial prepn. and in the presence of PhMe which acts as a protoplasmic poison yields $(\text{CH}_3\text{CO}_2\text{H})_2$ and AcOH ; similar fermentations with living bacteria and without the protoplasmic poison gave $(\text{CH}_3\text{CO}_2\text{H})_2$, AcH , $\text{C}_2\text{H}_5\text{CO}_2\text{H}$, AcOH and CO_2 ; washed and dried bacteria are lacking in the coenzyme which causes esterification of II with phosphates; the phosphatase coenzyme of lactic

acid bacteria can replace the similar coenzyme of the propionic acid bacteria which is removed from the latter by washing and drying. Lactic acid (III) which is quant. fermented by living propionic acid bacteria yielding I, AcOH and CO₂, remains unfermented when PhMe is added to the culture. The results show that in the fermentation of II with propionic acid bacteria there are at least 2 distinct fermentations, one being $\text{III} \rightarrow (\text{CH}_3\text{CO}_2\text{H})_2 + \text{AcOH}$, and the other $\text{III} + (\text{phosphatase coenzyme}) \rightarrow \text{III} \rightarrow \text{I} + \text{AcOH} + \text{CO}_2$.

N. A. LANGE

The Gram reaction. PH. LASSEUR AND SCHMITT. *Ann. inst. Pasteur* 41, 554-75 (1927) There is a stage of max. speed of decolorization for each bacterial species, usually coincident with the stage where the cytoplasm is undifferentiated and homogeneous. Variation in the nutritive media in which the bacteria are grown has no appreciable effect on their resistance to decolorization. In a narrow range the speed of decolorization is not modified by the temp. of the wash water, but great difference is observed in a range of 4° to 50°. Decolorizing liquids operate about 3 times as fast at 16° as at 4°. The speed of decolorization also depends greatly on the method of staining, results of comparable value can be obtained only when use is made of (1) the same stain, (2) the same staining technic and (3) recently prepd. reagents and bacterial preps. Strong concns. of counterstains may displace the violet-black of the Gram stain and lead to error. Weak concns. do not have this effect. Within certain limits the speed of decolorization is inversely proportional to the concn. of I used in the staining, the duration of the I treatment and the temp. of the I soln. Bacteria vary greatly in their individual resistance to decolorizing reagents, and therefore quant. use of the Gram stain permits the recognition of species differentiation not detectable by the usual qual. method.

E. R. LONG

Identification of pathogenic bacteria of the intestine. LOMRY AND GILLET. *Ann. inst. Pasteur* 41, 618-67 (1927) The enzymes secreted by the pathogenic bacteria of the intestine vary with the microorganism. Fermentation of sugars is a means of differentiation, which may be confirmed by agglutination. Prolonged rejuvenation is sometimes necessary to bring out differences.

E. R. LONG

Some factors governing the production of diphtheria toxin in artificial culture media. C. S. GIBBS AND L. F. RETTGER. *J. Immunol.* 13, 323-44 (1927).—Sugar-free veal broth prepd. by fermenting lean veal with *B. coli* for 12 to 15 hrs., and adding to the filtered broth 2% Difco Proteose Peptone and 0.5% NaCl, and adjusting the liquid to a H-ion concn. of 7.5 or 7.6, made a favorable culture medium for the production of diphtheria toxin. Sugar-free veal broth would not support toxin formation unless combined with certain substances in Difco Proteose Peptone, Witte's Peptone, or a fraction of Difco Bacto-Peptone which is sol. in cold 50% alc. but insol. in cold 80% alc. The addn. of certain pure amino acids, except in very small quantities, interfered with toxin production. Cystine and tryptophan were favorable in amts. not exceeding 0.5%, aiding both growth and toxin production. Com. peptones contg. large quantities of proteose were especially favorable for diphtheria toxin production. Media contg. digests prepd. by 48 hrs. peptic and 3-5 hrs. tryptic digestion of blood fibrin produced "peptones" suitable for the elaboration of potent diphtheria toxins when used in sugar-free veal infusion broths and inoculated with habituated, virulent strains of *C. diphtheriae*. Good toxin production was secured when such digests were added to veal broths in the proportion of 2% solid weights. The biuret, Sørensen and Van Slyke tests were useful in detg. the points at which digestion should be interrupted to obtain digests yielding potent diphtheria toxin. Toxin was formed only when strong biuret tests were secured with the fibrin and veal digest filtrates and when the formal titration figures closely proximated or exceeded those of the Van Slyke test.

E. R. LONG

Energy relations in the metabolism of autotrophic bacteria. L. G. M. BAAS-BECKING AND G. S. PARKS. *Physiol. Rev.* 7, 85-106 (1927).—A review of the dynamics involved. A limited no. of inorg. geochem. reactions are thermodynamically possible. Only a few have been studied microbiologically. Green plants probably do not have a monopoly of photosynthesis. The existence of Fe bacteria is not proven.

E. R. LONG

The production of acetylmethylcarbinol by *Clostridium acetobutylicum*. P. W. WILSON, W. H. PETERSON AND E. B. FRED. *J. Biol. Chem.* 74, 495-507 (1927).—Qual. tests have shown the production of acetylmethylcarbinol (CH₃CHOHCOCH₃) from more than 20 carbohydrates by the Me₂CO-BuOH-producing organism *Clostridium acetobutylicum* (Weizmann) and a quant. study of the production of this compd. has now been made at various stages of the fermentation. This substance is a regular end-product of the reaction, the amts. formed averaging 300 to 400 mg. per l. It is formed at about the same time as the acetic and butyric acids and all 3 probably have

the same precursor. Its production can be increased by the addn. of phosphates and decreased by proteins and is more closely assocd. with the formation of the acids than with that of the Me_2CO and BuOH . The amt. reaches a max. and const. level at a time when about 75% of the solvents have been formed and 40-50% of it is produced when only 10-15% of the solvents have been formed.

A. P. LOTHROP

The soluble specific substance of pneumococcus. V. The chemical nature of the aldobionic acid from the specific polysaccharide of type III pneumococcus. MICHAEL HEIDELBERGER AND W. F. GOEBEL. *J. Biol. Chem.* **74**, 613-8(1927); cf. *C. A.* **21**, 2288.—The aldobionic acid isolated from the hydrolytic products of the sp. polysaccharide of type III pneumococcus is a compd. of glucuronic acid and glucose, combined in glucosidic linkage through the aldehyde group of the glucuronic acid and one of the C atoms of glucose (which one remains to be detd.).

A. P. LOTHROP

The soluble specific substance of Friedländer's bacillus. IV. The nature of the hydrolytic products of the specific carbohydrate from type A Friedländer's bacillus. W. F. GOEBEL. *J. Biol. Chem.* **74**, 619-29(1927), cf. *C. A.* **20**, 614.—The sol. sp. substance of the type A Friedländer bacillus yields on hydrolysis an aldobionic acid, glucose, and a 2nd unidentified sugar acid, the compds. occurring approx. in the ratio 1:1:1. The aldobionic acid consists of a mol of glucuronic acid linked through its reducing group to a mol of glucose and is isomeric with the acid similarly derived from the sol. sp. substance of type III pneumococcus (cf. preceding abstr.). The polysaccharide is apparently a condensate of 2 mols. of aldobionic acid and 1 mol. of glucose.

A. P. LOTHROP

Non-protein antigens of the bacteria. J. FREUND. *J. Elisha Mitchell Sci. Soc.* **42**, 135-8(1926).—F. has found an alc.-sol. antigen in *Streptothrix*. The smallest dose of this material giving complement fixation in rabbits was 0.002 mg. This antigen is chemically distinguishable from the lipid antigens of tubercle and diphtheria bacilli.

A. I. MEHRING

Calcium precipitation due to microorganisms. CARL NÆSLUND. *Biochem. Z.* **184**, 1-9(1927).—Exptl. evidence is presented to show the pptn. of Ca and formation of concretions in cultures of microorganisms, apparently due to lowering of the acidity.

S. MORGULIS

Quantitative dismutation of methylglyoxal to lactic acid through *Bacillus Delbrücki* as well as *Bacterium lactis aerogenes*. Experiments on the variable behavior of phenylglyoxal in this reaction. CARL NEUBERG AND ERNST SIMON. *Biochem. Z.* **186**, 331-6(1927).—*B. Delbrücki* converts both methylglyoxal and phenylglyoxal into *l*(+) optically active mandelic acid. *B. lactis aerogenes* converts methylglyoxal quickly and quantitatively into racemic lactic acid while phenylglyoxal is changed quantitatively to *d*(-) mandelic acid.

S. MORGULIS

Studies on iodine as a biogenous element. XI. The effect of iodine on yeast. I. K. SCHARRE AND W. SCHWARTZ. *Biochem. Z.* **187**, 159-79(1927); cf. *C. A.* **21**, 3383.—Inorg. salts of I_2 in small concns. stimulate the rate of multiplication of yeast, but there was no evidence that the actual yield of mass was likewise increased. The yeast stores up I_2 , part of which seems to be in loose combination. I_2 apparently plays no significant role in the metabolism of yeast.

S. MORGULIS

The inhibiting power of some vegetable essential oils towards various pathogenic microbes. A. MORILL AND A. ROCHAIX. *Parfumerie moderne* **19**, 184(1927); cf. *C. A.* **17**, 122.—The min. quantities of oils of thyme, *Eucalyptus citriodora*, Australian eucalyptus, lavender, lemon and orange, required to prevent the development of *B. Eberthii*, staphylococci and *B. Loeffleri* on agar medium, were detd. The order of decreasing activity is not the same as the order of decreasing antiseptic power, as previously detd.; e. g., oil of lemon was one of the most active antiseptics, but has a relatively low inhibiting power. Considerable difference was observed in the activity of 2 different oils of thyme (one with high thymol and the other with high carvacrol content) and also of the 2 different eucalyptus oils, indicating the importance of variations in compn. due to differences in botanical origin. Also in *Compt. rend. soc. biol.* **96**, 1311-2(1927).

A. PAPINEAU-COUTURE

Resistance of the lytic principle (bacteriophage) to mercuric chloride. G. PROCA. *Compt. rend. soc. biol.* **96**, 1244-6(1927).—The lytic principle is very strongly resistant to the action of HgCl_2 .

L. W. RIGGS

Utilization of sugars by *Spirochaeta duttoni*. R. BRUVNOCHE AND A. DUBOIS. *Compt. rend. soc. biol.* **96**, 1403-4(1927).—Expts with mice proved that glucose or other sugar is indispensable to the metabolism and to the activity of spirochetes.

L. W. RIGGS

Decomposition of fats by tubercle bacilli. A. SÉDYCH AND G. SELIBER. *Compt.*

rend. soc. biol. 97, 57-8(1927).—The bacilli were grown in ordinary media to which 4% of olive oil or butter had been added. Tests were also made by adding 0.8 g. of palmitic or stearic acid and 0.2 g. of glycerol per 50 cc. of nutrient medium. The results proved that the bacilli consume both fats and mixts. of acid and glycerol. The bacilli were grown on ordinary agar to which cod-liver oil had been added, and in a mineral medium with the addn. of beef tallow or beeswax. In the latter instance the bacilli developed around the surfaces of the solid fat or wax.

L. W. RIGGS

Centrifuging filtrable viruses. M. S. MARSHALL. *Science* 66, 219(1927).—From an application of Stokes law to the conditions of a virus particle 0.1μ in diam. suspended in a liquid of d. 1.0 and viscosity 0.01, and located 20 cm. from the center of the centrifuge, a speed of 3600 r. p. m. would require 8.8 hrs. of centrifuging to carry the particle 5 cm. Ordinarily centrifuge methods applied to filtrable viruses are, from the standpoint of phys. laws, of questionable value.

L. W. RIGGS

Further studies on the role of organic salts and phosphates in the cultures of *Aspergillus niger*. TETSU SAKAMURA. *Japn. J. Botany* 3, 245-65(1927).—The earlier work (*C. A.* 19, 2512) is confirmed; the org. salts and phosphates serve mainly as buffers and play little part in the nutrition of the *Aspergillus niger*.

C. J. WEST

Acids formed by *Rhizopus* species. TEIZO TAKAHASHI AND TOSHINOBU ASAI. *Proc. Imp. Acad. (Japan)* 3, 86-9(1927).—The culture solus. of *Rhizopus* contg. gluconic acid, after being kept several weeks at 25-30°, contained AcOH, HCO₂H, EtOH, fumaric and succinic acids. Thus gluconic acid is the intermediate product between glucose and these acids. From the culture of (AcO)₂Ca at 25-30° for 60 days succinic acid was isolated.

C. J. WEST

D—BOTANY

B. M. DUGGAR

Jute seeds. *Corchorus capsularis*. I. N. K. SEN. *Quart. J. Indian Chem. Soc.* 4, 205 8(1927).—The seeds contain moisture 7.1, ash 6 and fixed oil 14.73%. Pressure does not sep. the oil but extn. with ligroin does. The characteristics of the oil are d., 0.921, viscosity at 28° (water = 1) 53.1417, n_D^{20} 1.4705, optical rotation 0.0, sapon value 184.4, I value (Wij) 109.2, acid value 24.07, unsapon. matter 3.0%. The oil is insol. in H₂O, EtOH, AcOH, dil. H₂SO₄ and dil. HNO₃, but readily sol. in Et₂O, C₆H₆, CCl₄, AmOH and C₂H₅N. Reactions occur in the presence of Na₂CO₃, HNO₃, Br₂ water, KMnO₄ and Na. The residue of the seeds after the oil was removed was extd. with EtOH. A white gum-like substance, a glucoside, which darkens in air was obtained. The gum does not reduce Fehling soln., but it hydrolyzes in mineral acids to produce glucose and a second substance insol. in water. The glucoside shrinks at 98°, decomposes at 105°, and shows a dextro rotation of 103.6°. Its partial analysis is C 31.16, H 9.65.

F. E. BROWN

The water saturation of plants and its importance in plant growth. HEINRICH WALTER. *Z. Pflanzenernähr. Düngung* A6, 65-88(1925); *Chem. Zentr.* 1926, I, 1876.—The known phenomena of the conservation of org. substances by drying were investigated, and particularly the relation between the relative vapor pressure and bacteria and mold growth. It was found that org. substances no longer become moldy when the relative vapor pressure does not exceed 80% at their surface. A simple process for detg. the relative vapor pressure is described, which is simpler than a detn. of the osmotic pressure. A table shows the min. humidity necessary for the growth of mold fungi and bacteria, from which it is seen that mold fungi begin to grow at 85% and bacteria around 95% humidity. The formation and growth of known types of mold fungi and their antagonism to sugar and salt solns. are also described. In connection with a compilation of earlier works, the importance of the condition of water satn. of higher plants is discussed, and it is considered that in practice in many cases it is more important to provide water than fertilizers. A deficiency of water of but a few per cent, though not necessarily visible in its effects, may nevertheless cause internal damage to the plants.

C. C. DAVIS

An investigation of the occurrence and causes of the phenomena designated by the term "Urbarmachungskrankheit." W. S. SMITH. *Dissertation*, 149 pp., 20 plates. Summary in German. H. Veenman & Sons, Wageningen, Holland, 1927.—Investigations were carried out on the nature and causes of the pathol. symptoms in plants designated by the name "Urbarmachungskrankheit." Pot expts. were conducted with 11 "sick" soils, using oats and peas; in general the symptoms agreed in all cases, while frost injury could not be the cause. Bacteria were eliminated as a cause; the usual sterilization of the soil had no effect. The popular idea that the disease is associated

with a certain type of black moor ("Gliecke") was confirmed; admixt. of this material with normal sandy soil induced the usual symptoms. By extn. of the "Gliecke" with hot alc. 2 types of org. substances were isolate 1, 1 fraction pptg. on cooling of the alc. and 1 remaining in soln. From the latter a crst. substance was isolate 1 which is fairly volatile at 100° and which is called "ghedne". A few mg. of this substance applied to soil growing healthy pea or oat plants caused the disease to appear; in very low concns. it had a stimulating effect. The fraction pptd. on cooling of the alc. caused the symptoms of "gray spot" disease in oats. The effect was studied on various "sick" soils of applications of sand, CaCO_3 , compost, stable manure, CuSO_4 , MnSO_4 , KMnO_4 , ZnSO_4 , MgSO_4 and FeSO_4 . Only compost and CuSO_4 had any remedial effect. The latter was most effective in applications of 50-100 kg per hectare, depending on the intensity of the disease and also probably on the humus content of the soil. The beneficial effects of the compost and CuSO_4 continued during the 2nd yr. Since an org. substance slowly distg. at 100° appeared to be involved, expts. were carried out in which "sick" soils were heated for 3 hrs. on 3 different days in a steam sterilizer. A slightly "sick" soil was completely restored, a moderately "sick" one was almost entirely restored, while a very "sick" soil showed the symptoms only after some time. Sterilized, as well as ashed and ignited, compost was as effective as the untreated material, hence the effect cannot be ascribed to bacteria, but must be due to org. constituents. The titration curves of the "sick" soils did not differ from those of normal ones. Evidence is submitted that the favorable effect of CuSO_4 is due to the formation of an insol. compd. of Cu and the org. substance "ghedne" which causes the "Urbarmachungs" disease.

P. R. DAWSON.

Photosynthesis with ammonia. DEAN BURK. *J. Phys. Chem.* **31**, 1338-51 (1927).—About 500 photosynthesis expts. involving NH_3 and various carbonaceous substances, including CO_2 , HCOOH , HCHO , and glucose, were performed in the attempt (1) to induce NH_3 to build up complex biochem. N compds., (2) to reduce CO_2 , bicarbonates and carbonates, (3) to oxidize NH_3 to hydroxylamine, nitrites and nitrates. Sunlight, condensed through 12-in. lenses, in combination with colored inorg. catalysts was used. Particular attention was paid to purity of materials, control of light intensity and wave length, avoidance of contamination by org. matter, and methods of analysis. Only one type of photochem. change with NH_3 was observed, in the presence of FeCl_3 , NH_3 was oxidized to nitrates; in the presence of ZnO and HgO to nitrites and nitrates. Hydroxylamine was never produced. No photochem. reduction of CO_2 was observed. No complex biochem. N compds. were produced from NH_3 and carbonaceous substances. The results are not in accordance with the positive photosynthesis results of Moore and of Dhar and Sanyal (cf. *C. A.* **20**, 2346).

R. L. DODGE.

Temperature coefficient of absorption in seeds of corn. C. A. SHULL AND S. P. SHULL. *Bokun. Gaz.* **77**, 262-79 (1924); *Physiol. Abstracts* **11**, 573. —The results obtained were similar to those from the study of *Xanthium* seeds and pea cotyledons. The same formulas applied. The temp. coeff. for 5° to 50° was about 1.537. The rate of absorption at 50° was about 8 times that at 5°, whereas chem. theory would call for a rate 32 times as great. Irregular absorptions were also noted, which suggest that some substances have sp. absorption behavior.

H. G.

The ether-soluble substances of cabbage leaf cytoplasm. III. The fatty acids. A. C. CHIBNALL AND H. J. CHANNON. *Biochem. J.* **21**, 479-83 (1927); cf. *C. A.* **21**, 2489. —The fraction of the ext. not pptd. from ether by acetone contains the fatty acids which are not in complex combination in P-contg. substances. The fatty acids shown to be present in this fraction are linolenic, linolic, palmitic and stearic. B. H.

Wheat. A study of the influence of heredity and environment. F. T. SHURR. *Rept. Agr. Canada, Rept. Dominion Chemist*, March 1926, pp. 62-70 (1927); cf. *C. A.* **20**, 434. —The effect of different environmental conditions on the compn. of wheat and on the character of the grain of the same variety is being investigated. Data on the wt. per 1000 kernels, and the H_2O , N and ash content are tabulated for 165 samples representing 45 varieties grown on 18 farms and stations of the Exptl. Farm System throughout the Dominion of Canada during 1924. The av. protein content of the Marquis and Garnet varieties was 16.46 and 15.78%, resp., the former without exception giving the heavier wt. per 1000 kernels. One sample of Marquis wheat grown on irrigated land contained 14.54% protein and 2 samples of the same variety grown on unirrigated land in the same district contained 18.66 and 19.42%. Detailed analyses of flours made from Marquis and Garnet wheats grown at one station in 1925 showed close agreement in the chem. compn. Preliminary expts. showed that wheat grown on summer-fallowed land had practically the same protein content, 13.76%, as the parent

seed, but wheat grown on sweet-clover sod and after sunflowers contained 12.64 and 11.72%, resp. The protein content of barley, grain and straw following timothy was appreciably less than that of barley following meadow fescue, Kentucky bluegrass, bromo and western rye. These investigations are being continued. K. D. J.

The photosynthesis of naturally occurring compounds. I. The action of ultra-violet light on carbonic acid. E. C. C. BALY, J. B. DAVIES, M. R. JOHNSON AND H. SHANASSY. *Proc Roy Soc (London)* 116, 197-211 (1927), cf. *C. A.* 16, 3463; 17, 1923. The view previously advanced (*C. A.* 15, 3072) that the photosynthesis of carbohydrates from carbonic acid takes place in two steps is incorrect. The carbonic acid mol., activated by light, is converted into O and activated HCHO, which then polymerizes into the reducing sugars. Ordinary HCHO is not a component of the photochem. compd. crystallized when an aq. soln. of carbonic acid in quartz tubes is exposed to ultra violet light. The org. compd. present is probably a complex aldehyde. Attempts to effect the photosynthesis of the carbohydrates by adding a harmless reducing agent to the carbonic acid soln., in the hope of shifting the equil. to the carbohydrate side by the removal of O, were successful in only one case. $\text{Fe}(\text{HCO}_3)_2$ in aq. soln. is converted by ultra violet light in the absence of O into $\text{Fe}(\text{OH})_3$. At the same time org. compds. with reducing properties are formed, but the yields are very small. When an mol. of powder, capable of adsorbing carbonic acid on its surface, is suspended in H_2O through which a stream of CO_2 is passed, and the whole is exposed to ultra violet light, complex org. compds. are photosynthesized. Effective powders are Al powder, BaSO_4 , freshly pptd. $\text{Al}(\text{OH})_3$, and the basic carbonates of Al, Mg and Zn. The total quantity of org. compd. produced is about 0.02 g. in 2 hrs., when 8 quartz test tubes, 9 in. \times 1 in., contg. 720 cc. H_2O and the suspended powder, are exposed to the light from a 220-volt U-shaped lamp at an av. distance of 6 cm. The org. compds. produced seem to be complex carbohydrates. They char readily when heated alone or with concd. H_2SO_4 . After hydrolysis with HCl, the soln. in most cases reduces Benedict's soln. **II. The photosynthesis of carbohydrates from carbonic acid by means of visible light.** E. C. C. BALY, W. E. STEPHEN AND N. R. HOOD. *Ibid.* 212-9. Photosynthesis of org. compds. takes place when carbonic acid, adsorbed on the surface of NiCO_3 or CoCO_3 suspended in H_2O , is exposed to visible light. To obtain the best yields of org. matter the suspended carbonate must be in the form of a fine powder and free from every trace of alkali. One of the products is a carbohydrate which reduces Benedict's soln., gives the Mohr and Hübner reactions and forms a solid osazone. The reducing power of the photosynthesized compd. is increased on hydrolysis by HCl, indicating the presence of complex carbohydrates of higher mol. wt. than the hexoses. The O set free during the photosynthesis tends to poison the surface by the formation of oxides. The surface slowly recovers under H_2O , so that increased yields of carbohydrates are obtained with unit quantity of light when the intensity of illumination is decreased. When the surface has become completely poisoned, the photosynthetic process ceases and then with intense illumination the carbohydrates previously formed are photochemically decomposed. **III. Photosynthesis in vivo and in vitro.** E. C. C. BALY AND J. B. DAVIES. *Ibid.* 219-26.—In this paper B and D. summarize the features common to photosynthesis *in vivo* and *in vitro*. LOUISE KELLEY

The globulins of rice, *Oryza sativa*. D. BREESE JONES AND C. E. F. GERSDORFF. *J. Biol. Chem.* 74, 415-26 (1927).—By dialyzing saline exts. of white rice a protein fraction was isolated which contained 2 globulins coagulating at 74° and 90°, resp., which were sepd. by fractional coagulation. The elementary compn. of the 2 varied and is, resp. C 52.83, 49.15; H 6.77, 7.86; N 16.31, 17.94; S 0.98, 1.45; ash 0.29, 1.64%. The following percents of certain amino acids were found in the 2 globulins: cystine 2.25, 2.89; arginine 7.85, 15.18; histidine 2.42, 3.01; lysine 7.14, 3.63; tryptophan 2.69, 2.32; tyrosine 5.60, 7.53. The fractions coagulating at 74° and 90° amounted to 0.09 and 0.07% of the flour, resp. A. P. LOTHROP

Studies on glutelins. II. The glutelin of rice (*Oryza sativa*). D. BREESE JONES AND F. A. CSONKA. *J. Biol. Chem.* 74, 427-31 (1927); cf. *C. A.* 21, 2718.—In contrast with wheat endosperm, polished rice contains but one glutelin. This is pptd. from an 0.2% NaOH ext. by 0.03 satn. with $(\text{NH}_4)_2\text{SO}_4$. Its isoelec. point is at p_H 6.45. It contains 11.13% of arginine, 2.39 of histidine, 4.73 of lysine and 2.35 of cystine and has the following % compn.: C 52.58, H 6.42, N 17.57, S 1.65, P trace, ash 0.384. A. P. LOTHROP

Variation of protein content of corn. V. H. B. ARBUCKLE AND O. J. THIES, JR. *J. Elisha Mitchell Sci. Soc.* 42, 113-7 (1926); cf. *C. A.* 20, 62.—A résumé of the previous papers is given. Immature corn is low in protein. Grains from the middle of the ears

are higher in protein than those from the butt or tip. Nitrates apparently increase and phosphates decrease the percentage of protein slightly. Climate and soil expts. gave varying results leading to no definite conclusions. A. L. MEHRING

Studies in the physiology of fruit trees. I. The seasonal starch content and cambial activity in one to five year-old apple branches. THOMAS SWARBRICK. *J. Pomology Hort. Sci.* 6, 137-56(1927).—A marked disappearance of starch from the cortex and phloem occurred in Jan with a reappearance late in Feb., followed in May by complete disappearance from all tissues of 1-4-yr. old branches. These changes occurred later in the 4-yr. than in the 4-yr. old branches. When elongation growth slowed down starch accumulation began in the cortex and xylem. In vegetative shoots cambial activity began early and the starch disappeared later, but in flowering shoots the reverse was true. Thirty-two citations are appended. A. L. MEHRING

Comment on L. Jost's paper, "The potential differences of the apple." I. MICHARLIS. *Biochem. Z.* 185, 113(1927); cf. *C. A.* 21, 2293. S. MORGULIS

Phytochemical reduction. GÜNTER NAGELSCHMIDT. *Biochem. Z.* 186, 317-21(1927).—The reduction of diacetyl takes place through the formation of acetoin. S. MORGULIS

Effect of age on the composition of the wood of maritime pine. M. H. PATY. *Chimie et industrie* 18, 204-10(1927).—Analyses are given of wood from trees of different ages and from trees that had been tapped and trees that had not. Pentosans first increase to a max. of about 10%, reached at about 5 yrs. of age, and then slowly decrease with age. Methylpentosans vary similarly. Lignin shows a const. but very slow increase with age (4% in 50 yrs.), the rate of lignification being slightly greater in young wood and tending to a limit below 35%. Total and α -cellulose increase fairly rapidly up to about 20 yrs., and more slowly thereafter, tending to limits below 60 and 40%, resp. β - and γ -Celluloses vary irregularly with increase in age, the max. of the curves increasing with age, those for γ -cellulose being higher than those for β -cellulose; the max variations are about equal in both cases (3-4%). Needles and young shoots have relatively high pentosan and low lignin and cellulose contents. Oleoresins increase slightly with age, but not above 2%. Ash varies but little, remaining in the neighborhood of 0.5%. Tapping considerably increases the oleoresin content. Recent tapping of the trees appreciably reduces the pentosan and total and α -cellulose contents and slightly reduces the β - and γ -cellulose, but not the lignin; as the duration of tapping increases, so does the reduction in pentosans and total cellulose, lignin also decreases, while γ -cellulose increases. This may be explained as follows. The growth of the trees continues during tapping, but it utilizes a greater proportion of its nourishment to elaborate the cicatrizing fluid (oleoresin), thereby reducing the relative proportion of the other tissues. Freshly cut wood has slightly higher total and α -cellulose and methylpentosan contents and lower pentosan and lignin contents than wood of the same age which has been cut two years. A. P.-C.

The role of phosphate in plant respiration. C. J. LYON. *Am. J. Botany* 14, 274-83(1927).—P exerts a promoter action upon potato oxidase, so that CO_2 is produced by an oxidation of some component in a soln. of glucose. P catalyzes the slow oxidation of pyrogallol and of tannic acid by atm. O, and increases the rate of production of CO_2 by anaerobic processes because of its role in the early stages of alc. fermentation. It causes an increase in the production of CO_2 by the aerobic phase of respiration through its action as a catalyst toward oxidases. This promoter action is equally pronounced when the enzymes are contained within the cells of such plants as *Elodea canadensis* or wheat seedlings. Arsenic also exhibits this catalytic property which is partly masked by its toxic effect. J. J. SKINNER

The hydron concentration of plant tissues. III. The tissues of *Helianthus annuus*. S. H. MARTIN. *Protoplasma* 1, 497-521(1927); cf. *C. A.* 21, 2721.—The sunflower (*Helianthus annuus*) was studied at all stages in the life history of the plant from the seed to the matured flowering plant. The reactions were obtained by noting the behavior of the various tissues toward suitable indicators, as shown by section. No distinct gradient of reaction for the different regions was observed, except in various tissues above and below the ground. The epidermal hairs gave a reaction of pH 9-10. All other reactions were on the acid side. **IV. The buffer of sunflower hypocotyl.** *Ibid.* 522-36.—The expressed sap of sunflower hypocotyl was on the alk. side of the isoelec. point of most plant proteins and as a negligible amt. of protein was present in the sap, attention was directed to the phosphate system as accounting for the buffering action of the sap. The inorg.-phosphate content in the expressed sap varied between 0.005 M and 0.007 M H_2PO_4 . The buffer values of the sap in terms of M H_2PO_4 corresponded very closely to the actual phosphate concns. The normal reactions of the

sap were therefore only slightly buffered, and the small amt. of buffer action was due to the correspondingly low concn. of inorg. phosphate in the sap. An atm. of CO_2 ranging from 5% upward changed the normal reaction p_{H} 5.6 to reactions of higher acidity. Below 5% the CO_2 did not affect the p_{H} of the sap within a range of 0.2 while above 5% a progressive series of reactions of decreasing p_{H} values was obtained with increasing concns. of CO_2 . **V. The tissues of *Vicia faba*.** M. W. REA AND V. SMALL. *Ibid* 2, 45-58(1927).—It was early demonstrated that the sunflower and the broad bean differed considerably in the differentiation of their tissues with regard to H-ion concn. The outstanding feature of the sunflower was the marked acidity of the epidermis which characteristic was absent from the broad bean. In the present investigation the tissues of *Vicia faba*, both white and green varieties, were examd. throughout the plant and at various stages in the life of the plant. A comparison of the tissue reactions of *Vicia faba* and *Helianthus annuus* was made. M. H. SOULE

Effects of correlation between vegetative and reproductive functions in the tomato (*Lycopersicon esculentum* Mill). A. E. MURNEEK. *Plant Physiology* 1, 3-56(1926).—The analytical data and growth records of M.'s comprehensive expts. on the tomato plant grown in sand and soil cultures indicate that vegetative growth is regulated or controlled by the fruit, which is able to monopolize almost all the available nitrogenous food supply. The rate of growth declines at the exact time and in inverse proportion to the amount of fruit set and developing. Suggestions are given as to the possible mechanism operating to produce the correlation between the reproductive and vegetative functions. WALTER THOMAS

The extraction of plant tissue fluids and their utility in physiological studies. R. NEWTON, W. R. BROWN AND W. M. MARTIN. *Plant Physiology* 1, 57-65(1926).—The tissue fluids from finely ground plant material are obtained by means of an hydraulic press. The operations are carried out close to 0° . Standardization of the extn. procedure, especially with regard to the use of low pressure, is shown to be essential in order that fluids obtained may be substantially of the same compn. as the original tissue fluids. The analysis of the fluids obtained in this way, supplemented by the ordinary chem. analysis of plant tissues, affords a convenient method of obtaining the distribution of any constituent between the physiologically active and inert portions of the plant. WALTER THOMAS

Studies on the oxygen-supplying power of the soil together with quantitative observations on the oxygen-supplying power requisite for seed germination. I. M. HUTCHINS. *Plant Physiology* 1, 95-150(1926); cf. *C. A.* 17, 3737.—The present paper describes in detail the standardization of an improved form of the earlier app. It affords an exceedingly sensitive and practical method for the exptl. study of the dynamics of the soil-oxygen aspect of ecology and agriculture. The principle of the method remains unchanged. Previous findings of the oxygen-supplying power of the soil for a plant root were corroborated. In addn. expts. were conducted on the O-supplying power requisite for germination of wheat, maize and rice seeds. Each kind of seed appears to have its own min. O requirement. The O-supplying power requirement for seed germination is in accord with what might have been expected, viz., that this requirement is not the same for all kinds of seeds. Some germinate well with exceedingly slow O supply while others require a very rapid supply of O. With the improved app. actual values or rates (expressed in mg. per sq. m. per hr.) of the supplying power index of the medium can be detd. H. pleads for the dynamic as opposed to the static concept of problems relating to soil aeration and of the oxygen needs of germinating seeds. WALTER THOMAS

Nutritional studies on *Fusarium lini*. I. Preliminary studies of some sugars and some nitrogen sources. E. S. REYNOLDS. *Plant Physiology* 1, 151-64(1926).—Fermi's culture medium with the glycerol replaced by sugars in concns. 0.25-0.05 M was used. The nutritional value of the sugars is in the following descending order: glucose > maltose > sucrose > levulose > xylose > arabinose > mannose > galactose. The nutritional value of the N compds. tested for this fungus are in the descending order: $\text{KNO}_3 > \text{Ca}(\text{NO}_3)_2 > \text{NH}_4\text{C}_2\text{H}_3\text{O}_2 > (\text{NH}_4)_2\text{HPO}_4 > \text{C}_6\text{H}_5(\text{NH}_2) \begin{smallmatrix} \text{COOH} \\ \text{CONH}_2 \end{smallmatrix} > \text{KNO}_2 > (\text{NH}_4)_2\text{SO}_4 > \text{CO}(\text{NH}_2)_2$. $\text{Ca}(\text{NO}_3)_2$ gave no growth. **II. Effects of flax extracts on *Fusarium lini*.** Using Fermi's culture medium R. found that the aq. ext. from a "resistant" strain of flax depressed the growth of the flax wilt-fungus more than the ext. from a "susceptible" strain. The same type of exts. when autoclaved accelerated growth; hence the factor causing depression in growth is a relatively labile or volatile compd., probably the glucoside linamarin. Inasmuch as R. has previously shown (*C. A.* 18, 2218) that concns. of KCN of 0.03 M and higher prevented the development

of fungus, it is suggested that the relatively higher quantity of the glucoside found in the resistant strain may offer an explanation of immunity to flax wilt-fungus. W. T.

Adsorption as a means of determining relative hardness in the apple. STUART DUNN AND A. L. BAKKE. *Plant Physiology* 1, 165-75(1926) — Good correlation was found between the adsorptive power of malachite green from soln. by pulverized tissues of apple twigs and the hardness of the varieties from which the samples were taken. The expts. were conducted on the cambium, cortical and other non woody tissues, which were able to pass through a 100 mesh screen, the wooly portions remaining behind. It is suggested that the hydrophylic colloids prevent death from the dehydrating force of freezing by their power to hold water within the cell. W. T.

A study of the clearing of alcoholic plant extracts. W. E. LOOMIS. *Plant Physiology* 1, 179-89(1926) — Consistent results can be obtained by taking up the alc.-free residues with warm water. After cooling to room temp. sufficient $Pb(OAc)_2$ soln. (d. 1.25) is added to form a faint, white ppt. with a drop of dil. $K_2C_2O_4$ soln. Twice this quantity is used for clearing the soln. to be tested, to insure pptn. of reducing impurities. The soln. should not stand for more than a few min. and is then filtered on to an excess of $K_2C_2O_4$ crystals or powder. Heating or standing in contact with a lead soln. causes a rapid destruction of reducing substances. Basic lead acetate is more destructive than the neutral salt and gives a variable loss even in cold solns., the magnitude of which depends upon the completeness of clearing. The degree of completeness of clearing does not affect the purity of the CuO ppt. However, as in cases where a plant ext. or a mixt. of ext. and sugar soln. was used, the percentage of Cu has been approx. 87% instead of the theoretical 88.8%. The explanation for these results is not apparent. WALTER THOMAS

The adaptation of certain colorimetric methods to the estimation of nitrates, phosphates and potassium in plant solutions. B. E. GILBERT. *Plant Physiology* 1, 191-9(1926) — The results of the analysis of tissue juices from corn, turnips, celery, beets, spinach and lettuce grown with different quantities of manure are recorded to show that the detn. of the sol. nutrients of fresh plant juices affords a more valuable method for establishing the optimum nutrient levels of the 3 principal fertilizer "elements." The tissue juices are obtained by grinding the fresh tissue in a Nixtanal mill and straining through fine-mesh silk. The analyses are carried out by slight modifications of well known methods, *viz.*, the phenoldisulfonic acid method for nitrate N, ceruric-molybdate for phosphate phosphorus, and the reduced chloroplatinate method for K. WALTER THOMAS

The mechanism of accumulation of dyes by living cells. G. W. SCARFF. *Plant Physiology* 1, 215-29(1926) — In all cases studied, basic dyes, when they accumulate in much higher concn. in the sap than outside, are held less strongly than acid dyes. (a) *Basic dyes.* — The exact mode of combination varies in different cells, but the common feature is that the dye may combine with a colloid having lipid properties and be stored simply in virtue of this combination. The affinity of this colloidal material for basic dyes is greatest when the pH of the sap is between 5 and 6. The colloidal material behaves as an ampholyte and its other phys. properties suggest that it is partly hydrated lipid, enveloped probably by a mono- or bi-mol. film. (b) *Acid dyes.* — While the ability of the normally basophil colloidal material to take up acid dyes when the sap is acidified points to the possibility of their adsorption in the cell, the actual mechanism of storage by the cells of *Anthurium* which normally accumulate such dyes remains undecided. WALTER THOMAS

Some chemical changes incident to ripening and storage in the Grimes apple. FISK GERHARDT. *Plant Physiology* 1, 251-64(1926); cf. *C. A.* 20, 3310. — The analytical work was carried out on the vacuum-dried, finely ground material, which was freed from lipoids and sol. org. acids. The analytical results indicate that (1) The ripening processes both on the tree and in storage are assoc. with loss of moisture, acidity, dextrins, starch and acid hydrolyzable material, together with an increase in sp. gr., sugars and sol. pectin. (2) The time of picking or condition of maturity has little influence on the ultimate compn. of the apples under investigation. (3) The production of apple scald tends to decrease with increase in maturity of the fruit. (4) There seems to exist an interrelationship between the relative amt. of total sugars in each individual picking of the fruit prior to cold storage and production of breakdown tissue, but with this exception, there appears to be no correlation between chem. compn. and keeping quality of cold-storage apples. It is suggested that phys. or chem. changes not detd. are involved in the formation of unfavorable tissue during storage. W. T.

Growth studies on fruits. F. G. GUSTAFSON. *Plant Physiology* 1, 265-72(1926). — The plotted growth measurements of fruits of *Cucurbita Pepo* var. *condensa*, *Cucumis*

Melo, *C. sativus* and *Lycopersicum esculentum* give the typical S-shaped curve. The agreement of the observed values with the values calcd. from the equation $x/(A-x) = K(t-t_1)$, where A represents the final size reached, x the size after time t and t_1 , the time at which half the size is reached (cf. *C. A.* 18, 1142), is fairly close except in the early phase. G., therefore, believes that the monomol. autocatalytic reaction interpretation of growth rates (cf. *C. A.* 18, 1142) is not entirely satisfactory. W. T.

Plant growth-promoting substances, hydrogen-ion concentration and the reproduction of Lemna. N. A. CLARK. *Plant Physiology* 1, 273-9(1926).—*Lemna major* grew and reproduced indefinitely in culture solns. of purified inorganic salts without the addn. of org. matter, both in daylight and under elec. light. The reproduction const. K was calcd. from the equation $\log N - \log N_0 = K(t-t_0)$ (cf. *C. A.* 20, 1427). Daily changes of the culture medium increased the rate of reproduction of the plants by keeping the H-ion concn. more uniform and diminishing the amt. of bacterial growth. When this latter influence was reduced as low as possible by using a frequently changed culture medium that had been boiled and afterward made up to the original concn. with sterile water, the plants still made good growth. The optimum p_H probably varies with the compn. of the culture soln. WALTER THOMAS

E—NUTRITION

PHILIP B. HAWK

Influence of surface-active substances on the fungus growths in thrush in respect to water-soluble vitamins. F. V. VON HAHN. *Kolloid-Z.* 40, 321-7(1926).—A study of the physico chem. conditions for the mycelial formation of the thrush revealed no difference between the natural vitamin-rich products and artificial solns. of high surface activity. This supports the view that the vitaminoid state is essentially characterized by a certain surface tension. B. C. A.

Blood counts in vitamin-A deficiency disease with especial reference to the platelets. E. H. FALCONER AND GLYNDON PEACHEY. *Am. J. Physiol.* 76, 145-50(1926).—Av. blood counts on 24 rats in various stages of vitamin-A deficiency showed 204,000 less platelets, 137,000 more red cells and 2300 more white cells than normal. It is concluded that these changes are not striking enough to constitute a sp. lesion of vitamin-A deficiency. J. B. BROWN

The resting metabolism of infant rats in relation to temperature control. ADDISON GELICK. *Am. J. Physiol.* 76, 206(1926).—Well conditioned rats in the first few days of life produce 7-9 cal. per kg. at 16°, 24° or 31°. In starved rats 2 days old the rate at 20° is less than half that at 30°. This basal metabolism is perhaps close to the physiol. limit of heat production in a relaxed organism. J. B. BROWN

Statistics of nutrition. IV. Statistics of the action of foodstuffs. L. BERCELLER AND H. WASTL. *Wiener med. Wochschr.* 77, 637-10(1927).—A review. A. G.

The sensitiveness of animals nourished with vitamin-free food to poisons in contrast to normally nourished and to fasting animals. II. Poisons and fasting. G. VERCELLANA. *Ann. igiene* 35, 860-4(1925); cf. *Ann. igiene* 35, 785.—The expts. showed that, in general, fasting animals are less sensitive to poisons than those on a vitamin free diet. This is attributed to the fact that fasting animals are weakened, while those on a vitamin-free diet become diseased. **III. The behavior of normally nourished rabbits, of rabbits fed exclusively on autoclaved oats and of fasting rabbits towards atropine.** *Ibid.* 953-9; *Chem. Zentr.* 1926, II, 59.—The expts. showed that rabbits fed exclusively with autoclaved oats lose their natural resistance toward atropine, in contrast to fasting animals, which retain it. Transfusion of the blood of normally nourished or of fasting animals to those on a vitamin-free diet restores the resistance of the latter to atropine. C. C. DAVIS

Recent work on the nutrition of the pig. J. B. ORR AND ARTHUR CRICHTON. *Trans. Highland and Agr. Soc. Scotland* [5], 39, 25-41(1927).—A review with bibliography. K. D. JACOB

Changes in the organism by cod-liver oil added to the food. ERIK AGDUHR. *La pædiatr.* 6, 165-79(1926); *Ber. ges. Physiol. expil. Physiol.* 40, 524.—Description of clinical symptoms and pathol. changes of blood and organs caused in rabbits, rats, doves, pigs, cats and dogs and particularly in white mice by prolonged oral or parenteral administration of large doses of cod-liver oil. The toxicity is somewhat diminished by simultaneous administration of vitamins B and C. The toxic substance has not been isolated. MARY JACOBSEN

Investigations concerning the photoactivity of certain oils, with special reference to their effect as antirachitics. EIGIL REKLING. *Acta radiol.* 5, 517-52(1926); *Ber.*

ges. *Physiol. expil. Pharmacol.* **40**, 177.—Photoactivity does not run parallel with antirachitic potency. Cod-liver oil is photoactive in its native condition. Linseed and olive oils acquire activity through irradiation in the presence of O_2 . The latter is indispensable. A current of air removes the acquired photoactivity but not that of cod-liver oil. *Conclusion*: The acquired photoactivity is detd. by the H_2 content of the oil, or by the Russel effect.

MARY JACOBSEN

Basal metabolism in vitamin B starvation. SEIZABURO OKADA, EIICHI SAKURAI, TSUKIO IBUKI AND HARUTOSHI KAHN-SHIMU. *Arch. Internal Med.* **40**, 292-313(1927).—Vitamin B starvation aggravates beriberi and produces in normal subjects a typical avitaminosis. In both cases the basal metabolism is lowered. Vitamin B raises the metabolic rate and effects improvement and cure, resp. The identification of beriberi with B-avitaminosis is opposed by a difference in many factors. Basal metabolism is normal in the former, lowered in the latter. In beriberi it increases with threatening decompensation and decreases in the presence of paralysis and atrophy. Whether the difference in metabolic rate may serve as a means of differentiation must be established by further expts.

MARY JACOBSEN

Changes in the kidney in animals with increased blood pressures while on high protein diets. F. R. NUZUM. *Arch. Internal Med.* **40**, 364-76(1927).—The urine of rabbits fed 24 months on liver and oats was acid and frequently contained casts and albumin. The nonprotein and urea N of the blood was increased, the CO_2 of the plasma lowered, systolic blood raised. A soy-bean diet caused an excessively alk. urine. There was clinical evidence of kidney injury which was possibly caused by the acidity or alk. of the urine passed by the animals during $\frac{1}{2}$ of their natural lives. M. J.

Comparative study of hunger and vitamin B starvation in the same subject. E. MIYAKE. *Folia endocrinol. japon.* **2**, 704-31(1926), *Ber. ges. Physiol. expil. Pharmacol.* **40**, 381. Blood gases, effect of adrenaline, N excretion and clinical symptoms were observed in a man receiving a vitamin B deficient diet before and after a hunger period of several weeks. Hunger reduces vitamin B consumption. The onset of avitaminosis is pptd. by a preceding period of hunger. The symptoms of B-avitaminosis are detd. by the carbohydrate rather than by the vitamin content of the deficient diet. The symptoms of hunger and vitamin B deficiency are altogether different. M. JACOBSEN

Utilization of the calcium of spinach. LAURA McLAUGHLIN. *J. Biol. Chem.* **74**, 455-62(1927).—Spinach, fed for 6 days as the only food high in Ca in a diet consisting of some of the most commonly used foods, produced distinctly positive Ca balances in 6 out of 7 healthy women and Ca equil. in the 7th. Spinach furnished 70% of the Ca and the intake was greater than the calcd. requirement for maintenance. It was thought that the repeated use of an unusually large quantity of spinach would emphasize any tendency toward hindrance to Ca assimilation through the presence of fiber or oxalates, but no such tendency was demonstrated. Storage of Ca in adult women is assumed to demonstrate a utilization of the Ca of spinach.

A. P. LOTHROP

The metabolism of sulfur. XIII. The effect of elementary sulfur on the growth of the young white rat. GEORGE T. LEWIS AND HOWARD B. LEWIS. *J. Biol. Chem.* **74**, 515-23(1927), cf. *C. A.* **21**, 3071. Flowers of S in concns of 0.08, 0.50, 0.75 and 1% were fed to young white rats maintained on 2 types of cystine-deficient diets, the Sherman-Merrill milk powder-starch diet and the Osborne-Mendel diet. The cystine requirements for growth were in no way altered and S cannot replace cystine in the diet. The addn. of 1% of S to the milk powder-starch diet caused the death of 14 out of 22 animals and thus was definitely toxic, the effect probably being due to H_2S formation in the intestine. Retardation of growth was observed when 1% of S was added to the Osborne-Mendel diet and with lesser concns. in the Sherman-Merrill diet. The toxicity was not affected by the presence of cystine in the diet.

A. P. LOTHROP

Influence of fat and carbohydrate diets upon the level of blood uric acid. V. J. HARDING, KATHLEEN D. ALLIN AND B. A. EAGLES. *J. Biol. Chem.* **74**, 631-43(1927); cf. *C. A.* **19**, 1292. The increase in blood uric acid observed on high fat diets is correlated with decreased excretion. Low protein-high carbohydrate diets of mixed origin fail to raise the level of blood uric acid in the normal puerperium. Similar diets showed raised blood uric acid in the puerperium following toxemia.

A. P. LOTHROP

The antirachitic value of irradiated cholesterol and phytosterol. VIII. The activation of sterol fractions by ultra-violet irradiation. A. F. HESS AND R. J. ANDERSON. *J. Biol. Chem.* **74**, 651-7(1927), cf. *C. A.* **21**, 100.— α -Sitosterol is strongly antirachitic after activation by ultra-violet light while β - and γ -sitosterols are inactive. As the latter 2 substances are purified by bromination, any antirachitic substance which might be present in these less sol. sterol fractions is destroyed in the purification. It cannot be definitely stated whether traces of ergosterol are present in corn oil and is the sub-

stance in the α -sitosterol which is activated. "If ergosterol is the sole antirachitic precursor, it is evident that this sterol must be universally present in all fats of animal and of plant origin that are capable of activation by ultra-violet light. This is an exceedingly broad conception. Considerable further chem. and biol. investigations will be necessary before it can be decided whether certain sterols other than ergosterol can contribute to the antirachitic activity of irradiated material." A. P. LOTHROP

Vitamin A content of milk. J. BIRGER PLATON. *Biochem. Z.* 185, 238-41 (1927).—A comparison of the vitamin A content of milk with an av. fat content of 2.8 and 0.18% shows that 1.75-2.0 cc. of either is required for normal increase in wt. The expts. are not conclusive, but suggest that the vitamin A is combined with other constituents of the milk than fat only to a negligible extent. S. MORGULIS

Edible holothuria. SIGMUND FRÄNKEL AND CURT JELLINEK. *Biochem. Z.* 185, 389-91 (1927).—The protein of edible holothuria is nearly completely digested by pepsin, the N being almost entirely reduced to amino acid N. S. MORGULIS

Specific dynamic action of foodstuffs. VI. Specific dynamic action and carbohydrate metabolism. I. ABELIN AND B. KOBORI. *Biochem. Z.* 186, 3-27 (1927).—The sp. dynamic action is regarded to be assocd. with the formation of carbohydrate. Experimentally produced disturbances of the carbohydrate metabolism (feeding of thyroid, tyramine, phenylethylamine, adrenaline, etc.) lead to an increase in the basal metabolism and at the same time of the sp. dynamic action. Studies on the influence of phlorhizin show that following repeated injections the sp. dynamic action of meat generally is much increased, which is interpreted as being due to the greater demand for carbohydrate and to the enhanced formation of this from the protein. S. M.

The influence of food composition, especially its amino acid content, on the urinary C:N quotient. A. BICKEL AND I. REMEZOV. *Biochem. Z.* 186, 54-63 (1927).—If the protein of the food is partially replaced by an equiv. amt. of N in the form of amino acid, the C and N absorption in the intestine is improved but the oxidation of the protein is not increased. The N is retained while the unoxidized C in the urine is greater so that the C:N quotient increases. S. MORGULIS

Further studies on the influence of feeding active ferric oxide on metabolism with special reference to the nitrogen balance and the behavior of the urinary C:N quotient. IGOR REMESOV. *Biochem. Z.* 186, 64-86 (1927).—Baudisch's active Fe_2O_3 produces in dogs a retention of N due to a diminished protein oxidation in the intermediate metabolism and to an improved utilization of the food in the intestine. It likewise influences the fat and carbohydrate metabolism. S. MORGULIS

The different behavior of pigeons and chickens when their vitamin-B need is supplied in the form of fresh green vegetables. ARTHUR SCHEUNERT AND MARTIN SCHENBLICH. *Biochem. Z.* 186, 222-8 (1927).—Pigeons require much greater quantities of fresh green vegetables to supply their need for the antineuritic factor, and cannot therefore be used as exptl. animals in testing the vitamin-B content of such foodstuffs because of their inability to consume a sufficiency of them. S. MORGULIS

Further studies on the vitamin content of beer. ARTHUR SCHEUNERT AND MARTIN SCHENBLICH. *Biochem. Z.* 186, 229-31 (1927).—The vitamin-B content of dark beer prepd. from rye seedlings is very small just as was found to be the case also in porter beer. S. MORGULIS

The volatile fatty acids formed in the preparation of acid feed. II. C. BRAHM. *Biochem. Z.* 186, 232-41 (1927); cf. *C. A.* 19, 2714. S. MORGULIS

Demonstration of the antirachitic factor of grasses grown in the dark and under window glass. W. VOLTZ AND W. KIRSCH. *Biochem. Z.* 186, 255-63 (1927).—The seeds of the grass *Lolium perenne* do not contain any antirachitic substance. The seedlings of the same possess antirachitic properties when they are grown under window glass or in complete darkness. These results argue against the assumption that the antirachitic factor is formed through the radiation of a provitamin (ergosterol). S. MORGULIS

Studies on fat and lipid metabolism. IV. The role of the reticuloendothelial system in fat and lipid metabolism. SAMUEL LEITES. *Biochem. Z.* 186, 391-412 (1927); cf. *C. A.* 21, 2296.—Intravenous injection of colloidal Ag, Fe, India ink suspension or olive-oil emulsions causes a lowering of the cholesterol content in the peripheral blood of dogs which manifests itself within 10 min. after the injection. After 2 hrs. the normal content is restored. The loading of the dog with olive oil, olive oil and cholesterol, or olive oil and lecithin *per os*, causes less lipemia or cholesterolemia after a preliminary blocking of the reticulo-endothelial system than without such blocking. Following a mild blocking, loading the dog with fat *per os* causes the cholesterol content of the blood from the hepatic and femoral veins to be lower than in the arteries while

in the v. linealis the neutral fat content is less than in the artery. With strong blocking, the neutral fat content of the v. linealis and femoralis is greater than in the artery while the cholesterol content remains unchanged. The blood cholesterol is lowered through blocking even in the hypocholesterolemic condition resulting from splenectomy. Intravenous injection of Na oleate after preliminary blocking causes a rise in cholesterol in the femoral vein. Conclusion: The reticulo-endothelial system of the spleen, liver and bone marrow plays a part in the elimination of neutral fat and cholesterol from the blood as well as in the general processes of fat metabolism. The mild blocking of this system increases its absorption ability for neutral fat in the bone marrow, and for cholesterol in the liver and bone marrow. With more extensive blocking, the absorption of neutral fat diminishes while that of cholesterol is unaffected. At the same time the function of the reticulo-endothelial system of the bone marrow and spleen of converting cholesterol into neutral fat, and of the liver and bone marrow of the building of cholesterol from fatty acids is increased. V. The role of the spleen in fat and lipid metabolism. *Ibid* 436-50.—Following splenectomy in dogs the bound cholesterol and lipid P of the blood increase for a period not exceeding 6 months. Loading splenectomized dogs *per os* with olive oil or olive oil and cholesterol leads to a much greater hypercholesterolemia than before splenectomy, but this is not a regular occurrence. Intravenous injection of olive oil emulsion causes an increase in the neutral fat of the blood which is not observed before splenectomy. Splenectomized dogs, unlike normal dogs, show no lowering of the neutral fat and rise in cholesterol of the hepatic vein blood as a result of loading. Likewise, the arterial blood fails to show marked changes in cholesterol. The increased alimentary hyperphemia of splenectomized dogs is obviously due to the absence of an organ where the elimination of neutral fat takes place as well as to the disturbance of neutral fat elimination and cleavage in the liver. The increased alimentary hypercholesterolemia of splenectomized dogs is due to the diminished elimination of endogenous cholesterol which normally occurs in the spleen, and to the greater cholesterol content of arterial blood and lungs. S. M.

The biochemical relation between the condition of the organism, nutrition and the resistance of red blood cells. GYOZO PETRANYI. *Biochem. Z.* 186, 419-35(1927).—There is a definite correlation between the resistance of the blood cells and the general condition of the organism, which increases with loss of body wt. and diminishes with gain in wt. Food consumption likewise increases the resistance, the greatest influence being exerted by protein and fat foodstuffs. S. MORGULIS

Vitamin C in fresh grass (*Lolium perenne*; English Rye grass) and the weight of various organs in scurvy. E. BROUWER. *Biochem. Z.* 187, 183-93(1927); cf. *C. A.* 20, 2693. Fresh grass is rich in vitamin C during all seasons of the year. A g. of fresh grass per day protected guinea pigs for months against scurvy. Hay is very poor in vitamin C. Preservation of grass in silos likewise caused destruction of the vitamin. In scorbutic animals granules of Fe are deposited in the spleen, adrenals, intestine and liver. A comparison of the wt. of different organs from normal and sick animals shows a striking diminution of the thymus and increase of the adrenals in scurvy. The wt. of the eye and kidney is unaltered, that of the spleen shows great variability from animal to animal, while the wt. of all other organs is less in the animals suffering scurvy. S. MORGULIS

Biochemistry of iodine. STEFAN WEISER AND ARTHUR ZAITSCHEK. *Biochem. Z.* 187, 377-81(1927). I₂ in food had no effect on the duration of pregnancy, but a much larger per cent of the new born pigs had reached maturity without any intercurrent diseases. Likewise, the pigs nursed by sows receiving I₂ attained a much greater body wt. at the time of weaning (13.17 and 18.54 kg. on the av. for the young of animals fed without and with the addn. of I₂). The amt. of milk secreted was apparently not affected by the presence or absence of I₂ in the food. S. MORGULIS

Contribution to the knowledge of the fate of isopropyl alcohol in the human organism. HIKMET KEMAL. *Biochem. Z.* 187, 461-6(1927). Isopropyl alcohol is partly eliminated from the human body as acetone in the urine and expired air. In the urine the acetone appears within the first hr. and can be still quantitatively demonstrated even after 48 hrs. In the breath the acetone appears within 15 min. The acetone in the urine could be demonstrated even with 0.25 g. of isopropyl alc., but the acetone represents a small fraction of the ingested isopropyl alc. The quantity could be increased up to 100 mg. by liberal consumption of liquids. When the isopropyl alc. was taken in several small quantities the acetone elimination in the urine was reduced. No diacetic acid was found. S. MORGULIS

Vitamins and the canned foods industry. A. PELLERIN. *Chimie et industrie* 18, 211-5(1927).—A discussion of the effect of pH, heat, O, drying and aging on vitamins

showing that canned foods subjected to modern sterilizing processes retain a considerable proportion of their vitamins.

A. PAPINEAU-COUTURE

Is the formation of sterols connected with the metabolism of fats? E. F. TERROINE, R. BONNET, G. KOPP AND J. VECHOT. *Bull. soc. chim. biol.* 9, 678 91(1927).—The parallelism observed by Terroine, in various species of animals, between the content of aliphatic acids and sterols, does not exist in the seeds of flax, castor-oil plant, soy bean, peas, peanut and sorghum. The cholesterol content of muscle and liver in animals which have been fattened by abundant rations is the same as that in normal subjects of the same species. In microorganisms naturally rich in fat or caused to produce fat by being grown in a disequilibrated medium rich in glucose, there is no parallelism between the content of aliphatic acids and sterols. These facts do not support the hypothesis of a simultaneous synthesis of neutral fats and sterols. In the course of germination of oily seeds the disappearance of fats corresponds to an increase of phytosterol more marked in light than in darkness. In the bean, pea and sorghum the disappearance of fats is accompanied by a diminution, or no change, in the phytosterol. *Sterigmatocystis nigra* grown on various fats has a higher content of sterol than if grown on glucose or peptone. This indicates a formation of sterols at the expense of the fats.

L. W. RIGGS

Comparative studies on the content of glutathione of certain tissues and blood of the normal pigeon, the underfed pigeon and the pigeon deprived of vitamin B. (MME.) L. RANDOIN AND RENÉ FABRE. *Compt. rend.* 185, 151 3(1927).—Expts were made with 40 pigeons divided into appropriate groups. In adult normal pigeons the skeletal muscles contain an av. of 26 mg. of glutathione per 100 g. of fresh tissue, heart 30, liver 140 and the blood 61. In the underfed pigeon a marked diminution of glutathione occurred in the muscles but was slight in the other tissues. In the pigeon deprived of vitamin B there was little or no change in the glutathione content during the first period of pre-mortal temps. In the second period there is a diminution of glutathione in the skeletal muscles which reaches about 10 mg. per 100 g. at the crisis. The diminution is much less in the other tissues. During the period of deprivation of vitamin B there appears to be an increase of reducing substances other than those which contain the SH group.

L. W. RIGGS

Variations in the iron content of the liver, spleen and blood under the influence of a regimen disequilibrated by a complete removal of the antiscorbutic vitamin. (MME.) L. RANDOIN AND (Mlle.) A. MICHAUX. *Compt. rend.* 185, 365-8(1927); cf. C. A. 21, 1139. A first lot of 25 guinea pigs was fed a complete artificial ration commonly used, and a second lot of 25 received the same ration deprived of vitamin C. The Fe content of the spleen averaged practically the same for each lot, while the Fe content of the liver was diminished so that by the 20th day it was about $\frac{1}{4}$ the normal figure. The Fe content of the blood diminishes slightly during the scurvy.

L. W. RIGGS

Different extracts of yeast and their content of vitamin D compared with the initial proportion of vitamin in the fresh yeast. CASIMIR FUNK AND RAOUL LECCO. *Compt. rend. soc. biol.* 97, 440-2(1927); cf. C. A. 17, 129, 3043. —With either beer or distillery yeast, extd. by the method of Harris or by 70% alc., the quantity of vitamin D in the exts. remains proportionally the same as in the fresh yeast used. The proportion of vitamin D does not appear to be connected with the antineuritic factor or the water-sol growth-promoting factor.

L. W. RIGGS

Antirachitic activity of irradiated cholesterol, ergosterol and allied substances. A. E. HESS. *J. Am. Med. Assoc.* 89, 337 9(1927), cf. C. A. 20, 2187. —Expts. in feeding rats with a rickets-producing ration and various irradiated foods led to the following conclusions: The most practical application of an irradiated food is the use of irradiated dried milk for infant feeding. This food prevents or cures infantile rickets and tetany, and maintains its sp. activity for at least 6 months. Irradiated cholesterol and irradiated dried brain were used successfully. The activity of irradiated cholesterol is due probably to a contaminating sterol. Ergosterol prepd. from yeast brought about calcification of the epiphyses when as little as 0.002 mg. was fed daily. This is the smallest quantity of any vitamin which was found to exert a sp. action. Irradiated yeast is highly effective as an antirachitic in animals and in infants.

L. W. RIGGS

Treatment of pernicious anemia by a special diet. G. R. MINOT AND W. P. MURPHY. *J. Am. Med. Assoc.* 87, 470 6(1926); *Expt. Sta. Record* 56, 294. —A diet composed of foods rich in complete protein and iron, particularly liver, and contg. an abundance of fruits and fresh vegetables and very little fat, was given to a series of 45 patients with pernicious anemia for periods varying from 6 weeks to 2.5 years, with promising results in prompt remission of the anemia, rapid increase in the red blood corpuscles and hemoglobin count, and improvement in clinical appearance.

L. W. R.

A diet rich in liver in the treatment of pernicious anemia. G. R. MINOR AND WM. P. MURPHY. *J. Am. Med. Assoc.* 89, 759-66(1927).—A study of 105 cases treated from 3 months to 3 years with a diet rich in marshallian liver (200 \pm g. cooked wt. daily) shows that this diet can benefit essentially all patients with this disease. The improvement is usually rapid and striking, and there is a marked and prompt increase of the red blood corpuscles in almost every case. Symptomatic improvement is pronounced. A few g. per day of a non-protein fraction of the liver produces a prompt temporary increase of reticulocytes, causing a rapid rise of the red blood corpuscles, and appears to benefit the patient in the same manner as whole liver. In all cases the patient must take an adequate and well balanced diet. L. W. RIGGS

Maintenance requirements of cattle on different rations and at different rates of production; with a note on "dynamic action." JAMES WILSON. *Sci. Proc. Roy. Dublin Soc.* 18, 399-406(1927).—A discussion of work by Armisby and by Kellner. L. W. RIGGS

Microbiological investigation as to the extent to which rice has been polished. P. J. TEDING VAN BERKHOUT. *Mededel. Dienst Volksgezondheid Nederland-Indië* 1926, Pt. 4, 489-502.—The expts. indicate it may be possible to det. the extent to which rice has been polished by detg. the influence of rice ext. on yeast growth or glucose fermentation. GEORGE ERIC SIMPSON

Nutrition and cell function. V. Psychic behavior of rats fed upon different diets. EMIL ANDERHALDEN AND ERNST WERTHEIMER. *Arch. ges. Physiol. (Pflüger's)* 216, 396-401(1927); cf. *C. A.* 20, 3489.—When rats had been fed for a considerable period on a diet rich in protein and poor in carbohydrate their behavior differed definitely from that of control rats which had received an abundance of carbohydrate, in that their spontaneous activity and susceptibility to fright was increased. The rats which had received high protein were more resistant to alc. than were those on the high carbohydrate diet. G. H. S.

Metabolism in the hedgehog and mole. FRANCE GROEBBELS. *Arch. ges. Physiol. (Pflüger's)* 213, 407-18(1926).—The hedgehog awakened from hibernation and placed in an av. external temp. reacts with an intense and gradual increase in O utilization with a corresponding production of heat. In the awakening process glycogen is consumed primarily, later fat is burned. The respiratory rate varies with the heat production. As compared with the hedgehog the mole exhibits a poor chem. heat regulation, heat production resulting only from muscular activity or because of the sp. dynamic power of its food. Normally the mole first utilizes glycogen, but when deprived of food, fat is consumed. G. H. S.

A study of colostrum with special reference to the effect of heat (pasteurization) on its physico-chemical, bacteriological, immunological and nutritional changes. A. C. RAGSDALE, SAMUEL BRODY AND C. W. WEBER. *Missouri Agr. Expt. Sta., Bull.* 236, 46-7(1926).—A study was made of calves in the dairy and beef cattle herds in order to det. the "normal" mortality rate. The mortality rate was also detd. for calves fed their mother's pasteurized colostrum and also raw wholemilk and egg white and milk emulsion as substitutes for colostrum. The growth of *B. coli* in colostrum and colostrum substitutes was also detd. E. F. SNYDER

The causes of vitamin destruction in cooked and canned foods. HANNAH A. STILLMAN. *Missouri Agr. Expt. Sta., Bull.* 236, 63-4(1926).—Oxidation was studied as a cause of vitamin C destruction. Exhausting cans and using minimum head space should tend to preserve vitamin C. E. F. SNYDER

Mineral and vitamin requirements of pigs, with special reference to the effect of diet on bone development. G. BOUSTEY, W. L. ROBINSON, R. M. BETHKE AND B. H. EDGINGTON. *Ohio Agr. Expt. Sta., Bull.* 395, 59-229(1926).—The basal ration used, or a ration composed of grains and seeds or their products, is too low in certain vitamins as well as both the quantity and quality of the ash to permit normal growth and continued health. For the proper development of the animals the basal ration appeared to contain vitamins A and D in too limited amts. The addn. of yeast, fed either dry or left to ferment the feed in a moist condition, made no appreciable difference in the effects of the ration. Vitamin B, therefore, does not play a significant role. The first 3 expts. showed rather conclusively that the proteins and fiber in the basal ration of white corn, wheat middlings, linseed meal, and salt were not prominent factors in the problem of so-called stiffness in pigs. An immediate cause of posterior paralysis was found to be fractured vertebrae in the lumbar-sacral region of the spinal column. Ground limestone was consistently the most effective single addn. to the basal ration. Green grass in addn. to the consumption of soil and the basal ration made for most rapid gains and best health judging from external appearances. Bone fractures were common

in pigs fed cod-liver oil with the basal ration, unless some Ca salt was fed with the ration. Alfalfa meal or cod-liver oil in the ration accounted for a relatively high inorg. P content of the blood serum. The best growing pigs had the highest blood P, and the poorest ones the lowest. Com. blood meal fed with the basal ration hurried pigs into stiffness and paralysis. Fish meal and tankage both caused fairly rapid growth and good bone.

E. F. SNYDER

The antirachitic value of human milk. H. J. GERSTENBERGER, J. I. HARTMEN AND D. N. SMITH. *California and Western Med.* 27, 40-4(1927).—Human milk from mothers receiving 1 tablespoonful of cod-liver oil daily in addn. to a good general diet possessed no antirachitic properties when fed to 3 cases of active non-healing rickets for periods up to 36 days. Antirachitic properties were shown on the 20th and 32nd days of feeding by human milk from mothers exposed to artificially produced actinic rays.

R. C. WILLSON

The vitamin value of some common foodstuffs. W. H. EDDY. *N. Y. State J. Med.* 27, 170-2(1927); cf. *C. A.* 20, 1432.—With the aid of guinea pigs on the Sherman-LaMer basal diet, vitamin A, B and C values for various fresh and canned, raw and cooked vegetables and fruits were detd. Values are expressed in percentages of standards.

R. C. WILLSON

The value of butter in the diet. C. U. MOORE. *Northwest Med.* 26, 29-30(1927).—When vegetable fats are substituted for butter in the diet of rats and puppies, their growth is stunted. Vegetable fats cause a deficiency in calcification resulting in greater fragility of the bones together with increased transparency to x rays. Clinical experiences indicate that children respond in a similar way.

F—PHYSIOLOGY

E. K. MARSHALL, JR.

Histologic studies on the fat content of the normal human thyroid. R. H. JAFFÉ. *Arch. Path. Lab. Med.* 3, 955-62(1927).—The lipid droplets found in the epithelium of the thyroid gland in human beings are the products of the secretory activity of these cells. According to their staining reactions, they consist mainly of mists of phospholipins. They are discharged into the colloid secretion of the thyroid gland where they are dissolved gradually. The excretion of the lipins starts after the first year of life and increases with age. Diseases do not seem to have any influence on the intensity of the lipid excretion. In 45% of the thyroid glands distinct staining of the plasma of the smaller blood vessels with Sudan III was observed, suggesting that the blood that circulates about the vesicles is rich in fat. Both clinical and exptl. data are available which, in accordance with the microscopic observations, point toward some relation between the fat metabolism and the function of the thyroid.

HARRIET F. HOLMES

The method for graphic determination of the total gaseous exchange in man during muscular activity. J. G. DUSSEER DE BARENNE AND G. C. E. BURGER. *Proc. Acad. Sci. Amsterdam* 29, 1075-80(1926); cf. *C. A.* 19, 88, 679, 1873.—The method previously described by the authors is applied to the detn. of the total gaseous exchange in man before, during and after muscular activity.

DAVID DAVIDSON

The sugar metabolism of the nervous system. HANS WINTERSTEIN. *Sitzb. Abhandl. naturforsch. Ges. Rostock* 1, 7-12(1925-6).—In the resting state, a loss of glycogen occurs in the isolated surviving central nervous system of the frog, which is greater than that occurring during elec. stimulation. The addn. of sugar to the surrounding medium has no appreciable influence unless insulin is added, when extensive synthesis of glycogen and cerebroside takes place. The simultaneous action of insulin, sugar and elec. stimulation greatly enhances this synthesis so that the carbohydrate content may exceed that of the fresh prepn.

DAVID DAVIDSON

New investigations of the nitrogen exchange of the central nervous organs. HANS WINTERSTEIN. *Sitzb. Abhandl. naturforsch. Ges. Rostock* 1, 13-4(1925-6); cf. *C. A.* 20, 365.—The nitrogenous substances given off to the surrounding medium by the surviving isolated central nervous system of the frog in the resting state consist of NH_3 and protein (few %), N titratable by CH_2O and water-sol. lipoids (28-9%) and N of unknown origin (about 25%). When stimulated by the elec. current the ammonia and protein N remain unchanged, the lipid N increases somewhat, while the N titratable by CH_2O and that of unknown origin are increased several times. The addn. of glucose affects N economy, particularly during stimulation, when all of the effect may be borne by the sugar. Sick animals show an increased protein excretion and a greatly

increased metabolism under stimulation Narcosis diminishes the N exchange to undetectable limits.

DAVID DAVIDSON

Historical development and conquests of biochemical methods in physiology. A. CLEMENTI. *Arch. farmacol. sper.* **43**, 129-41(1927).—An address, introductory to a course in human physiology at the Univ. of Catania.

A. W. DOX

Preliminary communication on the excretion of kynurenic acid in the bile. Y. KOTAKE AND K. ICHIHARA. *Z. physiol. Chem.* **169**, 1-2(1927).—After subcutaneous injection of 2.0 g. tryptophan in a dog with biliary fistula, 0.061 g. kynurenic acid was recovered from the bile and 0.3572 g. from the urine in 24 hrs. In a 2nd expt. 0.2327 g. was isolated from the bile and 0.1842 g. from the urine. The excretion of kynurenic acid in the bile now explains the wide variations often observed in the urinary excretion of this acid after administration of tryptophan.

A. W. DOX

The relationship of the hydrogen ion to the genesis of the cardiac rhythm. E. P. CARTER AND E. COWLES ANDRUS. *J. Clin. Investigation (Proc.)* **2**, 599(1926).—The effect of p_{H} changes of the fluid bathing the isolated heart on the origin and spread of the excitatory process was studied. It is suggested that the rate of origin and propagation of this process is dependent upon the difference of $[\text{H}^+]$ within and without the cardiac cells.

ARTHUR GROLLMAN

A study of red blood cell permeability. J. P. PETERS, A. J. EISENMAN AND A. M. WAKEMAN. *J. Clin. Investigation (Proc.)* **2**, 603-4(1926).—The distribution of base between human blood cells and serum after the addition of NaCl, KCl, Na_2CO_3 and K_2CO_3 was determined. Whether equimolar amounts of Na or K were added, the changes in distribution of H_2O , Cl and CO_2 were quantitatively identical and hence there was no evidence of any change in distribution of base between cell and serum.

ARTHUR GROLLMAN

The carbon dioxide equilibrium in alveolar air and arterial blood during exercise. A. V. BOCK, D. B. DILL, J. S. LAWRENCE AND L. M. HURXTHAL. *J. Clin. Investigation (Proc.)* **2**, 604(1926).—By a modification of the Haldane Priestley method for obtaining samples of alveolar CO_2 during exercise, a close agreement between the CO_2 tension in the alveoli and arterial blood was demonstrated.

A. G.

Energy used in "sprint" running. K. FURUSAWA, A. V. HILL AND J. L. PARKINSON. *Proc. Roy. Soc. (London)* **B102**, 43-50(1927).—Upon comparison of the mechanical work done in sprint running against the viscous resistance of the muscles with the O_2 consumption during recovery from the effort, the mechanical efficiency was found to be approximately 38%. In a 200-yard sprint, the maximum velocity attained was 11.46 yards per sec. with an energy output of 8.5 horse power, and a lactic acid production in the muscles of more than 4 g. per sec.

JOSEPH S. HEPBURN

Occurrence of the estrus cycle after x-ray sterilization. IV. Irradiation of the adult during pregnancy and lactation, and general summary. A. S. PARKES. *Proc. Roy. Soc. (London)* **B102**, 51-62(1927); cf. *C. A.* **21**, 2934.—The periodicity of estrus apparently is due to the periodic attainment of a threshold value by estrin. The synchronization of ovulation and estrus is probably due to a common stimulus.

JOSEPH S. HEPBURN

Experiments concerning the question of secretion of phenolsulfonephthalein by the renal tubule. A. N. RICHARDS AND J. B. BARNWELL. *Proc. Roy. Soc. (London)* **B102**, 72-91(1927).—Phenol red, applied to the decapsulated kidney (rabbit or frog), passes into the urine eliminated by it. When NaCl solution is made to flow from the ureter through the tubule to Bowman's capsule, while the renal portal system is perfused with phenol red solution, that dye can be identified in the liquid collected from the capsule. Even when circulation through the glomerulus is completely obstructed, phenol red enters the tubule and becomes concentrated there. On immersion of an excised frog kidney in oxygenated phenol red solution, the dye passes into the tubule and becomes concentrated. This apparent secretion of phenol red by the tubule cells is best explained by (1) diffusion of dye and water into the tubule at one level, (2) active extrusion of water and retention of dye at another level, and (3) a fluid current within the tubule from the one level to the other. This explanation is supported by the action of cyanides. When cyanides are used to abolish the vitality of the tubule cells, they also abolish the power of the excised kidney to concentrate phenol red within its tubules, but do not prevent entrance of the dye into the tubules; they also abolish the power of the tubules to retain phenol red, and stop the fluid current, which can otherwise be demonstrated by noting the progressive changes in the distribution of C or a colloidal dye injected into the tubule.

JOSEPH S. HEPBURN

Coagulation of hemoglobin in the presence of alcohols. II. B. JIRGENSONS. *Kolloid-Z.* **42**, 59-65(1927); cf. *C. A.* **21**, 2924.—The coagulation of hemoglobin in the

presence of varying concns. of MeOH, EtOH and PrOH and of $MgCl_2$ and $CaCl_2$ has been studied in order to det. the relations between alc. and salt concns. and coagulation. In the presence of 0.0033 M $CaCl_2$ all 3 alcs. sensitize the coagulation in all concns. up to 60% alc. At higher salt concns. (0.5–1.0 M) EtOH and PrOH exert stabilizing effects. MeOH sensitizes the coagulation under all conditions investigated. EtOH sensitizes the coagulation at all alc. concns. when only small quantities of $MgCl_2$ or $CaCl_2$ are present; at higher salt concns. EtOH has a stabilizing action when it itself is present in large amts. The lower concn. limits for the stabilizing action are approx. 0.2 M $CaCl_2$ and 63% alc. PrOH acts similar to EtOH; the lower concn. limits for the stabilizing effect are 0.2 M $CaCl_2$ and 53% alc. At lower salt concns. larger concns. of EtOH and PrOH are necessary to stabilize the hemoglobin soln.; as the salt concn. is increased less alc. is necessary. A large amt. of tabulated data is given and the results are shown graphically. C. D. INGERSOLL.

The storage of water by various tissues of the body. HAROLD SKELTON. *Arch. Internal Med.* 40, 140–52 (1927).—The distribution of water in man, in the rat, dog, cat and rabbit is tabulated. The muscles contain 50, the skin 25, the blood 7% (plasma 67, corpuscles 33%) of the water. The effects of hemorrhage, dehydration, fasting and injections of distil. water, hypo-, iso- and hypertonic NaCl and 1.2 and 1.4% $CaCl_2$ are described in detail. Conclusion: Muscle is the main water depot. It loses the least amt. of water per g. tissue, gives up the most fluid in hydration and takes up the greatest portion of the water added. The skin is second in importance as a water reserve. Changes of water content affect the liver and intestines first. The response of the various tissues to a change of water content, especially following hemorrhage or injections of distil. water or hypotonic NaCl, is in agreement with Starling's interpretation of capillary permeability. MARY JACOBSEN.

Fat embolism. Experimental studies. DINO VANUCCI AND PIERO FRANCESCHINI. *Arch. ital. chir.* 16, 585–681 (1926). II. Considerations on the fate of fat introduced into circulation. PIERO FRANCESCHINI AND DINO VANUCCI. *Scritti biol.* 1926, 163–88; *Ber. ges. Physiol. expil. Pharmacol.* 40, 648–9. MARY JACOBSEN.

Muscle contracture and rigidity. FIL. BOTTAZZI. *Arch. sci. biol. (Italy)* 8, 417–447 (1926).—When gradually heated in Ringer soln. or a paraffin oil bath contg. O_2 the striated amphibian muscle shows a shortening called heat contracture (I) at 35–40°, a 2nd contraction or heat rigidity (II) at 42–6° and a terminal contracture (III) at 51–60°. In the diaphragm muscle of the dog I occurs at 45° (slight precursor at 20°), II at 50°, III at 63–7°. I is reversible; II and III are not. III also takes place in dead muscle and is apparently caused by changes in connective tissue. The effect of low temps. discussed. The contracture of freezing occurs in striated and heart muscle of cold- and warm-blooded animals, but never in smooth muscle. Lactic acid is considered a prerequisite of its production. Muscles desiccated in air are capable only of III. $CHCl_3$ has the same effect, but mammalian muscle may be able to perform I and II if the exposure was but short. Moderate work, especially when carried out in an O_2 -free bath, lowers the temp. of I to 30° (lactic acid). Addn. of lactic acid has no effect on amphibian muscle up to 27°. On gradual heating a contraction begins at 30°, increases slowly toward 60° and ends in a sudden rupture of the muscle at 61° caused by the conversion of collagen to gelatin. Mammalian muscle shows in the presence of lactic acid a slow contraction at 30° resembling death rigor, which becomes more rapid at 37° to 40°. III occurs at 45°. Caffeine and to a lesser degree nicotine lower the temp. of contraction (I at 25°, II at 45°). Acetylcholine and novocaine have no effect; apparently they do not cause the formation of lactic acid. Veratrine causes contractures which are by far less intense than I and II and does not hasten the heat contractures. M. J.

Muscle tonus. A review. FIL. BOTTAZZI. *Arch. sci. biol. (Italy)* 8, 480–506 (1926).—A discussion of the current views on the contractile muscle elements, stimulation and the mechanism of contraction, the latter in connection with the theories of imbeddation, surface tension and gelification. B. has advanced the view that both fibrillae and sarcoplasm are contractile. The former contract rapidly and intermittently, the latter slowly and continuously. Under physiol. conditions both function jointly, even if not simultaneously. The physiol. tetanic contraction of striated muscle is the sum total of fibrillary contractions supported by sarcoplasm contraction. Normal tonus, partial muscle function, the contractures of decerebration, heat, cold, veratrine and nicotine depend chiefly on the function of the sarcoplasm. Since both tonic contractions and contractures occur *in vivo* without the intervention of poisons or abnormal tonus it is necessary to assume twofold innervation: one acting chiefly or exclusively on the fibrillae, the other on the sarcoplasm. Double (sympathetic and somatic) innervation could be eventually dispensed with. Somatic innervation alone, either with

twofold excitation depending on a different condition of nerves and substrate to which the stimulus is carried, or with a different stimulus conduction in each medium would satisfactorily account for the phenomena. B agrees with Cobb that convincing evidence of sympathetic muscle innervation has not been produced. MARY JACOBSEN

Spleen and carbohydrate metabolism. V. Glycogen formation. A. NOMA. *Okayama Igakkai Zasshi* 1926, 1185 1213. *Ber. ges. Physiol. exptl. Pharmacol.* 40, 384.—Glycogen formation, hyperglucemia and glucosurias are not affected by splenectomy. MARY JACOBSEN

The problem of calcium fixation in the body. C. SERONO. *Rass. clin., terap. sci. affini* 26, 123-7(1927).—The absorption and fixation of Ca and Mg in the body are detd. by org. phosphatides, which in their turn are fixed by cholesterol. An energetic metabolism produces enough CO₂ to maintain a sufficient concn of Ca and Mg in the body fluids. With progressing age production of phosphatides and basal metabolism slow down while the absorption of cholesterol, chiefly from the food, is not materially lowered. This leads to hypercholesterolemia and calcification of tissues. These degenerative changes of old age also appear in children under pathological conditions. The sluggish metabolism results in CO₂ deficiency and alkalosis followed by the pptn. of Ca and tetany. The convulsions of insulin overdosage are of the same origin (the hypoglucemia causing a decrease of blood CO₂). Similar metabolic disturbances occur in protracted diseases, such as tuberculosis, syphilis and malaria. In spite of their different origins the same treatment is recommended for rickets and the cachexia resulting from the above diseases: thyroid-parathyroid, combined with Ca and a diet rich in cholesterol or cholesterol injections. For hemorrhages, tetany and eclampsia 5% Ca lactate is recommended. Unlike all other Ca salts and gelatin it is painless on injection. For recalcification Ca₃(PO₄)₂ or Ca phospholactate is used in doses not over 1-2 g. Addn. of 8-10% Mg is recommended. MARY JACOBSEN

Physico-chemical theory of nerve functioning. P. LAZAREV. *Riv. biol.* 8, 638-57 (1926); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 715.—The excitation of nerves or sense organs is brought about by local changes in ion concn. For details see the original. The cond. of a visual red soln. increases on exposure to light and decreases again in the dark, the changes following the law of a monomol. reaction. MARY JACOBSEN

Reinjection of blood of the same organism. III. Modification of stability of blood suspensions by the injection of own and heterogeneous red cells. G. DI MACCO. *Riv. patol. sper* 2, 29-36(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 694.—The injection of the animal's own and of beef erythrocytes had the same effect. The sedimentation velocity was diminished even 1 hr. after injection. Viscosity and n were slightly lowered, the surface tension was slightly increased. The effect is attributed to a decrease in the percentage of serum proteins which in its turn is caused either by an influx of water from the tissues or by a surface action of the injected red cells. MARY JACOBSEN

The surface tension of urine in pregnancy. I. BASILEVIC AND A. JANCENKO. *Ukrainski med. visti* 2, 13-9(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 40, 705.—Out of 202 cases only 21% showed a lowered surface tension (bile salts) of the urine in the 1st 5 months of pregnancy. Urobilin was demonstrable in 30.3%, bilirubin only rarely. In the 2nd half of pregnancy and immediately *post partum* the surface tension was lowered in 60%, urobilin increased in 34%, bilirubin rarely. The results support the view of "pregnancy liver". MARY JACOBSEN

Changes in the human tracheal cartilage under physiological and pathological conditions. HANS NEVINNY. *Z. Konstitutionslehre* 13, 155-98(1927).—Detailed anatomical and histological study. The following chemical changes are discussed: calcification occurred in granular and plaque form. Albumoid degeneration was very frequently, the amyloid one never, encountered. Edema of the cartilage is detd. not only by pathol. body fluids but also by colloidal swelling of the tissue which needs further study. In incomplete involution of the cartilage fatty degeneration of the basic substance was never observed, but there was a strikingly high fat content of the cartilage cells, especially in the intermediate strata. MARY JACOBSEN

Extra-hepatic functions of bile. C. L. A. SCHMIDT. *Physiol. Rev.* 7, 129-50 (1927).—Review and bibliography taking up the role of bile as a reservoir of alkali, its property of activating enzymes and accelerating their action, its emulsifying effect on fat, its functions in regulating the intestinal bacterial flora and promoting intestinal peristalsis, its relation to the action of cathartics and its importance in other biological processes. E. R. LONG

Current views on "internal secretion." SWALE VINCENT. *Physiol. Rev.* 7, 288-319(1927).—Review and bibliography. E. R. LONG

Oxytocic power of the pituitary under different circumstances. C. PAK. *Arch. expl. Path. Pharmacol.* 114, 354-61 (1926).—The oxytocic power of the posterior lobe of the pituitary of the rat was not affected by As, x-rays, thyroid removal and CO poisoning. Diphtheria toxin and Hg poisoning caused a decrease; while elec. stimulation of the sympathetic nerve was followed by an increase. J. F. LYMAN

The antagonism of pituitrin and insulin. G. A. CLARK. *Proc. Physiol. Soc., J. Physiol.* 62, viii (1926).—Previous injection with ergotamine did not abolish the antagonism between pituitrin and insulin contrary to the results of Lawrence and Hewlett (*C. A.* 19, 3113). Pituitrin probably does not act by way of the sympathetic nervous system. J. F. LYMAN

Studies on the biochemistry of menstruation. KAREL KLAUS. *Biochem. Z.* 185, 3-10 (1927).—The blood of menstruating women contains a high choline concn. The choline is eliminated both in the sweat and in the menstrual blood but in either case, especially the latter, it undergoes bacterial decompn. with the liberation of trimethylamine (possibly also of di- and monoaniline), which is responsible for the sp. smell of the secretion during menstruation. S. MORGULIS

The enzymic lactic acid formation in muscle extract. IV. Cleavage of hexosemonophosphoric acid. OTTO MEYERHOF AND KARL LOHMANN. *Biochem. Z.* 185, 113-64 (1927); cf. *C. A.* 21, 2280. —Chemically the natural hexosemonophosphoric ester and the Robison and Newberg esters differ from the synthetic esters by their much greater reducing value (Bertrand method) and by their different aldose content. Unlike the synthetic esters or the hexosediphosphate they are more prone to spontaneous oxidation in phosphate soln., whereby the Newberg ester with a higher ketose content oxidizes 3-4 times as rapidly as the Robison ester and twice as rapidly as fructose. The monoesters are stronger acids than the di-esters, the Newberg and Robison acids having a p_{K_1} of 0.97 and 0.94 and p_{K_2} 6.11; while with the synthetic ester of Hatano $p_{K_1} = 0.61$, $p_{K_2} = 5.83$, and that of Nodzu $p_{K_1} = 0.84$, $p_{K_2} = 5.67$. The natural mono-esters are at first very rapidly hydrolyzed by muscle ext. whereby a part of the lactic acid is decompd. and another part is simultaneously synthesized to hexosediphosphoric acid. The accumulation of Harden-Young's acid is indicated by its rapid cleavage in the presence of arsenate, as well as at 37°, into equiv. amts. of lactic acid and H_3PO_4 . In the presence of F the splitting to lactic acid fails to materialize while the synthesis of the di-ester continues with the absorption of inorg. PO_4 . This cleavage-esterification reaction proceeds in the presence of coenzyme and is as sensitive as the cleavage of polysaccharides. Unlike the Robison or Newberg ester, the synthetic esters are almost as stable in muscle ext. as they also are in phosphate soln. The mono-ester manifests similar behavior in yeast ext. The hypothesis is postulated that the intermediary ester in the nascent state assumed to appear in carbohydrate cleavage by muscle or yeast ext. is a hexosemonophosphoric acid similar to that of Robison or Newberg. S. MORGULIS

Studies on the physiology of glands. LEON ASHER. CV. The influence of meat on the respiratory metabolism of rats fed on fat. A contribution to the physiology of the liver. TATYOSHI HONDA. *Biochem. Z.* 185, 173-91 (1927); cf. *C. A.* 21, 2328. —A one-sided diet of bacon causes a lowering of the basal metabolism of the rat as compared with the metabolism on a mixed diet. The specific-dynamic effect of meat, which has been detd. in rats on a mixed diet, is lost almost entirely when the rats are fed on bacon alone. Since the liver of these animals shows signs of fatty degeneration which progresses in a manner parallel to the loss of the specific-dynamic effect, it is thought that this may be a manifestation of altered liver function. CVI. **Effect of the thymus gland on the sensitivity to lack of oxygen with special reference to the respiratory center.** HANS STAMPFEL. *Ibid* 192-204. —Thyroidectomized guinea pigs behave toward lack of O practically as normal animals. Removal of the spleen makes them for a time much more sensitive to lack of O, which must be ascribed to the onset of thyroid hyperfunction since splenectomy does not cause anemia in the guinea pig. When both thymus and thyroid glands are removed the reaction is markedly different from that of the normal guinea pig because the respiratory center becomes much less sensitive. CVII. **Further studies on the mode of action of specific diuretics. The blocking of the normal reaction through intraperitoneal injection of distilled water.** G. M. CURTIS. *Ibid* 186, 95-111. —Injection of 100 cc. H_2O intraperitoneally practically suppresses the specific diuretic action of ephyllin, but when the intraperitoneal fluid becomes isotonic with the blood and has the same concn. of Cl an injection of ephyllin produces diuresis. CVIII. **Further studies on the mode of action of specific diuretics. The blocking of the normal reaction in rabbits with denervated kidneys.** G. M. CURTIS AND N. F. SCHAMBAUGH. *Ibid* 111-29. —Injection of distd. water into the peritoneal cavity of rabbits with completely denervated kidneys blocks

entirely the vigorous diuresis due to ephyllin. This blocking effect is not caused by a reflex vasoconstriction. Likewise, the increased urine excretion following total denervation of the kidney is inhibited by the presence of the peritoneal exudate. Analyses show that the blocking of the diuresis is caused by the removal of electrolytes from the body into the peritoneal cavity.

S. MORGULIS

The destruction of diacetic acid in the kidney. I. SNAPPER AND A. GRÜNBAUM. *Biochem. Z.* **185**, 223-8 (1927).—When the surviving kidney of the dog or sheep is perfused with blood to which diacetic acid was added only 27–55% of this is found in the kidney and blood. In 6 expts. 68, 67, 73, 52, 45 and 58% of the diacetic acid added (177 to 349 mg. calcd. as acetone) disappeared. Only a small part was changed to β -hydroxybutyric acid (5, 6, 1, 11, 6 and 8% of the added diacetic acid). In the liver, 16–33% of β -hydroxybutyric acid is oxidized to diacetic acid but very little of the added β -hydroxybutyric acid is destroyed. Likewise in the liver 50–60% of added diacetic acid is reduced to β -hydroxybutyric acid and very little is destroyed. The kidney, on the other hand, destroys a large part (29–70%) of the added β -hydroxybutyric acid without a simultaneous oxidation to diacetic acid, and, furthermore, destroys a large part (50–70%) of diacetic acid with only a very small (1–11%) conversion to β -hydroxybutyric acid. These results are only obtained in perfusion expts. with surviving kidneys, but not with the ground-up organ.

S. MORGULIS

The regulation of the hydrogen ion concentration in blood. I. Studies on the changes in potential of blood using the quinhydrone electrode and their theoretical significance. SCHAU-KUANG LIU. *Biochem. Z.* **185**, 242–54 (1927). The H and quinhydrone electrode give a difference of 0.01–0.01 pH. Blood from the left ventricle, dild. 1:4, gives a very regular series of potential changes using the Pt quinhydrone electrode, rising to a max. within the first min., remaining const. for 1–2 min., then slowly dropping off by about 1 milliv. per min. Au electrodes give more const. results.

II. Studies of the effect of solution and saturation of the quinhydrone on the potential changes in blood. *Ibid.* 255–62.—The quinhydrone potential changes of the blood are apparently due to such factors as oxidation-reduction, alteration in red cells, catalysis, etc. III. Studies on the potential changes of serum, plasma, red cell suspensions and hemoglobin solutions using the quinhydrone electrode. *Ibid.* 263–74. Plasma or serum, dild. 1:4, shows a rapid rise in potential which remains const. for 1/2 min. and then gradually declines. Buffered hemoglobin solns. or red cell suspensions give only a negligible alteration of potential.

S. MORGULIS

The behavior of the liver in rarefied air. A. LOEWY. *Biochem. Z.* **185**, 287–319 (1927).—At 250 mm. barometric pressure (corresponding to an altitude of 8500 m.) guinea pigs lose much more in wt. than control animals. In rats the difference was not as pronounced. The effect on the H₂O content of the liver is not definite, and seems to be greatly influenced by the method of killing the exptl. animals. The content of N substances in the liver is less than normal in rats at reduced pressure, and especially low in thyroidectomized rats under such barometric conditions. Furthermore, the non-protein fraction of the total N of the liver is very greatly increased, much more so than fasting alone would occasion. The av. increase in non-protein N of the liver of rats which died under low barometric pressure was 74%. In the thyroidectomized rats this increase was 190% on the av. The ether ext. of the liver is much more increased in guinea pigs than in rats at reduced pressure as compared with the liver fat content under similar conditions but at full atm. pressure. The increase in P content of the ether ext. indicates that the P contg. components of the liver (lipoids) are becoming constantly more sol. The P/N ratio in the liver increases above normal in rats under reduced pressure.

S. MORGULIS

The blood sugar problem. II. The quantity of the non-glucose fraction under different conditions. B. SJÖLÉMA. *Biochem. Z.* **185**, 355–61 (1927); cf. C. A. **21**, 2712.—Disaccharides are sepd. from glucose in blood filtrates by an adsorption reaction with charcoal which in the presence of 0.5% AcOH leaves only glucose in soln. but leaves also the disaccharides dissolved if sufficient ether is added. By this method 3 fractions are distinguished (glucose, disaccharide and non-sugar). In horse blood the total reducing substance for the plasma was 103.6 mg., of which the 3 fractions contained 82, 21.6 and 0 mg.; the corpuscles with a total of 135.9 mg. reducing substance had 64.9, 71 and 0 mg. of the 3 fractions, resp. From this and other detns. it is concluded that the non-glucose fraction is present chiefly in the corpuscles.

S. MORGULIS

Comparative studies on the sugar content of capillary and venous blood following muscle activity. M. DORLE AND W. LIEHR. *Biochem. Z.* **185**, 365–72 (1927).—The changes in blood sugar level of venous or capillary blood of an organ whose muscles are exercised are described. Generally the capillary blood sugar level rises if there is

no fatigue or falls in case fatigue does result. The venous blood sugar level remains more nearly const. S. MORGULIS

Cholesterol metabolism and the reticulo-endothelial system. F. GOEBEL AND H. GNOINSKI. *Biochem. Z.* 185, 484-9(1927).—See C. A. 21, 2929. S. M.

Studies on the physiology of the surviving mammalian heart. II. Comparative studies of the sugar consumption of the surviving cat heart with the older types of apparatus and with the improved Locke-Rosenheim apparatus. GEORG AMBRUS. *Biochem. Z.* 185, 442-9(1927). S. MORGULIS

Studies on the physiology of the surviving mammalian heart. III. The sugar consumption of hearts of different size as a function of the body surface or body weight. ZOLTÁN O-ZÓDI. *Biochem. Z.* 185, 450-69(1927); cf. C. A. 21, 2487.—The heart of cats weighing 2-3 kg. consumes 7 mg. sugar per hr. and per g. of fresh substance, which is greater than indicated by earlier investigations. It is pointed out that the consumption of sugar is more accurately expressed in terms of the dry substance or of the heart with its normal H₂O content (at beginning of expt.) than as is usually done, upon the basis of the wt. at the close of an expt. when the heart had absorbed much water. The sugar consumption of the heart of any species is greater the smaller the heart. The sugar consumption is not related apparently either to the frequency or force of the contraction of the surviving heart. S. MORGULIS

The distribution of oxygen in separate organs according to experiments on angiotomized dogs. E. S. LONDON AND L. M. RABINKOWA. *Biochem. Z.* 186, 155-7(1927).—The blood from the hepatic vein, kidney vein, as well as spleen and pancreatico-duodenal veins contains less N during digestion than in the fasting condition. Passing amino acids through the liver impoverishes the O₂ content of the blood. The right and left kidney veins contain different amts. of O₂. S. MORGULIS

Studies on the effect of high altitude. TH. BRÄHME AND P. GYÖRGY. *Biochem. Z.* 186, 213-21(1927).—The blood reaction changed to the acid side at 2400 m. in one subject, and in both exptl. subjects at 3400 m. altitude. The adrenaline reaction was very much increased at that height. The total base content of the blood is increased. S. MORGULIS

Note on the technic of the Geppert-Zuntz respiration experiment. J. TAECHTNER. *Biochem. Z.* 186, 264-8(1927). S. MORGULIS

"Perspiratio insensibilis": its nature and cause. FRANCIS G. BENEDICT AND CORNELIA GOLAY BENEDICT. *Biochem. Z.* 186, 278-312(1927); cf. C. A. 20, 3492.—87.5% of the total "perspiratio insensibilis" is due to water lost from the skin and lungs. S. MORGULIS

The occurrence of plasmalogen. II. The distribution of plasmalogen in animals. K. INHAUSER. *Biochem. Z.* 186, 360-75(1927).—Organs particularly rich in lipoids have the highest plasmalogen content. No distinct difference was observed between the different sexes but the serum of females seems to have somewhat more plasmalogen than that of males. Furthermore, the av. plasmal content of serum is characteristic for each species. S. MORGULIS

Fat metabolism. I. A. LÖW AND R. PFEILER. *Biochem. Z.* 187, 114-6(1927).—The petroleum ether fraction of the blood fat does not vary under the influence of adrenaline injections. A study of the alc. fraction, however, shows that the extd. lipid of the blood is greatly increased. S. MORGULIS

The lactic acid content of the cerebrospinal fluid. ANNELESE WITTGENSTEIN AND ALMA GAEDERTZ. *Biochem. Z.* 187, 137-45(1927).—In man and dog the lactic acid content of plasma at rest was found to be 15-18 mg. %, and in the cerebrospinal fluid 13-16 mg. %. Where the plasma lactic acid is low it corresponds to that of the cerebrospinal fluid. Expts. on dialysis of serum against NaCl-lactic acid solns. corroborate the view that the cerebrospinal fluid may be regarded as a dialysate of the plasma from the point of view of the lactic acid. The aq. humor of the eye, however, is entirely different in this respect, and its lactic acid content is considerably greater than that of the cerebrospinal fluid or even of the plasma. The lactic acid of the cerebrospinal fluid returns to its normal resting level and much slower than that of the plasma. In various forms of meningitis or tumors the rise in lactic acid of the cerebrospinal fluid is parallel to the fall in glucose. Suboccipital injection of alk. lactate is innocuous, but that of lactic acid causes a rise in lactic acid content of the cerebrospinal fluid and coma-tog. death. Also in *Klin. Wochschr.* 6, 1289-90(1927). S. MORGULIS

Conditions of autolytic ammonia formation in tissues. III. Relation of the tissue ammonia to the purine metabolism. P. GYÖRGY AND H. RÖTHLER. *Biochem. Z.* 187, 1-1219(1927); cf. C. A. 21, 423.—Liver, kidney, thymus and muscle tissue, as well as exts. of the same, can split off NH₃ from Na nucleinate or from adenosine. In blood

there was no evidence of deamination of the Na nucleinate. The course of the NH_3 formation showed the same dependence upon the H-ion concn. and of sugar or lactate with and without these addns. of purines. The optimum deamination with phosphate buffering is at p_{H} 5.2-5.5, except with muscle tissue where the optimum H-ion concn. is somewhat further on the alk. side. The alc. analogy between autolytic NH_3 formation and the deamination of purine bodies leads to the conclusion that the physiol. NH_3 formation in tissues is partly assocd. with the purine metabolism. The cellular NH_3 production would thus appear as a special manifestation of the activity of nucleus. It is further pointed out that the NH_3 metabolism stands in relation to glycolysis and respiration.

S. MORGULIS

The effect of the thyroid gland hormone on cellular metabolism. Experiments on leucocytes. W. FLEISCHMANN. *Biochem. Z.* **187**, 324-7(1927).—Cell respiration and glycolysis of exudate leucocytes from thyroidectomized animals are normal. The respiration of the leucocytes is unaffected by the addn. of thyroxin *in vitro* though the anaerobic glycolysis is markedly increased.

S. MORGULIS

Variations in the blood sugar of cattle. M. S. AWDEJEW, E. L. PROWATOROWA, N. G. SAWITSCH AND E. L. THAL. *Biochem. Z.* **187**, 369-76(1927).—The blood sugar of fasting cows is very low, and carbohydrate food causes no rise in the blood sugar level. The variations in blood sugar of the same animal on different days are greater than those of different animals. No relation was observed between the low sugar level or its variations and the secretion of milk.

S. MORGULIS

Studies on blood sugar following vagus stimulation and its relation to the insulin in muscle tissue. JÜRGEN LEHMANN. *Skand. Arch. Physiol.* **52**, 169-86(1927).—The vagus nerve of rabbits was exposed on both sides in the neck frozen with CO_2 snow and cut. The animals were under urethan anesthesia. The peripheral end of the right vagus was then stimulated (which stimulates the isles of Langerhans) and the changes in blood sugar were observed. The operative procedure, and especially the sepn. of the nerves, produced hyperglucemia. The stimulation of the right vagus gave a definite lowering of the blood sugar in 2 instances, the result was doubtful in 2 other instances and was definitely absent in 3 rabbits. The changes in blood sugar cannot therefore serve as an indicator of the reaction of the islands of Langerhans since Ahlgren has shown that there is an increase in the insulin content of muscles under these conditions of stimulation.

S. MORGULIS

Composition of living organisms. I. Inorganic elements contained in cats. V. S. SADIKOV AND M. K. SHCHEGL'SKA. *Bull. acad. sci. union rep. soviet social* **1926**, 1619-46.—The purpose of this investigation was to find quant. relations of chem. elements which are characteristic of a given species of animals. Seven expts were made on cats aged between 2 and 35 days and 2 expts. on grown cats. Each animal, after being weighed, was heated in an autoclave for 6 hrs. at $180-200^\circ$ whereupon they were transformed into mixtures consisting of an aqueous soln., oily substance and incompletely decomposed bones. On being treated first with ether, then with alc., these mixts. can be resolved into (1) an aq. fraction, (2) an ethereal fraction, (3) an alc. fraction, (4) a residual fraction. Five tables are given containing the percentages of various elements in the 4 fractions obtained from cats of various ages. In the course of the growth of cats the percentage of water in the living organism decreases with the increase of its total wt. Thus the water content is equal to 82.08% for 2-day-old cats, 70.17% for 35-day-old cats. One 6-month-old cat contained 66.6% water; a 2-year-old cat contained 73% water. **Aqueous fraction:** The % of elements C, H and N in the aq. fraction is identical for cats of all ages. The ash content of this fraction consists of water-sol. inorg. substances. Chlorides, phosphates and sulfates in the ashes decrease with the age of the cat, but the P content is about const. The **etheral fraction** is ash-free. The C content of this fraction is generally about 73%, but it decreases by about 5% in the case of very old cats. The **alcoholic fraction** contains chiefly the substances of the nervous system which are insol. in ether; consequently the increase of this fraction during the first weeks of growth of cats is due to upbuilding of the nervous system during this period. This fraction is ash-free. The C content increases with the growth of the cat; the N content is largest in old cats and smallest in well-nourished cats. The **residual fraction** consists chiefly of inorg. substances. The proportion of this fraction changes but little during the growth of cats and represents about 9.5% of their total weight. It contains neither C nor N and is rather rich in P, which chiefly presents itself in combination with Ca. **II. Inorganic elements contained in frogs.** V. S. SADIKOV AND R. A. GUTNER. *Ibid* **1927**, 95-116.—The compn. of frogs was investigated for a comparison with that of cats. While in order to decompose to a structureless mass the organism of a cat, it must be submitted to prolonged heating at $180-200^\circ$, with frog-

it is sufficient to operate at room temp. or at 38° under the action of some autolytic enzymes. Analyses are given for winter frogs which were in a state of hunger, autumn frogs which were well nourished and very young frogs.

BERNARD NELSON

Study of the physico-chemical basis of thrombosis. H. SCHULTE. *Med. Klinik.* 1926, 1003; *Colloides biol. clin. therap.* 1, 73(1927).—In isotonic solns. free from colloids, agglutination of the blood takes place at p_H of 4.3–3.5 and cataphoretic detns. show the isoelec. pt. to be at p_H 3.9–3.49, Na, Ca and Cl ions having no perceptible influence. Since such p_H values are never found *in vivo*, other factors must come into play in agglutination in the formation of thrombus, particularly the presence of other colloids.

A. PAPINEAU-COUTURE

Relations between the nucleic phosphorus index and other phosphorus indexes of the tissues. M. JAVILLIER AND H. ALLAIRE. *Bull. soc. chim. biol.* 9, 772–7(1927); cf. *C. A.* 21, 750, 951.—Tables are given which show the total P, lipidic P, nucleic P and mineral and undetd. org. P in 13 fresh and dry tissues of a healthy horse. The ratios of these fractions of P partition to the total P and to each other are calcd. The figures thus obtained are regarded as evidence that the different tissues contain a normal content of nucleic P, that there exists a physiol. index of nucleic P for each tissue of a given animal species, and that the different tissues vary in this respect so that the content of nucleic P constitutes a true characteristic or true index of each tissue (cf. following abstr.)

L. W. RIGGS

Nucleic phosphorus balance and phosphorus ratios during growth. M. JAVILLIER, H. ALLAIRE AND (Mlle.) SIMONE ROUSSEAU. *Bull. soc. chim. biol.* 9, 778–84(1927). See *C. A.* 21, 3208

L. W. RIGGS

Presence of lithium and strontium in human teeth and bones and their chemical state of combination. A. DESGREZ AND J. MEUNIER. *Compt. rend.* 185, 160–3(1927).—Li exists in bone and teeth as a phosphate. Sr is present as carbonate. It is probable that these elements pass from the blood into these tissues without changing their chem. form

L. W. RIGGS

Modification of the respiratory exchanges after removal of the thyroid or suprarenals from the rat. C. D. MASSEY. *Compt. rend. soc. biol.* 97, 405–6(1927).—After the extirpation of either the thyroid or suprarenals the basal metabolism falls. It falls still more when the other gland is removed, thus showing that each gland has its independent action.

L. W. RIGGS

Determination of respiratory exchanges in the rat and the rabbit. ARGENTINA ARTUNDO. *Compt. rend. soc. biol.* 97, 407–8(1927).—An illustration of the app. and description of the process are given. **Basal metabolism of rats deprived of suprarenals.** *Ibid.* 408–9.—The basal metabolism varied at different temps. In 6 rats which were kept at 30° the basal metabolism was not modified by removal of the suprarenals. **Summit metabolism of rats deprived of suprarenals.** *Ibid.* 409–10.—When the surrounding temp. is lowered during several days from 25° to 18° the metabolism rises more rapidly and distinctly in the decapsulated rats. On placing the rats successively at 30° , 15° and especially at 0° , the metabolism was elevated less after extirpation of the suprarenals. **Glucemia, glycogen and action of insulin in decapsulated rats.** *Ibid.* 411–3.—Rats decapsulated within 2 weeks were very sensitive to the hypoglycemic, toxic and convulsive effects of insulin even with doses which produced no symptoms in the controls. Rats decapsulated within 5 weeks were much less sensitive than the first lot, but much more sensitive than the controls. Hypoglycemia was more prolonged in the first lot than in the second lot or in the controls. Liver glycogen diminishes somewhat regularly according to the individual. Muscle glycogen diminishes more irregularly.

L. W. RIGGS

Glutathione and the reducing properties of tissues of decapsulated rats. B. A. HOUSSEY AND P. MAZZOCCO. *Compt. rend. soc. biol.* 97, 417–9(1927).—The suprarenals were extirpated under ether in 30 sec., a similar operation being made on the controls but without removing the suprarenals. The decapsulated rats showed an increase of reduced glutathione in the muscles which disappears in 32 to 36 days after the operation. The liver contains a variable content of reduced glutathione generally slightly less, while that of the kidneys was higher than in the controls.

L. W. RIGGS

Gastric digestion in children of three to fourteen years. F. LESNÁ, P. ZIZINE AND M. PICQUARD. *Compt. rend. soc. biol.* 97, 445–7(1927).—The gastric contents of about 30 normal children were sampled with the Einhorn tube after test meals of white of egg aromatized by orange-flower water. These samples, analyzed by standard methods, gave free HCl 0.22 g. per l., acids of fermentation 0.32, combined Cl 0.66 and total acidity 1.19. The corresponding figures for adults are 0.50, 0.20, 1.10 and 1.80. Lactic acid was generally present. The p_H value averaged 3.3 instead of 2.4 for adults.

The peptic activity was in proportion to the free HCl present, and was increased by the addn. to the test meal of NaCl, MgCl₂ and CaCl₂. L. W. RIGGS

Distribution of folliculin in the organism. L. BROUHA and H. SIMONNET. *Compt. rend. soc. biol.* **97**, 459-60(1927). Expts. with several species of animals proved that the follicular hormone exists in the blood and milk, but in a concn. inferior to that of the follicular liquid. The uterine muscle contains no folliculin during the diestrus. L. W. RIGGS

Partition of the total nitrogen in the lobes of the frog liver. CL. GAUTIER and H. P. THIERS. *Compt. rend. soc. biol.* **97**, 485-6(1927). The total N content per kg. of the right, left and median lobe of frog liver in May and June was substantially the same. L. W. RIGGS

Relation of smooth muscle tone to oxidation-reduction processes. J. M. JOHNSON, W. T. McCLOSKEY and CARL VORGLIN. *J. Pharmacol. Proc.* **31**, 201-2(1927). The contraction of smooth muscle was observed after substances "which presumably affect biological oxidation-reduction processes" were added to the surrounding bath. Increased tone of guinea pig uterus was seen after cysteine, both forms of glutathione, other amino acids, NaCN, Na₂S, etc. Slight increase in the tone of rabbit jejunum was seen after H₂O₂, reduced glutathione and cysteine. "The conclusion is reached that oxidation-reduction processes influence the tone of the 2 types of smooth muscle used." GEORGE ERIC SIMPSON

Connection between tension and lactic acid formation in muscle during tetanic contraction. JULIUS SURANYI. *Arch. ges. Physiol.* (Pflüger's) **214**, 228-30(1926). The tetanic coeff. in indirect stimulation is definitely greater (some 20%) than with direct stimulation, and the formation of lactic acid is somewhat greater with indirect than with direct stimulation. G. H. S.

Regulation of metabolism. VII. Glycogen deposition in artificially stimulated denervated muscle. AUGUSTE HOFFMANN and ERNST WERTHEIMER. *Arch. ges. Physiol.* (Pflüger's) **216**, 337-40(1927), cf. *C. A.* **21**, 2298. Muscle deprived of nerves gain but little or no glycogen, but if subjected to elec. stimulation large amts. are deposited. G. H. S.

Effect of high altitudes on the animal organism. EMIL ABDERHALDEN, NINA KOTSCHNEFF, E. S. LONDON, A. LOEWY, LUBOW RABINKOWA, GEORG ROSKE, ERNST ROSSNER and ERNST WERTHEIMER. *Arch. ges. Physiol.* (Pflüger's) **216**, 362-95(1927). -- In passing from a low to a high altitude the no. of red cells in the blood increases; it falls if the animal goes from a high to a lower level. In animals native to high altitudes transfer to a lower level caused a reduction in red cells, but it takes place more slowly than in animals indigenous to the plains. Those animals native to high altitudes have an extremely small no. of white cells. In general the no. of white cells are reduced in passing to a high altitude, while the viscosity of the blood varies in different vascular beds, being lower in the peripheral circulation than in deeper beds. The sedimentation velocity of the red cells also varied. The total blood vol. was not changed by passage from one level to another, nor is there any alteration in the p_{H_2O} or blood sugar. The alkali reserve falls upon ascending the mountains, while the K and Ca content show fluctuations and the P_2O_5 is increased. At all altitudes the blood sugar is higher in the hepatic vein than elsewhere, while the peripheral blood and that of the renal vessels are the same. In general there was more fat in the blood of the portal vein than in that of other beds. Blood from the renal vessels showed high Cl values and higher P_2O_5 than the blood from the other regions tested. The degree of O satn. in the blood varies with the vascular bed and is modified by altitude, while the CO₂ tension varies within normal limits. G. H. S.

Effect of some inorganic salts on the contraction capacity of muscles. RUDOLF HÖBER. *Arch. ges. Physiol.* (Pflüger's) **216**, 402-19(1927). -- In general the smooth muscle of both vertebrates and invertebrates is relatively resistant to K while striated muscle is susceptible. G. H. S.

Urine formation in the frog kidney. XI. Secretory activity of the glomeruli. RUDOLF HÖBER and ERICH MACKUTH. *Arch. ges. Physiol.* (Pflüger's) **216**, 420-31(1927). -- Narcotics, KCN and N cause a reversible inhibition of urine formation in the isolated kidney undergoing perfusion with a modified Ringer soln., even though the perfusion rate is not altered. This also happens if the tubules have been treated through the portal vein with sublimate. Treatment of the glomeruli with sublimate also interferes with urine secretion. G. H. S.

Effect of definite hormones on metabolism. III. Effect of adrenaline on conjunction with an adequate diet. P. JUNKERSDORF and H. SCHÜLLER. *Arch. ges. Physiol.* (Pflüger's) **216**, 549-54(1927), cf. *C. A.* **20**, 1442. -- With dogs of various races, different

ages, and in various nutritional states the metabolism varied in accord with the amt. of adrenaline given, its mode of administration, and the physical condition of the animal at the beginning of the expt. **A** G. H. S.

Effect of spermine on the motility of spermatozoa. ERNST REDENZ. *Arch. ges. Physiol.* (Pflüger's) **216**, 605-10(1927).—Spermine does not protract the period of motility of sperm cells. G. H. S.

Physical chemistry of leucocytic emigration. J. JOCHIMS. *Arch. ges. Physiol.* (Pflüger's) **216**, 611-23(1927).—In a neutral isotonic soln. leucocytes migrate in all directions, but if a weakly acid soln. is added (p_H 6.3 or 6.0) they migrate toward the acid. Alk. solns. (p_H 8.5) are without effect on the direction of movement. Migration is not modified by isotonic neutral solns. of NaCl, KCl and $MgCl_2$, but $CaCl_2$ and $BaCl_2$ stimulate movement. G. H. S.

Studies on growth. III. Chemical changes in the entire body and in organs during post-uterine development. DORA HAX. *Arch. ges. Physiol.* (Pflüger's) **216**, 627-39(1927).—Data are tabulated showing the variations in glycogen, fat and water content of different organs of dogs at various ages after birth. **IV. Changes in the weight and in the chemical composition of the entire body and of organs during fetal development. Changes in the body of the mother during pregnancy.** FR. LIESENFELD, H. DAHMEN AND P. JUNKERSDORF. *Ibid* 712-28. —In the mother the most outspoken changes are those of the liver and heart, in the fetus the characteristic changes are those involving the relative wt. and chem. compn. of the liver, thymus, kidneys, spleen, pancreas and heart. G. H. S.

Secretion of the adrenals in angiotomized dogs. P. J. POWOW. *Arch. ges. Physiol.* (Pflüger's) **216**, 651-6(1927).—The blood of such animals contains an increased content of adrenaline. G. H. S.

The all-or-none law and metabolism. HANS WINTERSTEIN AND ELSE HIRSCHBERG. *Arch. ges. Physiol.* (Pflüger's) **216**, 671-80(1927).—The O utilization of the spinal cord, peripheral nerves, skeletal muscle and gastric musculature of frogs in salt soln. under elec. stimulation increases with the increase in stimulation. Frog stomach in an O atm. shows a reversal of this relationship. With frog heart the O use is quite independent of the degree of stimulation. G. H. S.

Physiology of the thymus glands. F. D. AGAFONOW. *Arch. ges. Physiol.* (Pflüger's) **216**, 682-96(1927).—In frogs bilateral extirpation of the thymus does not lead to any serious ill effects. Exts. of the gland are active on the frog heart when applied by any method, and when injected intravenously into mammals they affect the inhibition app. of the heart. The administration of atropine prevents the characteristic reaction of the exts. Exts. prepd. *in vitro* do not accelerate blood coagulation. The effect on the blood pressure is not removed by elimination of the choline. The exts., given intravenously, cause first a reduced irritability of the nerves, and later an increase. Treatment of the exts. with alc. or acetone deprives the exts. of some of their effects on heart and nerves. In many respects exts. of lymph nodes react as do preps. of the thymus, although they are without effect on the pulse and the irritability of the vagus. G. H. S.

Sex specificity of the internal secretions of the germinal glands. JOACHIM LEHMANN. *Arch. ges. Physiol.* (Pflüger's) **216**, 729-48(1927).—Specificity of the hormones is demonstrated. G. H. S.

A hormone of heart activity. VI. Stimulus substance of the heart. L. HABERLANDT. *Arch. ges. Physiol.* (Pflüger's) **216**, 778-88(1927); cf. *C. A.* **21**, 1143. **VII. Independence of the formation of stimulus substance from the sympathetic nervous system of the heart.** *Ibid* 789-95.—A stimulating substance is demonstrated, whose origin is independent of the sympathetic system. G. H. S.

Reaction of the blood in frogs. LIDIA HERTWIG-HONDRU. *Arch. ges. Physiol.* (Pflüger's) **216**, 796-7(1927).—By giving boric acid by mouth the reaction of the blood could be changed from p_H 7.46 to 7.39, while Na_2CO_3 given in the same way caused a shift from 7.46 to 7.92. G. H. S.

LABBÉ, MARCEL, AND VIOLLE, P. L.: *Le métabolisme de l'eau*. Paris: 1927. Masson & Cie. 256 pp.; 28 francs. Reviewed in *Bull. soc. hyg. aliment.* **15**, 262-3(1927).

G—PATHOLOGY

H. GIDEON WELLS

Blood sugar and urinary D:N ratio in the hours following pancreatectomy. W. CHAMBERS. *Am. J. Physiol.* **76**, 205-6(1926); cf. *C. A.* **21**, 764.—During the opera-

tion there is a distinct fall in N excretion and no change in blood sugar. There is a rapid rise in both following pancreatectomy with a max. at about the 21st hr.

J. B. BROWN

Blood changes and experimental cretinism, hyperthyroidism and myxedema. MARGARETE M. KUNDE. *Am. J. Physiol.* **76**, 225(1926).—In rabbits suffering from hypothyroidism the following blood changes are noticed: marked secondary anemia, with low hemoglobin and red cell count; increased cholesterol; and not much change in Ca. After administration of thyroïl there is a polycythemia, with hemoglobin still below normal, decrease in cholesterol and slight increase in Ca. H_2O is excreted from the skin. The cretin scales are high in cholesterol.

J. B. BROWN

Edema by perfusions with saline solutions and the reaction of the perfusion liquid. TULLIO GAYDA. *Arch. sci. biol.* **9**, 354 61(1927).—When a prepn consisting of the head, heart and extremities of a frog is perfused with Ringer-Locke soln., an edema is produced in these organs which varies with the p_H of the soln. The edema is a min. for p_H 4.7, while for values either above or below this the value first increases and then decreases, having 2 maxima at p_H 3.1 and 10.3. Since p_H 4.7 is the isoelec. point for muscular protein material, and since the variation in intensity of edema with p_H corresponds to the variation in osmotic pressure with p_H , G. concludes that edema by perfusion with saline solns. is a phenomenon of osmosis.

A. W. CONTIERI

Different behaviors of the central and cortical substances of the crystalline lens in post-mortem cataract. G. BUGLIA. *Arch. fisiol.* **24**, 451-9(1926); *Physiol. Abstracts* **12**, 15. —The isoelec. point of the protein of the cortical substance of the crystalline lens is more displaced toward the acid zone than that of the protein of the central or nuclear portion. In addn, the cortical protein has a greater capacity to mask the H^+ than the nuclear protein. This explains why the 2 portions of the lens behave somewhat differently in the so-called post mortem cataract as well as in certain other forms of opacity of the same tissue.

H. G.

A new protein from the placenta in a case of nephrosis of pregnancy. ERNST SCHWARZKOPF AND HERMANN SIEVERS. *Deut. med. Wochschr.* **53**, 1303-4(1927).—A protein of the Bence-Jones type was derived from the placenta in the case of a nephrosis of pregnancy. Initial pptn. of the new protein took place at 65°, max. pptn. at 85°, and partial soln. above 85°.

ARTHUR GROLLMAN

The blood peptide nitrogen in arterial hypertension. HENRY JACKSON, JR., D. W. SHERWOOD AND OLIVE J. MOORE. *J. Biol. Chem.* **74**, 231-3(1927).—In a series of 50 cases, 34 of whom had hypertension, no evidence was found to show that the peptide N in hypertension rises sufficiently to be of etiological importance.

A. G.

Oxygen consumption, oxygen debt and lactic acid in circulatory failure. JONATHAN MEAKINS AND C. N. H. LONG. *J. Clin. Investigation* **4**, 273-93(1927).

A. G.

The cholesterol problem in gastric pathology. LEO JARNO. *Wiener med. Wochschr.* **77**, 1005 6(1927).—Gastric ulcer is accompanied by a hypocholesterolemia which may be influenced by *salvarsin* medication. There is a definite inverse relation between the blood cholesterol values and gastric acidity.

ARTHUR GROLLMAN

Tuberculous meningitis, tuberculoma and the total chlorides in the spinal fluid. R. L. PITFIELD. *Arch. Pediatrics* **44**, 502-7(1927).—The total chlorides of the spinal fluid were decreased in a fatal case of tuberculous meningitis (581 mg. per 100 cc.) and in a fatal case of tuberculoma of the medulla (650 to 707 mg.).

JOSEPH S. HEPBURN

The enzyme theory of antibody formation. W. H. MANWARING. *Sci. Monthly* **1927**, 362 9.

E. H.

The calcium content of the tissue fluids in spasmophilic and non-spasmophilic conditions. N. MALMBERG. *Acta paediatr.* **6**, 241 9(1926); *Ber. ges. Physiol. expil. Pharmacol.* **40**, 232.—The Ca content of tissue fluids in tetanic and normal infants was the same as that of the blood.

MARY JACOBSEN

The pathology of metabolism in obesity. H. C. HAGEDORN, C. HOLTEN AND A. HECHT JENSEN. *Arch. Internal Med.* **40**, 30 7(1927).—After 2 days of a diet consisting chiefly of carbohydrates the respiratory quotient was lower in obese than in normal persons, the lower, the higher the percentage of overweight. Conclusion: Obesity is caused by excess conversion of carbohydrate into fat.

MARY JACOBSEN

Calcium studies in jaundice. With special reference to the effect of parathyroid extract on the distribution of calcium. A. CANTAROW, S. M. DODEK AND BURGESS GORDON. *Arch. Internal Med.* **40**, 129-39(1927).—In jaundice the serum contained 9.3-12 (normally 10.09-10.45), the blood 4.8-12 mg. Ca per 100 cc. The Ca content reached the normal level 12 hrs. after the administration of parathyroid hormone. The Ca deficiency is probably caused by the excess bile acids in the blood. The tendency of jaundiced tissues to bleed is favorably influenced by the treatment.

M. J.

Diseases of the liver. VI. A comparative study of certain tests for hepatic function in cases of cirrhosis of the liver. C. H. GREENE, C. S. McVICAR, A. M. SNELL AND L. G. ROWNTREE. *Arch. Internat. Med.* 40, 159-81(1927); cf. *C. A.* 20, 3503.—Of the tests studied, fructose tolerance, N partition, fibrinolytic element, serum bilirubin (I) and phenoltetrachlorophthalein (II) only I and II are of clinical importance in liver cirrhosis. I is particularly valuable in detg. the degree of bile retention. II is always present and more pronounced than might be expected from I. It is particularly useful in liver cirrhosis with ascites and serves as "an index to the existing functional balance between degenerative and reparative changes in the liver. As such the observations are largely independent of the amt. of ascitic fluid" MARY JACOBSEN

Blood bilirubin. Estimation and clinical significance. F. S. PERKIN. *Arch. Internal Med.* 40, 195-202(1927).—The normal bilirubin content as detd. by the Thannhauser-Andersen method in P's modification was 0.5-3.5 mg. per 100 cc. blood independently of age and sex. It is but slightly affected by pigmentation and only slightly lowered by fasting. It suffers significant changes in As and Pb poisoning, various liver and gall bladder diseases, pernicious anemia and purpura. Although a valuable diagnostic aid in liver diseases it often does not permit differential diagnosis. The test is particularly recommended for the early detection of possible liver damage in patients receiving As.

MARY JACOBSEN

Effect of exercise on respiratory exchange in heart disease. II. J. M. H. CAMPBELL AND F. J. SALE. *Arch. Internal Med.* 40, 237-50(1927).—Exercise equiv. to slow and ordinary walking produced little change from normal (3 patients). There was a linear increase of ventilation and circulation with the work done. The O_2 intake was only slightly higher than normal. The CO_2 elimination showed greater differences, causing the respiratory quotient to fall more than usually in the beginning and to rise considerably more toward the end. The CO_2 % in the expired air was low since overventilation had to compensate for defective circulation.

MARY JACOBSEN

Study of the physico-chemical properties of tissues in relation to the normal and pathological condition of the organism. II. Study of mouse tissues and tumors. F. VLÈS AND A. DE COULON. *Arch. phys. biol.* 5, 125-60(1926); cf. *C. A.* 20, 1249.—A new series of expts. with C, emery powder, corundum, Au, Fe, Zn, Pb and staphylococci injections and with burns confirmed the former findings: the receptivity of mice for implanted tumors increases and decreases parallel with the p_H of the isoelec. point. From the therapeutic point of view the following substances are of interest which produce a progressive and relatively lasting, even if not very powerful, inhibitory effect: coarse emery powder, C, Au and possibly also burns. There is no distinct relation between the chem. nature of the substance employed and its effect. It is noteworthy that at the time zero the receptivity was always the same in spite of the variety of the substances employed. The min. p_H is usually coincident with the interval between the critical point (inversion of the receptivity index) and the min. receptivity. A powerful inhibitory effect is mostly associated with a long interval between injection and critical point and between the latter and min. receptivity. III. Studies of human serum. *Publ.* 161-211.—Within the p_H limits studied (5-12) human normal and pathol. sera exhibit certain, more or less const., isoelec. points. For normal adult men these points are: α at about 5.5, β below 5.0, γ between 9 and 12, δ above 12. Not all points are always represented by the same sample. In the serum of women γ is mostly absent, except in pregnancy when it is usually very low, and, like α , subject to considerable fluctuations. The α of virgins is remarkably const., 5.5; that of mature women is 6.5. There is a pronounced displacement, mostly an increase of α in acute infectious diseases and in syphilis, a less pronounced one in more chronic processes, like tuberculosis. In these conditions γ is rarely present. Severe cases with impending death are often associated with a complete absence of isoelec. points between p_H 4 and 12. The isoelec. points may be influenced by medication. Their displacement in dependence upon the condition of health permits an interpretation of the various serum flocculation reactions.

MARY JACOBSEN

The blood calcium of patients with bone fractures during the period of callus formation. LUIGI BAJ. *Gior. batteriol. immunol.* 2, 94-100(1927); *Ber. ges. Physiol. u. exp. Pharmacol.* 40, 550-1.—The blood Ca is above normal during the period of callus formation. Immediately after the fracture it is 10.2 mg/100 cc. in patients 5-14 years old and 8.4 mg. in adults (controls 9.3 and 7.85, resp.). A max. is passed on the 18-22nd day, 10.8 and 8.9, resp. The values decrease subsequently but remain above normal for some time after clinical recovery. Only 1 case presented progressive Ca decrease of unknown origin.

MARY JACOBSEN

The mechanism of the action of curative vaccines. The behavior of a few physico-

chemical properties of the serum of children treated with typhoid vaccine. MICHELE GERBASI. *Pediatrics rivista* 35, 857-76(1927).—The changes of surface tension and serum protein during vaccine shock vary in degree and sign. The conductivity is first increased, then notably diminished at the height of shock. These phenomena were observed in normal children and in typhoid patients.

MARY JACOBSEN

Changes in the physico-chemical constants of blood in anemia. II. Viscosity and coagulability. M. GIUFFRÉ. *Pediatrics rivista* 35, 877-80(1927); cf. *C. A.* 21, 2734.—Various forms of anemia (aplastic, Jaksch-Hayem, leishmaniasis, infantile scurvy, luetic hemolytic icterus) are associated with a constant decrease of viscosity and an increase of coagulation time.

MARY JACOBSEN

Blood phosphorus in some diseases of childhood. ALESSANDRO LAURINISCH. *Pediatrics rivista* 35, 913-9(1927).—The blood P was 4.84 mg/100 cc. in 25 normal, and 3.19 in 25 adenoid children; 2.2-3.0 in mongolism, 3.1-3.3 in myxedema, 5.1-3.1 in Oppenheim's disease (a few cases each). Deaf but normal children had a normal blood P.

MARY JACOBSEN

Erythrocyte resistance in anemias of infancy. S. BARBERI. *Pediatrics rivista* 35, 935-45(1927).—The max. and mostly also the medium resistance to hypotonic NaCl is increased in regenerative and decreased in non-regenerative anemias. The min. resistance is mostly normal, sometimes lowered. With the progress of clinical improvement the resistance tends to become normal, but a return to normal means an unfavorable prognosis when it is associated with an otherwise aggravated condition. When the hemolysis is preceded by CO₂ treatment the behavior resembles that of whole blood.

MARY JACOBSEN

Indicanemia in nephritics and the experimental production of nephritis by indole. G. PHOCAS. *Ann. inst. Pasteur* 41, 576-81(1927).—The elimination of indican is increased in the urine of nephritics. The indicanemia in this case is probably the result of an overproduction of indole. Nephritis once established probably tends to retention of indican. Small doses of indole, individually harmless, when given over a long period of time lead to chronic nephritis in the rabbit. On the theory that indole produced in ordinary human metabolism tends to cause nephritis P. advocates the therapeutic use of small daily doses of sulfuric ions and glucose to detoxicate the indole, where there is evidence of its excessive production.

E. R. LONG

Effect of mechanical obstruction of the hepatic veins upon the outflow of lymph from the thoracic duct. J. P. SIMONDS AND W. W. BRANDES. *J. Immunol.* 13, 11-7 (1927). Simple mech. obstruction of the hepatic veins in otherwise normal dogs increases the outflow of lymph from the thoracic duct from 2.4 to 6.2 times, with an av. of 5.2 times the normal. Since, as previously shown, little or no blood escapes from the liver during the height of anaphylactic and peptone shock, it is suggested that engorgement of the liver due to obstruction to outflow of blood may be an important factor in the increased output of lymph in these 2 types of shock. The substance produced when homologous serum passes through the liver of a sensitized animal is not entirely identical with peptone in its action, lacking the powerful lymphagogic effect of peptone.

E. R. LONG

Relation of anaphylaxis to immunity. I. Passive desensitization in dogs. W. H. MANWARING, P. W. SHUMAKER, R. W. WRIGHT, D. L. REEVES AND H. B. MOY. *J. Immunol.* 13, 59-62(1927), cf. *C. A.* 20, 2879.—Immune blood contains a desensitizing substance capable of causing complete desensitization of hypersensitive fixed tissues, but no antibody that serves as a demonstrable circulating defense to hypersensitive fixed tissue. All phenomena of passive desensitization or passive immunization thus far studied in dogs may be accounted for as a result of the action of this desensitizing antibody. The sensitizing and desensitizing antibodies appear to be of different chem. constitution; neither is identical with the sp. precipitin of test tube reactions. **II. The phenomenon of antianaphylactic immunity.** W. H. MANWARING, D. L. REEVES, H. B. MOY, P. W. SHUMAKER AND R. W. WRIGHT. *Ibid* 63-7.—Tissues of actively immunized dogs transplanted by vessel anastomosis into hypersensitive recipients show a complete acquired insusceptibility to the hepatic anaphylatoxin. The hepatic anaphyl-toxin, therefore, must be regarded as a secondary antigen, presumably of protein nature, and conceivably a denaturation product of the primary antigen.

E. R. LONG

Studies in hypersensitiveness. XXIV. The question of identity of the atopens of the pollens of high ragweed and low ragweed. AARON BROWN. *J. Immunol.* 13, 73-8(1927).—Equal sensitiveness of hay-fever patients to high and low ragweed pollens, and similar prophylactic value of preps. from the 2 sources, indicates the identity of the atopen of the 2 pollens.

E. R. LONG

Alcohol-soluble specific substances of *B. diphtheriae* and of *Streptothrix*. J. FRUND. *J. Immunol.* 13, 161-9(1927).—The antigens of the bacterial suspension and the alc. ext. of the diphtheria strain used could not be differentiated by absorption. Diphtheria toxin is a different antigen from both the alc.-sol. antigen and the antigens demonstrable in non-toxic diphtheria bacillus emulsion. The alc.-sol. sp. substance of *B. diphtheriae* is sol. in MeOH, acetone and weak alkali, and insol. in Et_2O , weak acids and water. The N content of 2 purified preps. was 5.6 and 5.7%. After hydrolysis the biuret reaction was negative and the ninhydrin positive. Pepsin and trypsin did not increase the potency of a purified prepn. for the complement-fixation test. The addn. of an alc. soln. of lecithin to the alc. ext. of *B. diphtheriae* increased its potency in the complement-fixation test 4 times. The soly. of the sp. substance makes its protein nature improbable. An alc.-sol. sp. substance was demonstrated in a *Streptothrix* strain. The addn. of an alc. soln. of lecithin to the alc. ext. of *Streptothrix* increased its potency in the complement-fixation test 200 times in a mixt. contg. 2% alc. ext. No alc.-sol. substance could be demonstrated in *B. xerosis*, *Trichophyton*, *Actinomyces* and yeast.

E. R. LONG

Action of enzymes on the protective antibody of pneumococcus. L. D. FELTON AND GLADYS KAUFFMAN. *J. Immunol.* 13, 219-35(1927); cf. *C. A.* 20, 1455.—Protective antibodies, as found in the water-insol. protein fraction sepd. from Types I, II and III antipneumococcus horse serum by diln. in water, were digested by pepsin, trypsin, pancreatin and papain with a loss of their protective property. The loss appeared to parallel the extent of protein cleavage. Prolonged contact of the antibody soln. with rennin, ptyalin, amyllopsin, taka-diasase and malt diastase resulted in loss to varying degree, ptyalin and rennin being the least destructive. Huntton's antibody was completely destroyed by pepsin, trypsin and pancreatin.

E. R. LONG

Experimental immunization with bacteria detoxicated by gold chloride. M. B. OSMAN. *J. Immunol.* 13, 243-64(1927).— AuCl_3 has a marked detoxicating action on various bacteria. The power of bacteria detoxicated by AuCl_3 to stimulate agglutinin production is slight. Animals immunized with such detoxicated organisms, however, tolerate large doses of live organisms.

E. R. LONG

The bacteriophage-antibacteriophage reaction. EMIL WEISS. *J. Immunol.* 13, 501-9(1927).—Bacteriophage mixed with antibacteriophage serum and incubated 24 hrs. at 37° or longer shows the following properties: Filtered through a colloidal sac, it does not influence bacterial growth. It does not penetrate an av. agar layer in a Petri dish, although bacteriophage penetrates it where mixed with normal serum or alone. It is pptd. by 13.5% Na_2SO_4 , but remains in the filtrate when mixed with normal serum or alone. Bacteriophage is not destroyed by its union with antibacteriophage serum. When a mixt. of bacteriophage and antibacteriophage serum is digested with trypsin, the bacteriophage again appears active.

E. R. LONG

Bacteriophage purified with lipoids. EMIL WEISS. *J. Immunol.* 13, 311-7(1927).—Bacterial proteins in a phagic fluid can be pptd. by lipoids in proper concn. This purified bacteriophage produces only antilynsins, is non-toxic, has no prophylactic value and is very useful for therapeutic purposes on rabbits infected with Shiga bacilli.

E. R. LONG

Relation of anaphylaxis to immunity. IV. Normal and anaphylactic detoxication of specific foreign proteins. W. H. MANWARING, D. H. MARINO, T. C. MCCLEAVE AND T. H. BOONE. *J. Immunol.* 13, 357-63(1927); cf. *C. A.* 20, 2879.—Titrations by means of rabbit precipitin indicate that horse proteins injected intravenously into normal dogs are retained apparently quantitatively in the circulating blood for at least 4 days. Nevertheless, transfusions of these bloods into partially exsanguinated hypersensitive recipients show that by the end of 4 days the circulating horse proteins are so altered that they are no longer capable of calling forth recognizable anaphylactic reactions in horse serum hypersensitive tissues. In horse serum hypersensitive donors, a gradual complete anaphylactic detoxication of horse proteins, also without demonstrable quant. reduction, takes place in 10-18 hrs. These results favor the view that marked chem. alterations take place in sp. antigens when injected into the animal body, and that many of the essential immunologic adaptations are to the resulting denaturation products (secondary antigens) rather than to the primary antigens originally injected.

E. R. LONG

The relatively heat-stable components of complement. H. R. WHITEHEAD, JOHN GEDDON AND ARTHUR WORMALL. *J. Immunol.* 13, 439-49(1927).—Small quantities of H. or amines inactivate complement by destroying a relatively heat-stable component not identical with the 3rd component. A 4th component of complement is, therefore, postulated. The action of NH_3 is sp., as other alkalis have no similar effect. The

relatively heat-stable components of serum are much more stable toward ultra-violet light than the heat-labile components. E. R. LONG

The action of pancreatic extracts on complement. II. The relationship between proteoclastic and anticomplementary powers of different enzyme extracts. ARTHUR WORMALL, H. R. WILKINSON AND JOHN GORDON. *J. Immunol.* **13**, 451-7 (1927); cf. *C. A.* **19**, 2852. The proteoclastic and anticomplementary powers of 3 pancreatic exts. ran parallel. Hence shows that these 2 functions of a pancreatic ext. reside in 2 different substances and not in the same one. E. R. LONG

Observations with the precipitin reaction. LUDVIG HEKTOEN. *J. Immunol.* **14**, 1-8 (1927). Review. The serum proteins, hemoclobin and the sp. precipitinogen of senescent appear to be closely related in many distinct species. Casein also may fall in the latter group. Hemoclobin the blood reveals a much wider antigenic relationship than is observed in the case of casein. It is important and of great theoretic interest that the sp. antigens can evoke the formation of corresponding antibodies in the same species under certain conditions. E. R. LONG

A colorimetric reaction between gold chloride and toxins apparently indicative of toxic strength. Preliminary report. LUCY MITCHELL AND CHARLES KRUNWIEDE. *J. Immunol.* **14**, 1-8 (1927). Toxin values in most instances closely approximating those obtained by animal test were secured by means of a colorimetric reaction obtained by adding AuCl₃ to toxic filtrates. No colorimetric end point corresponding to the combining value (toxin:toxoid) of toxins was observed. The mechanism of the reaction was not studied. E. R. LONG

The heterogenetic haptenes. IV. K. LANDSTEINER AND P. A. LEVENE. *J. Immunol.* **14**, 81-90 (1927); cf. *C. A.* **19**, 2853 and *Proc. Soc. Exptl. Biol. Med.* **23**, 343 (1926), **24**, 693 (1927). The crude material from alc. exts. of horse kidney was freed from H₂O sol. substances, dissolved in 20 pts. hot pyridine, allowed to stand in the ice box 24 hrs., filtered and evapor. almost to dryness. The residue was dissolved in CHCl₃ and poured into Me₂CO. The ppt. after drying was extd. with a mixt. of equal pts. CHCl₃ and MeOH. The residue, except for a small fraction, dissolved in hot H₂O. One-half vol. Fehling's soln. added to the aq. soln. caused a gelatinous ppt., which after suspension in H₂O acidified with HCl was reprecip. with alc., Et₂O or Me₂CO. A white powder was obtained of the compn. C 55.39, H 9.22 and N 2.15%. The residue left after the hot H₂O extn. was dissolved for the most part in boiling H₂O, and the soln. clarified by centrifuging. Fehling's soln. pptd. a material sol. in a little 10% HCl. On addn. of Me₂CO a ppt. came down which on drying to a white powder had the following compn.: C 40.91, H 6.78 and N 1.79%. Both products were serologically active. The substance with the lower C value gave complement fixation with heterogenetic immune serum in high diln. and on injection into animals produced hemolysis. On acid hydrolysis 100 mg. reduced a quantity of Fehling's soln. corresponding to 28 mg. glucose. The compn. of the preps. suggests that they contain sp. groups similar to the bacterial haptens studied by Avery and Heidelberger. E. R. LONG

The chemical nature of immune substances. MICHAEL HEIDELBERGER. *Physiol. Rev.* **7**, 101-28 (1927). Review and bibliography. A relationship exists between group specificity and chem. compn. in the sol. sp. substances of the 3 antigenic types of *Pneumococcus*. Even with such widely different bacteria as *Pneumococcus* type II and the type B Friedlander bacillus, a certain similarity in the chem. nature of their sp. polysaccharides is accompanied by a corresponding similarity in the immunological properties of the organisms themselves. The structure of the polysaccharide of type III *Pneumococcus*, the only one so far investigated in detail, appears different from that of any known non-nitrogenous sugar deriv. E. R. LONG

Distribution of iodine with especial reference to goiter. J. F. McCLENDON. *Physiol. Rev.* **7**, 189-258 (1927). Review and extensive bibliography. I is of very wide distribution, and is more or less concentrated by the leaves of plants and the thyroid glands of animals. Goiter is due to a deficiency of I. The prevention of goiter is of the utmost importance in pregnancy, during which the use of iodized salt is of great value. Endemic goiter is the easiest known disease to prevent (Kimball). E. R. LONG

Phlorhizin diabetes. T. P. NASH, JR. *Physiol. Rev.* **7**, 385-430 (1927); cf. *C. A.* **20**, 1106. Review with extensive bibliography. E. R. LONG

The distribution of protein in the blood in experimental anemia. MEYER BODANSKY, STANLEY W. MORSE, VEON C. KIECH AND ROBERT B. BRAMKAMP. *J. Biol. Chem.* **74**, 463-71 (1927). "The distribution of the protein fractions in the plasma and serum of the dog has been studied according to Howe's method (*C. A.* **16**, 729). Of the globulin fractions, pseudoglobulin I was usually predominant; of the albumins,

fraction VIII was usually present in greatest amt. A small quantity of protein is pptd. when serum from defibrinated blood is added to 0.5 M NaCl (the concn. of Na_2SO_4 which pptd. fibrinogen). The albumin globulin ratio of the serum proteins diminished during exptl. period as judged by acetylphenylhydrazine. Invariably, the fibrinogen content of the plasma and the globulin fraction of the serum increased in amt., and the 0.75 M fraction of the serum was increased in nearly every case. A tendency to return to normal values was observed in several expts. in which the animals were allowed to recover. More than half of the total protein, including hemoglobin, liberated from normal corpses by hemolysis in dil. salt soln. may be salted out within the pptn. limits of the globulins. It is possible that a part of the extra protein salted out as albumen and globulin may have had its origin in the hemolysis of the corpses.

A. P. LÖNNBERG

Nitrogenous metabolism in postencephalitic rigidity. M. HIRST AND C. G. IMRIE. *Proc. Physiol. Soc., J. Physiol.* **62**, iv-vi (1926). No close and constant relation between encephalitic rigidity and uric acid excretion could be established. Great uricuria was found in all 4 cases of encephalitic rigidity studied. J. F. LYMAN

Urobilin studies. II. The place of formation of urinary urobilin. E. B. SÄLEN AND B. ECKELÖF. *Acta med. scand.* **66**, 366-442 (1927). The occurrence and the variations in the symptoms of urobilinuria and bilirubinuria are very largely independent of the degree of cholemia. Cases are cited to demonstrate extensive urobilinuria without pathol. cholemia and vice versa. Furthermore, the presence of urobilin in urine and intestine is demonstrated in spite of the fact that no bile passed for a long time through the bile ducts, whereby it is also shown that the urobilin has been absorbed from the intestine and that it was derived from bilirubin from the blood. This explains why in instances of severe liver injury a small amt. of urobilin in the intestine suffices to cause considerable urobilinuria. S. MORGULIS

Studies concerning the variations of the blood-sugar reactions in disease. OESTEN HOLTEN. *Acta med. scand.* **66**, 443-60 (1927). Blood sugar tests were made repeatedly on 10 healthy persons, 29 patients with arthritis and 38 patients with various other maladies, 100 g. glucose being given in each case. Most acute diseases showed a higher and more protracted blood sugar reaction during the active stage, while all chronic cases showed a greatly variable reaction even during the active stage. S. MORGULIS

The potassium and calcium content of blood serum under normal and certain pathological conditions. A. BREMS. *Acta med. scand.* **66**, 473-83 (1927). The very high K values found by some observers are attributed to the fact that the serum was not quickly separated from the red cells. The av. normal values found are 17.94 mg. % K and 11.48 mg. % Ca with a K/Ca = 1.62. The Ca value varies little from the normal in essential hypertony, bronchial asthma or diabetes mellitus. The K values, on the other hand, not in each individual case are considerably increased in hypertony and asthma (17.7 and 20.19 mg. %) and to a lesser degree in diabetes (18.51 mg. %). The K/Ca ratio is normal in the latter but in the former 2 diseases is increased to 1.81. No connection was discovered between the K/Ca ratio and the adrenaline reaction.

S. MORGULIS

Clinical investigations into the basal metabolism in diseases of the thyroid gland. ROBERT MÖLLER. *Acta med. Scand.*, Suppl. xxi, p. 219 (1927).—The basal metabolism was made according to Krogh's method, and the Harris-Benedict standards were found to give the best expression of the metabolic rate. In a series of 89 cases of Graves's disease, 70 exhibited the true disease (goiter, tremor and permanent tachycardia) and the remaining 19 were classified as Grave's "formes frustes." The basal metabolism in 721 detns. was found to vary from 99.1 to 190.2%. In 10% of the patients with true Grave's disease it was below 110%. In the formes frustes the basal metabolism varied from 95.8 to 138.1%, being below 110% in 69% of the cases. A study of the various symptoms of Grave's disease leads to the conclusion that a basal metabolic rate within normal limits should not exclude a diagnosis of this disease, the arrangement of the common symptoms in the order of their frequency being: tachycardia, tremor, goiter, nervousness, increased metabolism, palpitation, increased sweat secretion and exophthalmos. Treatment by rest and overfeeding usually occasioned a lowering of the basal metabolism 10-20% within 2-4 weeks. X-ray treatment likewise produces abatement of symptoms, the basal metabolic rate usually decreasing after general abatement of all other symptoms. The x-ray treatment was successful in at least 13 of the cases studied. In 5 patients with toxic adenoma of the thyroid basal metabolism values of 113.7-129.2% were found, and in 20 out of 21 patients with simple goiter normal values were found. A large number of metabolic detns. were also made on 18 myxedema cases, 2 cachexia strumipriva and 3 cases of slight hypothyroidism. In

the former 2 conditions the metabolic rate did not diminish below 60%; in the latter it was about 90%. The effect of thyroid treatment in these patients was to increase the metabolic rate, the rise first appearing after 2-3 days and reaching a max. in 2-8 weeks.

S. MORGULIS

Does diabetic serum contain substances which affect the permeability of the cells to glucose? E. BISSINGER. *Biochem. Z.* 185, 229-37(1927).—The results of Geiger and Loewi are corroborated in that the surviving frog liver does not absorb much glucose when diabetic serum is added to the perfusion sugar solu. The free sugar in the liver tissue under these exptl. conditions is increased, and the resulting diminution in the diffusion potential is held responsible for the lowered glucose absorption rather than a primary alteration in cell permeability.

S. MORGULIS

The role of the pancreas in some toxic glucemias. I. A. BORNSTEIN AND R. D. LOEWENBERG. *Biochem. Z.* 186, 243-51(1927).—The blood sugar is equally affected by pilocarpine, narcosis or ergotamine in normal and pancreatectomized dogs which are given continuous intravenous injections of glucose and insulin. The glucemia of pilocarpine and narcosis are therefore essentially independent of the pancreas.

S. MORGULIS

A note on the relations between blood sugar, cholesterol and hypertony. M. DORLE AND W. LEHR. *Biochem. Z.* 187, 385-7(1927).—No definite relationship has been found between the blood sugar or cholesterol level and blood pressure in cases of arteriosclerosis and hypertony.

S. MORGULIS

The difference between the homologous and heterologous complement-fixation reaction. R. TORIKATA. *Centr. Bakt. Parasitenk. 1. Abt.*, 103, 129-47(1927).—Antigens for the homologous complement fixation reaction consist of 2 parts, a protein and a lipid. Specificity depends on the protein and complement-binding energy on the lipid. The antigen in the heterologous reaction is a lipid only. It reacts with serum proteins in order to bind complement.

JOHN T. MYERS

Rate of sedimentation in digestive hemoclasia. M. POPPER AND F. KREINDLER. *Paris médical* 16, 128(1926); *Colloides biol. clin. thérap.* 1, 38(1927).—Investigation of the rate of sedimentation of red corpuscles may be of great importance in revealing digestive hemoclastic shock. The rate of sedimentation differs in normal and hepatic subjects even merely after ingestion of milk. In subjects exhibiting a normal liver activity, the rate of sedimentation is the same before ingestion of milk and 45 min. after. In hepatic subjects 3 different classes of results may be obtained, permitting of differentiating between 3 types of affection of the organ: (1) in the case of patients shown by clinical symptoms to be suffering most severe affections of the hepatic cell, sedimentation is accelerated, probably through a disturbance of the proteoplectic function of the liver, allowing of the passing into the general circulation of proteins having a low degree of dispersion, which facilitates sedimentation; (2) there is a retardation of sedimentation, owing to the passing into the blood of finely dispersed proteins, which inhibit sedimentation; (3) there is no change in the rate of sedimentation, showing that the proteoplectic function of the liver is intact. These hypotheses have been confirmed by detn. of the proteins in the plasma, an inversion of the plasmatic formula (relative ratios of fibrinogen, albumin and globulins) being observed, corresponding to the change in rate of sedimentation.

A. PAPINEAU-COUTURE

The isoelectric point of rabbit serum in relation to the development of cancers by tar. A. DECOULON, J. NICOD AND F. VLÉS. *Arch. phys. biol.* 4, 245-63(1927).—If the development of tumors, papillomas or true cancers follows the painting of rabbits with tar the serum of such rabbits shows variations in its isoelec. points. In the case of papillomas the α point undergoes oscillations more or less irregular. Each change of the growth (increase, decrease, appearance of malignity, etc.) is preceded or accompanied by perturbations of the isoelec. point of the serum. During cancerization the irregular oscillations give place to a slow and continuous ascension of the isoelec. point toward its max. value and there is established a new equil. different from the normal value.

L. W. RIGGS

Chemistry of cancerous tissue. (M.) AND (MME.) ENSELME. *Compt. rend.* 184, 1353-4(1927).—The object of this study was to learn what modification takes place in the chem. compn. of cancerous tissue following therapeutic irradiation by ultra-penetrant rays. In cancerous tissue there is a notable increase of nucleic P as compared with the healthy organ. Irradiation causes this excess of P to disappear, the irradiated cancer contg. the normal amt. of nucleic P. The lipidic P increases in the irradiated cancer and at the same time the proportion of fat; there appears to be a regression of nucleic compds. and a tendency for cancerous tissue to be transformed into fat. A particularly interesting point is that this evolution of neoplastic takes place only when irradiation has produced favorable therapeutic results.

L. W. RIGGS

The factors of mechanical decompression and biochemical hypo-oxygenation in the genesis of blood and pulmonary lesions in animals subjected to rarefied atmospheres. **RAOUL BAYEUX.** *Compt. rend.* **184**, 1356-8(1927).—Rabbits were exposed to rarefied air with and without the addn. of O. The results showed that the effects of rarefied air were due both to mech. conditions and to lack of O. The effects are additive, but are overcome by a subcutaneous injection of 250 cc. of O in a rabbit weighing 1.2 kg. This treatment is recommended in place of O inhalation which Richet and others have shown to be dangerous (cf. *C. A.* **21**, 2083). **L. W. RIGGS**

Seroflocculation by resorcinol and reaction of fixation; their comparative value as methods of diagnosis and prognosis of pulmonary tuberculosis. **V. GRYSEZ, R. PIERRET, LANGERON, A. BRETON and H. D'HOOR.** *Compt. rend. soc. biol.* **97**, 245 8(1927).—Seroflocculation by resorcinol has a high diagnostic value and a considerable prognostic value in pulmonary tuberculosis. It is superior in sensitiveness to the deviation reaction. **L. W. RIGGS**

The blood in suprarenal insufficiency. **G. VIALE and A. BRUNO.** *Compt. rend. soc. biol.* **97**, 261-3(1927).—In suprarenal insufficiency the blood loses plasma, perhaps by increased permeability of the vessels. **Lecithinases in suprarenal insufficiency.** **G. VIALE and T. COMBS.** *Ibid* 265 6.—The lecithinase activity is greatly diminished and often lacking in suprarenal insufficiency. **Suprarenal insufficiency and carbohydrates in the muscles of the dog.** **G. VIALE, S. M. NEUSCHLOSZ and TURCATTI.** *Ibid* 266-7.—Muscular glycogen in suprarenalectomized dogs is a little less than in normal dogs but it never disappears entirely. The lactacidogen always diminishes and after a certain time attains a value one-half that observed in normal animals. **L. W. RIGGS**

Edema and disturbances in the acid-base equilibrium. **MARCEL LABBÉ and É. AYERAD.** *Compt. rend. soc. biol.* **97**, 365 6(1927).—In 10 patients with edema it was not possible to establish any relation with the p_{H} of the blood or liquid of edema and the alk. reserve. It is believed that modifications of p_{H} in the interior of the cells is a factor in the pathology of edema. **L. W. RIGGS**

Blood groups of horses and adsorption of the red corpuscles. **R. DUJARRIC DE LA RIVIERE and N. KOSOVITCH.** *Compt. rend. soc. biol.* **97**, 373-6(1927).—Sufficient evidence was not found to show a relation between the blood groups and the antitoxic power of the serum. **L. W. RIGGS**

Cholesterol content of the serum of nursing infants in the course of disturbances in the alimentary canal. **M. MANICATIDE, A. BRATESCU and A. RUSescu.** *Compt. rend. soc. biol.* **97**, 391 3(1927); cf. *C. A.* **21**, 2727. —A study of 55 infants ranging from a few weeks to 18 months of age showed that the cholesterol content of the serum is not to be taken as an abs. prognostic factor in infantile dyspepsia. **L. W. RIGGS**

Condition of basal metabolism and of neuro-vegetative tonus in certain cases of hysteria. **PAULIAN PADÉANO and C. ARICESCO.** *Compt. rend. soc. biol.* **97**, 400-3 1927. Seven cases are reported. **Value of basal metabolism and condition of the neuro-vegetative tonus in certain cases of nervous maladies.** *Ibid* 403-4.—Eight cases are reported. **L. W. RIGGS**

Urinary lactic acid, ammonia and creatinine in Parkinson's disease. **J. FROMENT and L. VELLUZ.** *Compt. rend. soc. biol.* **97**, 490-1(1927).—A study of NH_3 and lactic acid elimination leads to the conclusion that Parkinson rigidity has its origin in acidosis. The findings with reference to creatinine confirm the conclusions of Koch, Marinesco and Popesco. **L. W. RIGGS**

Mechanism of inactivation of tetanic toxin by soaps and aliphatic acids (cryptotetanus). **P. SÉDALLIAN and L. VELLUZ.** *Compt. rend. soc. biol.* **97**, 496-8(1927).—Detailed explanations are proposed. **L. W. RIGGS**

Tetanic toxin and adrenaline of the suprarenals. **G. MOURIQUAND, A. LEULIER and P. SÉDALLIAN.** *Compt. rend. soc. biol.* **97**, 500(1927).—Acute or chronic tetanic intoxication does not appear to affect the adrenalinogenic function of the suprarenal gland and differs in this respect from diphtheritic intoxication which causes a notable diminution in the adrenaline content. After recovery from an exptl. tetanus the suprarenal medulla does not retain any disturbance in its functioning. During a subacute diphtheritic intoxication there is a diminution in the proportion of adrenaline. **L. W. R.**

A new serologic test for kala-azar. **L. E. NAPIER.** *Indian Med. Gaz.* **62**, 362-5 1927. The test is performed by adding 2 drops of a 24-hr.-old serum to 2 cc. of a 0.2% soln. of urea stibamine (Stiburea brand), or 2 drops of freshly sepd. serum to 2 cc. of a 1% soln. of stibamine, agitating and allowing to stand 10 min. If the serum is from a kala-azar patient a heavy flocculent ppt. seps., leaving the liquid clear. **L. W. RIGGS**

Carcinoma of the islands of the pancreas. Hyperinsulinism and hypoglycemia. RUSSELL M. WILDER, FRANK N. ALLEN, M. H. POWER AND H. E. ROBERTSON. *J. Am. Med. Assoc.* **89**, 348-55 (1927). — In a case of cancer originating in the islands of Langerhans, hourly doses of glucose were required to prevent convulsions from spontaneous hypoglycemia. When the ingestion of the necessary sugar was delayed the blood sugar fell below 0.03%. The blood phosphates fell with the sugar and rose again on the restoration of the blood sugar. The liver functioned normally in deaminizing amino acids and excreting bile and test dyes, but the glycogen stores proved abnormally stable to the action of adrenaline. Alkaloids from cancer tissue in the liver acted like insulin on injection into rabbits. L. W. RIGGS

Theory of cancer causation. ELLICE McDONALD. *Med. J. Record* **125**, 795-7 (1927). *J. Am. Med. Assoc.* **89**, 824. Speculative. L. W. RIGGS

Effect of tubercle bacilli and the chemical fractions obtained from analysis on the cells of the connective tissue in rabbits. FLORENCE R. SABIN AND CHARLES A. DOAN. *Proc. Natl. Acad. Sci.* **13**, 552-4 (1927). — Two specimens of water-sol. proteins, 304 and 903, and 2 phosphatide fractions, A 3 and A 4, from the labs. of Johnson and Anderson, Yale Univ., were tested with rabbits. The protein fractions were given intravenously in satd. aq. soln. These fractions are toxic, are associated with a damage to the endothelium producing hemorrhage and give a pressor effect on elastocytes. The phosphatide fractions were given intraperitoneally in the form of an emulsion. These are non-toxic but cause a local production of typical tuberculous tissue. L. W. R.

Plasma calcium. W. R. TWEEDY AND S. B. CHANDLER. *Science* **66**, 194 (1927), cf. *C. I.* **21**, 2112. The findings indicate that the thyroparathyroidectomized rat is much more responsive to the calcium principle than the normal albino rat. This is contrary to the conclusions of Collip from expts. with dogs. L. W. RIGGS

H--PHARMACOLOGY

A. N. RICHARDS

Histologic study of resorption and elimination of tellurium. C. LEVADITI AND O. DIMANESCO-NICOLAI. *Compt. rend. sci. Biol.* **95**, 149-64 (1926). — Te, like Bi, when administered intramuscularly undergoes progressive dissolution *in situ* through the formation of protein metallic derivate in which the element Te is found. It is absorbed in this form by the cells of the reticulo-endothelial system, the cytoplasm and mitochondrial network of which bring about a partial intracellular reduction. The other elements belonging to the same system phagocytize and transform the injected Te directly. It is in this dissolved form that the Te is carried through the body and comes in contact with the lymphoid organs, which fix and reduce it, and with the *Trepennia* on which it has a parasitocidal effect. The kidney secretes it as it secretes urates in birds, only the epithelium of the convoluted tubules and the ascending loop of Henle undertaking the secretion. The mitochondrial network of the epithelium seems to play an important part in this metal elimination process which does not seem to affect in any way the function of the kidney. This agrees with the statements of Lacazeigne, Latta and Levaditi concerning the localization of Po in the region of the renal cortex, all permitting a better understanding of the mechanism of elimination of metal. M. BEBER

Chronic meat intoxication* in Eck's-fistula dogs. S. A. MATTHEWS. *Am. J. Physiol.* **76**, 219-20 (1926). — An increase of NH_3 in the blood was found. In chronic meat intoxication one of the first results is gastric atonicity, followed by putrefaction of stomach contents. This is when the NH_3 content of the blood is highest. After emesis and gastric lavage, the high NH_3 drops and signs of intoxication disappear. The urine in Eck's fistula dogs is generally alk. with a tendency for the deposition of phosphates in the kidneys and tubules. J. B. BROWN

The inhibition of photodynamic phenomena. G. PENNETTI. *Arch. sci. biol.* **9**, 398-404 (1927). — It is known that eosin, when added to adrenaline soln. and the mixt. exposed to the sun, inactivates the adrenaline. Various substances were added to eosin adrenaline solns. to prevent this loss of activity in the adrenaline. Gelatin, egg albumin, glucose, Witte peptone, pyrogallol, hydroquinone and resorcinol were tried. Only the phenols were partially effective in preventing inactivation. A. W. C.

The action of insulin. G. QUAGLIARIELLO. *Arch. sci. biol.* **9**, 459-80 (1927). — A review. A. W. CONTIERI

The influence of light upon tuberculin. I. W. HAUSMANN, W. NEUMANN AND K. SCHUBERTH. *Z. Tuberk.* **46**, 32-6 (1926). — High dilns. of tuberculin are markedly weakened or made inactive by intensive exposures to the quartz lamp insofar as their

intracutaneous reacting power is concerned. Concd. tuberculin solns. are resistant to the action of light. The action is due to the short wave lengths (325 millimicrons).

H. J. CORPER

The relations of experimental pharmacology to chemical science. H. H. MEYER. *Ber.* **60B**, 21-36 (1927).—An address

E. J. C.

Action of new bismuth preparations (Heyden "564b" and "590") on dogs. JOSEPH LINGEMANN. *Deut. tierarztl. Wochschr.* **34**, 313-4; *Chem. Zentr.* **1926**, II, 456.—Administered *per os*, the prepn. "564b" was tolerated by dogs in quantities not exceeding 2 g. With subcutaneous administration, however, both "564b" and "590" were disproportionately poisonous, the doses tolerated by dogs per kg. of body wt. being 0.003-0.004 g. of "564b" and 0.002-0.003 g. of "590"

C. C. DAVIS

The distribution of bismuth in the animal organism after intra-muscular injection of 540D (vet.). OTTO MISEKE. *Deut. tierarztl. Wochschr.* **34**, 375-6; *Chem. Zentr.* **1926**, II, 456.—The expts. were carried out on rabbits with the Bi prepn. "540D." All the organs and the places of injection were examd. After injection of 1 cc. of "540D" (0.007 g. Bi), the kidneys had a high Bi content, the liver, intestine and stomach had less quantities. The other organs, as well as the blood, urea and feces, contained no Bi. The elimination of Bi began at the same time with its resorption. With Aubry reagent, a soln. of l-quinine, Bi can be detected when only 0.000002 g. per cc. is present. On addn. of Cd and pptn. in acid soln., the Bi can be quant. pptd. and Fe removed

C. C. DAVIS

The therapeutic activity of salts of acetylsalicylic acid. OSKAR NEMETZ. *Wiener Med. Wochschr.* **39**, 422; *Chem. Zentr.* **1926**, II, 282.—Ca acetylsalicylate, manufactured by Gelelon Richter as "Kalmapyrin," was used in place of aspirin, hypopyrin and other salicylates, with success in almost every case. It has the great advantage of not having a disturbing effect on the heart action and the circulation.

C. C. DAVIS

History and development of homeopathy. CLARENCE BARTLETT. *J. Am. Inst. Homeopathy* **20**, 759-77 (1927). Contains a concise summary with bibliography of Samuel Hahnemann's contributions to chemistry, toxicology and pharmacy.

JOSEPH S. HEPBURN

Therapeutic action of some bismuthyl derivatives of organic hydroxy acids. C. H. BROWNING, J. B. COHEN, R. GULBRANSEN, E. PHILLIS AND W. R. SNODGRASS. *Proc. Roy. Soc. (London)* **B102**, 1-9 (1927).—A series of 24 bismuthyl derivs. of org. hydroxy acid. was prepd., by reaction between the parent org. compd. and $\text{Bi}(\text{NO}_3)_3$ in soln. in AcOH . Their therapeutic action was tested on mice infected with *Spirochaeta pallida*. The org. constituent of the mol. apparently played a part in the detn. of therapeutic efficiency, since cures were effected only by the BiO derivs. of saccharic, gluconic, lactobionic, tartaric and citric acids. When bismuthylsaccharic acid was administered to 17 human subjects as 10% aq. suspension with an av. dose of 2.5 g. 5 to 10 doses at weekly intervals, an antisyphilitic action was noted insofar that the lesions healed in 12 cases, local irritation at the point of injection and slight poisoning by Bi occurred in many of the patients. The Na salt was tolerated distinctly less than the free acid. Bismuthylgluconic acid, administered intravenously or intramuscularly as a 10% aq. soln., had a marked antisyphilitic action.

JOSEPH S. HEPBURN

The effect of thyroid medication in nephrosis. SHIH-HAO LIU. *Arch. Internal Med.* **40**, 73-9 (1927).—In 2 cases thyroid medication caused disappearance of edema, reduction of albuminuria and subjective improvement. The rise of basal metabolism was associated with a decrease of blood cholesterol and an increase of serum proteins. The conclusion that nephrosis depends on hypothyroidism is, however, not warranted.

MARY JACOBSEN

Poisonous principles from Chinese rhododendron, Nao-yang-hua, Rhododendron sinuwellianum. TSAN-QUO CHOU. *Chinese J. Physiol.* **1**, 157-60 (1927); *Ber. ges. deutsch. exptl. Pharmakol.* **40**, 751.—Description of andromedotoxin which has been recently isolated by Hardikar and Plugge from *Andromeda japonica* and *Rhododendron sinuwellianum*. It is probably identical with Eykman's asebotoxin.

MARY JACOBSEN

Effect of morphine and quinine on the blood gases and their relation to internal secretions. E. MIYAKE. *Folia endocrinol. japon.* **2**, 4-5, 57-86 (1926); *Ber. ges. deutsch. exptl. Pharmakol.* **40**, 266.—In rabbits a dose of morphine decreases the CO_2 capacity of the blood, while the O_2 dissoxn. curve is unaltered or lowered. CO_2 content and capacity are increased by continuous oral administration of 5-10 mg. quinine. H_2O and lowered by 50 mg. When the drug habit is formed, the CO_2 content only is increased. The effect of the drugs on the CO_2 tension is lowered by thyroidectomy or castration and returns to normal on thyroid feeding.

MARY JACOBSEN

Effect of insulin on fat content of body and organs. S. OMURA AND K. NITTA.

Folia endocrinol. japon. **2**, 103-21(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **40**, 383.—Rabbits respond to insulin injections with a fat increase in heart, kidney and skeletal muscle and a tendency toward fat decrease in the liver. Insulin-glucose increases the fat content of all organs. In mice insulin alone or with glucose gives rise to a general fat increase. The function of insulin therefore consists in glucose oxidation and glycogen and fat synthesis.

MARY JACOBSEN

Mutual antagonism of novocaine and caffeine. MINORU SHINAGAWA. *Folia pharmacol. japon* **3**, 340-6(1926); *Ber. ges. Physiol. exptl. Pharmacol.* **40**, 213.—Expts. on the rabbit uterus and the femoral vessels of the frog indicate that the prevention by novocaine of the muscle rigidity produced by caffeine is based not on a direct chem. reaction between the 2 compds. as assumed by Schuller, but on a physiol. process.

MARY JACOBSEN

The synergism between the local anesthetics of the cocaine group and potassium. JÔRÔ KAWABATA. *Folia pharmacol. japon.* **4**, 16-34(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **40**, 456; cf. *C. A.* **21**, 3234.—The anesthetic effect of cocaine (I) and β -eucaine (II) on the sensory and motor endings of the frog sciatic and on the sensory app. of frog and guinea pig-skin and the action of novocaine (III) on the sensory app. is considerably enhanced by K. The skin anesthesia produced by KCl is intensified by minute quantities of I, II and III, which alone would be ineffective. KCl is the more powerful synergist. When KCl is given simultaneously with *tropacocaine*, *alpyne* and *stovaine* only a summation of effects is observed. **The synergism of cocaine and ammonium, calcium, strontium, barium and magnesium.** *Ibid* 35-57.—The cocaine anesthesia of the motor endings of the frog sciatic and of the sensory app. of the frog and guinea-pig skin is powerfully increased by K, NH_4 , Ca, Sr, Ba, the effect decreasing in the above order. The cocaine anesthesia of the sensory endings of the frog sciatic is similarly intensified by KCl and NH_4Cl . Cocaine is a (less powerful) synergist of the 5 salts with regard to skin anesthesia. The effects of cocaine and Mg are merely additive.

MARY JACOBSEN

The relation between the effect of adrenaline and the site of its injection. MASAHARU OGAWA. *Folia pharmacol. japon.* **4**, 64-75(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **40**, 453.—The min. pressor dose is 0.001 mg./kg. rabbit intravenously (I) and about 0.5 mg. intramuscularly, subcutaneously or intraperitoneally. The effect is distinct but transitory in I, while the other modes of injection produce a slight but more lasting effect. When introduced into the gastrointestinal tract adrenaline is rapidly detoxified by the liver. The min. pressor dose *via* the small intestine is 6 mg., while intrastomachally 10 mg. has no effect. Rectally 2 mg. produces a noticeable and lasting effect, probably because the hemorrhoidal veins enter directly into the *vena cava* and thus withdraw part of the poison from hepatic circulation. M. J.

The detoxifying effect of the liver on cocaine. KIICHI KUSAKA. *Folia pharmacol. japon.* **4**, 79-96(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **40**, 456.—Cocaine is detoxified chiefly in the portal circulation not in the liver.

MARY JACOBSEN

Effect of cocaine on hepatic and femoral vessels. KIICHI KUSAKA. *Folia pharmacol. japon* **4**, 97-100(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **40**, 456.—Low concns. have a vasodilator, higher ones a vasoconstrictor, effect on the femoral vessels of the rabbit. Vasodilation on perfusion from either the portal or hepatic artery is hardly noticeable. Vasoconstriction in the portal region is insignificant although the vessels show considerable dilatation on subsequent washing with Ringer soln. M. J.

Pharmacology of aristolochine. KANSIJA RYO. *Folia pharmacol. japon.* **4**, 123-31(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **40**, 462.—Aristolochine, $\text{C}_{22}\text{H}_{22}\text{N}_2\text{O}_3$, isolated from *Aristolochia debilis*, causes cardiac and respiratory paralysis in frogs and mice, an As-like intestinal inflammation in dogs and an alon-like hemorrhagic nephritis in rabbits. The pressor effect and the increase in respiratory rate and vol. (rabbits) are not influenced by vagotomy or atropine. The frog heart is first stimulated and then paralyzed; peripheral vessels are strongly constricted. Skeletal muscle is excited by small, paralyzed by large, doses. Smooth and earthworm muscles are acted upon directly.

MARY JACOBSEN

Pharmacology of toad venom. I. A toxic substance from toad liver. KANSIJO RYO. *Folia pharmacol. japon* **4**, 132-43(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **40**, 463-4.—A substance with the pharmacol. action of Handovsky's *bufotenine* was obtained by triturating toad liver with quartz sand and 96% alc., dissolving in water and extg. with ether.

MARY JACOBSEN

Detoxification experiments with an antagonist. SHIGERU UCHIDA. *Folia pharmacol. japon.* **4**, 144-55(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **40**, 459.—Atropine subcutaneously prevented 90% acetylcholine, 67% physostigmine, 30% pilocarpine,

25% ergot and 32% adrenaline deaths, the latter only when given in large doses. With regard to digitoxin, atropine showed an additive rather than an antagonistic effect.

MARY JACOBSEN

Influence of physical and pharmacological factors on the action of curare. I. Effect of temperature. SRIJI HORI. *Folia pharmacol. japon.* 4, 195-204(1927); *Ber. ges. Physiol. expll. Pharmacol.* 40, 457.—The effect of curare on the motor nerves of the frog increases with the temp. between 10° and 41°, while at low temp. the contrary is the case. The min. paralyzing doses were: 0.05 mg./10 g. frog at 2°, 2.5 at 10°, 0.5 at 20°, 0.1 at 30° and 0.025 at 41°. Both sensitivity of the nerve endings and reaction velocity seem to increase with the temp. **II. Effect of acids and alkalis.** *Ibid* 205-15.—The effect of curare is intensified by NaOH and inhibited by HCl in concns. identical in themselves. This is attributed to a change of reaction of the body fluids which detrs. the liberation of the curare base as well as the sensitiveness of the nerves.

MARY JACOBSEN

The effect of narcotics on convulsions caused by various poisons. EKIZO KOBAYASHI. *Folia pharmacol. japon.* 4, 233-46(1927); *Ber. ges. Physiol. expll. Pharmacol.* 40, 455.—Chloral hydrate, urethan and NaBr check strychnine (I) and picrotoxin (II) convulsions, but have no effect on physostigmine (III) convulsions. Morphine stimulates I and II and to a certain degree also III. Atropine, hyoscyamine and scopolamine aggravate II, inhibit III and have no effect on I.

MARY JACOBSEN

Treatment of amebal dysentery with emetine, yatren and stovarsol. P. B. VAN STEENIS. *Geneeskund. Tijdschr. Nederland. Indië* 67, 347-57(1927).—Emetine-HCl is still indispensable. It prevents relapses by sterilization of the entire body with regard to the histolytic form of *Amoeba tetragena*. Yatren is in most cases very effective especially against the minute forms and cysts. It is non-toxic, not cumulative and particularly useful for the treatment of emetine fast cases. An unpleasant collateral effect is the diarrhea. Stovarsol gave good results especially against minute forms and cysts, but less so than emetine and yatren. Toxic effects were not observed. M. J.

Treatment of tropical (amebal) liver abscess. P. B. VAN STEENIS. *Geneeskund. Tijdschr. Nederland. Indië* 67, 358-68(1927).—Emetine-HCl alone, 60 mg. daily or in combination with yatren (3 g. daily for 2 weeks) makes the clinical symptoms disappear. The blood picture improves gradually. It follows from the literature that emetine-stovarsol has a similar effect. Yatren or stovarsol alone is ineffective. M. J.

Blood sugar, adrenaline and sympathetic nervous system. A test for the excitability of the sympathetic. I. J. DELBAERE. *Nederland. Maandschr. Geneeskunde* 14, 119-120(1927).—The hyperglucemic effect of adrenaline is used as a test for the excitability of the sympathetic. After a theoretical discussion the results of tests are given: The hypodermic or intramuscular injection of 0.001 cc./kg. 0.1% adrenaline immediately after a meal rich in carbohydrates increased the blood sugar of normal children by at least 0.1% within 1/2 hr. after the injection. The response was less pronounced in convalescents from severe infections, esp. those with high fever, and in children suffering from acute nutritional disturbances (decompensation Herter's infantilism), exudative diathesis, or acute rickets with or without tetany. Although it seems established that the vagus has no part in the production of hyperglucemia a few expts. in this direction were made. The slightly antagonistic effect of histamine is attributed to an inhibition of the sympathetic rather than to a stimulation of the vagus. Atropine had a slightly synergistic effect.

MARY JACOBSEN

Effect of camphor on blood pressure. RYUZO KATAGI. *Okayama Igakkai Zasshi* 1927, 111-22; *Ber. ges. Physiol. expll. Pharmacol.* 40, 747.—In rabbits the subcutaneous injection of camphor has none or a varying effect on blood pressure. A rise in pressure is prevented by section of the *plexus lumbosacralis*. Intravenous injections always raise the pressure especially when it was artificially lowered. An injection into the jugular vein is more effective than one into the femoral. The effect is attributable to stimulation of the vasomotor centers, since it may be prevented by section above the spinal cord.

MARY JACOBSEN

Clinical study of the substance A of insulin. MARCEL LANDSBERG. *Progrès méd.* 55, 242-5(1927); *Ber. ges. Physiol. expll. Pharmacol.* 40, 601.—In diabetics the blood sugar dropped from its original value of 0.159-0.362 to 0.07-0.262 within 90 min. from the subcutaneous injection of 1.2 mg. of Funk's substance A. The decrease was independent of the original sugar level. The effect produced by 20 units of Burroughs-Wellcome insulin was but slightly greater. Oral administration is ineffective. Five out of 6 normal persons responded with a slight hyperglucemia. Marked hypoglycemia was produced in a case of doubtful pancreatitis. Six mg. promptly relieved coma. Shock did not occur in 2 cases of marked hypoglycemia. M. J.

Remarks on M. Landsberg's clinical study of the substance A of insulin. CASTMIR FUNK. *Progrès méd.* **55**, 245(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **40**, 602.—L.'s results (preceding abstract) are confirmed by 25 clinical cases. The substance A is activated by co-insulin (substance C). In the normal person A and C are exactly balanced so that introduced A remains ineffective. The therapeutic availability of A on a larger scale depends on the isolation of C. The relative activity of insulin and of A is not definitely established.

The protective action of caffeine. A. LJUBUŠIN. *Zurnal eksperim. biol. mediciny* **4**, 438-45(1926); *Ber. ges. Physiol. exptl. Pharmacol.* **40**, 459.—Caffeine increases the resistance of the frog heart to diphtheria toxin.

MARY JACOBSEN

Tellurium, new element with curative value in syphilis. C. LEVADITI, in collaboration with M. and MME. NICOLAU and MILE Y. MANIN. *Ann. inst. Pasteur* **41**, 364-442(1927).—Te injected into the rabbit in the state of the reduced element has a rapid curative action on exptl. syphilis and spontaneous spirochetosis. The therapeutic properties of Te bivalent, Te trioxide and quinine iodo-tellurate are almost equal to that of the free element. The sol. salts of Te, particularly TeO_3Na_2 and TeO_3K , are more toxic and less efficacious. The aromatic derivs. of Te, such as diphenyl Te, seem to have no curative effect, and are poorly absorbed after intra-muscular injection. A cyclic compd., 4-thyleyclofollurium-pentanediene, has weak therapeutic properties.

E. R. LONG

Tellurium in the treatment of human syphilis. L. FOURNIER, C. LEVADITI AND L. GUÉNOT. *Ann. inst. Pasteur* **41**, 443-57(1927); cf. *C. A.* **21**, 1845.—Te has a marked therapeutic effect upon human syphilis as shown by clinical observation and change from positive to negative in the Wassermann reaction. The action is not so rapid, however, as with As and Bi. There are certain disadvantages in the use of Te which for the present preclude its routine clinical employment, viz. bluish discoloration of the skin, tendency to cause slight loss in weight, pain and slight swelling on injection, slight febrile reaction, discoloration of the hair and the production of a disagreeable odor in the expired air. Toxic manifestations of importance are not caused by the injection, and the only effect on the kidneys is a slight polyuria of 1 and 2 weeks' duration.

E. R. LONG

The influence of dipping in solutions of arsenic upon the course of trypanosomiasis. L. E. W. BEVAN. *Rhodesia Agr. J.* **24**, 163-90(1927).—The expts. were inconclusive but indicate that trypanosomes can be held in check by frequent dipping of the animal in arsenical solutions.

A. L. MEHRING

Insulin and glycogen formation. K. POGÁNY. *Biochem. Z.* **187**, 72-7(1927).—Expts. on mice indicate that glycogen storage occurs under the influence of insulin and in such a way that the formation varies directly with the dose of insulin administered. If, however, the insulin treatment leads to cramps the formed glycogen is used up in the muscles.

S. MORGULIS

The relation of chemical, colloidal and biological effects of Röntgen rays of differ-

ent wave lengths to the ionization which they produce in air. I. Action of Röntgen rays on solutions of oxyhemoglobin in water. HUGO FRICKE AND B. W. PETERSEN. *Am. J. Roentgenol. and Radium Therapy* 17, 611-20(1927).—A soln. of oxyhemoglobin prepd. from rabbits' blood, approx. $\frac{1}{2} \cdot 10^{-4}$ N in respect to hemoglobin, was irradiated with 3 types of x-rays, giving homogeneous rays of wave lengths 0.248 Å U., 0.527 Å U., and 0.754 Å U. The oxyhemoglobin is transformed to methemoglobin and perhaps other substances. The 2 longer wave-length radiations have the same effect, while the shortest produces a slightly greater effect for the same dose, as measured by the ionization produced in air. EDITH QUIMBY

The skin erythema dose with a combination of two types of radiation. EDITH H. QUIMBY. *Am. J. Roentgenol. and Radium Therapy* 17, 621-5(1927).—The dose required to produce an erythema on human skin was detd. for 2 types of radiation, one purely γ , the other about 70% β , 30% γ , when a treatment consisting of half of each of these doses was administered, no erythema resulted. It was necessary to use $\frac{1}{2}$ of a dose of each in order to produce the same skin effect as one full dose of either. EDITH QUIMBY

The causes of the destruction of cholesterol in vitro by Röntgen irradiations. R. P. MACFARLANE AND A. BACHE. *Am. J. Roentgenol. and Radium Therapy* 18, 150-1(1927).—Cholesterol in different solvents was irradiated with x-rays under the following conditions: 170 kv., 20 ma., 12 in. distance, 20 min. exposure, one black paper as light filter. Destruction resulted only with CHCl_3 and CCl_4 . The effect is an indirect action due to the formation of oxidizing substances, probably the oxy acids of Cl. EDITH QUIMBY

The use of colloidal lead in the treatment of cancer after the method of Blair Bell. Preliminary report. H. J. ULLMANN. *Radiology* 8, 461-5(1927). The cancer problem with reference to recent developments. M. J. SITTENFIELD. *Ibid.* 465-9. The metallic colloids in the treatment of cancer, a preliminary report. ALBERT SOLAND, W. E. COSTLOW AND O. N. MELAND. *Ibid.* 469-74. These three papers and the accompanying discussion constitute a symposium on the present status of the treatment of cancer by intravenous injection of metallic colloids. EDITH QUIMBY

Excitability and contractility of the muscle of the frog as a function of the calcium chloride content of the perfusing liquid. J. P. BOUCKAERT AND J. COLLE. *Compt. rend. soc. biol.* 96, 434-7(1927). The influence of changes in the CaCl_2 content of the perfusing liquid upon contractility, rheobasis and chronaxie was detd. and was illustrated by curves. Excitability was shown better by the rheobasis than by chronaxie. This result is analogous to that obtained by Buchanan and Garven (*J. Physiol.* 62, 190-200) in their study on chronaxie in parathyroptoxic tetany. L. W. RIGGS

Action of insulin on glucose in vitro. T. J. C. COMBES. *Compt. rend. soc. biol.* 97, 268-70(1927).—Insulin does not transform α or β glucose into γ glucose in vitro, nor does it accelerate the stabilization of glucose. The rotatory power of a soln. of glucose is not diminished in the presence of muscle of the guinea pig, and the reducing power remains the same. Insulin does not modify the rotatory power. A diminution of the rotatory power is due to the presence of levogyrous substances which dialyze and which are adsorbed by animal charcoal. L. W. RIGGS

Effect of insulin and glucose on the oxygen utilization of the surviving spinal cord of frogs. H. J. WOLF. *Arch. ges. Physiol. (Pflüger's)* 216, 322-36(1927).—The O₂ of the cord of summer frogs is not modified by insulin alone (that of winter frogs but slightly changed) nor by glucose alone if the cord is not artificially stimulated. However, the cord is damaged or is that of a sick animal, glucose addn. may cause a considerable, though transitory, increase in O₂ utilization. When insulin is added to a cord in glucose soln. a definite and protracted increase in O₂ use follows, the effect depending on the concn. of insulin, high concns. being without effect or inhibitory. G. H. S.

Effect of atropine on the reaction of skeletal muscle to direct stimulation. W. H. HUBB AND J. BÜSCH. *Arch. ges. Physiol. (Pflüger's)* 216, 644-50(1927).—The behavior of the frog gastrocnemius intoxicated with atropine differs in several of its reaction phases from that of the normal muscle. G. H. S.

Relation of the action of thyroxin to the sympathetic nervous system. EMIL H. HUBB AND ERNST WERTHEIMER. *Arch. ges. Physiol. (Pflüger's)* 216, 697-707(1927).—The increased action of thyroxin due to a diet especially rich in protein is abolished by carbohydrate feeding, or by the parenteral administration of suitable doses of ergotamine. The latter given alone causes a fall in body temp. and an immediate reduction in the gas exchange. This increases again after a few hrs. and may

reach values above the normal level. With repetition of the treatments with ergotamine the effects become less marked. Apparently thyroxin acts upon the sympathetic. G. H. S.

Alkaloid of the seeds of *Nandina domestica* (TAKASE, OHASHI) 17.

1- ZOOLOGY

R. A. GORTNER

The amino nitrogen in the eggs of *Bombyx mori*. M. TIRELLI. *Arch. farmacol. sper.* 43, 115-28(1927).--In the freshly deposited eggs of the silkworm moth and in those kept over the winter the amino N is present in greater amt. than in the incubated eggs. Variations in amino N were noted in hibernating eggs. During incubation there is first a decrease and then an increase in amino N. Autolysis in the presence of PhMc also results in an increase, especially with eggs in the later stages of incubation. A. W. DOX

Study of the direct and indirect action of x-rays upon the tissues of the embryonic fowl. T. S. P. STRANGEWAYS AND HONOR B. FELL. *Proc. Roy. Soc. (London)* B102, 9-29(1927).--The degenerative changes produced in the tissues of 6-day embryos by x-rays are intimately related to cell metabolism; the lethal action of the rays is due, not to the formation of stable toxic products, but, in part at least, to the absence of gaseous exchange in the tissues, possibly as a result of intravascular clotting of the blood. JOSEPH S. HEPBURN

The tubes of *Spirographis spallanzani*. Discovery of a supporting substance which is a conjugated hydroxyamino acid and sulfuric acid. SIGMUND FRANKEL AND CURT JELLINEK. *Biochem. Z.* 185, 379-83(1927).--The house tubes of *Spirographis* are made up of proteins which can be removed by peptic and tryptic digestion. The remaining undigested basic substance is a H_2SO_4 -ether combination with at least 3 amino acids, 2 tyrosyl groups and 1 arginine group. S. MORGULIS

Limulus polyphemus. SIGMUND FRANKEL AND CURT JELLINEK. *Biochem. Z.* 185, 384-8(1927).--The *Limulus* carapace, unlike the shell of crustacea, has no $CaCO_3$ deposit, and also contains a large amt. of protein (70%). The chitin is richer in C and poorer in N than the chitin of crustacea. S. MORGULIS

Dihydroxyphenylalanine in the cocoon of *Samia cecropia* L. (Saturniidae). HANS PRZIBRAM AND HANS SCHMALFUSS. *Biochem. Z.* 187, 467-9(1927).--3,4-Dihydroxyphenylalanine was isolated from cocoons of *Samia cecropia*. S. MORGULIS

Origin of the yellow color of beeswax. G. F. JAUBERT. *Compt. rend.* 185, 405-6(1927); cf. *C. A.* 21, 2509.--The m. p. of 1,3-dihydroxyflavone given by Picard (*Beilstein* 3, 628) as 275° is inexact; it should be 285° . It is suggested that the coloring matter of beeswax may be obtained from *Reseda luteola*, *Calluna vulgaris*, *Apium pectinatum*, etc., as well as *Populus nigra*, and that beside 1,3-dihydroxyflavone, small quantities of other derivs. of this coloring matter may be present. L. W. RIGGS

Action of metallic silver upon infusoria; sensitization by eosin. MARYVONNE HAMON. *Compt. rend. soc. biol.* 97, 340-2(1927); cf. Drzewina and Bohn, *C. A.* 20, 3316; 21, 750.--*Paramecia* lived without apparent difficulty in a culture contg. 1 in 500 of eosin. *Paramecia* from a culture contg. 1 in 100,000 of eosin when exposed to metallic Ag were dead in about 15 min., while control *Paramecia* not exposed to eosin lived about 2 hrs. With eosin at 1 in 10,000 the *Paramecia* when placed on Ag died in about 3 min. L. W. RIGGS

Ratio of carbon to nitrogen in the urine of certain mammals. R. VLADESCO. *Compt. rend. soc. biol.* 97, 393-5(1927).--In herbivora the ratio C/N averaged about 2.5, dog 1.06, cat 0.65 and man 0.88. The larger ratio in herbivora is attributed (1) to the greater proportion of cyclic org. compds. from the food which are not oxidized in the body but are eliminated by the kidneys, (2) the greater length of the intestine favoring more complete absorption, and (3) the vegetable foods contain K compds., which are eliminated in the urine as carbonates. L. W. RIGGS

Physical and chemical modifications of the plasma under the action of snake venom in vivo. J. J. ROSSINGROLL. *Compt. rend. soc. biol.* 97, 414-5(1927).--The venoms of *Lachesis alternatus* (1 mg.), *L. newwedri* (1 mg.) and *Naja tripudians* (1 to 3 mg.) were severally dissolved in 10 cc. of 0.9% NaCl soln. and were injected in 2 to 3 min. into the jugular vein of the dog. Each of these venoms caused a diminution of the surface tension, an increase in the viscosity and a diminution of the total proteins of the blood. The diminution of total proteins was especially marked with the venoms of the *Lachesis*. Fibrinogen was strongly diminished. The fraction of the blood precipitable as globulin was increased but that of albumin was diminished. Non-

protein N was increased. The variation in the proportions of globulin and albumin *in vivo* is inverse to that observed *in vitro*. Physico-chemical modifications of horse serum under the action of snake venom *in vitro*. *Ibid* 415-6.—Snake venom (1 mg. per cc. of serum) added to normal horse serum at 37° and under a layer of toluene produces an immediate opalescence, which after 24 hrs. becomes opaque. Except with venom of *Naja tripudians* there is a diminution in viscosity which progresses for 24 hrs., and varies with the proteolytic power of the venom and the dose used. This action is least at p_H 6.0 and is at a max. with a p_H between 6.46 and 6.48. It diminishes after 6.46 and becomes almost const. between 6.67 and 8.36. Venom of *Naja tripudians* increases the viscosity of the serum. The surface tension always diminishes. After 24 hrs. contact under toluene the f. p. of the serum is lowered. Non-protein N always increases. L. W. RIGGS

Egg of the mollusk *Voluta brasiliana* and its use as a dialyzing membrane. A. H. ROFFO AND L. M. CORREA. *Compt. rend. soc. biol.* 97, 420(1927).—The egg gives the reactions of keratin, and its alky. calcd. as $NaHC_2O_3$ is 0.21%. It contains dry substance 25.48%, mineral substances 16.0, org. substances 9.0, Cl as NaCl 13.70, SO_3 1.03, Ca 0.216. The membranes of these eggs have all the characters of semipermeable membranes and have been used as ultra-filters. L. W. RIGGS

Iron organisms. WM. J. MEEHAN AND L. BAAS-BECKING. *Science* 66, 42(1927).—A medium of tap water and Fe filings was favorable to the growth of *Toxothrix*, *Spirophyllum*, etc. of the *Gallionella* group. The occurrence of these organisms in the vicinity of Stanford Univ. appears to be related to the aeration of deep waters in which the aeration of the hydrotroilite black mud causes a formation of H_2S , while the oxidation of Fe goes parallel to an acidification of the aerated water, the p_H changing from 7.6 to 6.8. As soon as the p_H drops below 7.0 the black suspended hydrated pyrite begins to decompose. L. W. RIGGS

Biophysics of lower organisms. II. Specific weight and volume of *Naegleria*-Sp. HANS LEONTIEV. *Arch. ges. Physiol.* (Pflüger's) 213, 1-4(1926); cf. C. A. 20, 3701.—For *Naegleria* the sp. wt. was detd. as 1.045; for ameba, the wt. as $9.65 \cdot 10^{-8}$ mg. G. H. S.

12—FOODS

F. C. BLANCK AND H. A. LEPPER

Determination of benzoic acid in foodstuffs. G. W. MONIER-WILLIAMS. *Chemist & Druggist* 106, 351-2(1927).—An abstr. from Rept. No. 39, Public Health and Medical Subjects, Ministry of Health. A new method of detg. BzOH in fruit and vegetable products is based on the ready and complete distn. of BzOH with steam from a liquid acidified with H_3PO_4 and satd. with NaCl. Collect the vapor in *N* NaOH, evap. to a small bulk, oxidize the impurities with $KMnO_4$, ext. BzOH with a mixt. of Et_2O and petroleum spirit (b. 30-50°), evap., and resublime BzOH by the Polenske method, modified. Recovery of BzOH by this (tentative) method is satisfactory. S. W.

A bibliography for cookery investigation problems. VICTORIA CARLSSON. *Separate* 168 pp.) publ. by Bur. of Publications, Teachers College, Columbia Univ., N. Y. City (1927). F. J. C.

Dehydrated fruits and vegetables. F. T. SHUTT. *Dept. Agr. Canada, Rept. Dominion Chemist, Year Ending March 31, 1926*, 94-5(1927).—Data are given on the H_2O content of 5 varieties of fruit and 6 of vegetables before and after dehydration. The max. amt. of SO_2 found in dehydrated apples was 0.08 part per 1000 and in dehydrated peaches 0.3 part per 1000. K. D. JACOB

Storage and transportation diseases of vegetables due to suboxidation. R. NELSON. *Mich. Agr. Expt. Sta., Tech. Bull.* 81, 38 pp.(1926).—The results of the investigation of certain non-parasitic diseases affecting crucifers, lettuce and potatoes in storage and transportation are presented. These diseases include black leaf speck on crucifers, redheart of lettuce and cabbage and surface pitting of potato tubers. These diseases are symptoms of breakdowns that occur under present conditions of storage and transportation and are caused primarily by an inadequate supply of O_2 at low temps. which prevent the utilization of the O present. These breakdown diseases have been produced in the lab. under various conditions of temp. and air compn. and both of these factors are important in causation. Air movement without renewal has not been effective in preventing breakdown and at low temps. air composition appears to be less important than low temp. as a cause of these diseases. Surface

breakdown of potato tubers occurs in the absence of blackheart and may be produced by exposure to conditions less severe than is assumed to produce black heart. It is suggested that the ultimate cause of the blackheart is the liberation or accumulation in certain cells of some toxic material, possibly from the mixture of hydrolytic enzyme and glucoside. The conditions favoring this reaction are brought about in storage and transportation by prolonged exposure to low temp. or an inadequate O supply.

J. J. SKINNER

Maize by-products. W. L. DAVIS. • *Langston, Feeding Stuffs and Farm Supplies* J. 12, 43-10(1927). The composition and feeding value of corn by-products are discussed.

Report of Committee on Standardization of the Experimental Baking Test, 1926-1927. I. General report and recommendation of "fixed type of procedure." M. J. BLISH. *Cereal Chemistry* 4, 299-302(1927), cf. C. I. 21, 2036. II. Comments on the proposed baking test. L. H. BAILEY AND EMILY GREWE. *Ibid* 303 5. III. Observations of baking tests. R. C. SHERWOOD AND C. H. BAILEY. *Ibid* 305 9. IV. Comments. C. B. MORRISON. *Ibid* 309 10. V. Comments. L. D. WHITING. *Ibid* 310.

L. H. BAILEY

The bleaching of flours. F. BORDAS. *Ann. fals.* 20, 413-20(1927).—From a discussion of the advantages and disadvantages of bleaching flours, B. concludes that, from the standpoint of the public health, consumption of bread made from bleached flour possesses nothing but drawbacks.

A. PAPINEAU-COUTURE

Heat-damaged wheat. D. A. COLEMAN AND R. E. ROTHGEB. U. S. Dept. Agr., *Tech. Bull.* 6, 1-31(1927). A study was made of the phys. characteristics and chem. compn. of heat-damaged and header-damaged wheat of different varieties, the effect of the damage upon yield and compn. of flour and the character of the resulting loaf of bread. The results show that the addition of 0.5% of badly heat-damaged kernels to sound wheat injures the milling and baking qualities of the sound wheat. Header-damaged wheat is also of inferior milling quality in that it gives a low yield of flour of high ash content and the resulting bread is of undesirable color and taste.

W. H. ROSS

Study of the simplified molecular constant (S. M. C.) of milks of the Somme. G. JORET AND R. RADET. *Ann. fals.* 20, 341-53, 493-11(1927), cf. Oubrè and Fournier, C. I. 18, 3233-4. Analyses of 196 samples of milk of herds and of individual cows, all of known purity, and of 11 samples of commercial milks are tabulated and discussed. The results indicate that 70 is a reasonable min. value for the S. M. C., but with milk of individual cows a tolerance of ± 1 is permissible. The S. M. C. is affected by the feeding of the cows, being lowered by oil cakes, and particularly by bran, presumably because of their high P.O. content which increases the sol. P.O. in the milk serum and correspondingly reduces the Cl content.

A. PAPINEAU-COUTURE

The relative values of reductase test and acidity for the evaluation of the hygienic condition of milk. W. H. PADMOS. *Nederland. Tijdschr. Hyg. Microbiol. Serol.* 2, 132-8(1927), cf. C. I. 21, 614. The min. reductase time should be 2 hrs. in summer and 4 in winter. Because of the long incubation period the acidity is not an adequate indicator of contamination or stability. In a series of 3115 summer samples the reductase time was less than 2 hrs. in 2.3%, while less than 1% had a pH below 8.

MARY JACOBSEN

Estimation of milk fat in milk chocolate by means of a modified xylene number. C. A. GREENLEAF. *J. Assoc. Official Agr. Chem.* 10, 396-101(1927).—A method is given for detg. a modified xylene no. on fats, consisting essentially in sapon. with glycerol-KOH, pptg. out the insol. Mg salts, red. by the filtrate, extg. the xylene-sol. acids, distg. the residual H₂O-sol. acids, and titrating the distillate. The technic is described in detail. Examn. of 12 samples of butterfat gave xylene nos. of 25.20-27.70 (av. 26.18), examn. of 6 samples of cacao butter gave 0.10-0.40 (av. 0.19). In mixts. of butterfat and cacao butter, when the xylene no. < 11.72 butterfat % = $\frac{\text{xylene no.} - 0.19}{0.288}$, and when the xylene no. > 11.72 butterfat % = $\frac{\text{xylene no.} - 2.08}{0.241}$.

0.241

Closely agreeing results were obtained in duplicate detns. and by 2 different analysts.

A. PAPINEAU-COUTURE

The degree of dispersion of fat in milk. H. H. WEIGMAN, JR. *Milchwirtschaft Forsch.* 4, 259-311(1927).—A series of tables give the variation in size of different breeds, also the distribution of various sizes, with vol. and wt. of fat in the various sizes.

G. R. GREENBANK

The bactericidal action of milk. K. DREWES. *Milchwirtschaft. Forsch.* 4, 403-30(1927).

G. R. GREENBANK

Some factors other than bacteria that influence the body of artificial buttermilk. GEORGES KNAYSI. *J. Agr. Research* **34**, 771-84(1927).—The quality of artificial buttermilk may be improved by the addn. of various Na salts to the milk before souring but the flavor of the product is altered by this treatment. Heating milk at 100° produces a marked improvement in the body of the product over heating at 82°. The tendency of artificial buttermilk to whey off when incubated at rather high temps. is due largely to phys. forces. Homogenizing artificial buttermilk results in the sepn. of serum and homogenizing milk before souring has no beneficial effects. Substances like gelatin and starch produce no improvement in the quality of the buttermilk when used under the conditions of the expts. W. H. ROSS

Composition of Danish butter and some methods of analysis. A. C. ANDERSON. *World's Butter Rev.* **1**, No. 4, 21-2(1927).—To prep. samples for analysis, the stirring method affords greater accuracy than the shaking method. It is quite impossible to take out 2 similar samples from the same parcel of butter, it never being altogether homogeneous. Fat is detd. by an indirect method, 100 - (% water + fat-free dry matter). The sum of water and fat content is fixed at 98.3% for salted butter and 99.1% for fresh butter by the indirect fat detn. method. The sum of water and fat content by direct detn. is at present 98.5% for salted butter, and 99.4% for fresh butter. The α is somewhat dependent on the season. The av. salt content in salted Danish butter is about 0.9%, in unsalted butter not more than 0.08%. If fat is detd. by the Gerber method, 0.5% is deducted from the value found. J. C. JORRGENS

Green color in butter. A. A. RAMSAY, A. M. BROWN AND H. H. RANDELL. *Agr. Res.* **1**, No. 3, 175-80(1927).—The development of green color in certain samples of butter appeared to be due to protein decompn. with formation of melanins. The green color was confined to butter from cows grazing on herbage infested with aphids and appeared to be restricted to butter produced by certain members of the herd. Pasteurization hastened development of the abnormal color. There was no definite correlation between the bacterial flora of the milk and the color of the butter. K. D. JACOB

Determination of iron in butter. G. SCHWARZ. *Milchwirtschaftl. Forsch.* **3**, 50-54(1926); *Ber. ges. Physiol. exptl. Pharmacol.* **40**, 350; cf. *C. A.* **9**, 1442. —S determination of iron in butter by a colorimetric method based on Chugaev's dimethylglyoxime reaction. Ca, Mg and H₂PO₄ interfere only when present in larger proportions. The rapid decompn. of milk which imparts to it a salty and metallic taste can be induced by a few mg. Fe. MARY JACOBSEN

The distribution of water in butter. HANS BOYSEN. *Milchwirtschaftl. Forsch.* **3**, 21-24(1927).—The distribution of water in butter is shown by photomicrographs of each parallel and crossed Nicol prisms. The disappearance of droplets, about salt crystals, is shown and accounted for. G. R. GREENBANK

Chemistry of cheese ripening. III. W. GRIMMER AND K. SCHUTTLER. *Milchwirtschaftl. Forsch.* **3**, 495-502(1926); *Ber. ges. Physiol. exptl. Pharmacol.* **40**, 646.—Caseoglutin, the alc. sol. protein of brick cheese, has been studied by Grimmer and Schuttler. The compn. of the new prepn. differs from the former and from paracaseoglutin. Caseoglutins are probably mixts. of S compds. and of S-free substances of varying tryptophan content, which are always higher than those of the original substance. Caseoglutin contained 1.0% histidine, 3.2 arginine, 13.4 lysine, 0.8 NH₂, 3.3 tryptophan, 1.0 alanine, 5.8 valine and leucine, 12.6 isoleucine, aspartic and glutamic acids, phenylalanine, 1.1 tyrosine and 1.9 proline. MARY JACOBSEN

The action of rennet. II. W. GRIMMER AND W. RUDZIK. *Milchwirtschaftl. Forsch.* **3**, 361-403(1926); *Ber. ges. Physiol. exptl. Pharmacol.* **40**, 727.—The expts. were carried out with the strongly acid Swiss Peptolab and 2 slightly acid German rennets, the p_H of which increased inversely with the enzyme concn. Grimmer and Rudzik's former expts. on war rennet were confirmed. The relation between $c \times t$ (enzyme concn. \times coagulation time) and c is represented by a logarithmic curve, the p_H of which tends to flatten with decreasing p_H . The factor is const. for the same p_H and, apart from a few inexplicable exceptions, independent of the p_H . In solns. containing 1 mg. rennet and 0.1 cc. 0.05 N HCl in 10 cc. $c \times t$ decreases with increasing c , the relation being represented by a logarithmic curve. In 0.1 N HCl $c \times t$ first increases with c , then decreases after having passed a max. at 20-30 mg. rennet. With const. p_H the curves differed from each other and from those obtained in aq. solns. only slightly. In phosphate solns. the p_H decreased with increasing c , while $c \times t$ followed a log. curve. The same was the case in a HCl soln. kept at p_H 4.8. On souring or addn. of acids t was a log. function of p_H . In a few cases the coagulation

velocity increased parallel with the acidity. Rennet is injured by the direct addn. of alk. salts.

MARY JACOBSEN

A study of metal foils and glazed paper as wrapping material for cheese. B. BLEYER AND K. MAYER. *Milchwirtschaft. Forsch.* 4, 312-35(1927).—A study of the changes occurring on the surface due to adsorption of metal or coatings on paper.

G. R. GREENBANK

Creatinine determinations in bouillon preparations. WILHELM MÜLLER. *Mitt. Lebensm. Hyg.* 18, 112-3(1927); cf. *C. A.* 20, 2375.—A comparison of the methods for creatinine according to Sudendorf and Lahrman (C. A. 9, 1948) and *Schweiz. Lebensmittelbuch* 3, 72(1917).

R. C. ERB

Effect of ethylene on the composition and color of fruits. E. M. CHACE AND C. G. CHURCH. *Ind. Eng. Chem.* 19, 1135-9(1927)—Ethylene treatment does not appreciably alter the compn. of citrus fruits but does accelerate the coloring. The same treatment hastened the coloring of persimmons, destroying the astringency and producing softening. Conclusive data on other fruits are not yet available.

R. C. E.

Fruit jellies. P. B. MYERS AND G. L. BAKER. Delaware Agr. Eng. Sta., *Bull.* 141, 14-9(1925); cf. following abstr.—Regardless of total acidity or presence of salts, the minimum point of jelly formation occurs at a p_H value of 3.50-3.55, values very close to Tarr's min. point. The optimum point of jelly formation varies between p_H 2.85 and p_H 3.30, depending upon the nature of the acid and salt used. Total acidity can vary over a wide range, depending upon the buffering power of the initial soln. from which jelly is made. The strength of the jelly, made by adding a salt to the pectin, acid, sugar soln., is dependent upon the initial p_H value of the soln. and the concn. of the salt.

E. F. SNYDER

Fruit jellies. IV. The role of salts. P. B. MYERS AND G. L. BAKER. Delaware Agr. Expt. Sta., *Bull.* 144, 3-35(1926); cf. preceding abstr.—The effects on jelly formation of variations in H-ion concn., salt concn. (total acidity const.) and salt concn. (H-ion concn. const.) were studied. The buffer action of fruit juices is largely due to the presence of salts in the juices. The quantity of acid that may be present in a juice of good jelling properties is dependent upon the buffer action of the juices. The H-ion concn. detcs. the jelling properties of a fruit juice rather than its acid content, other conditions being equal. The anion of the salt functions mainly as a buffering agent and may also function as a peptizing agent if present in sufficient quantities, thereby increasing the strength of jellies and preventing syneresis. The cation of the salt functions in a manner similar to that of the H ion of the acid, but only at definite H-ion concns. Syneresis in jellies may be caused by the H ion alone or by the H ion and cation of the salt together, but not by the action of the cation of the salt alone. Clear, sparkling jellies were obtained from pectin solns. contg. appreciable quantities of a salt, while cloudy and dull-appearing jellies otherwise resulted.

E. F. S.

Analysis of "fruit and apple" jams. (Estimation of the ratio of apple to "fruit.") C. F. MUTTELET. *Ann. fals.* 20, 391-4(1927).—The acidity of fruits contg. only citric acid is fairly const., with the following min. values: black currant 3.0, gooseberries 2.0, raspberries 1.0, strawberries 1.0% of the juice. Examn. of a large no. of different kinds of jams and jellies showed that on the av. they consist of about 64% added sugar (sucrose and invert sugar) and 36% "fruit" and apple or apple product (pomase, pectic juices, etc.). The proportion of "fruit" can be calcd. approx. from the citric acid, and apple, etc., by subtracting the "fruit" from 36%. Analysis of a no. of com. samples of "fruit and apple" jams showed little or no malic acid, indicating that the use of pectic juices is now current com. practice for this class of goods.

A. P.-C.

Glycerol substitutes. W. A. WHATMOUGH. *Chemist & Druggist* 106, 411(1927).—Concd. invert sugar sirup, being non-cryst. and non-fermenting, and in itself an excellent food, is recommended as a substitute for glycerol as a preservative of fruit juices. It far surpasses it by conserving the natural fruity taste. Addn. of honeys may affect the taste, and may also cause crystn. or fermentation. The concd. sirup must be used undild. with H_2O .

S. WALDBOTT

Apple wrappers. F. T. SHUTT. Dept. Agr. Canada, Rept. Dominion Chemist, Year Ending March 31, 1926, p. 94(1927).—Sulfite-paper wrappers contained the highest % of moisture, 11.6, and the lowest % of petroleum ether ext., 0.61. Wax-stripe paper wrappers contained the lowest % of moisture, 2.94, and the highest % of petroleum ether ext., 48.84.

K. D. JACOB

Correlation of nutritive value with dry matter content of pastures. E. J. SHEEHY. *Sci. Proc. Roy. Dublin Soc.* 18, 389-98(1927).—Two pastures which differed markedly in the botanical characters of their herbage were studied by lab. analysis and by feeding expts. with guinea pigs. The chem. compn. and digestibility of the dry matter was

practically the same for both pastures. The percentage of dry matter in the herbage was 25% higher in the pasture contg. closely packed grass, over the pasture contg. more clover and miscellaneous plants. This was the one definite factor of difference between the 2 pastures. Since nutritive value is roughly proportional to the dry matter content the latter may be taken as a measure of the value of pastures. L. W. RIGGS.

Wyoming forage plants and their chemical composition. VII. Effect of altitude, seasonal variation and shading experiments. E. N. ROBERTS. Wyoming Agr. Expt. Sta., *Bull.* 146, 35-89 (1926).—Western forage plants increase in feeding value with increase in altitude at which they are grown. Increase in altitude caused an increase in crude protein, in N-free ext. and caloric value. As the season advanced, the crude protein of the forage plants decreased and the N-free ext., ether ext. and crude protein increased. Shading caused an increase in crude protein and a decrease in N-free ext.

J. J. SKINNER

Composition of Arizona forages, with comparative data. C. N. CATLIN. Arizona Agr. Expt. Sta., *Bull.* 113, 155-73 (1925).—The data have been compiled from analyses made during the past 25 yrs. at this station. Appended tables show the compn. of forages, hays, silages, fodders, grains, miscellaneous feeding stuffs and the digestibility coeff. of feeding stuffs.

E. F. SNYDER

A method of improving the feeding value of straw-chaff. ALBERT HOWARD. *Agr. J. India* 22, 41 2 (1927).—Millet straw was converted into a satisfactory cattle food by fermenting for 35 days in mixt. with green corn and NaCl (cf. Jonas, *J. Roy. Agr. Soc. England* [2], 6, 119 (1870)).

K. D. JACOB

Preservation of young green fodder. II. K. SCHMIDT. *Leopoldina* 2, 107-16 (1926); cf. *C. A.* 20, 3050; 21, 2748.—Lab. and large-scale expts. were made on the effect on the compn. of lucerne silage of evacuating the silos after filling and then introducing CO₂ or CS₂ vapor. Feeding expts. with sheep and cows showed that the silage made in this way gave satisfactory results. In the lab. expts., the formation of butyric acid was entirely suppressed. Treatment with CS₂ also reduced the amts. of acetic acid and NH₃ produced. Samples of the gases in the silos were analyzed at intervals. There was a markedly greater production of H in the silage treated with CO₂ than in that treated with CS₂; and, in the large silo, an increased amt. of H in the lowest layer. Temp. changes and the rate of formation of acids in the silage are also discussed.

B. C. A.

New uses for pectin (ROOKER) 18. Anhydrides of aliphatic acids (HOLDE) 10. Plant composition as influenced by variations in soil type (STIEVERS, HOLTZ) 15. Sterilizing milk or fruit juices by percolation through silver-coated sand (U. S. pat. 1,642,089) 13. Apparatus for fermentation and storage of foodstuffs (U. S. pat. 1,643,018) 1.

BIDAULT, C.: *La conservation de la viande et du poisson*. Paris, 1927; J. B. Baillière et Fils. Reviewed in *Bull. soc. hyg. aliment.* 15, 273-4 (1927).

Bread. C. B. HILL and G. L. TINTNER. U. S. 1,643,011, Sept. 20. Dried yeast is added to a soln. of yeast food comprising sugar, malt ext., (NH₄)₂SO₄, Ca₃(PO₄)₂ and CaSO₄ to revivify the yeast and prep. a starter for making bread. U. S. 1,643,012 describes adding wet live yeast to a yeast nourishing medium comprising similar ingredients, allowing the mixt. to stand for yeast multiplication and using the product for making bread.

Bread. F. A. LADDEMAND. Can. 272,266, July 12, 1927. A compn. for use in the making of bread, etc., consists of 1.021 g. NaF, 1 oz. NH₄Cl, 2.5 oz. NaCl, 2.5 oz. CaSO₄, 4.252 g. (NH₄)₂HPO₄ and about 4 oz. flour. The proportions for use are 7 oz. of the compn. to 100 lbs. of flour in the dough batch.

Improving the flavor of yeast. E. B. BROWN. U. S. 1,642,537, Sept. 13. Yeast is subjected to the action of a solute such as a sugar or salt soln. under conditions as to temp. and concn. such that autolysis and fermentative activity are substantially checked, and the excess of the solute is then removed from the yeast.

Preserving and packing yeast. L. O. LEWTON. Brit. 262,063, Nov. 24, 1925. Yeast mass or cake is surrounded with a surface film such as vegetable or mineral oil or "vegetable lard" or cacao butter and then wrapped; the wrapper may be lined with the oleaginous material.

Food product from yeast. A. K. BALLS. U. S. 1,642,320, Sept. 13. Yeast is heated to a temp. of not over 150° for a period of less than 90 min. and the resulting liquid is concd.

Food preparations from pectin. H. G. LOESCH. Brit. 262,736, Dec. 10, 1925. Jellies and preserves are made by the use of a pectin prepn. contg. solid pectin suspended in a liquid medium such as ale, glycerol, or a sirup prepd. from sucrose, dextrose, invert sugar, or a mixt. of sugars, or sirups prepd. from fruit juices. Org. acids such as lactic tartaric, citric or male may be added. Numerous details are given.

Nitrogen-containing products from autodigestion of fish. M. KAHN. U. S. 1,642,209, Sept. 15. A product suitable for use as a food is obtained by maintaining fish for 1-5 days at a temp. of 37-55° in the presence of a quantity of NaCl not exceeding 10%.

Food from fish. C. BIRD-EYE. U. S. 1,642,209, Sept. 20. See original pat. 1,608,832, C. J. 21, 291.

Cocoa. H. BOLLMANN. Brit. 262,339, Nov. 9, 1925. The soly of cacao powder is increased by adding about 2% of phosphatides derived from soy beans or other suitable vegetable materials. The phosphatide used may be so purified that their phytosterol content is retained, i. e., by first adding H₂O and then distg. under reduced pressure after centrifuging to remove the main quantity of oil.

Concentrated maple flavoring. J. W. SALE and J. B. WILSON. U. S. 1,642,789, Sept. 20. Maple sirup is adjusted to a d. of about 28° B_x, heated to about 80° and is condensed after pptg. substantially all the sugar present, i. e., by adding Ba(OH)₂.

Comminuting and melting blocks of hard fats for margarine manufacture, etc. B. JIROTKA. Brit. 262,433, April 17, 1926.

Sausage casings made from disintegrated skin-splits, sinews and similar animal substances. J. SVAUCH. Brit. 262,202, Sept. 18, 1925. Brit. 262,352 also relates to sausage casings made from similar materials.

13 GENERAL INDUSTRIAL CHEMISTRY

HARRIAN MINER

Economic factors in chemical industry. J. E. TEEPLE. *Ind. Eng. Chem.* **19**, 1085-7 (1927).—A chem. industry is defined as one which produces something essentially chemically different from the raw materials, one in which the preponderance of the operations involved include chem. changes, one in which the chem. processes are under the direction and control of trained chemists, and in which the direction of the policies of the business is in the hands of men having chem. training and understanding and a chem. outlook. The growth of chem. industry thus defined has been enormous within the last 20 yrs. and touches nearly all of the materials of daily life. The future possibilities are briefly considered and the important factors in chem. industry are listed as follows: raw materials, power, markets, technically trained personnel, and "money that is needed."

A. W. KENNEY

The economic basis of industrial chemistry. WILLIAMS HAYNES. *Ind. Eng. Chem.* **19**, 1082-4 (1927).—The beginnings of chem. industry are in prehistoric times and chem. processes become more important with developing civilization. The modern chem. industry began with the industrial revolution and has developed with great rapidity. Chem. processes are now taking the place of mechanical and other manufg. processes and are especially important in the development of new materials to meet new needs.

A. W. KENNEY

Important novelties in inorganic chemical industries 1926. HERMANN VON KÉLER. *Z. anorg. Chem.* **40**, 911-24 (1924).—A review is given, contg. short abstracts of new processes in the following more industries: sulfur, sulfuric acid, sulfuric acid, sulfate and hydrochloric acid, nitrogen oxides, ammonia, cyanogen compds., hypochlorites, peroxides and peralts, various light and heavy metal industries, etc. References to 153 patents of different countries are given.

B. J. C. VAN DER HOEVEN

The relation of research to industry. W. S. JAMES. *J. Soc. Automotive Eng.* **21**, 265-7 (1927).

M. B. HART

Analysis of statistics. J. H. GRAFF. *Trans. Am. Inst. Chem. Eng.* **18**, 105-85 (1926).—A method is described for developing a quick and comparatively simple method for the analysis of statistics. The method makes it possible to find quickly the values of the correlations between any no. of factors. Factors for consideration in statistical research include (1) general economic conditions; (2) financial and operating data of the concern; (3) factors influencing the industries to which products are sold; (4) factors influencing the market conditions of the raw materials; and (5)

the kind of data tabulated and charted in the plant or research dept. Many charts and curves are given by way of illustration. W. H. BOYNTON

Chemistry and national defense. C. E. BRIGHAM. *Trans. Am. Inst. Chem. Eng.* **18**, 403-8(1926).—B. outlines the inception of poison gas warfare, the role played by chemistry, the need of chem. preparedness and the importance of defense forces against the use of toxic gases on cities under attack. "National strength is a power for peace." W. H. BOYNTON

The economical production of steam. ORDENKOVEN. *Bull. assocn. lives inst. sup. fermentations Gand* **28**, 205-10, 253-80(1927).—An address. A. P.-C.

Modern trends in steam generation. THEODORE MAYNZ. *Chem. Met. Eng.* **34**, 537-43(1927). E. H.

The production of steam from waste heat. A. J. EBNER. *Chem. Met. Eng.* **34**, 572-4(1927). E. H.

Steam metering and control. H. M. HAMMOND. *Chem. Met. Eng.* **34**, 569-71(1927). E. H.

Modern developments in the steam-piping field. A. B. WILLIAMS AND C. W. WELCH. *Chem. Met. Eng.* **34**, 547-50(1927). E. H.

Gas-fired steam boilers. A. B. GREENLEAF. *Chem. Met. Eng.* **34**, 566-8(1927). E. H.

Some odd applications of steam. CROSBY FIELD. *Chem. Met. Eng.* **34**, 577-80(1927). E. H.

Application of superheated steam in industrial processes. F. G. PAGE. *Chem. Met. Eng.* **34**, 575-6(1927). E. H.

Automatic volume control of steam and air. JOHN WOLFE. *Chem. Met. Eng.* **34**, 562-5(1927). E. H.

Application of steam accumulators. GROVER KEETH. *Chem. Met. Eng.* **34**, 571-3(1927). E. H.

By-product power from steam turbines. C. B. CAMPBELL. *Chem. Met. Eng.* **34**, 571-9(1927). E. H.

Fluid heat transmission for high temperatures in industrial processes. J. A. MAYER. *J. Soc. Chem. Ind.* **45**, 367-76T(1927). A description of the Merrill system of heating apparatus by circulating hot oil. W. L. BADGER

The flow of thick pastes through tubes. H. HERBST. *Z. angew. Chem.* **40**, 899-900(1927).—Kaolin slurries of varying water contents were forced through a meter tube of 20 mm. bore with a 5-mm. orifice at the end. A graph of pressures in atm. necessary to start the flow plotted against the water content of slurry is given. At about 30% water the curve breaks sharply, indicating enormous increase in viscosity. H. L. OLIN

Specification of losses in operation. J. P. TREUB. *Chem. Weekblad* **24**, 406-12(1927).—A method is described for calcn. of losses of each of several basic products in plant operation from monthly balance sheets by means of the least squares. B. C. J. VAN DER MOEVEN

Waste heat boiler application. J. B. CRANE. *Blast Furnace and Steel Plant* **15**, 50(1927).—In recovering waste heat, equal increments of heating surface do not recover equal amts. of heat, the later additions being much less effective. A series of calcs. should be made in such cases to det. at what percentage recovery the max. annual returns will be obtained. W. L. BADGER

Cleaning filter-press cloth. STEIN. *Tageszeit. f. Brauerei* No. 250; *Brasserie et Pâtisserie* **17**, 155-9(1927).—Results are given of a no. of treatments for removing incrustations which accumulate on filter-press cloths, the most satisfactory of which consisted in immersing 3.5 hrs. at 93-5° in 2% NaOH, letting cool overnight, rinsing lightly with cold water, brushing vigorously, rinsing in hot water and finally passing through cold 0.5% AcOH. This restores the cloth to practically its original wt. A. PAPINEAU-COUTURE

The properties and functions of filter aids. H. L. OLIN, F. V. MORRISON, J. S. PETERS AND G. H. NELSON. *Trans. Am. Inst. Chem. Eng.* **18**, 379-90(1926).—A preliminary study of a no. of substances commonly used as aids in filtration shows that they possess adsorptive capacities in varying degrees. The theory is advanced that to a large extent the clarification and flow rate increase which they bring about is due to their coagulative and adsorptive action which they bring to bear on colloids present in the slurry. Studies were made on (a) adsorptive capacities of different filter aids, (b) rate of flow tests with a large lab. filter and (c) tests on the effect of filter aids on sedimentation. H. L. OLIN

Weighing in the chemical industries. W. A. BENTON. *Chemistry & Industry*

46, 741-4, 764-7(1927).—A sketch of the industrial weighing instruments used in chem. industries is given and the relative accuracy and usefulness of each are discussed.

J. W. SHIPLEY

Researches on the theory of fine grindings. VI. The diameters of irregularly shaped crushed sand particles lifted by air currents of different speeds and different temperatures. GEOFFREY MARTIN *Trans. Ceram. Soc. (Eng.)* **26**, 21-33(1927); cf. *C. A.* **21**, 1857.—In continuation of the reported work on the fundamental laws governing the fine grinding of cements and related materials, M. finds the most accurate and rapid method of detg. the diam. of irregularly shaped particles is to estimate the velocity of the fluid which supports them. When particles are very small Stokes' law, $v = k \text{ diam}^2$, is obeyed, the const. k depending on whether the fluid flow is in stream line or turbulent flow, and also the shape and nature of the particles. As the particles become larger at some critical diam. Stokes' law gives way to the linear law, $V + \dots = k \text{ diam}$. At still higher fluid velocities the linear law is replaced by the parabolic law, $\text{velocity} = k\sqrt{\text{diam}}$. The influence of temp. on the size of particle supported by a gas stream is marked. The phenomena of evapn. and distn. in liquids are simulated by powders. A table is included giving the diam. and wt. of quartz particles lifted by air speeds from 0 to 328 ft./sec., together with mesh apertures of the chief industrial sieves. **VII. The efficiency of grinding machines and grinding media, with special reference to ball and tube mills.** GEOFFREY MARTIN, assisted by F. B. TURNER AND FRANCIS LINSTED. *Ibid.* 34-44.—The efficiency of a grinding machine is defined as the work performed by the machine in ft. lb. in increasing the surface of standard Leighton Buzzard sand by 1 sq. ft. The method of detg. the surface of sand particles consists of a rate of solu. detn. in dil. HF, as described in Parts II and III of this work (*C. A.* **20**, 2034, 2035). The relative efficiency of grinding machines can thus be detd. Their absolute efficiency can be calcd. from the heat of volatilization of brittle crystals and their mol. dimensions. The work done in grinding is proportional to the surface produced, being a statistical result similar to the law of extension of liquid films. Thus the work done in grinding to any degree of fineness desired can be calcd. from the formula $W = B(S_2 - S_1)$, where W is the work required in ft. lb., S_1 and S_2 are the original and final surfaces of the powder, and B is a const. measuring the efficiency of the machine. The most efficient grinding media in tube and ball mills are $3/4$ " steel balls followed by 1" steel balls. Flints are extremely inefficient. When the surface of the powder exceeds the surface of the grinding media by 100-500 times efficiency is obtained. Grinding in a current of air does not notably increase the efficiency. **VIII. The variation in specific gravity of quartz sands on prolonged grinding.** GEOFFREY MARTIN, assisted by WALTER WATSON AND EDGAR BOWES. *Ibid.* 45-56(1927).—After grinding quartz sand 25-50 min., the sp. gravities of 17 sands prep'd. by air elutriation are the same or slightly higher than that of unground sand, the greatest variation being 0.2%. Thus no amorphous SiO_2 was produced during the grinding. The d. of quartz is dependent on the particle size of the sample, increasing slightly with greater fineness down to 0.03 mm. diam. Prolonged grinding ($3\frac{1}{2}$ hrs.) produced a slight decrease in sp. gr. (0.004), indicating the formation of amorphous SiO_2 , calcd. to amt. to 0.92%. A vacuum pycnometer was used in these detns.

H. F. K.

Adsorption and its relation to refrigeration. F. G. KEYES. *Proc. Am. Gas Assoc.* **1926**, 729-34.—An elementary discussion of the thermodynamics of adsorption. An adsorbent to be successful in refrigeration must be cheap, high in its adsorptive capacity and must take up the refrigerant fluid with as small an integral heat of adsorption as possible relative to the ordinary heat of evapn. of the refrigerant. It must be stable chemically and physically and be non-corrosive.

H. L. OLIN

Chemistry's contribution to automotive transportation. T. A. BOYD. *Ind. Eng. Chem.* **19**, 1088-9(1927).—An introduction.

W. H. BOYNTON

Protection of enclosed spaces from noxious gas. M. E. BARKER. *Trans. Am. Inst. Chem. Eng.* **18**, 391-401(1927).—A method consisting solely of air-locks at the entrances is not satisfactory. Supply of gas-free air to the room under a slight positive pressure through suitable filters eliminates diffusion and keeps out gas.

F. D. S.

EDWARDS, JUNIUS DAVID **Aluminium Bronze Powder and Aluminium Paint.** New York: Chemical Catalog Co. 104 pp. \$3.00. Reviewed in *Mech. Eng.* **49**, 1041(1927).

REYSCHER, K.: **Die Lehre vom Trocknen in graphischer Darstellung.** 2nd ed., revised. Berlin: Julius Springer. 74 pp. R. M. 4.50.

Separation of gases. M. BENSON. Can. 273,390, Aug. 30, 1927. A mixt. of gases is sepd. by fractional soln. under pressure, the pressure of the undissolved portion of the mixt. being utilized to generate pressure on the mixt. under treatment.

Drying gases. W. MULLER. Can. 273,517, Aug. 30, 1927. Air or other gases are dried by treating with a soln. of P_2O_5 in H_3PO_4 .

Recovering volatile solvents from air or gas mixtures. I. G. FARBERINDUSTRIE AKT.-GES. Brit. 262,404, Dec. 3, 1925. Tricresylphosphates or other triarylphosphates are used for absorbing solvent vapors such as are obtained in the celluloid or artificial silk industries and in low-temp. distn. and coking.

Thickening solid and liquid mixtures. A. L. GENTER. U. S. 1,642,673, Sept. 20. Mech. features of suction, filtration, etc., are specified.

Sterilizing water, milk, fruit juices or other liquids by percolation through silver-coated sand. A. SCHREIER. U. S. 1,642,089, Sept. 13.

Insulating and dielectric material. S. BOYER. Brit. 262,473, Dec. 4, 1925. Materials such as $PhNO_2$, nitrotoluene, paraldehyde, acetophenone and TiO_2 may be used alone or together as a dielectric material or may be used to impregnate paper. Basic oxides such as those of Ca, Ba or Al may be used to reduce impurities in $PhNO_2$. Numerous modifications are described.

Protective systems for liquid-insulated electrical apparatus. M. BUCHHOLZ. U. S. 1,642,397-408, Sept. 13. Various devices are specified, for use in connection with oil transformers or similar app., in which elec.-actuated protective app. is controlled by the sp. gr., gas evolution on decompn. or other characteristics of the insulating liquid.

Photographic method of determining yielding of materials under stress. L. HARTER. Brit. 262,378, Dec. 4, 1925.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Technic and practical applications of the crystallographic study of mineral waters. MAURICE PERRIN and PIERRE COLSON. *Compt. rend. soc. biol.* 97, 379-80(1927).—By the study of residues from drops of water evapd. on a slide, it is possible to distinguish a natural mineral water from an artificial imitation of that water.

L. W. RIGGS

The arsenic content of East Prussian waters. S. GOY and W. RUDOLPH. *Z. angew. Chem.* 40, 945-8(1927).—The As content of waters and of slimes does not differ greatly between industrial and non-industrial districts. The As content of the slime is several hundred times as great as that of the water. Conclusion: Bacteria remove As from the water and enrich the slime and the As content of the slime parallels its org. content.

FOSTER D. SNELL

Sulfur in rain water. S. V. EATON and J. H. EATON. *Plant Physiology* 1, 77-87(1926).—In rain water collected during 1921-23 at Chicago, Ill., there was more than 5 times as much S as that in water from a typical agricultural region (near Liberty, Ind.). Seasonal variations occur; the largest quantity of S is found in the winter rain. The quantity of S added to the soil by rain varied directly with the rainfall, but the percentage of S content of the rain water varied inversely with the pptn. The bearing of the results on soil fertility and crop yields is pointed out.

WALTER THOMAS

Additional note on water analysis. W. R. ATKIN and D. BURTON. *J. Intern. Leather Trades Chem.* 11, 204-5(1927).—The methods for hardness previously outlined (C. A. 21, 1860) are modified by the substitution of bromophenol blue for phenolphthalein in the detn. of Mg hardness.

H. B. MERRILL

Small-scale waste-water purification. O. WEICKERT. *Chem.-Ztg.* 51, 549-50(1927).—The waste liquor is clarified mechanically in a settling well, then passed through a system of drainage pipes around and finally into a self-draining seepage well. It is claimed that complete purification (partly by biol. processes) is obtained with a drain drainage tube.

B. J. C. VAN DER HOEVEN

Water softening as practiced at Oberlin, Ohio. W. H. CHAPIN. *Ind. Eng. Chem.* 19, 1182-7(1927).—C. discusses: cause and nature of hardness, manner of indicating hardness, variation in hardness, tolerance, methods of softening, reactions of the soda process, mechanism of treatment (lime-soda-alum) at Oberlin, calcn. of the soda and of soda-ash treatment, calcn. graphs, total hardness, testing the after-pptn. product and its prevention by long storage, use of alum, and the effect of sand filtration on stored water. At the Oberlin plant after-pptn. is obviated by storing the treated water for 30 days before it enters the mains. In addn. to stopping after-pptn. al-

most completely this storage has given the advantage of making filtration unnecessary.

J. A. KENNEDY

Pre-sedimentation of turbid water supplies. A. W. BULL AND G. M. DARBY. *Trans. Am. Inst. Chem. Eng.* **18**, 365-78 (1927). Pre-settling reduced the suspended solids by 85-95%. A 3 hr. pre-sedimentation reduced the coagulants required to approx. half the amts. for direct treatment. Pre-sedimentation reduces the accumulation of solids in the coagulation basin, reduces the cost of cleaning and saves the cost of chem. treatment of the water discharged with the sludge from pre-settling. When water is to be softened there is also a saving in lime. The Dorr clarifier reduces the sludge vol. approx. 30% below that obtained by direct sedimentation. Results of 7 points on the Mississippi, Missouri and Arkansas rivers were about the same. Clarifier and lab. results at Jefferson City were closely parallel.

FOSTER D. SNELL

Chlorinated drinking water and goiter and other diseases. JAMES OLIVER. *Med. Press and Circular* **175**, 49 (1927). "Since drinking water has been chlorinated, there has been such a notable decrease in endemic goiter, cancer, rheumatoid arthritis, neuritis, and other diseases that the predisposition, if not the actual cause, of some of these diseases is due to changes produced in the drinking water by chlorination."

JOSEPH S. HILPBURN

Removal of oil from boiler-feed water and water for making ice. H. JUNGWIRT. *Chem. Zp.* **14**, 391 (1927). Reuts. D'Alshoorn's method (C. I. **20**, 1482) is described.

J. H. MOORE

Protection of condenser tubes and metal surfaces in contact with water. BOURCHARD. *Art. et Matiers* No. **83**, 301-3 (Aug., 1927). Brief discussion of the merits of "apexol," a product prepared in the electric furnace at about 3300° and contg. approx. 98% of pure amorphous C. Results are given of a no. of tests which showed complete protection of condenser tubes and increase in the heat transmission coeff. These results were corroborated by application to the tubes of the boilers of the SS. Berengaria.

A. PAPINEAU-COUTURE

Sealing and corrosion of steam boilers. H. DAUSSAN. *Rev. gén. mat. plastiques* **3**, 566-70 (1927). After a brief outline of the causes of sealing and corrosion and the various methods of treatment to prevent or remedy them, D. describes a simple device consisting essentially of a chamber contg. a mixt. of specially prepd. Na_2CO_3 and Na silicate (method of prepn. and proportions not given) connected to the steam space of the boiler by means of a relatively small pipe. Steam penetrates into the chamber, condenses, dissolves the reagent, and the soln. drips back into the boiler. The merits of this treatment are discussed.

A. PAPINEAU-COUTURE

Studies on the biology of sewage disposal. New Jersey Agr. Expt. Sta., *Bull.* **427**, 103 pp. (1926). This is the fourth annual report of the sewage substation for the yr. ending June 30, 1925. **Chemical studies on Imhoff tanks.** W. RUDOLFS AND F. L. CAMPBELL. - The investigation was made in order to acquire a more exact knowledge of sludge digestion under different conditions. Analyses of gases evolved from tanks over a period of about 10 months showed that fluctuations in the CO_2 content were more or less oscillatory in character, the oscillations in general being correlated with the resting and operating periods of the tanks. Detns. of the p_H values of the liquid in the digestion chamber can be used as an index to the course of sludge digestion. Chem. and bacteriol. analyses show that the liquid between sludge and scum (from definite and const. depths) is a better indication of general activities in the tank than are the analyses of sludge filtrate. Gas production and chem. and bacteriol. analyses show that the relation between ripe sludge and incoming fresh solids is fairly definite for rapid and efficient digestion. This relation should be kept const. as nearly as practical operation will allow. **Bacteriological studies on Imhoff tanks.** MARGARET HOTCHKISS. The general bacteriol. flora are influenced by the manner of operating tanks, and seasonal effects are obscured by these short time variations. The bacteriol. numbers in a tank, which had been altered and put into operation anew, increased rapidly during the first 6 weeks, but about 5 months elapsed before the numbers were comparable to an old tank (relation between ripe sludge and fresh solids). The different groups of bacteria showed marked fluctuations, although this was not the case in a tank used for the storage of partly digested material. **Kinds, distribution and fluctuations of protozoa in Imhoff tanks.** J. B. LACKEY. - One new genus and 4 new species of protozoa have been described and figured. A recheck of previous data strengthens the conclusion that the vertical distribution of ciliates is variable, and that the max. occurrence of flagellates is near the point where the slots in the tanks occur. No seasonal fluctuation of protozoa is evident for species, genera, ciliates or flagellates. When large amts. of CO_2 are present large numbers of protozoa occur, indicating a direct relation between

- chem. end products and animal population.' Accumulation of partly digested material results in large increases in numbers of protozoa. The protozoa are independent of short ranges of p_{H} values above or below 7.0 in the tanks. Tank protozoa are largely independent of bacteria as a direct source of food: they are for the most part sapropelic; they may utilize bacterial decompn. products. The tank protozoa are either facultative or obligatory anaerobes that may be cultured in the lab. **Sprinkling filter-bed studies.** J. B. LACKEY.—The filter bed studies showed that there were surprising fluctuations in the weekly accumulation of film. There was no great difference between the numbers of animals in the old and new films. The numbers of living organisms in the film tend to maintain a physiol. level. When fungi obtain their largest vol., protozoa are fewest and *vice versa*, and when one group of animals diminishes in number another increases. **Studies on fresh solids digestion.** WILLEM RUDOLFS, MARGARET HOTCHKISS, A. J. FISCHER AND J. B. LACKEY.—Two quantities of fresh solids were placed in an incubator, one of which was kept in a tightly stoppered bottle, while to the other small quantities of air were admitted. The results show that the general course of digestion in these two bottles seemed similar, but that the type of digestion was different. In the bottle without air (A), the solid org. materials were transformed to liquid org. materials, whereas more of the org. material in the bottles with air (B) was "gassified." The production of gas was approximately 4 times larger from (B) than from (A). The rate of digestion was dissimilar with and without air. It was found that the succession of different types of decompn. was about as follows: (a) chiefly materials of a carbonaceous nature (sugars, soluble starches, etc.), (b) chiefly nitrogenous materials (proteins) and (c) chiefly complex carbohydrates (cellulose, fibrous matters and carbonaceous material of partly decompd. proteins). These "cycles" are repeated until all material is "mineralized" and "gassified." **The relation between ripe sludge and fresh solids and the effect of "washing" on digestion.** WILLEM RUDOLFS, H. HEUKELKIAN, P. J. A. ZELLER AND J. B. LACKEY.—There must be maintained a definite relation between sludge and incoming fresh solids. Under favorable conditions ripe sludge cannot handle more than 2% fresh solids daily (computed on dry basis). There is a definite relation between nos. of protozoa and certain bacterial decompn. products. Addn. of tap water (washing) to the sludge-fresh-solids-mixt. produced a better looking sludge. **Notes on the more unusual Imhoff tank gases.** F. I. CAMPBELL AND WILLEM RUDOLFS.—See C. A. 20, 252 **Effect of stirring on digestion.** WILLEM RUDOLFS.—All samples after standing 1 day smelled faintly putrefactive and looked alike, had a blackish color, with all solids at the top. The p_{H} decreased, the material having a strongly putrefactive odor, until after about 3 weeks when the p_{H} values rose. Results indicate that no advantage was gained by too frequent stirring. It is possible that the effect of air overcomes the possible beneficial effects of stirring, and expts. are under way to det. the possible effect of stirring under positive anaerobic conditions. **Preliminary results on chemical precipitation as an aid to digestion in Imhoff tanks.** A. J. FISCHER.—The addn. of an alkali or an alk. salt will cause the solids to settle to the bottom of a tank, causing digestion to proceed more rapidly. Neutral Ca salts such as CaCl_2 will serve the same purpose. Lime should prove beneficial provided not too much is added. It appears that CuSO_4 , although of no value for settling solids, might be used to dry greasy scum. **Preliminary notes on partial sterilization.** WILLEM RUDOLFS AND H. HEUKELKIAN.— CuSO_4 and HgCl_2 in concns. varying from 1:100,000 to 1:1,000,000 depress the numbers of protozoa and stimulate the numbers of bacteria. Toluidine in 1:1000 killed off all protozoa, and in 1:10,000 greatly suppressed their numbers. Lime in concns. of 1:750 and 1:1000 killed all protozoa within 24 hrs.; when fresh solids were added, making the mixture less alk., the protozoa were markedly stimulated. CS_2 emulsion in concns. varying from 1:1000 to 1:5000 killed off all protozoa and suppressed their growth for over a month; even in lower concns. such as 1:500 and 1:10,000 their nos. were greatly reduced. However, in a concn. of 1:15,000 there was a marked stimulation of the nos. of protozoa after 1 week. E. F. S. **Sewage of the city of Buenos Aires. Its discharge into the Rio de la Plata.** A. BADO AND V. J. BERNAOLA. *Anales asoc. quim. Argentina*. 25, 105-37(1927). E. M. SYMMES **Procedure for clarifying large amounts of liquids (city or industry waste liquids) by means of dam or crater filtration.** E. R. BESEMFELDER. *Chem.-Ztg.* 51, 505-6 (1927). -Descriptive. A. L. HENNE **Active substance of the Baresges waters (ROBINE, DEJUSSIEU) 11A. The removal of phenol from coke-works waste water (RACHIG) 21. Sterilizing water by percolation through silver-coated sand (U. S. pat. 1,642,089) 13.**

Softening hard water. G. PETROFF and P. SHESTAKOFF. U. S. 1,642,594, Sept. 13. H_2O to be softened is treated with sulfonic acids of high mol. wt., *e. g.*, with naphthol-sulfonic acids.

Hardening and sealing water-bearing strata in the ground. T. BLANDFORD, A. GEE and H. E. POTTS. Brit. 262,223, Oct. 14, 1925. A soln. of caustic alkali or alkali carbonate is injected into the ground, with or without an org. substance such as soap, followed by a cement suspension.

Apparatus for testing water while undergoing softening or for testing other liquids. H. S. HATFIELD. U. S. 1,643,213, Sept. 20. A relay device and indicator are arranged to be actuated by frothing or other changes such as are produced by the addn. of soap soln. to hard H_2O .

Precipitated zeolites. H. KRIEGSHIEIM and W. VAUGHAN. U. S. 1,642,880, Sept. 20. In the manuf. of pptd. zeolites having a large area of quick-acting surface, a gel body of normal structure is produced by the action of a soln. of Na aluminate on a soln. of Na silicate; this body is partly dried in its original condition, without sepn. of H_2O prior to drying, and this is followed by washing and further drying.

Base-exchange composition. A. S. BEHRMAN. Can. 271,393, June 7, 1927. A metallo-silicate is produced by mixing a soln. of an alkali metal silicate, an acid and a non-alk. soln. of an amphoteric hydroxide to form a stiff firm gel, which is dried by heating, and the heated mass is then wetted to remove the sol. compds.

Lining for water pipes. O. G. LUYWIES. U. S. 1,643,021, Sept. 20. Linings are formed of cork, fibrous material such as asbestos and a binder, *e. g.*, an asphaltic mixt. contg. linseed oil and gilsonite.

Water-wheel for use in automatic sewage-distributing apparatus. J. W. HARTLEY. Brit. 262,680, May 29, 1926.

Apparatus for sewage treatment by activated sludge and sludge digestion methods. K. IMHOFF. U. S. 1,642,206, Sept. 13.

Rotary sewage distributor for filter and bacteria beds. J. W. HARTLEY. Brit. 261,852, Aug. 29, 1925.

Incinerator for garbage, etc. W. C. EPSTEIN. U. S. 1,643,206, Sept. 20.

Apparatus for fumigating with hydrocyanic acid. K. A. KILBOURNE. U. S. 1,642,779, Sept. 20. Liquid HCN is used.

Apparatus for generating hydrocyanic acid for fumigating. H. LAINE. Brit. 262,423, Dec. 5, 1925.

Spraying apparatus for fumigating with liquid hydrocyanic acid. K. F. COOPER. U. S. 1,642,920, Sept. 20.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

Grouping of soils on the basis of mechanical analysis. R. O. E. DAVIS and H. H. BENNETT. U. S. Dept. Agr., *Circ.* 419, 1 14(1927).—The proportions of sand, silt and clay of a sample of soil cannot be shown on a right-angled diagram. The mech. compn. of the main soil classes may be graphically indicated on an equilateral triangle by showing their percentage compn. of sand, silt and clay. The proposed diagram is an improvement over the earlier ones of the Bureau of Soils in that it includes the proportion of sand as well as of silt and clay, it being necessary on the earlier diagrams to det. the third component from the other two. Twenty principal and subordinate soil classes based on mech. compn. are recognized. These may be grouped into 3 major classes according to their clay content. W. H. ROSS

Is the soil reaction of any importance in practical agriculture? M. TRENEU. *Z. Pflanzenernahr. Düngung, Abt. B* 5, 169-81; *Chem. Zentr.* 1926, I, 3098; cf. *C. A.* 21, 2346.—In work closely related to practical agriculture, it is shown that the soil reaction charts, which are obtained with the "acidimeter" of T., reflect the tendency to grow of "acid sensitive" cultivated plants, including sugar beets, barley, clover, alfalfa, peas and beans. As soon as the $[H^+]$ in suspensions of soil contg. KCl was more acid than $pH = 6$, these plants were injured and the yield was diminished. Oats and wheat gave max. yields at a pH of 5.2, and at pH 4.3 the oats were injured. Judged by yield, potatoes are insensitive to an acid medium with a pH value of 4.2. Rye is indifferent to variations in the acidity of the medium between pH 4.2 and 7.6. Investigation of the subsoil is of great importance, otherwise false conclusions are inevitable.

C. C. DAVIS

A fundamental study of the mechanism of buffer action in soils. P. B. MYERS AND G. L. BAKER. Delaware Agr. Expt. Sta., *Bull.* 141, 13-4(1925).—Several soil types were ignited and 3 samples of each titrated with acid and alkali. In all cases the initial p_H increased with temp., probably because of the destruction of an org. acid, or the conversion of the metals to the oxides or carbonates. The buffer action decreases with increased temp. The titration curves show that the buffering power of the Norfolk Sand is nearly destroyed at the medium temp. (about 450°) while the curves of the other types of soil show that the change in buffering power due to heating is more gradual than with the sand. It is proposed to study the effects of added colloidal matter on highly ignited soils. E. F. SNYDER

Soil studies at the Washington Station. The maintenance of organic matter in eastern Washington soils. F. J. SIEVERS AND H. P. HOLTZ. Wash. Agr. Expt. Sta., *Bull.* 196, 38-41(1925); 35th ann. rept. for the yr. ending June 30, 1925.—In any system of practical agriculture it is impossible to maintain the soil org. matter constant at the point at which it was found in the virgin state. The only exception to this rule is under conditions where arid soils are brought under irrigation and are then formed under what virtually amounts to changed climatic conditions, thus making more luxuriant plant growth possible. Crop residues like straw which are low in N have a depressing effect on NO_3 accumulation and on yield when first applied to a soil. Distribution of org. matter in the soil is influenced in a very pronounced degree by soil reaction. **Fertility investigations of Washington soils.** *Ibid.* Sufficient data are available from all sections of the state to make it possible to distribute information regarding the plant food deficiencies of the various soil types. **The fixation and distribution of nitrogen and organic matter by legumes in Palouse silt loams.** A. FLOYD HICK. *Ibid.* The object of this investigation is to establish the amts. of atm. N fixed by various legumes when grown in Palouse silt loam and also the amt. and distribution of their org. matter. **Plant composition as influenced by variations in soil type.** F. J. SIEVERS AND H. P. HOLTZ. *Ibid.* This investigation was undertaken because of the interest of Western Wash. dairy farmers in obtaining relief from what appeared to be nutritional disorders in their stock. It would seem that nutritional disorders, if they exist, as they apparently do, might be assoc. with low P and Ca content of the feed and that they might in the main be overcome indirectly through systems of soil management that will make it possible or less difficult to produce legume hays. E. F. SNYDER

The nature of organic soil constituents; the role of microorganisms in their formation and decomposition. S. A. WAKSMAN. *Naturwissenschaften* 15, 689-96(1927).—A review of recent work (cf. C. A. 21, 1512). A bibliography is added.

B. J. C. VAN DER HOEVEN

The soluble silicate content of soils. W. R. G. ATKINS. *Sci. Proc. Roy. Dublin Soc.* 18, 433-6(1927).—It is suggested that a detn. of the silicate in soln. may afford a rapid method of detecting a soil of low fertility, as well as a detn. of the cond., but the former is made in less time and with less costly app. The sol. silicate was estd. by the method of Diénert and Wandenbuleke (C. A. 18, 1540, 2096), or alternatively, by the method of Diénert (C. A. 16, 3831). Since silicates are taken up by the plant its presence in soln. and varying quantities in the soil may be a factor of significance. I. W. RIGGS

Disintegration of incrustated cellulose in the soil. •II. Stubble and roots of grain-producing plants in sandy soil. CHR. BARTHEL AND N. BENGTSOHN. *Kgl. Landbruks-Högh. Handl. Tid.* 66, 306-15(1927); cf. C. A. 20, 1881.—The content of the more or less sol. N combinations in grain-producing and leguminous plants is sufficiently high to furnish the N necessary for the decompn. (fermentation) of incrustated cellulose, which may explain the relatively rapid disappearance of stubble and roots in the soil. The rate of disintegration of cellulose is directly proportional to the N content of the plant material within the same group of plants such as the straw-producing or the leguminous plants located in sandy soil deficient in N. When different groups are compared with one another the relationship of the rate of cellulose decompn. to the N content varies much. The decompn. is much slower in the leguminous plants than in the straw yielding group, even though the N content of the former is many times that of the latter. The reason for this may be ascribed to the higher % of non-cellulosic N compounds present in leguminous plants, these compds requiring more of the N of the plant material for their decompn. E. O. ELLINGSON

Changes of bases in arable soils. P. BOISCHOT. *Rev. sci.* 65, 302-6(1927).—A review. A. PAPINEAU-COUTURE

Determination in the cold of ammonia nitrogen in soils and fertilizers. A. DEMOLINS. *Ann. fals.* 20, 412-3(1927).—The detn. is carried out by placing the sample,

together with a suitable amt. of H_2O and concd. $NaOH$, in a flask and drawing a rapid current of air successively through H_2SO_4 , the sample, standard acid, and distd. H_2O (to stop any acid that might be entrained), a suitable trap or valve being interposed to prevent possible backing of the water from the siphon pump. With 1 g. of fertilizer contg. 6% NH_3 N, the detn. can be stopped after 2.5 hrs. For soils, use a 25-g. sample, 50 cc. H_2O and 2 g. Na_2CO_3 .
A. PAPINEAU-COUTURE

Soil acidity in relation to spinach production. H. H. ZIMMERLEY. Va. Truck Expt. Sta., *Bull.* 57, 501-21 (1926).—Expts. were conducted for the purpose of detg. the soil reaction range for optimum growth of spinach, the greatest degree of soil acidity at which spinach may be produced profitably and the effects of various amts. of lime in reducing the H -ion concn. of the more important types of soil used locally for spinach production. The reaction range for optimum growth occurred between pH 6.5 and 7.0 except in 1924 when the highest yields were secured on the slightly alk. soils. A soil reaction of pH 5.5 was found to be the lower limit for profitable production under optimum conditions of temp., moisture and fertility. On soils more acid than pH 5.0 injury was usually severe. The effectiveness of lime in reducing acidity varied with the types of soil. Large applications of lime may be wasteful and dangerous. The economical procedure, even where a neutral reaction is desirable, is the application of only sufficient lime to bring the upper 4 in. to the desired reaction a short time before planting.

E. F. SNYDER

The relation of the soil nitrogen to nodule development and fixation of nitrogen by certain legumes. GUNNAR GLOBEL. New Jersey Agr. Expt. Sta., *Bull.* 436, 3-125 (1926).—Pot culture expts. with alfalfa have demonstrated conclusively that infection and the establishment of the process of N fixation proceed best in plants well supplied with combined N during the early stages of growth. Under the exptl. conditions alfalfa fixed very little N during the first crop before the flowering stage. After this stage fixation took place very readily in one expt., and in all cases N was fixed to the full capacity during the second and the following crops. The amts. of N fixed, in all cases, were inversely proportional to the amts. of sol. soil N at the disposal of the plants. On soils depleted of N , gains in soil N resulted from the growth of 6 crops of inoculated alfalfa when the tops were removed. On the other hand, on soils well provided with N in available form, losses in soil N occurred. Pot culture expts. with soy beans indicated that small amts. of combined N are desirable for the early growth of the plants and for best nodule development. With soy beans, however, this was much less pronounced than with alfalfa. The removal of tops of inoculated soy beans resulted in a slight gain in soil N on one soil of medium fertility. On soils richer in NO_3 , losses occurred and these were larger with the larger amts. of NO_3 in the soil. With soy beans grown in soil, approx. 8% of the total N in the plants was found in the roots. Nodule development by alfalfa and soy beans was adversely affected by the presence of larger amts. of NO_3 in soil or sand cultures. The depressing effect of NO_3 on nodule development and the process of N fixation appeared to be connected with the nutrition of the plants, the NO_3 being used in the first place to fill the need of N by the plant. An extensive bibliography is given.

E. F. SNYDER

The evolution of the fertilizer industry. JAMES HENDRICK. *Trans. Highland and Agr. Soc. Scotland* [5], 39, 79-96 (1927).—A general discussion with particular reference to recent developments in the manuf. of fertilizer materials.

K. D. J.

Mucks, peats and miscellaneous fertilizer materials. F. T. SHUTT. Dept. Agr. Canada, *Rept. Dominion Chemist, Year Ending March 31, 1926, 1927*, 32-46.—Partial analyses are tabulated for 42 samples of muck and peat from deposits in various parts of Canada. Complete analyses are given for samples of *flue ashes from cement kilns*, "lime sludge" from pulpwood plant and eelgrass ash. Partial analyses are given for samples of *lime-kiln waste*, *marine mud* from a deposit near Halifax, N. S., *seaweed (Fucus serratus)* from Pictou, N. S., and other miscellaneous fertilizer materials.

K. D. J.

Annual report of the economic botanist to the government of Bengal for the year 1925-26. G. P. HECTOR. *Ann. Rept. Dept. Agr. Bengal, Year 1925-26, 1927*, pp. 1-8.—The *transpiration ratio of rice plants* grown in soil at 75% satn. was reduced from 515.6 to 480.5 by applications of phosphate fertilizer. In soils at 33% satn. the ratio was reduced from 542.7 to 438.1.

K. D. JACOB

Annual report of the agricultural chemist to the government of Bengal, Dacca, for the year ending March 31, 1926. M. CARBERY. *Ann. Rept. Dept. Agr. Bengal, Year 1925-26, 1927*, pp. 9-39.—Data are given on the *compn. of the ash of sugarcane juice* produced from 7 varieties of cane. The % of all the inorg. constituents of the juice was reduced by cutting off the cane flowers. Numerous analyses of the *ash from healthy and diseased betel vines* did not indicate that the disease was due to any

excess of deficiency of inorg. compds. In expts. on a red laterite soil it was definitely established that large single applications of lime reduced the availability of the soil K_2O , but frequent small application did not have any appreciable harmful effect. Phosphate and nitrate were essential to the growth of rice in water cultures. Lack of Mg had no effect and lack of K_2O very little effect. K. D. JACOB

Effect of potash fertilizer on the carrying quality of tomatoes. W. B. LANHAM. Texas Agr. Expt. Sta., *Bull.* 357, 38 pp. (1927).—Expts. are reported showing the effect of K on the yield and carrying quality of tomatoes. In the spring of 1926 a series of expts. was started with 5 varieties at 4 different Substations to find out the effect of K on the yield and the carrying quality of tomatoes. Four fertilizer formulas were used. The fertilizer used in the check plats contained 8% P_2O_5 , 4% NH_3 and no K_2O . The other plats received the same amts. of P_2O_5 and NH_3 and in addn. 4, 6, and 8% K_2O , resp. The tomatoes were subjected to various tests to study their resistance to rough handling. Some green tomatoes were shaken until they broke, some were dropped from a given height until they cracked, others were crushed until they broke, and still others were kept in storage until they ripened. Some of the ripe tomatoes were shaken until they broke and some were kept in storage until they decayed. K in the fertilizer increased the yield, but had no consistent effect on the carrying quality, as measured by the above tests. The time of harvest and the differences between varieties were much greater than the difference between tomatoes grown on plats contg. various amts. of K. J. J. SKINNER

The effect of fertilizing a crop on the vegetative and reproductive capacity of the seed. B. V. NATH, M. SURYANARAYANA AND R. MCCARRISON. *Memoirs Dept. Agr. India* 9, 85-124 (1927).—In plot and pot expts. with wheat, *ragi* and *pani varagu*, seed from plants fertilized with mineral fertilizers, cattle manure or no fertilizer were sown in an unfertilized soil of moderate fertility and the yields from the second crop were compared. In practically all cases the effect of fertilizing the crop persisted in the seed and was visible in the next crop. Crops fertilized with cattle manure gave seed with better cropping value than seed from crops fertilized with mineral fertilizers and the latter gave seed with better cropping value than seed from unfertilized crops. However, the superiority of seed from crops fertilized with mineral fertilizers varied with the nature of the crop. The results of animal nutrition expts. with the same grains as those used in the plant expts. showed that the "cattle manure seed" were more nutritious than "mineral fertilizer seed" or "no fertilizer seed." Synthetic farmyard manure, prepd. by fermenting grass and stubble, had as high a fertilizer value as fermented natural farmyard manure and both were superior to unfertilized manure. The H_2O and alc. exts. of fermented manure and the residue from the extn. had practically the same fertilizer value. The H_2O ext. of fresh manure was superior in its fertilizer value to that of the residue but was distinctly inferior to the H_2O ext. of fermented manure. Small amts. of yeast had a stimulating effect on the crops and gave nearly 1.5 times the yield obtained with fermented farmyard manure. It was shown that this effect was not due to the N and P_2O_5 content of the yeast. The results of the expt. indicated that org. fertilizers, besides improving the phys. condition of the soil and being sources of ordinary food for plants, also supply some agents like auximones or vitamins which contribute greatly to the growth and reproduction of plants and through the plants and their seed supply additional food to animals and plants. K. D. JACOB

Liquid phosphoric acid as a source of phosphorus for plants. D. DRUZHININ. *J. chem. Ind. (Russia)* 2, 382-5; *Chem. Zentr.* 1926, I, 3352-3.—On sandy podsol soil, which contains only 0.03% adsorbed Ca, the yield of oats is considerably lowered by 25 g. of liquid H_3PO_4 per plant, is increased about 50% by 6 g. of $CaCO_3$ and is increased still more by $H_3PO_4 + CaCO_3$. On loamy podsol soil, with 0.08% adsorbed Ca , H_3PO_4 also exerts a favorable action, while $CaCO_3$ has an unfavorable one. About 3 fold yield is obtained by fertilizing with $NaNO_3$ and H_3PO_4 , while $NaNO_3$ alone is ineffective. The injurious action of H_3PO_4 on soils poor in lime is explained by the acidification of the soil by the H_3PO_4 and the consequent arrest of nitrate formation by bacteria. Mixed with $NaNO_3$, H_3PO_4 is still more energetic than the corresponding quantity of superphosphate. C. C. DAVIS

Experiments with fertilizing eucalyptus trees. JAMES WATSON. *Rhodesia Agr.* 24, 767-9 (1927).—It is generally believed that tap-rooted trees do not make much response to the application of fertilizers. However, after 16 months the av. height of unfertilized eucalyptus trees was 6 ft. and of 70 unfertilized controls 2.2 ft. A. L. MEHRING

The results of experiments on the experimental field of Dolgoprudnoje in the year

1923-24. N. G. KOSHECHKIN. *Trans. Inst. Fertilisers Lief* 30, 47-63(1925); *Chem. Zentr.* 1926, I, 2040-1.—Moscow phosphorite, with 24% P_2O_5 , increases the yield of rye at least 30% when 80-1000 kg. of P_2O_5 per hectare are used, and $CaCO_3$ increases it by 36% for 9000 kg. per hectare. $CaCO_3$ also increases the yield of clover when 2250-22,500 kg. per hectare are used and changes the proportion of weeds to Graminaceae in favor of the Graminaceae. C. C. DAVIS

Inoculation of alfalfa on lime-deficient sandy soils. Soil transfer vs. use of cultures. F. J. ALWAY AND G. H. NESOM. *Minnesota Agr. Expt. Sta., Tech. Bull.* 46, 62 pp.(1927).—(Observations and expts. are reported on the growth of alfalfa on widely scattered sandy fields in Minnesota, all more or less lime deficient toward both alfalfa and sweet clover, and on which the H-ion concn. of the surface soils was between 5.0 and 6.0. On one of the fields the crop had been under observation for 8 consecutive seasons and on the others for shorter periods. When the land had been limed well in advance of the seeding, the use of artificial cultures was as effective as a heavy application of soil from an established field of alfalfa or sweet clover; but when it had not been limed, the soil transfer method was far more effective with the first seeding. Increasing the amt. of culture to many times the usual rate did not make it as effective as soil transfer. The difference between the 2 methods appears to increase with the lime deficiency of the land being seeded. The growing of alfalfa or sweet clover on such unlimed soils, even where the stand was thin and only a few of the plants were vigorous, satisfactorily inoculated a following seeding of alfalfa. On these soils, when inoculation has been effected by soil transfer or by the previous growth of alfalfa or sweet clover, remunerative crops of alfalfa may be grown without lime. On all except the least lime-deficient fields, however, liming increases the yields even where satisfactorily inoculated by one of the above methods, but the increase actually due to liming, independent of its influence on inoculation, may be too small to be profitable, and during a drouth the beneficial effect may be entirely masked. Liming expts., in which the current pure culture methods of inoculation are relied upon, are likely to lead to very erroneous conclusions as to the economy of liming such soils for alfalfa. J. J. SKINNER

Testing corn stalks chemically to aid in determining their plant food needs. G. N. HOFFER. *Indiana Agr. Expt. Sta., Bull.* 298, 31 pp.(1926).—A method is given for recognizing deficiencies in soils of the nutrient necessary for the proper growth of corn plants. The method is based on the color reaction of the cut surface of mature corn stalks to solns. of diphenylamine, KCNS and HCl. N and K deficiencies in the soil are indicated. J. J. SKINNER

Granulated cyanamide and dicyanodiamide. G. LEFORT DES YLOUSES. *Chimie et industrie* 18, 216(1927); cf. Dutoit, *C. A.* 18, 1874-5; Brioux, *C. A.* 21, 790.—Y. attributes the unfavorable results obtained by B. with dicyanodiamide to the fact that his expts were carried out in pots, with an excessive dose (approx. 20 mg. per kg. of soil), and with white mustard and buckwheat which are particularly sensitive to the action of dicyanodiamide. Field expts. and experience with dicyanodiamide (as present in "Eusac" brand granular cyanamide) in agricultural operations have given much more favorable results, and considerable increases in crops have been obtained even with products contg. up to 80% of their N in the form of dicyanodiamide. Highly compressed cyanamide contg. considerable proportions of dicyanodiamide are much less dangerous than similar products in powd. form and can be used as top dressing. A. PAPINEAU-COUTURE

Evidence on the indispensable nature of zinc and boron for higher green plants. A. L. SOMMER AND C. B. LIPMAN. *Plant Physiology* 1, 231-49(1926).—The expts. were carried out in nutrient solns., using purified salts, in a small greenhouse equipped so as to furnish a dust-free atm. Sunflowers, cotton, barley, buckwheat, castor beans, flax and mustard made little growth in a culture soln. composed of KNO_3 (800 p.p.m.); KH_2PO_4 (150 p.p.m.); $MgSO_4 \cdot 7H_2O$ (500 p.p.m.); Mn as $MnSO_4$ (1.5 p.p.m.); Al as $Al_2(SO_4)_3$ (0.5 p.p.m.); NaCl (12.7 p.p.m.); $CaSO_4$ (300 cc. satd. soln.); Zn (0.5 p.p.m.); and $FeSO_4$ (trace). Good growth, however, was obtained in the above medium when 0.5 p.p.m. of H_3BO_3 was added. Also barley and sunflowers made little growth in the above culture medium when the Zn was replaced by B. The addn. of 0.5 p.p.m. Zn, however, resulted in good growth. WALTER THOMAS

The current mineral nutrient content of the plant solution as a possible means of chemical control of optimum fertilization. B. E. GILBERT AND L. J. HARDIN. *J. Agr. Research* 35, 185-92(1927).—The current concns. of mineral nutrients in the solns. of crop plants in general correlated directly with applications of chem. fertilizers. K showed the least fluctuation during the season, nitrate N the most, while the fluctuation of phosphate P was intermediate. The current mineral nutrient content of the plant

soln. is suggested as an index of fertilizer needs and tentative crit. concns. have been chosen for each nutrient. W. H. ROSS

A note on *Danthonia*, with particular reference to the effect of sulfuric acid on the germination of the seed. H. C. TRUMBLE. *J. Dept. of Agr. So. Australia* 30, 1210-13 (1927).—Immersion of *Danthonia pilosa* seed in H_2SO_4 (d. 1.84) causes the greater part of the glumes to be removed and stimulates germination. Expts. indicate that 5 min. is optimum time for immersion. The seeds must then be rapidly washed for 5 min. to remove free acid. Fifteen min. immersion in the acid destroys about 50% of the seeds, and no seeds survive the treatment longer than 30 min. Seed treated with the acid for 5 min. and subsequently washed and dried retain the capacity for germination the same as untreated seed. M. S. ANDERSON

Assimilation of fixed nitrogen by Havana tobacco. A. B. BEAUMONT AND G. J. LARSINOS. *Science* 66, 237(1927).—Havana tobacco is capable of assimilating urea N in the unchanged form. Plant growth, however, is not as rapid with urea as a source of N as with $Ca(NO_3)_2$ or $NaNO_3$. M. S. ANDERSON

Two experiments on tobacco. J. CARBONEL. *Rev. agr. Maurice* 4, 48-50(1927).—Two series of fertilizer tests in the Gironde, France, have shown that heavy applications of $NaNO_3$, up to 400 kg. per hectare, pay best; that the nitrate should be applied in 2 doses, at planting and at the 2nd hoeing; that nitrate is superior to cyanamide. F. W. ZERBAN

Physiological and chemical aspects of cereal straw. ANON. New York Agr. Exp. Sta., *Rept.* 1926, 17 pp.—A mixt. of $(NH_4)_2SO_4$, acid phosphate, KCl and ground limestone rotted straw in 3 to 5 months, when kept wet. The process required packing and was considered impractical for large-scale operations. J. J. SKINNER

Soil bacteriology work at the Delaware station. T. F. MANNS. Delaware Agr. Expt. Sta., *Bull.* 147, 35-7(1926).—Most sulfates stimulate S oxidation. K_2SO_4 is most active; the sulfates of Fe, Al and Mg show slight stimulation. S oxidation is rapid in soil or org. composts. Plant tests were used to study the availability of P made citrate-sol. by the S-oxidation process, which was compared with P in com. fertilizers. J. J. SKINNER

Comparative biological and chemical studies of stable manures. G. RUSCHMANN. *Centr. Bakt. Parasitenk.* 2 Abt. 70, 214-60, 383-411(1927). JOHN T. MYERS

Phyto-pharmacotherapy. D. VAN OS. *Pharm. Weekblad* 64, 861-9(1927).—A discussion of the enormous losses caused in various countries by the depredations of animal pests, insects and plant diseases, and the means of combating them, e. g., by rotation of crops, development of disease-resistant varieties and the use of insecticides and fungicides. A. W. DOX

Development of more effective dust fungicides by adding oxidizing agents to sulfur. H. A. LEE AND J. P. MARTIN. *Science* 66, 178(1927).—The fungus disease of sugarcane, called eye spot, is but little affected by ordinary fungicidal dusts and sprays. The action of S dust alone produces only slight reduction of the disease, but when an oxidizing agent is present the efficacy of the S is greatly increased. Cane treated with S to which 1.0% pulverized $KMnO_4$ had been added showed a reduction of 89.9% of infections compared with undusted plots. S plus 0.25% HNO_3 reduced the disease 61%. $KMnO_4$ in a non-S carrier such as kaolin was ineffective. The treatment with oxidized S preps. appeared to stimulate growth independent of the disease control. M. S. ANDERSON

Relation of size of oil drops to toxicity of petroleum-oil emulsions to aphids. E. I. GRIFFIN, C. H. RICHARDSON AND R. C. BURDETTE. *J. Agr. Research* 34, 727-38 (1927).—Petroleum-oil emulsions were prepd. (1) while hot under pressure, (2) by a colloid stir method, and (3) by grinding in a colloid mill, to give a series of preps., with and without emulsifiers, in some of which the oil droplets were large and in others small. The emulsions in which the oil droplets were relatively large were decidedly more toxic to *Uribis rumicis* than those in which the droplets were small. The toxicity of the preps. as correlated with drop size was not influenced by the phys. characteristics of the oil, the presence or absence of a soap emulsifier, or the presence or absence of cresol. When plants are sprayed with emulsions of large drop size more oil is retained by the plant surface than when sprayed with emulsions of small drop size. It is suggested that the elec. charges of plant surfaces and oil droplets are a factor in detg. the ability of oil in an emulsion to adhere to plant surfaces. Under conditions of comparable drop size and type of oil, miscible oils are probably less toxic to insects than the ordinary petroleum oils because they contain smaller oil droplets and the oil therefore adheres to the plant less effectively. W. H. ROSS

The codling moth. I. S. L. ALLMAN. *Agr. Gas. N. S. Wales* 38, 551-6(1927).—

Pb arsenate solns. of varying concns. were compared with Ca arsenate and Na arsenite in expts. on the control of codling moth apple. In regard to the % of infested fruit, % calyx infestation, and the ratio of stored to larvae, the best results were obtained with Pb arsenate used at the rate of 36 ounces per 50 gallons of H₂O. Na arsenite at concns. as low as 0.02 ounce per gallon caused severe foliage burns. Combined sprays of lime-S and normal Pb arsenate gave pronounced spray residue which necessitated washing the fruit. K. D. JACOB

Prevention of weevil infestation by use of copper carbonate. H. C. STENING. *Agr. Gaz. N. S. Wales* 38, 589(1927). Wheat treated with Cu carbonate dust at the rate of 2 ounces per bushel was not attacked during 12 months storage under conditions favorable to weevil infestation. Untreated wheat stored under the same conditions was severely attacked. Germination of the wheat was not affected by treatment with CuCO₃. K. D. JACOB

Sulfur in rain water (EATON, EATON) 14. The adaptation of certain colorimetric methods to the estimation of nitrites, phosphates and potassium in plant solutions (GILBERT) 11D. Oxygen supplying power of the soil (HUTCHINS) 11D. Phosphate rock (JACOB) 18. Tobacco cultivation and fertilization (DE SORNAY) 17. Geology of the country around Ipswich, England [deposits for use in agriculture] (BOSWELL) 8. Fertilizer deposits of S. Africa (FILLING) 8. Fertilizer from sulfite liquor (Can. pat. 271,893) 23. Apparatus for fermentation and storage of fertilizer (U. S. pat. 1,643,018) 1.

BEAR, FIRMAN E. **Soil Management.** 2nd ed., revised and enlarged. New York City: John Wiley & Sons, Inc. 412 pp. \$3.50.

Fertilizer. B. BODRERO. Brit. 262,017, July 26, 1926. In the prepn. of a phosphate fertilizer contg. S, vapor of S is led into a mixing-vessel lined with Pb and deposited as a sublimite on finely powd. Ca phosphate.

Vermine-destroying composition. W. HEERDT. Can. 271,863, June 28, 1927. A compn. for destroying plant and animal pests comprises HCN and kieselsuhr.

Fungicide. J. D. JENKINS and E. F. BERGER. U. S. 1,642,370, Sept. 13. A colloidal dispersion of Cu₂O and metallic Cu is formed from compds. such as Cu hydride or basic Cu sulfate, NaOH and corn sirup and is used with a protective colloid such as gum arabic.

Insecticide and fungicide. G. E. SANDERS. U. S. 1,642,511, Sept. 13. A material suitable for use as a dusting powder is formed by mixing As₂O₃, lime and sufficient H₂O to hydrate the lime and form a paste, adding a fungicidal salt such as CuSO₄ and then adding a further quantity of lime sufficient to take up all free H₂O. Cf. C. A. 21, 1526

16 - THE FERMENTATION INDUSTRIES

C. N. FREY

Synthetic methanol and ammonia from butyl fermentation gases. J. C. WOOD RUFF. *Ind. Eng. Chem.* 19, 1147-50(1927).—The Comm. Solvents Corp'n. plants at Terre Haute, Ind., and Peoria, Ill., for the manuf. of butanol from corn produce together about 6 million cu. ft. daily of by-product gas approx. 60% of which is CO₂ and 40% H₂. The vapors of EtOH, C₄H₉OH and (CH₃)₂CO present in the waste gases are removed by activated coconut charcoal, then the major portion of the CO₂ by pressure scrubbers and the last traces in a NaOH tower. The purified H₂ is then mixed with N₂ and NH₃ produced by passing the gas at 300 atm. pressure over a suitable catalyst at the optimum temp. The particulars are not disclosed. At Peoria the NH₃ process has recently been abandoned, and the waste gases are converted into MeOH with the aid of "highly efficient and novel catalysts. . . . protected by recently issued patents." CO₂ + 3H₂ → CH₃OH + H₂O. A portion of the CO₂ (about 75%) is first removed in pressure scrubbers. If the CO₂ be converted into CO first, the loss of H₂ as water is eliminated (CO + 2H₂ → CH₃OH). E. G. R. ARDAGH

Production of lactic acid by fermentation of wood sugar remaining after alcoholic fermentation. E. A. MARTEN, E. C. SHERRARD, W. H. PETERSON and E. B. FRED. *Ind. Eng. Chem.* 19, 1162-5(1927).—Lab. expts. show that the waste residue from the alc. fermentation of wood-sugar liquor can be fermented. The ratio of AcOH to lactic

acid produced is dependent upon the kind of sugars present in the liquor. This varies with the wood used and the extent of the previous alc. fermentation. Soft wood liquors give a larger proportion of lactic to acetic than do hardwood liquors.

E. G. R. ARDAGH

Improved method for making cider vinegar. S. C. VANDECAVEYE. Washington Agr. Expt. Sta., *Bull.* 202, 5-26(1926).—It is possible under the conditions described to make good cider vinegar of marketable strength in 6 months or less. The temp. should never exceed 75° F. by more than a few degrees because of the danger of losing alc. by evapn. Inoculation with pure cultures of yeast, *Saccharomyces ellipsoideus*, stimulated the alc. fermentation and checked the development of undesirable bacteria.

E. F. SNYDER

Influence of the physiological condition of yeast on the flavor of beer. J. RAUX. *Brasserie mullerie* 17, 181-3(1927).—A brief discussion bringing out the necessity of preventing incipient autolysis through defective storage conditions of the yeast.

Investigation into the composition of rums from the French colonies. X. ROCQUES. *Ann. Jav.* 20, 399-403(1927); cf. *C. A.* 21, 2355.—The changes noted in the compn. of rums produced at the present time, as compared with that of some yrs. ago, are attributed to improvements in fermentation technic, while modernization of distn. practice is not considered to have any great effect.

A. PAPINEAU-COUTURE

Utilization of molasses (Cross) 28. Alcohol as a by-product of paper manufacture (ANON) 23.

Drying yeast in mixture with purified cellulose. A. K. BALLS. U. S. 1,643,047, Sept. 20. Cellulose such as that derived from bran or rice polishings or plant fiber mixed with yeast (in such proportion, e. g., that it may comprise 30% of the product) and the mixt. is dried, suitably at a temp. of 20-40°.

Preparing molasses for yeast manufacture. R. KUSSEROW. U. S. 1,642,929 Sept. 20. Lactic acid bacteria are propagated in an alk. soln. of crude molasses to decompose colloids and form a ppt.

Propagating *Saccharomyces disjunctus* in a mash of crude West Indian cane molasses. A. K. BALLS. U. S. 1,642,192, Sept. 13.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

The varying alkaloid content of *Hyoscyamus niger* L. ZD. KLON. *Časopis Československého Lékařnictva* 5, 16-9, 33-7; *Chem. Zentr.* 1926, 11, 235.—The alkaloid content of different plants varies greatly, though plants growing luxuriantly contain no greater proportion of alkaloid than small plants. Plants which in their first yr. contain a high % of alkaloid become in their second yr. relatively poor in alkaloid, and vice versa. On the other hand, plants are found which vary little or not at all yr. by yr. It remains to be investigated whether these great variations depend upon the quality of the soil, the climate or other factors.

C. C. DAVIS

***Cannabis indica*, with special reference to the production of *Herba cannabis indicæ* of high quality through cultivation in Germany.** TH. SABALITSCHKA. *Heil Gewürzkräuter* 1926, 10 pp.; *Chem. Zentr.* 1926, 1, 2111.—A monograph dealing with the properties and use of Indian hemp (*Cannabis indica*), with its active principle, *cannabinol*, C₂₁H₃₅O₂, and particularly with the cultivation of this plant in Germany. Success was attained in growing at the expt. station in Happing (Upper Bavaria) a plant with a high protein content which furnished a rich and active ext. The plant is not particularly sensitive to cold and can be grown successfully anywhere in Germany where wheat

C. C. DAVIS

Detection and determination of small quantities of morphine in mixtures. L. VAN NELLE AND A. HARMSMA. *Mededeel. Rijks-Inst. pharmacotherapeutisch Onderzoek.* 1925, 2-4; *Chem. Zentr.* 1926, 1, 2612.—The sepn. of morphine must be carried out with due regard for the other ingredients in the mixt., typical examples of which are given. The most suitable method of detn. is reduction of HIO₄ and estn. of the color, which is influenced by addn. of NH₄OH. The following procedure is recommended: add 5 cc. of 5% aq. HIO₄ to 10 cc. of neutral or slightly acid aq. morphine soln., and after 3 min. compare the color with a series of solns. contg. known quantities of morphine.

C. C. DAVIS

Ferrous iodide-cod-liver oil. C. G. VAN ARKEL. *Pharm. Weekblad* **64**, 857-61 (1927).—This article of the Dutch Pharm. is prep'd. by dissolving I in cod-liver oil and shaking with Fe powder. FeI_2 is thus formed and is more or less sol. in the oil but not to the extent stated in the Pharm. The amt. of I and especially that of Fe taken up may be increased by allowing air access during the prepn. The action of the Fe and I on the oil causes certain changes which do not, however, consist in the addn. of I to the unsatd. fatty acids. Fe and I are not present in const. proportions in the product.

A. W. Dox

Examination of cubebs. A. J. STEENHAUER. *Pharm. Weekblad* **64**, 870-5 (1927).—A discussion of the pharmacognosy of *Piper cubeba* and the morphological characters which distinguish it from related species.

A. W. Dox

A German and an accompanying Dutch patent application for the manufacture of theobromine. O. P. A. H. SCHAAAP. *Pharm. Weekblad* **64**, 875-82 (1927).—The validity of the patent claim by the I. G. Farbenindustrie A. G., Frankfurt a/M, in which the use of alkali earth hydroxides or MgO is specified for the extn. of theobromine from cacao shells, is questioned on the ground of lack of novelty.

A. W. Dox

Papaver fruit and papaver sirup in connection with poisonings. A. J. STEENHAUER. *Pharm. Weekblad* **64**, 902-13 (1927).—In performing Pellagri's reaction for morphine it is advisable to add an excess of the alc. I soln. and then remove the I by $\text{Na}_2\text{S}_2\text{O}_3$. This makes it possible to detect 0.05 mg. morphine. For detn. the method of Mai and Rath and that of Georges and Gascard give comparable values. The morphine content of papaver fruits is quite variable, the max. being 0.5%. In the prepn. of papaver sirup according to the Dutch Pharm., all the morphine contained in the fruit goes into the sirup. When testing for small quantities of morphine by the Stas-Otto method clarification with $\text{Pb}(\text{OAc})_2$ is recommended.

A. W. Dox

Vanillin and piperonal as reagents for alkaloids. L. VAN ITALLIE AND A. J. STEENHAUER. *Pharm. Weekblad* **64**, 925-8 (1927).—Various aldehydes, e. g., CH_3O , BzH , chloral, bromal, paraldehyde and fufural, have been used as alkaloid reagents, but no mention has been made of vanillin or piperonal for this purpose. It is now shown that vanillin and piperonal give color reactions with a no. of alkaloids, especially morphine, codeine, apomorphine, aspidospermine and veratrine. The reddish violet color obtained by evapn. morphine with alc. vanillin and 2 N H_2SO_4 shows an absorption band with its center at $\lambda 560$. With alc. HCl in place of H_2SO_4 the color developed is a brownish green which becomes blue on addn. of H_2O , while with concd. HCl in the absence of EtOH the color is cherry-red. This last reaction is claimed to be suitable for colorimetric detn. of morphine. In all cases vanillin and piperonal give practically the same colors.

A. W. Dox

Decoctum chinæ. WILLY WOBBE. *Apoth. Ztg.* **42**, 981-2 (1927).—A commentary on the recent investigation of Awe (cf. C. A. **21**, 2957).

W. O. E.

Björklund ether test for oleum cacao. HANNS WILL. *Apoth. Ztg.* **42**, 982-3 (1927).—A renewed study of this test shows it to be inherently at fault in certain particulars. Thus, with an otherwise good oleum cacao a turbidity may appear after a lapse of 10 min. as the result of mech. impurities. The ethereal soln. of such samples should be filtered before application of a 2nd test, and following the Björklund procedure 3 g. of the sample are to be dissolved in 6 g. of Et_2O .

W. O. E.

Adulteration of drug plants in recent years. C. HAHMANN. *Apoth. Ztg.* **42**, 967-9 (1927).—The difficulties in the way of proper identification of sophisticated plant, leaf and flower material are emphasized, and some recent examples of adulteration enumerated, as *Origanum hirtum*, *Adonis vernalis*, *Marrubium vulgare*, *Galeopsis ochroleuca*, *Sweetia chirata* found contaminated with a variety of plant products. Belladonna, hyoscyamus, Stramonium, senna, pyrethrum and chamomile are cited as drugs frequently subjected to adulteration.

W. O. E.

Determination of potassium iodide in tincture of iodine. F. WEISS. *Apoth. Ztg.* **42**, 969 (1927).—A sample of tincture exam'd. by the official Ger. method and containing ether gave on analysis results indicating the presence of KI, although this substance was actually absent, as shown by the residue.

W. O. E.

Evaluation of liquid substitutes for blood. P. WOLFF. *Apoth. Ztg.* **42**, 1080-3 (1927).—Essentially a discussion of physiological salt soln. and the prepn. and application of its more recent substitutes.

W. O. E.

Estimation of potassium iodide in tincture of iodine. G. WARNECKE. *Apoth. Ztg.* **42**, 1039-40 (1927).—Into a small tared beaker weigh about 3 g. of the sample, heat gently over a wire gauze with a small flame, applying a current of air to the liquid to promote evapn. until finally all free I is eliminated. On cooling, det. the wt. of the

yellowish residue, then dissolve in H_2O and titrate with 0.1 N $AgNO_3$ soln. with $KCrO_4$ as indicator. W. O. E.

Testing medicine glass. W. V. BRUCHHAUSEN. *Apoth. Ztg.* 42, 1040(1927).—Exptl. evidence is adduced showing that while large and medium-sized containers may fulfill the Pharm. requirements perfectly, this would not be the case with the smaller sizes. Thus, a 30-cc. glass container yielded to 0.1 N HCl 2.5 times the amt. of alkali yielded by a 500-cc. container, a 50-cc. container twice the amt. W. O. E.

Artificial musk, its preparation, application, adulteration and control. ALFRED WAGNER. *Chem.-Ztg.* 51, 625-8(1927).—Some 30 different compds. are listed which possess a musk-like odor. The prepn. of musk *via* Baur, of xylene musk and and ambrette musk is discussed in connection with the app. used in their manuf. W. O. E.

Cultivation of belladonna, hyoscyamus and digitalis in China. J. C. LIU. *Ling-nam Agr. Rev.* 4, 37-42(1927).—Results of germination tests of belladonna show that untreated seeds require 4 weeks for germination, while those given an acid treatment germinate 10 days earlier. Acid treatment of seeds accelerates but does not increase the percentage of germination in the long run. Boiling the seeds for 3 min. kills their viability. The value of treating seeds with H_2O_2 is questionable. The viability of seeds is about 30%. Soil sterilization is distinctly valuable, as less mold is developed. The percentage of germination increases the most from the 5th to 7th week after sowing. In the cultivation tests of digitalis and hyoscyamus it develops that the soil and climate of North China are probably suitable for the cultivation of digitalis. Solanaceous plants do not thrive well on sandy loess soil, unfertilized with a plentiful supply of N as described in previous reports on wild plants. W. O. E.

Chemical reactions of synthetic perfumes. THOS. H. DURRANS. *Perfumery Essent. Oil Record, Special No. 18*, 307-34(1927).—An attempt has been made to indicate the manner in which synthetic perfumes are produced, and the complicated chem. reactions thereby involved. Thus, reactions initiated by Claisen, Cannizzaro, Bouveault and Blanc, Reimer-Tiemann, Grignard, Friedel-Crafts and others are discussed in a simple manner. Numerous examples also are cited in esterification, hydration, reduction, oxidation, halogenation and the manner of producing acetylenic carboxylic esters. W. O. E.

New rapid method for determining potassium iodide in the official German tincture of iodine. R. BERG AND M. TEITELBAUM. *Pharm. Ztg.* 72, 1060-1(1927).—*Free iodine*.—Dil about 2 g. of the sample with 5 to 10 cc. of H_2O in a flask with ground-glass stopper, and titrate the free I with 0.1 N $Na_2S_2O_3$ soln., 1 cc. of which = 0.012692 g. I . The normal consumption of the reagent should be 10.7 to 11 cc., which amt. corresponds to 6.8 to 7% free I . *Total iodine*.—To the soln. just titrated add about 30 cc. of C_6H_6 , shake vigorously, and without waiting for the emulsion to break add quickly in a single portion 10 cc. of satd. $Br-H_2O$, shake vigorously 5-10 sec., then immediately follow with 10 cc. of additional $Br-H_2O$. Shake 0.5 to 1 min., then titrate the liberated I with 0.1 N $Na_2S_2O_3$, without addn. of starch. If a is made to indicate the no. of cc. of $Na_2S_2O_3$ = the free I , while b stands for the amt. of $Na_2S_2O_3$ = total I , and c = amt. of sample taken, then the % of I = $1.2692 a/c$ and % of KI = $1.6602(b-a)/c$. The results obtained with several controls are given to show the accuracy of the method. W. O. E.

Sodium sulfide as applied in the German pharmacopeia. J. HERZOG AND K. SCHULZE. *Apoth. Ztg.* 42, 1078-80(1927).—In addn. to a discussion of this new reagent, several other reactions are considered involving the official salts of Bi . W. O. E.

Color tests for santonin. LAD. EKKERT. *Pharm. Zentralh.* 68, 545-6(1927).—If to several liquid portions, each contg. 2 cc. of 1% santonin soln. and 4 drops of 1% naphrole soln., 6, 4, 3, 2, 1.5 and 1 cc. of concd. H_2SO_4 are added, the resp. mixts. develop the following colors: currant-red; currant-red to ruby-red; currant-red to ruby to cherry red; rose, ruby, cherry, violet-red; rose, ruby, deep cherry, violet-red, red-violet, violet, blue-violet, violet-blue, dark blue; rose, ruby, almost blood-red. After addn. of the acid, the solns. should not be shaken, but allowed to stand quietly. After the lapse of several hrs. a mixt. of 1 cc. of santonin and 1 cc. of H_2SO_4 as above, as also one of 2 cc. santonin and 2 cc. H_2SO_4 , becomes blue. On substituting sucrose or levulose for naphrole, garnet-red solns. are obtained. W. O. E.

Some tests for the identification of luminal. CLÉMENT GENOT. *J. pharm. Belg.* 8, 331-5(1926).—A phys. and chem. study of luminal with special reference to properties which may serve in its identification. Descriptions are given of the cryst. forms deposited from soln. in H_2O , $EtOH$, dil. HCl , dil. NH_4OH , $AcOH$, $HCOOH$, $CHBr_3$, $AcOEt$, benzene, $C_6H_5CH_3$, HBr , concd. HNO_3 , $C_6H_5NH_2$, C_6H_5COOH , Me salicylate, $C_6H_5NO_2$, guaiacol, Et_2O , C_6H_6 , CS_2 , CCl_4 , xylene, amyl acetate, CH_3COCl ,

bromine water, amyl alc., HClO_4 , Ac_2O , perhydrol and creosote. A no. of microcryst. and 28 color reactions are also described. The article does not lend itself to abstracting and must therefore be consulted for details.

A. G. DuMEZ

Preparation of bismuth subgallate. A. SCHAMELHOUT. *J. pharm. Belg.* 8, 371-2(1926).—A convenient amt. of $(\text{Bi}_2\text{O}_3\text{CO}_3)_2 \cdot 2\text{H}_2\text{O}$ and a slight excess of gallic acid are introduced into a flask and a paste is formed by the addn. of H_2O . The flask is then placed in boiling water. When the reaction is completed the material is poured onto a force filter and washed with as little H_2O as possible. It is then dried on a porous plate at 30-35°. By this means, a uniform product citron-yellow in color is obtained.

A. G. DuMEZ

Some tests for the identification of chloralose. CLÉMENT GENOT. *J. pharm. Belg.* 8, 407-10(1926).—Chloralose ($\text{C}_6\text{H}_{11}\text{Cl}_3\text{O}_6$) is a hypnotic prepd. by the interaction of anhyd. chloral and glucose. It is a white cryst. substance having a bitter nauseating taste. Its soly. in 40 different solvents is given and the cryst. forms obtained from solns. made with 32 of these solvents are described. Some microcryst. and 25 color reactions are also described.

A. G. DuMEZ

Pepsin and the Belgian pharmacopeia. III. A. CASTILLE AND YVONNE POURBAIX. *J. pharm. Belg.* 8, 635-7, 651-3(1926).—C. and P. examd. samples of pepsin from different sources in the light of the standards prescribed by the Belgian Pharmacopeia III and reached the following conclusions: (1) None of the samples met the requirements of the Pharmacopeia. (2) Of the 7 samples examd., 4 did not meet the requirements of the pharmacopeias of the countries from which they came. (3) The requirements of the Belgian Pharmacopeia compared with those of other pharmacopeias are too rigorous. They should be modified to make them less prohibitive. (4) With this object in view C. and P. propose that the assay in the Belgian Pharmacopeia III be replaced by the following: Immerse in boiling water for 10 min. an egg from 2 to 10 days old. When cold sep. the white and rub it through a No. 10 sieve. Introduce 10 g. of this comminuted material into a mortar, add 0.1 g. of pepsin then, little by little during const. trituration, 60 cc. of distd. H_2O heated to 50° and contg. 3.5 cc. of official dil. HCl . Introduce the mixt. into a 250-cc. flask, using 40 cc. of distd. H_2O heated to 50° to rinse the mortar. Place the flask in a water bath and regulate the temp. so that the mixt. will be maintained at 45°. Shake the mixt. at 10-min. intervals. After 2 hrs. of digestion, pour the liquid in a 100-cc. graduated cylinder with a diam. of not over 3 cm. After standing 2 hrs. the deposit should not exceed 2 cc.

A. G. DuMEZ

Note on a Brazilian climber, "Soela Balle." N. WATTIEZ. *J. pharm. Belg.* 9, 545-9(1927).—Samples of a Brazilian plant, "Soela Balle," used as a tonic by the aborigines of that country, were identified by W. as a climber belonging to the genus *Strychnos*. The bark on extn. yielded neither strychnine nor curarine, but a mixt. of amorphous alkaloids possessing a stimulating action in small doses. The toxicity for frogs was 100 mg. per kg. body weight. An ext. of the bark marketed in Europe under the name "Refistine" represented about 5 times its weight of the dried drug and contained approx. 0.5 g. of alkaloids per 100 g.

A. G. DuMEZ

Digitonin—its properties, isolation and quantitative determination. I. S. MEL-LANOFF. *Am. J. Pharm.* 99, 390-401(1927).—Of the 6 diff. methods tried (digitonin-cholesterol, digitonin- α -naphthol, digitonin- β -naphthol, digitonin-thiophenol, digitonin-terpineol, digitonin-bromonaphthol) the best one was the digitonin-cholesterol. This method gave the highest results and showed that the addition compd. formed is the least sol. From an economical standpoint the digitonin- α -naphthol or the digitonin- β -naphthol method is the best. These pptg. agents cost least and can be easily sepd. from digitonin. The addition compd., when extd. with hot xylene or benzene, can be sepd. into its component parts. The pptg. agents are sol. in the above-mentioned solvents while digitonin is not. The quant. estn. of digitonin showed that there is about 1.4% in the seeds, 31.1% in digitalin (Merck) and 81.1% in digitonin (Merck). W. G. G.

Disinfectants from low-temperature tar. F. R. GREENBAUM. *Am. J. Pharm.* 99, 406-8(1927).—Combinations of low-temp. tar distillate and low- and high-boiling low-temp. tar phenols with rosin or castor oil soap were prepd. A drop of the so prepd. disinfectants formed a perfect white emulsion in H_2O , thereby clearly demonstrating that low-temp. tar is quite suitable for the prepn. of disinfectants. Its disinfecting properties are far superior to those obtained from ordinary aromatic tar. The emulsion, however, after a few minutes standing assumed a distinct red color. It was believed at first that an acid dye was being dealt with and the reactions of this dye pointed to the triphenylmethane group, and as it was an acid dye, it was believed to be either rosolic acid or a deriv. of rosolic acid. In spite of treatment with Na_2CO_3 which was supposed

to have removed the dye, the emulsion turned red. In coöperation with S. Caplan, G. went back to the oxidation theory, and it was assumed that the substance which caused the red color of the emulsion of the disinfectant is a polyhydroxyphenol. Burke and Caplan (*C. A.* 21, 814) continued to work on this problem and succeeded in isolating and identifying the polyhydroxyphenol and found it to be 3,4- or 3,6-dimethylcatechol. Very recently they developed a method by which they are able to remove this dimethylcatechol by treatment with Na borate without in any way changing the content of low-temp. tar phenols, so that today low-temp. tar can successfully be used for disinfectants which are superior in their phenol coeff. to the ordinary disinfectant from aromatic tar oil and which do no longer possess the objection of giving a red emulsion. W. G. G.

Further study of the tannin of *Heuchera americana* Linné. J. C. AND BERTHA L. DE G. PEACOCK. *Am. J. Pharm.* 99, 471-82 (1927).—A review, and revision in some particulars, of the results of an investigation of the root of *Heuchera americana*, published by one of the authors (J. C. B.) *Am. J. Pharm.*, April, 1891. Also in *J. Am. Pharm. Assocn.* 16, 729-37 (1927). W. G. G.

The comparative value of disinfectants. F. WEYRAUCH. *Centr. Bakt. Parasitenk. I Abt.* 103, 123-9 (1927).—A report of the strength of a no. of com. disinfectants. JOHN T. MYERS

Production of oil of citronella. W. BOBILIOFF. *Parfums de France* 5, 228-36 (1927) (in French and English); cf. *C. A.* 20, 3537.—Comparative distns. of cut and ment grass showed the former to give a higher yield of oil (0.79 as compared with 0.62%, av. of 5 tests); moreover, it allows of charging the still more heavily. Comparative tests by steam distn. and by water distn. (boiling in presence of considerable H₂O without introducing steam from an outside source) showed that the former gives a higher yield of oil (0.88% as compared with 0.82%) with higher total geraniol content (89.9% as compared with 88.7%); it is also cheaper and more easily controlled. Increase in steam pressure increases the yield of oil, but prolonged distn. at high pressure reduces the total geraniol content; as a general rule the pressure should not exceed 3 atm. (it may at times be necessary to use only 1-1.5 atm. to obtain 1-grade oil), and the time of distn. should be about 2 hrs. (for a still holding 500-1,000 kg. of grass). A. P.-C.

Citronella. JAS. PAUL JEANCARD. *Parfumerie moderne* 19, 166-71 (1927).—A description of the cultivation and distn. of citronella in Ceylon and Java and of the properties of the oils obtained. A. PAPINEAU-COUTURE

Oil of bastard lavender ("lavandin"). ANON. *Parfumerie moderne* 19, 191-4 (1927).—Three types of bastard lavender (hybrid of *Lavandula officinalis* and *L. spica*) gave oils with the following compn.: d 0.895-0.901, α -5.1 to -5.3°, n_D^{20} 1.4665-1.4697, esters 18.34-21.90%. A. PAPINEAU-COUTURE

Linalyl butyrates and the linalyl acetate content of lavender oil. A. KAUFMANN AND F. KJELSBERG. *Parfumerie moderne* 19, 198-200 (1927); cf. Dalton, *C. A.* 21, 798; Établissements A. Chiris, *C. A.* 21, 988; Parry, *C. A.* 21, 988; Langlais and Goby, *C. A.* 21, 1518.—Analysis of linalyl acetate, butyrate and isobutyrate. prepd. in the lab., gave the following results, resp.: ester content 97.0-98.5, 97.86, 94.49%; d_4^{20} 0.906-0.907, 0.8970, 0.8926; $[\alpha]_D^{20}$ -7.7 to -8.3°, -10.02°, -11.89°; n_D^{20} 1.450-1.451, 1.4518, 1.4487. The acetate is much more readily sapond. than either of the butyrates (which require 4-7 hrs. for complete sapon. under ordinary analytical conditions), and fractional sapon. of the above esters and of a no. of oils of different origins and known purity showed that the esters in the oil consist mainly (and at times practically entirely) of linalyl acetate. The largest amt. of butyrates found was 7.0% (calcd. from fractional sapon., but not otherwise identified) in an oil contg. 52.7% total esters, the other oils contg. 2-3% butyrates. The odor of the butyrates resembles that of lavender more closely than does the odor of the acetate; modern rapid steam distn. prevents decomposition of linalyl acetate which frequently took place in slow distn. over a naked fire, thereby lowering the relative proportion of butyrates to acetate in oils as now made. This may account for the fact that oil produced by modern distn. processes is frequently considered inferior in aroma to that obtained formerly. In an abs. lavender concrete obtained by extraction with volatile solvents, K. and K. found about 4.5% of methylumbelliferon, confirming A. Plau (*Perfumery Essential Oil Record* 18, 205-6 (1927)). A. P.-C.

Synthetic civetone and muscone. RENESTRAT. *Rev. chim. ind.* 36, 77-80, 116-51 (1927).—Review of recent work on the constitution and synthesis of muscone and civetone. A. PAPINEAU-COUTURE

Vegetable lactones having a musk odor. RENESTRAT. *Rev. chim. ind.* 36, 229-31 (1927).—Review of the work of Kerschbaum on the constitution of ambrettolide and of recent work on the musk-like lactone of essential oil of *Angelica*. A. P.-C.

Natural civet and musk. L. V. DOUAU. *Rev. parfumerie* 7, 276-80(1927).—Brief review of the present status of our knowledge of the constitution of *civettone* and *muscone*.
A. PAPINEAU-COUTURE

New remedies. W. F. ENGELHARDT. *Z. mediz. Chem.* 4, 51-2(1926); *Chimie et industrie* 18, 281(1927).—*Septamide* (Heyden) is the Mg deriv. of chloramine. It is a yellowish white cryst. powder, sol. in 50 parts of H_2O and has antiseptic properties.
A. PAPINEAU-COUTURE

Isacene. P. BERGELL. *Z. mediz. Chem.* 4, 65(1926); *Chimie et industrie* 18, 281(1927).—Isacene is a diacetyl bis-hydroxyphenylisatin and is closely related to phenolphthalein. It acts in doses of a few mg., 1 cg. being generally sufficient to regulate evacuation from the intestines, though up to 10 cg. may sometimes be required. Because of the smallness of the dose it has no effect on the stomach, and its use can be prolonged.
A. PAPINEAU-COUTURE

Alkaloid of the seeds of *Nandina domestica*, "nantenine." T. TAKASE AND H. OHASHI. *J. Pharm. Soc. Japan* No 535, 742-8(1926).—An alkaloid is isolated from seeds of *Nandina domestica* Thunb, which is quite different from nandinine isolated from the bark of the same plant. It is therefore called *nantenine*. It m. 138.5°, $[\alpha]_D^{17} = +111^\circ$. Detailed pharmacological effects of this alkaloid are given and compared with those of nandinine.
S. T.

Alkaloids of seeds of *Nandina domestica*. I. II. MANIWA, R. SAKAE AND I. KAN. *J. Pharm. Soc. Japan* No. 536, 833-42(1926).—From seeds of *Nandina domestica* was isolated an alkaloid of the compn. $C_{20}H_{23}O_4N$ (I, m. 138-9°. Since the properties of I are quite different from those of nandinine discovered by Eykmann (*Ber.* 17, 441 (1884)), in the bark and root of this plant, the name *domestine* is given to I. It has 2 MeO, a methylenedioxy, and an *N*-Me group; $[\alpha]_D^{20}$ 99.80°. It crystallizes in needles from petr. ether, and plates from H_2O soln. It is difficultly sol. in H_2O and petr. ether, sol. in alc, Et_2O , $CHCl_3$, Me_2CO , mineral acids and anhyd. AcOH. Its alc. soln. gives a rose-red color with concd. H_2SO_4 , later becoming dark in color. With HNO_3 it gives a dark brown color; with $FeCl_3$ soln. yellow-brown; other reactions with alkaloidal reagents are recorded. It is more toxic than nandinine. **Supplement.** *Ibid* 874.—Recently Kitasato (*Ibid* No. 534, 653) isolated another alkaloid, *domesticine*, $C_{19}H_{21}NO_4$ + 101.7°, which is very similar to I. By using Perkin's method K. prepd. *epi-dicentrine* and found it to be identical with domesticine methyl ether. Thus I is identical with K.'s domesticine methyl ether.
S. T.

Alkaloid of the seeds of *Nandina domestica*, Thunb. KITASATO. *J. Pharm. Soc. Japan* No. 536, 843-4(1926).—Takase and Ohashi isolated an alkaloid (cf. 2nd preceding abstract) from the seeds of *Nandina domestica* Thunb, and named it nantenine. Although the m. p. and $[\alpha]$ were given, no elementary analysis was reported. Maniwa, Sakai and Kan, on the other hand (cf. preceding abstract), isolated the same alkaloid from the seeds, but named it domesticine. K. isolated (cf. *Ibid* No. 534) another alkaloid, domesticine, from the same seeds, and by synthesizing its methyl ether detd. its structure. Since the m. ps. of domesticine methyl ether (m. 139°), nantenine (m. 138.5°), and domesticine (m. 138-9°), and their $[\alpha]$ are very similar, they might be the same compd. When M.'s domesticine and K.'s domesticine methyl ether are heated together, there is no change in m. p. Nantenine also must be identical with K.'s domesticine ethyl ether (former has $[\alpha] + 101.7^\circ$, and the latter, + 111°). Although the name nantenine had been introduced before K.'s domesticine was suggested, it was applied to an alkaloid isolated from the bark of the plant by Shibata. Thus domesticine methyl ether should be used instead of nantenine. The credit of discovery of natural domesticine methyl ether must go to T. and O., and M.; and T. and O.'s discovery that it is entirely different from nandinine in pharmac action should be properly acknowledged.
S. T.

Invert sugar sirup. W. A. WHATMOUGH. *Chemist & Druggist* 106, 281(1927).—These sirups used during the War as a substitute for glycerol are recommended to replace simple sirup, *Brit. Pharm.* They are best prepd. by the action of invertase on cane sugar solns., contain 80% sugars (*Brit. Pharm.* 66%), d 1.4 (*Brit. Pharm.* 1.33), are more viscous, sweeter, enhance delicate flavors, flow freely at low temps., and neither cake nor crystallize. Examples of pharmaceutical uses, *e. g.*, in cough sirups, are given. Admixt. with acid galenicals, also contact with sucrose crystals, should be avoided.
S. WALDBOTT

High-density sirup for pharmaceutical use. W. A. WHATMOUGH. *Pharm. J.* 118, 724, 789-90; *Chemist & Druggist* 107, 18-9, 115(1927); cf. preceding abstract.—The sirup (d. 1.40), contg. sucrose 40%, dextrose 20%, levulose 20%, H_2O 20%, is recommended for pharmaceutical use. For its prepn. from the pure (opaque) 82% invert

sugar sirup (A), melt together on the water bath A 5 parts with H_2O 1 part, add pure sucrose 4 parts, stir until dissolved; no sucrose crystals must remain in the finished product. Crystn. of the sirup is prevented by the hygroscopicity of the levulose; fermentation caused by wild yeasts is prevented by high density of the sirup. A number of pharmaceutical applications are indicated. S. WALDBOTT

A modern sirupus. W. A. WHATMOUGH. *Chemist & Druggist* 106, 675(1927).—"Nulomoline" is a non-crystg., non-fermentable invert sugar sirup, useful as a substitute for clarified honey in pharmaceutical prepn.s. The com. opaque variety used in confectionery contains 82% invert sugar, 18% H_2O ; dextrose is crystd. at ordinary temp., but is dissolved at 50–60°. The clear variety, "Nulomoline Pharmaceutical," is a mixt. of invert sugar 40%, sucrose 40% and H_2O 20%, recommended to take the place of "sirupus, Brit. Pharm.," in pharmaceutical prepn.s. S. WALDBOTT

Linimentum aconiti compositum, Brit. Pharm. Codex. ANON. *Chemist & Druggist* 106, 711(1927); cf. W. Forster, *Ibid* 105, 920(1926).—A sepn. noted by F. in this liniment was caused by $CHCl_3$ and was avoided by addn. of H_2O . Accordingly, an improved prepn., *linimentum sedativum* (North of England Med. Formulary), has the compn.: Lin. aconiti 6 drachms, Lin. belladonnae 6, $CHCl_3$ 2, H_2O 2 drachms. As no sepn. will take place in this prepn., its alkaloidal content will be const. S. W.

Vanishing creams for the skin. C. DOUBLEDAY. *Chemist & Druggist* 106, 780–1; 107, 62, 89–90(1927).—Formulas and practical directions are given for the compounding of skin creams. S. WALDBOTT

The new Roumanian pharmacopeia, 4th ed. ANON. *Chemist & Druggist* 106, 789(1927); cf. C. A. 21, 1522.—The phys. and chem. consts. of the official essential and fixed oils and the 3 official balsams are given in tabular form. S. WALDBOTT

A new emulsifying plant. W. A. WHATMOUGH. *Chemist & Druggist* 106, 844(1927).—Describes the mode of action of the "Premier emulsifying machine" with sketch of detail, and illustration of app. adapted for pharmaceutical use. S. W.

A propos the physiologic control of neoarsenobenzenes. L. LAUNOY. *Compt. rend. soc. biol.* 97, 324–7(1927).—This is mainly a discussion of previous work by the author and others. The mouse is recommended in place of the rabbit for standardizing the dose of neoarsenobenzenes. L. W. RIGGS

Assay of glycerophosphates by the method of Copaux. PAUL FLEURY and ZAHARIE SUTU. *J. pharm. chim.* 5, 56–62(1927); cf. Copaux, C. A. 16, 219.—The method, modified, permits detn. of total P in glycerophosphates (A) of Ca and Na and the granulated saccharate prepn. (Codex), after mineralization of the P by the methods of Fontès and Thuville (cf. F. and S., C. A. 21, 2713). The app. is a 60-cc. ampoule with a 10-cm. stem of 1.5 cc. total vol., graduated into 0.05 cc., each indicating about 1 mg. P_2O_5 . The reagents are: Na molybdate soln. (B) (dissolve MoO_3 100 g. in hot soln. of Na_2CO_3 (32 g.), fill up to 1 l.); Et_2O free from $EtOH$, d. 0.720; type soln. of KH_2PO_4 (3.778 g. per l. = 2 g. P_2O_5 per l.). Put 10–15 cc. of the soln. contg. the total mineralized P (not to exceed 30 mg. P_2O_5) into the app., add 3 cc. HNO_3 (d. 1.332) and Et_2O until after shaking, a 3–4-mm. layer of Et_2O is formed. Now add soln. B in 3 cc. fractions until after shaking and centrifuging for 1 min., 2 successive addns. leave the vol. of the yellow layer unchanged. Repeat this with the type soln. and det. the P content from the ratio of the 2 vols. For 30 mg. P_2O_5 , 15–17 cc. of B, for 2–4 mg., 5–10 cc. of B are required. The av. error by this method in 6 detns. was –0.4%. The method also allows direct detn. of H_3PO_4 in presence of A, since the reagents used do not hydrolyze A under the conditions of the detn. However, complete sepn. of 2 mg. P_2O_5 (present as H_3PO_4) from e. g., 1 g. Na-A or its equiv. of Ca-A, dissolved in 15 cc. H_2O , requires 12–13 cc. of soln. B instead of only 3–5 cc. used when H_3PO_4 is absent. S. WALDBOTT

Solution of ammonium acetate, Brit. Pharm. NOEL L. ALLPORT and T. TUSTING. *Pharm. J.* 118, 719–21, 788–9; *Chemist & Druggist* 107, 15–6(1927); cf. C. A. 21, 1522.—The Brit. Pharm. directs the prepn. of $AcONH_4$ by "neutralizing" dil. $AcOH$ with NH_4 carbonate. No method for checking the NH_3 or $AcOH$ contents of the product is given; nor is there any test for neutrality. Interpreting this word literally, the reaction should be that of abs. neutrality, i. e., $p_H = 7.0$. At this val., the soln. will contain NH_4HCO_3 and CO_2 in addn. to $AcONH_4$. This is shown (Table I) by a detn. of total $AcOH$, total NH_3 and total CO_2 in 3 solns. made from $AcOH$ and NH_4 carbonate, brought, resp., to p_H 7.0, 7.6 and 8.0; another soln. to 7.0 by simple neutralization with NH_4OH ; the latter product thus contains the theoretical equivs. of $AcOH$ and NH_3 . The excess of NH_3 at the 3 values of p_H named is, resp., 5, 7.6, 10.7%. Calcg. the ratio NH_4HCO_3/H_2CO_3 shows that at p_H 7.0 about 50%, at 7.6 100%, at 8.0 none of the H_2CO_3 is free; it then exists entirely in the form of NH_4HCO_3 .

Similar detns. (Table II) are made on a NH_4AcO soln. prepd. by 1:7 diln. of the well-known "concd. soln." The quantities of NH_3 at the above p_H are much less (1.26, 1.9, 4.4%), as the soly. of CO_2 in the concd. soln. is not proportional to the concn.; hence the dild. soln. contains less CO_2 , requiring less NH_3 to change the p_H . Conclusion: For dispensing purposes, a more satisfactory soln. than that of the Brit. Pharm. may be made by adjusting the reaction to p_H 8.0 by adding a soln. of NH_4OH to a soln. previously neutralized to p_H 7.0 by means of NH_4 carbonate. The reaction of solns. "neutralized" by the use of litmus may vary from p_H 6.5 to 7.5, and such solns. could be considered as having been prepd. according to the present Brit. Pharm. instructions.

S. WALDBOTT

A color test for ergot alkaloids. NORMAN EVERS. *Pharm. J.* **118**, 720-3, 789; *Chemist & Druggist* **107**, 16-7 (1927) - Tanret's color test (1875) (cf. Tschirch C. A. **21**, 1870) is modified in order to obtain the color in a homogeneous soln. so as to be measurable in a tintometer. For ext. ergotac liq., mix 2 cc. of the sample with 1 cc. of 10% NH_4OH and shake with 15, 10 and 5 cc. Et_2O . Filter and evap. the Et_2O soln. To the residue add 15 cc. glacial AcOH , filter and mix 4 cc. of the filtrate with 4 cc. of 50% H_2SO_4 by vol. The violet blue color is fully developed in about 12 hrs., and is stable for 24 hrs. longer. Addn. of FeCl_3 or of H_2O_2 is detrimental. In testing ergot, shake 2 g. of powd. ergot for 2 hrs. with 1 cc. of 10% NH_4OH , 2 cc. H_2O and 40 cc. Et_2O , and finish as before. A table gives the color results in Lovibond units, parallel with the results of physiol. assay of exts. standardized against ergotoxine. Well-marked colors are given by exts. contg. 0.065% of alkaloid. A negative color test always indicates an inactive prepn., although a positive color test is sometimes produced with such a prepn. It applies the color test also to known and varying quantities of ergotoxine and ergotinine. The resulting graphs, very similar to each other, show approx. proportionality between quantities of alkaloid and of color.

S. WALDBOTT

The volumetric assay of iodides. A. J. JONES. *Pharm. J.* **118**, 723-4; *Chemist & Druggist* **107**, 17-8 (1927).—In the place of the non-sp. method of the Brit. Pharm., the method of titration with HIO_3 soln. (L. W. Andrews, *J. Am. Chem. Soc.* **25**, 756 (1903)) is recommended, which detns. I in KI in the presence of large quantities of other halogenides. The reaction, in the presence of excess of HCl , is $2\text{HI} + \text{HIO}_3 + 3\text{HCl} \rightarrow 3\text{H}_2\text{O} + 3\text{ICl}$, taking place in 2 stages: (a) $10\text{HI} + 2\text{HIO}_3 \rightarrow 12\text{I} + 6\text{H}_2\text{O}$; (b) $3\text{HIO}_3 + 15\text{HCl} \rightarrow 3\text{I} + 15\text{ICl} + 9\text{H}_2\text{O}$. To 0.5 g. KI (or its equiv. of other iodides) add 10 cc. H_2O and 40 cc. HCl (d 1.16), then 0.1 N KIO_3 (10.701 g. KIO_3 per l.) until I, first increasing, disappears. While still brownish, add 5 cc. CHCl_3 and shake after addn. of each drop of the KIO_3 soln. until the pink color in the CHCl_3 disappears, the supernatant liquid has the bright yellow color of ICl . The method gives accurate results in an equimol. mixt. of bromide and iodide. Four com. samples of KI, in which Br and Cl were also detd., indicated by the Brit. Pharm. method 103.68, 102.06, 99.60, 98.97% KI; by the KIO_3 method, 96.28, 97.67, 99.17, 98.83% KI. By this method, HgI_2 may also be detd.; use 0.6-0.7 g., add 10 cc. H_2O and 40 cc. HCl as before. The HgI_2 will be completely dissolved before the CHCl_3 is to be added. The recent Spencer method (C. A. **21**, 2628) has not yet established non-interference of bromides.

S. WALDBOTT

The plastic behavior of tragacanth mucilage, and its pharmaceutical significance. G. MIDDLETON. *Pharm. J.* **118**, 727-30, 790; *Chemist & Druggist* **107**, 20-1 (1927).—The app. is described by means of which viscosity and plasticity of tragacanth mucilage are measured. The behavior of this mucilage resembles that of other emulsoids in showing a viscosity varying with the rate of shear. Typical flow-pressure curves are given. A standardized shot test is recommended for evaluation of the gum (cf. Evers and McLachlan (C. A. **18**, 3103)). The behavior of the mucilage in its pharmaceutical applications is discussed. The further study of probable variations in the plasticity curve of tragacanth mucilage with changes in concn. and temp., with addn. of acacia or alkali, etc., is contemplated.

S. WALDBOTT

A short note on Catechu pallidum. C. J. JORDAN. *Pharm. J.* **118**, 730-1, 790; *Chemist & Druggist* **107**, 21-2 (1927).—Of 12 com. samples examd., only 4 gave results approx. those required by the Brit. Pharm.; hence the com. drug is rarely of Brit. Pharm. quality.

S. WALDBOTT

Tobacco; cultivation and fertilization. P. DE SORNAY. *Rev. agr. Maurice* **4**, 44-8 (1927).—Ash analyses of tobacco from 3 different fields are presented, and on this basis the use of phosphate guano instead of acid phosphate is recommended. This should be applied before planting, and should be supplemented at planting and again 1 month later by a mixt. of NaNO_3 , KNO_3 and $(\text{NH}_4)_2\text{SO}_4$. Advice is also given concerning the optimum distance between plants.

Butylresorcinol. A. R. L. DOHME. Can. 272,351, July 12, 1927. A new product butylresorcinol, white crystals, m. 47-8°, slightly sol. in H₂O and readily sol. in alc., benzene and vegetable oil, and with a phenol coeff. of about 22.

Basic bismuth salts of aryl-arsonic acids. R. W. E. STICKINGS. Can. 273,216, Aug. 16, 1927. A basic Bi salt of *N*-phenylglycinamide-*p*-arsonic acid is manufd. by optg. the soln. of an alkali bismuthyl tartrate with an alkali salt of *N*-phenylglycinamide-*p*-arsonic acid in an excess of at least 25% over the quantity equiv. to the mother Bi salt.

Complex antimony compounds. I. G. FARBEINDUSTRIE AKT.-GES. Brit. 262,301, Feb. 15, 1926. A neutral salt of a mercaptocarboxylic acid is reacted on with an antimonyl compd. of a polyphenol or deriv. contg. 2 OH groups in *o*-position to each other. The products are *therapeutic agents*. The Na salt of thioglycollic acid may be treated with the antimonyl compds. of pyrocatechol, pyrogallol and gallic acid. The antimonyl compd. of gallic acid is made by heating Na gallate with Sb₂O₃. Cf. C. A. 21, 594.

Therapeutic vaccines, serums, etc. C. RATH. Brit. 262,080, Nov. 24, 1925. Chem. substances capable of influencing pathogenic microorganisms, as described in Brit. pat. 247,965 (C. A. 21, 626), are caused to act *in vitro* on cultures of spirochetes, trypanosomes, cocci or the like instead of being injected into an animal together with the microorganisms. The treated organisms become non-virulent and may be further weakened, e. g., by heating. The preps. may be used directly for immunizing or may be injected into an animal for obtaintment of immunizing serums, etc.

Pharmaceutical product. W. SCHULEMANN, F. SCHONHOFER, A. WINGLER and F. MIERZSCH. Can. 271,590. June 14, 1927. Polyamino quinoline derivs. and intermediate products for their manuf. consist of the respective amino derivs. being made strongly basic by the introduction of N atoms which are combined with the aromatic amino groups through the medium of aliphatic radicals. Cf. C. A. 20, 3333.

Sterilizing agents. C. H. H. HAROLD. Can. 272,013, June 28, 1927. A sterilizing agent is prepd. by adding to an aq. soln. of NH₃ of a concn. not greater than about 0.0125 per l., the equiv. quantity of Cl₂ corresponding to the formation of a chloramine with the total NH₃ present. Cf. C. A. 20, 1877.

Fumigant. R. N. CHAPMAN. Can. 273,260, Aug. 23, 1927. A fumigant composes CCl₄ and CCl₃NO₂ in equal parts by vol.

Medicinal plaster for use in the mouth. A. D. GOLDSTEIN. U. S. 1,642,653, Sept. 13. Thin strips are formed of an agar glycerol mixt. or similar material uniformly permeated with medicaments, e. g., with oil of cinnamon, ZnCl₂ or mercurichrome.

18—ACIDS, ALKALIES, SALTS AND SUNDRIES

FRED C. ZEISBERG

The volumetric and thermic relations of contact sulfuric acid. ROBERT NITZSCHMANN. *Continental Met. Chem. Eng.* 2, 176-8(1927).—In the roasting of Zn blende, Fe pyrite and S according to the equations $2ZnS + 4O_2 = 2ZnO + 2SO_2$, $4FeS_2 + 15O_2$

$= 2\text{Fe}_2\text{O}_3 + 8\text{SO}_3$, and $2\text{S} + 3\text{O}_2 = 2\text{SO}_3$, equations are given for the calcn. of the vols. of the gases, O_2 , N_2 and SO_2 after absorption of the SO_3 , as a function of the % conversion and the % SO_2 in the initial burner gas. *Ibid* 208-9(1927).—Graphs and tables of data are given for: the heat content of roaster gases (from Fe pyrite) as a function of the theoretical temp. of combustion; the max. temp. difference between the gases entering and leaving the converter as a function of the % conversion; the temp. of the gases coming from the contact catalyst as a function of the % conversion; and the relations of the exchange of heat up to the emission from the catalyst. J. H. PERRY

Production of nitric acid by the catalytic oxidation of ammonia. V. I. MALYAREVSKII. *Ukrainskii Khim. Zhurnal* 1, 97-140(1925); *Chem. Zentr.* 1926, II, 286.—A detailed description of the recovery of NH_3 in coking plants. C. C. DAVIS

Catalytic oxidation of ammonia. V. I. MALYAREVSKII. *Ukrainskii Khim. Zhurnal* 1, 141-63(1925); *Chem. Zentr.* 1926, II, 286; cf. preceding abstract.—The paper deals with the work of Malyarevskii and Malyarevskaya (cf. C. A. 20, 971). C. C. DAVIS

The Carrara process for the synthesis of ammonia. ANON. *J. four elec.* 36, 197(1927) — A short note. W. P. G. Carrara uses pressures around 150 atm. vs. 300 by Fauser, 500-700 by Casale, 200 by Haber and 1000 by Claude. There is less danger of explosion. The first product is a soln. of 20-5% NH_3 . The Carrara process is particularly applicable to small scale operation. At Padova, Italy, N from liquid air and electrolytic H are used. The compn. of the catalyst is not revealed. C. G. F.

Preparation of aldehyde-ammonia. V. SOROKIN. *J. Chem. Ind. (Russia)* 2, 64-6(1925); *Chem. Zentr.* 1926, II, 826 — Aldehyde ammonia is used under the name of "Vulkazit A" in the vulcanization of rubber. It is obtained in 93-95% yield by leading HCHO and NH_3 vapors into a large vessel. The NH_3 must be in excess, otherwise the product is yellow, and the temp. must be maintained below 30° . A 90% yield is obtained from 10% HCHO in conc. acetone with a slight excess of aq. NH_3 . C. C. D.

Liquid caustic soda. R. J. QUINN. *Oil Fat Ind.* 4, 289-97(1927).—This is a discussion of advantages of handling caustic soda in liquid form. E. SCHERUBEL

Ammonium thiocyanate from coking plants. W. GLUUD AND W. KLEMP. *Z. anorg. Chem.* 40, 659-60(1927).—The possibility of prep. large amts. of thiocyanates in the coke industry, both cheaply and easily, has not been fully realized. The principle of the thiocyanate method rests upon washing the gas, freed from tar and contg. NH_3 , H_2S and HCN , with an aq. suspension of S, and allowing time for the HCN to react with the ammonium polysulfide, resulting in the formation of NH_4SCN . This method was put into practice in a semi works, exptl. plant, and observed carefully in large scale operation. The increase in concn. of the NH_4SCN in the soln. was found to be uniform throughout. Increasing the temp. of the soln. during the washing gave solns. of higher concn. If the washing was conducted correctly, it was not difficult to obtain pure NH_4SCN from the soln. LOUISE KELLEY

The conversion of alkali chlorides into nitrates with simultaneous production of chlorine. VALENTIN DOMINIK. *Chimie et industrie* 18, 24-32(1927).—The purpose of the investigation was to det. the conditions under which cheap NaNO_3 could be obtained from synthetic HNO_3 and NaCl , the main difficulties of the problem lying in the working up of the mother-liquor from the sepn. of NaNO_3 , the complicated sepn. of the gaseous products of the reaction, and the selection of a sufficiently resistant material for the equipment. The conditions under which the reaction $\text{HNO}_3 + 3\text{HCl} \rightleftharpoons 2\text{H}_2\text{O} + \text{Cl}_2 + \text{NOCl}$ can be made to proceed towards the right are studied. The proportion of NaCl and concn. of HNO_3 can be selected so that distn. gives gaseous products (Cl_2 and NOCl), water, and a residue consisting of concd. HNO_3 holding the NaNO_3 in soln. The behavior on distn. of a mixt. of NOCl and Cl_2 (liquefied by cooling the distn. gases in liquid air) showed that the 2 gases do not combine under the conditions of the expts. and do not form a soln. with const. b. p., so that they can be sepd. completely by fractional distn. The soly. coeff. of NOCl in HNO_3 (d. 1.40) at 18° was found to be 36.1; and of Cl_2 at 21° , 1.82. NOCl may be converted into HCl , HNO_3 and NO in the absence of air according to the equation $3\text{NOCl} + n\text{H}_2\text{O} = 3\text{HCl} + \text{HNO}_3 + 2\text{NO} + (n-2)\text{H}_2\text{O}$ (1), or into HNO_3 and HCl in the presence of air according to equation $2\text{NOCl} + 2\text{H}_2\text{O} + \text{O}_2 = 2\text{HNO}_3 + 2\text{HCl}$ (2). Reaction (1) is particularly indicated in plants making synthetic HNO_3 , the NO being returned to the mixt. of N oxides and air; and in such a case the production of NaNO_3 may be represented by the equation $4\text{HNO}_3 + 4\text{NaCl} + \text{O}_2 = 4\text{NaNO}_3 + 2\text{Cl}_2 + 2\text{H}_2\text{O}$. Tests with Krupp's ferro-Si known as "thermisilid extra" showed it to be practically unaffected by boiling aqua regia. Application of these results to the continuous production of NaNO_3 and the advantages of

converting the Cl_2 to HCl and combining with NH_3 (also produced in the N-fixation plant) are discussed.

Molten ammonium chloride. WALTER MERTNER. *Chem.-Zig.* 51, 638(1927).— NH_4Cl was heated to 400° in a sealed glass tube. The white clouds formed at first disappeared gradually and the crystals showed the typical phenomena of melting until nothing but a mobile liquid remained. Upon cooling a hard vitreous mass was left, similar to com. "sublimed sal ammoniac," and it is claimed that the latter may really have been formed by distn. under pressure, rather than by sublimation. W. C. F.

Conversion of sodium chromate to dichromate with the aid of carbon dioxide. N. F. YUSHKEVICH AND M. N. LEVIN. *J. Chem. Ind. (Russia)* 2, 329-32; *Chem. Zentr.* 1926, I, 3390.—The possibility of converting Na_2CrO_4 to $\text{Na}_2\text{Cr}_2\text{O}_7$ by CO_2 under pressure, which has already been proved in earlier work (*C. A.* 21, 1525), is established in further expts. When Na_2CrO_4 soln. contg. 16.98% Cr is maintained 5 hrs. at 23° under a CO_2 pressure of 4 atm., 66% of the Cr is converted to $\text{Na}_2\text{Cr}_2\text{O}_7$. With shorter time the yield is smaller, probably because satn. of the soln. with CO_2 proceeds slowly. Under 8 atm. pressure of CO_2 , the reaction is complete in 2 hrs., a 14.3% (calcd. as Cr) soln. being converted to the extent of 65%. By concg. the final soln., part of the Na_2CrO_4 seps. and the ratio of Cr as $\text{Na}_2\text{Cr}_2\text{O}_7$ to total Cr increases to 0.77. By treatment of this concd. soln. with CO_2 under 8 atm. pressure, this ratio further increases to 0.85. To complete the conversion to $\text{Na}_2\text{Cr}_2\text{O}_7$, the soln. must then be acidified with H_2SO_4 , but by this method the consumption of H_2SO_4 and the formation of Na_2SO_4 as by-product are only about 0.2 of the quantities when H_2SO_4 is the only agent used for the conversion. Likewise only 0.5 the soda is used. C. C. DAVIS

Reciprocal system: water, sodium chloride, magnesium sulfate, magnesium chloride, sodium sulfate. A. KUPFER. *Caliche* 8, 467-87(1927).—Triangular and rectangular graphs, soly. tables and text describe isotherms of this system from 0° to 55° , giving the soln. compn. at the transition points. Soly. tables also are given from 0° to 100° for each of the 4 primary salts alone. J. HOWARD FLINT

Quaternary system: water, sodium nitrate, sodium chloride, sodium sulfate between 100° and 0° . A. CHRETIEN. *Caliche* 8, 390-408(1926).—This system is discussed in graphs and tables. At 68.5° the soln. is satd. with respect to chloride, nitrate, anhydrous sulfate and $\text{Na}_2\text{SO}_4 \cdot \text{NaNO}_3 \cdot \text{H}_2\text{O}$ (darapskite); this last can exist in the presence of the others down to 7.2° . Above 68.5° it is not formed when the soln. is satd. with NaCl , as in lixiviating caliche. Above 78.5° the sulfate is anhydrous, and below 7.2° is decahydrate in contact with solus. satd. also with simple nitrate and chloride only. At 16° there are four solid phases, chloride, darapskite, anhydrous sulfate and sulfate decahydrate. J. HOWARD FLINT

Quantitative relations in the "ocher" process for producing copper sulfate. G. AGDE AND H. BARKHOLT. *Metall u. Erz* 24, 49-52(1927).— CuSO_4 soln. is made from 30° B ϕ . H_2SO_4 flowing over Cu, with a counter current of air and steam in a Pb-lined concrete tower. Data are given for the yields with different acid concn. and temp., and for crystn. Crystn. from acid soln. is advised, but the temp. and concn. must be carefully regulated to avoid hydrates with less than 5 mols. water. C. G. K.

The production of magnesia from dolomite. LUDWIG KIEPENHEUER. *Zement* 15, 471-5(1926).—Calcined dolomite is treated with Na_2CO_3 soln. and CO_2 under pressure to form the double salt $\text{MgNaH}(\text{CO}_3)_2$ in soln., the CaCO_3 remaining undissolved. MgCO_3 is pptd. from this soln. by reducing the pressure of CO_2 . H. F. K.

Factors influencing the loss of iodine from iodized salt. A. H. JOHNSON AND B. L. HERRINGTON. *J. Agr. Research* 35, 167-83(1927).—In the absence of sunlight iodized salts undergo no serious loss of I when stored in atm. up to at least 50% relative humidity. Exposure of the salts to sunlight results in a considerable loss of the I present. This loss of I by the action of sunlight may be reduced by rendering the salt alk. with NaHCO_3 , and entirely prevented by iodizing the salt with KIO_3 . Exposure to heat alone effects losses of I from acid, neutral and alk. iodized salts, and from salt iodized with KIO_3 in the same order as exposure to sunlight. The quantity of I liberated from a neutral salt iodized with KI appears to depend on the quantity of KI present. W. H. ROSS

Monazite. ANON. *Mineral Ind.* 35, 471-3(1926).—The monazite industry is reviewed, including Th and Ce. A. BUTTS

Magnesite. HUGH M. HENTON. *Mineral Ind.* 35, 434-43(1926).—Varieties and production are covered, as well as Mg salts and Mg metal, with a bibliography. A. BUTTS

Mica. W. M. MYERS. *Mineral Ind.* 35, 461-7(1926).—Varieties and uses are discussed and data given on production. A. BUTTS

Asbestos. OLIVER BOWLES. *Mineral Ind.* 35, 66-74(1926).—Varieties and uses, market and world production are discussed. A. BUTTS

Asbestos. F. J. DUNK. *India Rubber J.* 74, 252(1927).—Crit. comments on an article by Longley (cf. *C. A.* 21, 2536); several errors are pointed out. C. C. DAVIS

Micro-asbestos. HEINRICH ROSENBERG. *Chem.-Ztg.* 51, 548-9(1927); cf. *C. A.* 21, 181, 510, 1692. - Asbestos from Burgenland (Austria) is a homogeneous, greenish white, fine powder of micro-fiber structure, SiO_2 51.1 to 49.9%, Al_2O_3 5.3 to 4.7%, CaO 14.0 to 15.2%, MgO 21.9 to 23.8%, moisture (120°) 0.3 to 0.5%, volatile (1000°) 3.1 to 2.5%. For all purposes, except spinning, it is equiv. to fibrous asbestos. B. J. C. VAN DER HOEVEN

Carbon black produced from natural gas in 1926. C. R. HOPKINS. *Bur. Mines, Mineral Resources of U. S. 1926*, Part II, 13-6(preprint No. 3, published July 20, 1927) E. H.

duced by burning P or gas mixts. contg. P and directing the P flame into an absorption tower.

Ammonia from carbides. L. TOCCO and M. LANDI. Brit. 262,090, Nov. 27, 1925. Ba carbide or other carbide is treated with N to obtain a cyanide and the cyanide is then treated with H to produce NH_3 and regenerate the carbide.

Cyanides. P. COMMENT and D. HATT. Can. 272,316, July 12, 1927. Cyanides of the alkali metals are made by mixing CaCN_2 , CaC_2 and Na_2CO_3 in the proportions given by the equations: $\text{CaCN}_2 + 2\text{CaC}_2 + \text{Na}_2\text{CO}_3 \longrightarrow \text{Ca}(\text{CN})_2 + 2\text{CaO} + \text{Na}_2\text{O} + 4\text{C}$; $\text{Ca}(\text{CN})_2 + 2\text{CaO} + \text{Na}_2\text{O} + 4\text{C} \longrightarrow 2\text{NaCN} + 3\text{CaO} + 4\text{C}$. The mixt. is heated in such manner that the quant. yield of cyanide will be approx. attained.

Alkali cyanides. I. G. FARBENINDUSTRIE AKT.-GES. Brit. 262,456, Dec. 4, 1925. Combined S is removed from solns. of alkali cyanides by treatment with Bi compds. such as a Bi salt or hydroxide.

Alkaline earth compound. II. HAILL. Can. 272,210, July 5, 1927. New complex alkali and alk. earth compds. of mercaptocarboxylic acids are produced by treating a mercaptocarboxylic acid with an O_2 compd. of tervalent Sb and neutralizing with an alkali or alk. earth.

Cyanogen compounds. R. W. POINDEXTER, JR. and W. E. OLBERG. U. S. 1,642,694, Sept. 20. In forming cyanogen compds. of alkali-forming metals, their carbides are treated with anhyd. HCN , and with a relatively small proportion of a promoter such as NH_4Br , PhCOOH , NH_4CNS , CaBr_2 , NH_4I , ZnCl_2 or ZnBr_2 which is free from H_2O and from H_2O -forming components.

Ammonium carbonate. RIENANIA-KUNHEIM VEREIN CHEMISCHER FABRIKEN AKT.-GES. Brit. 262,408, Dec 7, 1925. The H_2O required for the production of solid $(\text{NH}_4)_2\text{CO}_3$ by the interaction of gaseous NH_3 , CO_2 and H_2O is supplied either continuously or intermittently in liquid form to the walls of the reaction chamber or to reaction surfaces within it. The H_2O may be introduced in the form of an aq. soln. of NH_3 or of $(\text{NH}_4)_2\text{CO}_3$ and the reaction may be carried out in a rotating vessel.

Ammonium carbonate. T. COXON. Can. 271,935, June 28, 1927. Solid compns. in which the NH_3 - CO_2 ratio is less than that of $\text{H}_2\text{NCO}_2\text{NH}_2$ are produced by bringing CO_2 into reaction contact with solid $\text{H}_2\text{NCO}_2\text{NH}_4$ material in the presence of H_2O and introducing NH_3 with the CO_2 , so that surplus H_2O is removed by formation of solid NH_4HCO_3 .

Ammonium sulfate. SOC. ANON. DES FOURN A COKE SEMET-SOLVAY & PIETTE. Brit. 262,320, March 22, 1926. Distn. gases after removal of their NH_3 content are freed from impurities such as H_2S , CO_2 and HCN by scrubbing with aq. NH_3 and the fouled liquor is directly treated with CaSO_4 to form $(\text{NH}_4)_2\text{SO}_4$.

Ammonium fluoride. J. W. PROCTOR. U. S. 1,642,788, Sept. 20. HF gas is brought into contact with a liquor contg. NH_4F until a soln. is obtained which, on subsequent addn. of NH_3 and cooling, will deposit crystals of NH_4F and crystn. of the latter is then effected, the crystals are sepd. and the mother liquor is reused for continuing the process. An app. is described.

Fluorides. F. SANDER. U. S. 1,642,896, Sept. 20. Silicic acid, fluorspar and BaF_2 are heated with HCl , the difficultly sol. fluosilicate formed is filtered off, decompd. with aq. NH_3 , and the resulting soln. of NH_4F is filtered off.

Separation of oxy salts from alkali mixtures. H. HARRIS. Can. 271,497, June 14, 1927. Na oxy salts of Sn and As are sepd. from a soln. comprising NaOH , Sn and As, by bringing the soln. to such a concn. that the oxy salt of Sn is for the most part insol. in the soln. while hot, but the As remains sol. The insol. Sn is sepd. from the hot soln. and the remaining soln. is dild. to a concn. at which the As will sep. out when the soln. is cooled.

Sodium phosphate. II. HOWARD. U. S. 1,642,244, Sept. 13. A soln. contg. colored impurities (such as those occurring in a crude soln. of H_3PO_4 obtained by treating crude ground phosphate rock with H_2SO_4 and sepg. the soln. from the undissolved residue) and a Na phosphate or other O-contg. pentavalent P compds. is treated with Cl to effect decolorization.

Calcium nitrate. C. RYER and R. GRIESSBACH. Can. 273,331, Aug. 23, 1927. Solid $\text{Ca}(\text{NO}_3)_2$ is manufd. by spraying, by means of a current of air, a hot concd. soln. of $\text{Ca}(\text{NO}_3)_2$ contg. a small quantity of NH_4 salt.

Lead carbonate from lead chloride. S. C. SMITH. U. S. 1,643,261, Sept. 20. Pb chloride is suspended in an aq. soln. of NH_3 in excess of that equiv. to the chloride, and CO_2 is passed through the suspension.

Basic copper sulfate. H. HOFMAN. Can. 271,782, June 21, 1927. Basic Cu sulfate, suitable for the prepn. of ammoniacal CuO cellulose solns. in the artificial-silk

stretch-spinning process, is pptd. from a soln. of ammoniacal CuSO_4 by the addn. of H_2SO_4 .

Sodium sulfite and boric acid. H. BLUMENBERG, JR. U. S. 1,642,535, Sept. 13. A soln. of borax is treated with SO_2 until the reaction forming Na_2SO_3 and H_3BO_3 is complete as indicated by the formation of a cloudy ppt. of NaHSO_3 ; the pptd. H_3BO_3 is sepd. from the mixt. and the remaining mixt. is treated with SO_2 to form NaHSO_3 .

Potassium sulfate from sea water. E. NICCOLI. Brit. 261,991, May 13, 1926. In the production of K_2SO_4 from sea water as described in Brit. pat. 247,405 (C. A. 21, 630), the raw mixed salts are treated with a quantity of cold H_2O insufficient to give a total soln., so that Na salts and chlorides are removed, and the desired double sulfate remains as a residue. Any double sulfate which is dissolved is recovered by using the later washing waters for the raw salt repeatedly.

Decomposing insoluble minerals with boric acid. G. BERGE. U. S. 1,642,667, Sept. 20. Minerals such as feldspar are heated with H_3BO_3 to convert basic constituents such as K into borates and the latter are treated with dil. HNO_3 to form nitrates and free H_3BO_3 .

Aluminum oxide. B. T. HORSFIELD. Brit. 262,405, Dec. 4, 1925. Residual metallic oxide impurities are removed from the hollow globules of Al oxide, obtained by the process of Brit. pat. 248,360 (C. A. 21, 630), by leaching them, with or without preliminary crushing or grinding, with an acid reagent and then washing.

Iron oxide. H. C. STEWART. U. S. 1,642,975, Sept. 20. Dry copperas is delivered with a blast of air into a furnace within which it is incinerated.

Activated carbon. A. GODEL. Can. 272,729, July 26, 1927. Activated C is produced by heating carbonaceous material enclosed in a permeable vessel and applying externally an atm. contg. activating gases.

Active carbon. K. RUBE. Brit. 262,278, Dec. 22, 1925. Pulverulent active C is obtained at relatively low temps. by heating oils which are normally incapable of being cracked economically, such as gas tar from lignite, in pressure-resisting vessels to 350–500° so that part of the oil remains liquid during the reaction, and subsequently purifying the C, e. g., with hot H_2O . Powd. lignite and lignite oil may be used together as raw materials.

Regeneration of active carbon with chemicals. NAAMLIOOZE VENNOOTSCHAP ALGEMEENE NORIT MAATSCHAPPIJ. Dutch 16,750, Aug. 15, 1927. Active C is regenerated by treatment in 25% suspension with 1% HCl (or other acids) for $\frac{1}{2}$ hr. at 5 atm. The org. impurities are hydrolyzed.

Carbon black. L. SIMPSON. Can. 272,468, July 19, 1927. Carbon black is manufd. by mixing with pulverized albertite an inert preheated gas or air under pressure and partially burning the mixt. The resultant gases are passed through suitable screens to deposit the C.

Hydrogen. G. CLAUDE. Can. 271,785, June 21, 1927. A gaseous mixt. contg. H_2 is partially liquefied and the compressed residual H_2 thus obtained is washed with liquid N_2 which has been cooled to a temp. at least as low as -200° . The washed H_2 is then expanded.

Sulfur dioxide. METALLBANK UND METALLURGISCHE GES., AKT.-GES. Brit. 261,081, Nov. 25, 1925. Different gas streams carrying different quantities of SO_2 and possibly also of H_2O such as obtained in a single app. for roasting S-contg. materials are worked up separately for the manuf. of H_2SO_4 , sulfite soln., etc., by treatments suited to the diln. of the gas.

Drying sulfur dioxide. ALLGEMEINE GES. FÜR CHEMISCHE INDUSTRIE. Brit. 261,732, Nov. 19, 1925. Liquid SO_2 which has absorbed H_2O and been vaporized as in the process for refining hydrocarbons is dried by condensation and the liquid formed in the first stage and contg. all of the H_2O is sepd. from the remaining dry gas. The gas may be dried from the aq. condensate, and the condenser may be tapped at a suitable point or a preliminary and final condenser may be used.

Carbon disulfide. ZAHN & CO. BAU CHEMISCHER FABRIKEN GES. Brit. 261,990, May 12, 1926. In the continuous manuf. of CS_2 , S freed from impurities is combined with charcoal in a heated retort and CS_2 is formed and distd.; distillate is condensed in a cooler with sepn. of H_2S which is converted into S, and the CS_2 is led to a heated separator to remove the last traces of H_2S . App. is described for purifying the S by melting with external heating and drawing it off through a siphon device. Other features of the app. are also described in detail.

Composition for generating chlorine. D. A. PRITCHARD and J. H. HUBEL. Can. 273,085, Aug. 9, 1927. A mixt. for producing Cl_2 upon contact with moisture consists of dry $\text{Ca}(\text{ClO})_2$ and cryst. H_2BO_3 .

Recovery of volatilized catalysts. U. 262,475, Dec. 7, 1925. Catalysts volatilize materials such as active C, active SiO_2 and in the reaction app. The adsorbed catalyst is advantageously placed on each side of the intermittently reversed. The process is app. and H_2O vapors through a layer of C and is employed for recovery of Cu-Cl_2 in the Dea.

Silica gel. I. G. FARMENDUSTRIE. Silicic acid jelly, pptd. from an acid soln. such as Na_2CO_3 , NaOH , Na silicate, all for treating org. liquids.

Polishing and waterproofing composite and W. J. MCGIVERN. Brit. 269,571. A saponifiable material is mixed with finely divided with an aq. soln. of an org. colloidal.

Clarifying and decolorizing material MOORE. U. S. 1,642,871, Sept. 20, 1926. A clay with H_2O until in a plastic or flow state and the residue is then pptd. for use in clarifying and drying. The product is suitable for

Filtering membranes. J. DRECHSEL. filtrations and seps. are effected with an acetate, regenerated cellulose from vegetable. The membranes may be regenerated by impregnated with alumina, colloidal silica, Al₂O₃ or in multiple.

Filtering material. R. N. RIDGWAY. A mass is formed of an alkali metal carbonate soft coal; the mass is subjected to the heat at a temp. below 290° until the gas evolved is then subjected to temps. progressively increasing. N, dry steam is passed over the coked mass alkalis.

Filtering material. R. N. RIDGWAY. A soft coal is satd. with a soln. of an alkali and crystallized; the mass is air-dried at a temp. and the dried mass is heated in a reducing to a coking temp. in the presence of material with the volatile constituents of the coal, such as steam which will remove compds. of carbonate and the latter is leached out to suitable for use in filtering sugar solns. or

Bleaching pulp or other fibrous material 20. The fibers of pulp or other material are H_2O is added and the mixt. is discharged turbulence, and at the same time permitting

Composition for cleaning and polishing Sept. 20. Kerosene is mixed with a small

Stencil sheets. A. B. DICK CO. Inc. for use on duplicating machines are coated tempering agent such as Am or Bu tartrate or esters of glycerol, and a substance because the resistance of the compn. to being parted in making type-cut stencils, *e. g.*, chlorinated C₁₂ H₂₅ Cl₂ derivative, Zn stearate and oils such as castor, rape-seed, olive, almond or poppy oil.

Stencil sheet. W. H. KUEHL. U. S. 1,642,919, Sept. 20. Fine, unsized tissue paper is coated with material comprising a solid continuous phase of nitrocellulose compn. or other substance impervious to oil, a liquid oily phase such as a fatty oil dispersed in the continuous phase, and a preservative such as oil of camphor.

Stencil sheet coated with glue and zinc chloride. C. F. KUMML. U. S. 1,642,159, Sept. 13.

Artificial masses, lacquer, etc. C. NEPHEWER. Can. 272,404, July 19, 1927. A compn. of matter comprises a condensation product of urea and CH_2O and at least

1. FARMENDUSTRIE AKT.-Ges. Brit. 262,475, Dec. 7, 1925. Catalysts volatilize materials which may be suitably placed very active and adsorbent may be advantageously placed on each side of the intermittently reversed and the gas stream H_2O and to the passage of a mixt. of P through porous medium and may also be chloride.

U. S. 1,642,306, Feb. 19, 1926. A material is treated with a dil. soln. of alk. material NaOH or other base, to render it suitable

for use in the process. C. H. THOMPSON. Brit. 269,571. A resin or similar non-saponifiable material is melted and emulsified in water and alkali.

U. S. 1,642,871, Sept. 20, 1926. R. V. DAVIS and M. M. ALLEN. A composite type is agitated with an acid solution such as H_2SO_4 to remove the impurities, *e. g.*, by washing with water.

U. S. 1,642,871, Sept. 20, 1926. Various materials such as nitrocellulose, cellulose, gelatin, albumin, or gelatin or gelatin and cellulose may be impregnated with alumina and may be used singly or in combination.

U. S. 1,642,871, Sept. 20. A dry crystalline material is saturated finely divided alkali metal or other reducing agent and the residue is then subjected to the heat at a temp. below 290° until the gas evolved is then subjected to temps. progressively increasing. N, dry steam is passed over the coked mass alkalis.

U. S. 1,642,871, Sept. 20. A dry crystalline material is saturated finely divided alkali metal or other reducing agent and the residue is then subjected to the heat at a temp. below 290° until the gas evolved is then subjected to temps. progressively increasing. N, dry steam is passed over the coked mass alkalis.

U. S. 1,642,871, Sept. 20. A dry crystalline material is saturated finely divided alkali metal or other reducing agent and the residue is then subjected to the heat at a temp. below 290° until the gas evolved is then subjected to temps. progressively increasing. N, dry steam is passed over the coked mass alkalis.

U. S. 1,642,871, Sept. 20. A dry crystalline material is saturated finely divided alkali metal or other reducing agent and the residue is then subjected to the heat at a temp. below 290° until the gas evolved is then subjected to temps. progressively increasing. N, dry steam is passed over the coked mass alkalis.

one difficultly volatile substance capable of forming a solid soln. with the condensation product.

Heating composition. H. H. FAKER. Can. 273,386, Aug. 30, 1927. A compn. for chem. heaters comprises 70 parts comminuted metal, 7 parts CuSO_4 , 2 parts salt, $\frac{1}{10}$ part CaCl_2 , 1 part KClO_3 , and 1 part sawdust, all in commingled form and adapted to receive a quantity of H_2O to cause generation of heat.

Anti-freeze composition. R. S. WRIGHT. Can. 272,995, Aug. 9, 1927. An anti-freeze mixt. is comprised of 5 lbs. com. anhydrous CaCl_2 , $\frac{1}{2}$ oz. KHCO_3 , $\frac{1}{4}$ lb. mineral oil, 1 oz. $\text{K}_2\text{Cr}_2\text{O}_7$ and 9 lbs. H_2O . Cf. C. A. 21, 2174.

Fire-extinguishing device for use in oil tanks, etc. L. INGRAM. Brit. 262,697, Oct. 1, 1926.

Finish remover. C. ELLIS. Can. 272,162, July 5, 1927. A finish remover consists of a mineral wax, HCOAc , serving as a wax solvent, and Me_2CO , serving as a wax precipitant.

Ethyl acetate varnish remover. C. ELLIS. Can. 272,161, July 5, 1927. A non-aq. finish remover is composed of $\text{CH}_3\text{CO}_2\text{C}_2\text{H}_5$ as the sole solvent material, mineral wax and nitrocellulose.

Emulsion. G. J. MANSON. Can. 273,342, Aug. 23, 1927. Melted wax is mixed with a salt soln. and the salt soln. is pptd. under conditions to coat the wax particles with the ppt.

Emulsion. G. J. MANSON. Can. 273,343, Aug. 23, 1927. Wax is added to a soln. of Mg salt, which is then heated and agitated, and a silicate added.

Dolomitic article. H. S. LUKENS. Can. 271,804, June 21, 1927. Articles are made by carbonating MgO to convert it into a binder while accelerating the reaction by combining therewith moistened CaCO_3 .

Artificial mother of pearl. J. PAISSEAU. Brit. 261,771, Nov. 21, 1925. Sheets of plastic material contg. brilliant particles are distorted to modify their appearance. They may be superposed into a block and sliced or subjected to other mech. treatment. Brit. 261,772 specifies pressing or like treatment of similar material uniformly to distort the brilliant particles in parallel planes and produce sheets of uniform appearance.

Molding dentures of bakelite and similar materials. M. L. AXELROD. Brit. 261,410, Dec. 7, 1925. The exposed portions, or the whole denture, may be made of a mixt. of bakelite resin "SA225" and bakelite liquid resin "LA677" together with wood flour, lithopone, ZnO and a dye or pigment, e. g., toluidine toner. Various details of molding under pressure are described.

Molded composition. G. C. H. MILLER. Can. 271,394, June 7, 1927. A reaction mixt. comprising a fatty oil and S_2Cl_2 is introduced into a rigid and nondistensible mold and is then subjected to a high pressure sufficient to prevent sepn. of gaseous by-products until the desired reactions have progressed sufficiently to form a relatively rigid gel.

Diaphragm for telephone receivers. G. W. ELMEN. U. S. 1,642,778, Sept. 20, 1926. Diaphragms formed of sheet magnetic material such as an alloy of Fe 55 and Ni 45% are heated to about 1000° and slowly cooled, in order to develop max. permeability.

Marking articles with iodine and starch. J. D. GRANGE. U. S. 1,642,774, Sept. 20, 1926. Tracing cloth or other articles contg. starch are stamped with a soln. of I.

Thin acoustic diaphragms of pure aluminum. C. S. WICKES. Brit. 262,485, Dec. 7, 1925. Al is used contg. not more than 0.2% impurities.

Molded articles from scrap buckram, etc. J. SAMUELS, P. SLADE and J. F. WARD. Brit. 261,818, July 28, 1925. Buckram or other fabrics which may contain stiffening material, e. g., scrap obtained in hat-making, is used for making rods, sheets, blocks, plates or other forms under the action of heat and pressure and there may be added various substances such as glue, sawdust, sand, powd. glass, kieselsguhr or china clay. Floor- or wall coverings, heat-insulation, bowls, horns for loud speakers or other articles may be thus formed.

Discharging device for lime-kilns, etc. E. SOBEK. Brit. 262,125, Nov. 28, 1925.

Use of dichloroethylene as a refrigerating medium. W. H. CARRIER. U. S. 1,642,942, Sept. 20.

Use of an isomer of dichloroethylene as a refrigerating medium. W. H. CARRIER. U. S. 1,642,943, Sept. 20.

Refrigerant. J. PENTLAND. Can. 272,902, Aug. 2, 1927. A refrigerant is composed of SO_2 and pure ether mixed at a temp. of 20°F . and thoroughly mingled by agitation.

Animal and insect exterminator. E. DERREGBUS. Can. 272,775, Aug. 2, 1927.

A compn. is composed as follows: phenol 40, cresol 10, H_2O 20, alc. 15, pyridine 5 and $C_{10}H_8$ 10 g.

Adhesive. D. M. R. McCUBBIN. Brit. 262,313, May 5, 1926. An adhesive suitable for use on rubber and leather or for waterproofing fabrics is formed of gutta-percha, CCl_4 and C_6H_6 , with or without coloring substances such as Sb sulfide or lamp-black.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

Fuel economy in glassworks practice. T. C. MOORSHEAD. *Glass Ind.* 8, 185-9 (1927).—The fuel consumption for the several processes are melting 60%, power 18%, annealing 16%, heating, etc., 6%. The chief factors of the melting process which det. its efficiency are dimensions of the furnace in proportion to the glass melted, nature of fuel, compn. and color of glass heated, age of the furnace and temp. of the external surroundings. H. F. K.

Importance of ductility as a working property of glass. R. E. SWAIN. *Glass Ind.* 8, 183-4 (1927). H. F. K.

Phonolite in the glass industry. HUGO KÜHL. *Sprechsaal* 59, 217-8; *Chem. Zentr.* 1926, II, 95.—Because of their high alkali and low Fe content, phonolites are useful raw materials, especially for the manuf. of bottles. C. C. DAVIS

Proposed specifications for glass-making sands. ANON. *Glass Ind.* 7, 37 (1926).—Specifications covering the general character, sizing and compn. of glass sands are given. The allowable impurities range from 0.1% Al_2O_3 , 0.02% Fe_2O_3 , 0.1% CaO plus MgO in first quality optical glass to 4.0% Al_2O_3 , 1.0% Fe_2O_3 , 0.5% CaO plus MgO in ninth quality amber glass. H. F. K.

Brilliancy and compositions of glassware. OSCAR KNAPP. *Glass Ind.* 8, 73-4 (1927).—The brilliancy of glass depends upon its index of refraction. The index can be calcd. from the compn. of the glass since the power of refraction of glass is an additive property of the refractive powers of the glass-forming oxides. The greatest variation between the calcd. and observed indices given is 0.005. H. F. K.

Some aspects of current plate-glass practice. I. E. ADAMS. *Glass Ind.* 8, 1-4 (1927). H. F. K.

Art glass of Leerdam. K. WASCH. *Glass Ind.* 8, 5-7 (1927). H. F. K.

Manufacture of light-diffusing glasses. J. B. KRAK. *Glass Ind.* 8, 109-10 (1927).—The discussion deals with several opacifiers, especially F compds. H. F. K.

The flow of glass in tanks. D. J. MCSWINEY. *Glass Ind.* 8, 155-7 (1927). H. F. K.

The deterioration and failure of glassworks refractories. B. M. PEARSON. *Glass Ind.* 8, 127-34, 190-3, 211-3 (1927).—Glassworks refractories must withstand high temp., chem. corrosion and some abrasion. Chem. compn., uniformity of compn. and texture, moderate porosity and freedom from fissures are given as the most important characteristics of refractories. The life of refractories can be prolonged by bringing the furnace carefully up to the working temps., heat soaking to aid the formation of sillimanite (mullite) at the surface, glazing with cullet before charging, avoiding large variations in the compn. of the glass, and by forced cooling of the walls. Convection currents in the batch and irregular corrosion of the tank walls are discussed. H. F. K.

Temperature gradients in the fabrication of machine-blown glassware. R. E. SWAIN. *Glass Ind.* 8, 8-10 (1927). H. F. K.

The importance of the heat accumulator for economic glass-melting operations. H. BARTH. *Sprechsaal* 59, 189-91; *Chem. Zentr.* 1926, II, 95.—A general description. C. C. DAVIS

Measurements of the index of refraction of glass at high temperatures. C. G. PETERS. Bur. of Standards, *Sci. Papers* No. 521 (1926).—In the interference method described a plate of glass is placed in contact with 2 interferometer mirrors in such a way that 2 adjacent sets of interference fringes are visible, one produced by light passing through the glass, the other by light passing through an equal space in vacuum. The change in index produced by increasing the temp. was detd. from the no. of fringe passing a reference point on the upper interferometer plate. Measurements were made on 9 glasses in the temp. region 20-700°. Glasses passed through a crit. expansion

region near 500° in which the expansion rate increased 2–7 times. The index decreased during this rapid expansion period. In each case the measured index was much larger than the index computed from the density relation $(\mu-1)/d = C$. The increase in index with temp. is probably due to the same cause as that which shifts the absorption band toward the longer wave-length region. H. F. K.

Tank-block endurance. S. R. SCHOLLS. *Glass Ind.* 8, 61–2(1927).—The advantages of *mullite* as a refractory material in glass operations are pointed out. H. F. K.

Theory of glass tank block corrosion. E. P. ARTHUR AND A. ERNEST MACGEE. *Glass Ind.* 7, 107–9(1926).—The importance of the vapor phase in the attack of alkalis upon tank blocks is stressed. H. F. K.

Tank-block problem solved at Corning. ANON. *Glass Ind.* 7, 257–61(1926).—Aluminous mixts. having about the compn. of *mullite* are fused in an elec. arc furnace above 1800° and cast into molds for the described blocks or other refractory shapes. Very slow cooling is necessary, 4 days being given a 200-lb. block. Their duration in practice is at least 3 times that of fireclay blocks. H. F. K.

Influence of character of fire in continuous tank practice. I. E. ADAMS. *Glass Ind.* 8, 25 6(1927). H. F. K.

Glass for condenser lenses. G. JAECKEL. *Glasindustrie* 34, 4(1926).—The constituents of glass which furnish heat-resisting properties are discussed. The compn. of Resista glass is given as SiO_2 65.6, Al_2O_3 2.24, B_2O_3 17.94, Fe_2O_3 0.10, PbO 0.28, ZnO 3.25, CaO 0.29, Na_2O 6.88, K_2O 0.51 and Sb_2O_3 2.91%. Good condenser lens glass should transmit a high proportion of the visible-light rays as well as the heat rays. H. F. K.

A new method of producing colored glass. ANON. *Glass Ind.* 7, 90–1(1926).—The patented process described claims a definite color change in colored glass by the addn. of certain alkali halides, especially notable in glasses of high B content. The effect of the halogen salt reverses that of B_2O_3 . H. F. K.

The manufacture of incandescent lamp bulbs by entirely mechanical methods. A. KARSTEN. *Z. Ver. deut. Ing.* 71, 1227–30(1927). H. H.

Automobile glasses. E. W. TILLOTSON. *Ind. Eng. Chem.* 19, 1099–1101(1927).—Processes for the manuf. of plate glass are discussed with particular reference to the requirements of the automobile industry. K. D. JACOB

Strain and the hot-water test for bottles. D. J. MCSWINEY. *Glass Ind.* 7, 261–3(1926).—The resistance to thermal shock is slightly higher for unannealed than annealed ware. Strongly and uniformly strained ware has about double the resistance to internal hydraulic pressure that it shows when well annealed. H. F. K.

An x-ray study of clays. I. B. STRUTINSKIĖ. *J. Russ. Phys.-Chem. Soc.* 58, 214–25(1926).—Specimens of clays of varying plasticity (Crimeanⁿ nacrite, Lozovikov kaolin, halloysite; 3 specimens of sukhar' of poor plasticity and 2 of plastic mulienka from Borovichi) were examd. by the Debye-Scherrer method in studying the relationship between size of the particles and plasticity. A water-cooled Hadding tube was used with a Cu anticathode, the current being 20 milliamps. at 50,000 v. A suitable Ni filter allowed only the K series to pass; time of exposure was 5 hrs. A system of discrete points was found to represent reflections from rather large quartz particles; another system of lines present in nacrite and in the Borovichi specimens must correspond to the clay particles proper; it disappears almost totally on heating above 550° . Some of the lines coincided with those measured by Rinne; 25 lines in all were present in the nacrite spectrogram, 8 in those of the Borovichi clays. Both sukhar' and mulienka were of similar chem. compn. The width of the lines measured with the aid of Koch's microphotometer did not increase with the angle of reflection of the x-rays, as it was observed by Scherrer for colloid Au and Ag. A comparatively small no. of particles of the order of 10^{-6} cm. is, probably present. No const. diff. in the width of lines was observed for sukhar' and mulienka. S. concludes that the lower plasticity of sukhar' may be due to occluded bodies of microscopic size; in the case of kaolin it may in some way be connected with the large no. of lines. The broadening of lines may not be indicative of the particle size, but caused by the variable parameter of the grating. The simplest molar cell of nacrite (kaolinite) belonging to the prismatic class of the monoclinic system is found to contain 2 mols. of $\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2 \cdot 2\text{H}_2\text{O}$ and described by $a = 5.09$, $b = 8.61$, $c = 7.92$, $\beta' = 64^{\circ} 35'$, $n = 2$. Samoilov's formula:

$\text{O}_2(\text{H})\text{O Al}(\text{OH})_2\text{Si}(\text{OH})_2\text{Al}(\text{OH})_2\text{O.O}$ is the most suitable one. B. C. S.

Factory design and equipment and manufacture of clay wares. IV. Reduction

of raw materials. T. W. GARVE. *The Clay Worker* 87, 534-41(1927).—G. discusses friability, crushing, grinding and pulverizing of raw materials for clay wares.

L. B. MILLER

The effect of the addition of sodium carbonate and sodium silicate on the casting properties of clay slip. F. E. BROWN AND CHI-FANG LAI. *Proc. Iowa Acad. Sci.* 33, 170(1926).—An abstract. The addn. of small amts. of Na_2CO_3 , or of Na_2SiO_3 , increases the plasticity of some clay slips and permits them to be cast when they contain a much smaller percentage of H_2O . This permits a much more rapid casting. Casts are made and removed from the mold in 20 min. The time for a cast increased for successive casts as the mold became filled with H_2O . After drying the original rate was possible. A mixt. of Na_2CO_3 and Na_2SiO_3 was found to be superior to either alone. The use of these salts did not injure either the mold or the quality of the pieces cast. As many as 100 pieces were cast in one mold.

W. G. GAESSLER

The influence of the oxide admixtures on the physical properties of silica brick. K. ENDELL AND R. HARR. *Ceramic Age* 9, 133-8(1927).—The true sp. gr. increases with addns. of CaO , Fe_2O_3 or clay. Microscopic examn. indicates that increasing clay content retards the conversion of quartz. Increasing CaO favors the formation of tridymite. Fe_2O_3 accelerates the formation of tridymite. Thermal expansion curves (to 1000°) show pronounced cristobalite effect at 230° and a quartz effect at 575° with mixts. rich in clay. Samples high in Fe_2O_3 , show strong tridymite and cristobalite effects between 100° and 300° , but no quartz effect at 575° . High CaO content scarcely affects porosity; high clay causes porosity to increase rapidly; high Fe_2O_3 decreases porosity. The softening temp. under 1 kg. per sq. cm. pressure is unchanged with increasing CaO up to 6%. Increasing Fe_2O_3 content up to 6% shows a reduction of only 20° . Increasing clay content, however, even in the presence of CaO or Fe_2O_3 , lowers the softening temp. very appreciably. Conclusions: (a) Clay in fired SiO_2 bricks should not exceed 1.5%; (b) CaO , up to 8%, has no effect upon the softening temp. under pressure and promotes the conversion of quartz into tridymite; (c) increasing Fe_2O_3 favors formation of tridymite and up to 4% has no influence upon the softening temp.

Drying and baking of paving bricks. GUSTAVE COLIEZ. *Chaleur et industrie* 8, 449-55(1927) —Description of present-day practice in the United States.

A. PAPINEAU-COUTURE

The efflorescence of bricks and walls. W. DIETERICH. *Brit. Clayworker* 36, 134-5(1927).—The common causes of scumming and efflorescence are given. Scumming may be overcome by the addn. of BaCO_3 to the raw clay. Insol. salts of BaSO_4 and CaCO_3 are formed. A method for detg. the amt. of BaCO_3 required in any particular clay is given for use in plants having no chem. lab. Methods are also given for testing water and clay for sol. sulfates to det. the amt. of BaCO_3 required for use in plants having a small lab.

R. A. HEINDL

The relations between the composition and properties of enamel for steel plate. R. R. DANIELSON AND B. T. SWEELY. *Speersaal* 59, 80-1; *Chem. Zentr.* 1926, I, 2236.—Fourteef base and white-surface enamels were applied on plates and their resistance to shock, temp. changes and AcOH tested. Coeffs. of expansion and resistances to compression were first detd. Replacement of B_2O_3 by Na_2O increased the coeff. of expansion, the latter also being dependent upon the time of fusion and upon other influences. By replacing B_2O_3 step by step by Na_2O , the resistance to compression of base enamels diminished, that of surface enamels increased. Impact tests without bending are suitable for testing the adhesion of the enamel. The surface layer must be as thick as the base layer. Shock requirements for curved enamel parts serve as an indication of the toughness of the enamel. The resistance to temp. changes is increased when the coeff. of expansion of the base enamel is the same as, or greater than, that of the surface enamel. The resistance of the surface enamel to AcOH decreases directly with replacement of B_2O_3 by Na_2O .

C. C. DAVIS

The constitution of kaolin. Comment on the publication of G. A. Kall. O. KRAUSE. *Speersaal* 59, 186; *Chem. Zentr.* 1926, II, 96.—The proof given by Kall (cf. C. A. 20, 3339) is replete with errors.

C. C. DAVIS

"Stamped" porcelain or artificial resin. WALTER DEMUTH. *Speersaal* 59, 248-9; *Chem. Zentr.* 1926, II, 96.—"Stamped" porcelain should really be called "pressed" porcelain, since it is not stamped but pressed. It is replaced in elec. insulation work by artificial resin products, which fulfill more severe requirements.

C. C. DAVIS

The effect of reclaimed retort material and zinc oxide on the physical properties of retort mixts. E. S. WHEELER. *Bull. Am. Zinc Inst.* 10, No. 5-6, 97-107(1927).—A number of body mixts. for retorts were subjected to nine standard tests. Besides the

standard mix, which consisted of 50% fire clay and 50% flint clay, the mixes were made to contain increasing proportions of old retort material and in some cases ZnO. The addition of old retort material produces a lowering of the deformation value of a mixt. whereas the addition of ZnO seems to have little effect. Values for the water of plasticity and drying shrinkage were obtained. The mixts. contg. ZnO up to 7.5% showed the lowest drying shrinkage. A mixt. of 50% fire clay and 50% old retort material showed the highest shrinkage. A graph of the porosity of the mixts. at various temps. showed the standard mix to have a uniform and low porosity. Absorption values follow the trend of the porosity values almost exactly. Volume change on firing and transverse-strength measurements brought out the important fact that ZnO weakens the mixts. considerably at all temps. Mixts. contg. ZnO also make the poorest showing when subjected to the sag test. Those contg. over 25% old retort material show up poorest under the spalling test. The chem. analysis of each of the mixtures is included.

WILLIAM F. EHRET

Abrasives. V. L. EARDLEY-WILMOT. *Mineral Ind.* 35, 1-10 (1926).—A review, including natural and manufd. abrasives. A. BUTTS

Abrasives. I. Siliceous abrasives (EARDLEY-WILMOT) 8. The theory of fine grinding (MARTIN) 13. The importance of various materials in the gas industry (DUNKEL, PRAETORIUS) 21. Feldspar (WATTS) 18. RIES, HEINRICH: *Clays, Their Occurrence, Properties and Uses, with Especial Reference to Those of the United States and Canada*. 3rd. ed., revised and enlarged. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Ltd. 613 pp. 1901.

Glass. M. PERNET. Can. 273,537, Aug. 30, 1927. In the manuf. of Na-Al-B-silicate glass, the Al is added to the glass compd. as Al sulfite, and the B as crystd. boron.

Heat-absorbing glass. W. C. TAYLOR. Can. 272,685, July 26, 1927. A heat-reflecting glass of low coeff. of expansion and of high absorption of the infra-red, has a high boron content, and contains potash, lithia, B₂O₃ and FeO.

Apparatus for drawing sheets of glass. A. E. SPINASSE. U. S. 1,643,184, Sept. 20.

Apparatus for shaping glassware. J. DAVIS. U. S. 1,642,722, Sept. 20.

Glass-receiving and -forming apparatus for making pressed glassware. D. L. HUBENDORF. U. S. 1,642,741, Sept. 20.

Apparatus for making pressed or blown glassware. T. C. STRIMER. U. S. 1,642,740, Sept. 13.

Receptacle and discharge device for molten glass. L. D. SOUBIER. U. S. 1,642,741, Sept. 20.

Apparatus for producing mold charges of molten glass. W. J. MILLER. U. S. 1,642,966 7 8, Sept. 20.

Apparatus for feeding charges of molten glass. HARTFORD-EMPIRE CO. Brit. 414,988, May 26, 1926.

Glass-pressing and -blowing apparatus. F. O'NEILL. U. S. 1,642,660, Sept. 13.

Making glass tubes or rods. P. SCHOONENBERG. U. S. 1,642,312, Sept. 13.

Apparatus for forming molded articles from glass. M. K. HOLMES. U. S. 1,642,740, Sept. 13.

Apparatus for forming glass bottles. H. HILLMANN. Brit. 262,038, Nov. 28, 1925.

Apparatus for making blown articles from glass. J. F. RULF. U. S. 1,642,828, Sept. 20.

Apparatus for drawing glass. A. A. DEBROCC. U. S. 1,643,152, Sept. 20.

Decorating glass. O. HOMMEL. U. S. 1,642,441, Sept. 13. Heat stored in glass during manuf. is utilized for fusing to the glass a granular powder made of stable glass.

Apparatus and heating system for annealing sheet glass. PITTSBURGH PLATE GLASS CO. Brit. 262,629, Feb. 16, 1926.

Apparatus for annealing glassware. O. SCHACKELFORD. U. S. 1,642,790, Sept. 20.

Ceramic insulators. F. SINGER. U. S. 1,642,754, Sept. 20. Ti compds. such as TiO₂ or Ca titanate are added to the ceramic mix and it is burned with an oxidizing flame and with a reducing flame to form both cryst. and amorphous Ti compds.

Refractory material. B. T. HORSFIELD. Brit. 262,403, Dec. 7, 1925. Hollow

globules of alumina or other fused refractory oxide are cemented together with a binder such as Na silicate, Na or Ca aluminate or clay, preferably contg. a considerable proportion of the same oxide as forms the globules.

Refractory materials. SCHREIDHAUER & GIESSENG AKT.-GES. Brit. 262,383, Dec. 4, 1925. Non-plastic refractory materials such as sillimanite, cyanite, chromite, alumina, carborundum, ZrO₂, magnesite or dolomite are used instead of chamotte in clay-bonded products as described in Brit. pat. 253,947 (C. A. 21, 2543).

Magnesite refractory. A. MARKS. Can. 272,533, July 19, 1927. Molded magnesite refractories are manufd. by mixing with the pulverized magnesitic refractory body material a suitable siccativ oil to form a plastic mass, the article then being molded and dried to hardness.

Refractory slabs. G. D. MORRIS. U. S. 1,642,886, Sept. 20. Kiln car platform slabs are formed with a body portion of fireclay and an edge portion of stronger refractory material such as carborundum.

Unburned refractory brick. G. K. SCHLOTTERER and R. H. YOUNGMAN. U. S. 1,643,181, Sept. 20. Bricks are made from dead-burned magnesite 90% or more and a binder of Na silicate 10% or less; the raw bricks are initially stored for a time in an atm. of high humidity.

Enameling metals. C. TOTOT-GIBARU. Brit. 262,159, June 16, 1925. To avoid employment of a first layer of clear ground enamel in employing leadless glazes for enameling metals by the dry method, an enamel is used contg. SiO₂, borax or borate-forming substances and at least 20% of ZnO and also contg. various other ingredients.

Tunnel kiln. DRESSLER TUNNEL OVENS, LTD., AND O. VERMORCKEN. Brit. 262,678, Aug. 19, 1926.

Tunnel kiln (heated by electric resistances) for glazing pottery or annealing metals. MORGAN CRUCIBLE CO., LTD., AND C. W. SPEIRS. Brit. 261,866, Sept. 9, 1925.

Waterproof abrasive fabric. F. J. CRUPI. U. S. 1,642,766, Sept. 20. Sandpaper or the like is formed with abrasive material held on 1 side with adhesive and with a coating on the other side which may be formed of a compn. of cellulose nitrate, oil and solvents.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Special cements. J. DAUTREBANDE. *Rev. chim. ind.* 36, 151-6(1927); cf. C. A. 21, 2368.—A brief discussion of the manuf., compn. and properties of Fe cement, Ti cement, white cement, Keene's cement and refractory hydraulic cement.

A. PAPINEAU-COUTURE

The automatic furnace and its product. FRIEDERICH TIPPMANN. *Zement* 15, 370-3, 389-91, 404-7, 421-2(1926).—The deterioration of cement clinker during a 6 week period increased quite regularly with increasing fineness as did also the gain in CO₂ and H₂O. The most ideal separate consisted of well-burned pieces retained on the 1-in. screen. The general practices of clinker burning are discussed. H. F. K.

Reducing conditions and the color changes during the sintering of cement clinker. HANS KÜHL and W. ADAM. *Zement* 15, 456-8(1926).—In sintering clinker at least a part of the Fe₂O₃ present is uncombined because of the dissocn. of Ca ferrite at about 1400°. With quick cooling the Fe₂O₃ may remain free and tint the clinker according to the amt. present. Yellow to red tints may persist even under somewhat reducing conditions, if reduction is not carried to completion. H. F. K.

Plastic magnesia cements. L. C. STEWART. *Ind. Eng. Chem.* 19, 1139-43(1927).—A description of methods of tests, physical properties and uses of Sorel cements.

RAYMOND WILSON

Properties and testing of cement colors. C. R. PLATZMANN. *Rock Products* 30, No. 18, 107-9(1927).

RAYMOND WILSON

Action of calcium chloride on cements. M. ANSTETT. *Pit and Quarry* 14, No. 11, 51-2(1927).—A short review of the general results of other investigators of the effect of CaCl₂ upon the properties of concrete is given. The advantages to be gained by the use of CaCl₂ are stated.

L. B. MILLER

Lime. X. The loss in weight of limestone as a function of time and temperature of burning. H. K. LINZELL, M. E. HOLMES and J. R. WITHROW. *Trans. Am. Inst. Chem. Eng.* 18, 249-81(1926).—The results of an investigation indicate the following: (1) There is a min. temp. below which it is impossible to burn limestone, which is lower

for Mg limestones than for Ca limestones. The min. burning temp. (820° under conditions of the expts.) is a function of the concn. or partial pressure of CO present. There is a max. % loss of wt. on burning which varies with the chem. compn. of the stone. When maintained at 820° , the loss of wt. is directly proportional to the temp. and to the time of burning. The rate at which a limestone loses wt. on burning at any given temp. is a function of its chem. compn. The influence of time and temp. upon the completeness of burning on 9 limestones was detd. on a lab. scale. Exptl. data are tabulated, the general procedure is described, and the data and curves are discussed. The possible applications of the results obtained to com. lime burning are: (1) the elimination of the effects of the CO evolved by the use of air preheated by contact with the hot burned lime; (2) the manner in which the burning progresses from the heating zone to the center suggests that securing a means of spreading the heating zone further into the body of the charge might decrease the chances of having an unburned core and lessen overburning in the heating zone; (3) the application of these principles might permit the use of larger kilns and at the same time avoid the occurrence of unburned cores. Discussion brought out the accelerative effect of very small proportions of carbonate on the time of set of lime. The reason for this is yet unexplained.

W. H. BOYNTON

Report of the stone-preservation committee. ASTON WEBB, *et al.* *Dept. Sci. Ind. Research* (Brit.) 1927, 33 pp.—Decay of stone is chiefly due to soln. by H_2CO_3 of one or more of its constituents and mechanical removal of loosened but undissolved material. In city areas H_2SO_4 in the air causes the deposition of gypsum, resulting in surface scaling and internal stresses. The continuity and character of the porosity, whether intergranular or intercryst. (macro- or micro-porosity), appears to be important in detg. resistance to weather. A new method was developed for the prepn. of thin sections of weathered or soft stones for petrographic examn., consisting of impregnation *in vacuo* with liquid phenol resins and hardening of the resin under pressure in the pores of the stone. Exposure tests of representative stones with various preservative treatments have been started. Investigation of bacterial effect has revealed one species capable of luxuriant growth in an artificial medium extremely poor in org. food material.

RAYMOND WILSON

Highway construction. C. M. UPHAM. *Ind. Eng. Chem.* 19, 1121-2 (1927).

RAYMOND WILSON

Differentiation between seasoned wood and green wood. G. FRON. *Ann. fals.* 20, 386-91 (1927); cf. Lyon, F., and Fournier, C. A. 21, 1877.—The tests described were carried out on oven-dried wood. Kiln-seasoned wood gives practically the same results as green wood, so that the method can differentiate between kiln-dried and naturally seasoned wood. Wood aged by G. Lyon's process (treating with ozonized air with variations in pressure of the same order as variations in atm. pressure) gives the same results as naturally seasoned wood, showing that the process effects the same change in 1-2 months as are produced naturally in the course of several years.

A. P.-C.

The nature of decay in wood. B. O. LONGYEAR. *Colorado Agr. Expt. Sta., Bull.* 307, 58 pp. (1926).—The progressive loss of wt. during decay in wood may be used as a measure of the rate and extent of decay. A comparatively simple method is described whereby various cited relations affecting the rate of decay may be investigated.

E. F. SNYDER

Determination of Mg in portland cements (KALLAUNER, *et al.*) 7. Gypsum (WILDER) 18. Geology of the country around Ipswich, England [deposits for making cement and bricks] (BOSWELL) 8. Emulsions of bitumens, oils, rubber, etc. (Brit. pat. 262,724) 22.

Cement. T. RIGBY. *Brit.* 261,814, July 24, 1925. In making cement by the wet method in a rotary kiln, the dispersed slurry is caused to fill a substantial portion of the kiln and drying is so controlled that the deposited material, though still moist, is not sufficiently so to agglomerate into large masses. Various details of kiln construction and operation are specified.

Cement. E. C. ECKEL. *Can.* 271,852, June 28, 1927. A mixt. of materials contg. alumina, Fe, silica and CaO is fused in the presence of sufficient free C to form com. ferro-silicon and cement slag. Cf. C. A. 20, 272.

Low-lime high-alumina cements. H. S. SPACKMAN. U. S. 1,643,136, Sept. 20. A rotary kiln is used for fusing lime and aluminous materials in such proportions that the lime is present in substantially the quantity required to combine in a monocalcic ratio with the acid-acting components. The length of the kiln used does not exceed 10 times its internal diam.

Low-lime high-alumina cements. H. S. SPACKMAN. U. S. 1,643,137, Sept. 20. A charge of aluminous material such as bauxite and a base, *e. g.*, lime, is heated in an atm. adapted to prevent reduction of the Fe present, and the resulting slag is then cooled and pulverized.

Portland cement. C. PONTOPPIDAN. Can. 272,001, June 28, 1927. In making portland cement with an admix. of gypsum, the gypsum is not allowed to reach a temp. above 125°. Cf. C. A. 21, 3441.

Cements and mortars. C. SCHNEIDER. Brit. 262,294, Jan. 28, 1926. A colloid such as gelatinous silicic acid is added to salts such as CaCl_2 used to accelerate setting of cements or mortars or to activate substances such as slags having latent hydraulic properties, to render them resistant when stored. Oxides such as lime and retarding agents such as CaSO_4 may be added also.

Mortars. J. H. DITTER. Brit. 262,232, Oct. 30, 1925. Mg compds. such as asbestos, talc, magnesite or dolomite (but preferably Mg fluosilicate or other compds. comprising Mg and F) and an alkali silicate in colloidal form are added to mortar compns. H_2O -repelling substances or other materials also may be added. The production of the colloid is promoted by addn. of milk of lime or other alk. substances and the colloidal condition is maintained by adding CCl_4 .

Cement paint. S. B. NEWBERRY. Can. 272,549, July 19, 1927. A cement paint consists of portland cement incorporated with 0.1–1.0% of its wt. of a water-sol. Al salt and 1–10% of its wt. of an alk. earth metal chloride, and mixed with H_2O for use.

Porous concrete. E. I. LINDMAN. Brit. 262,394, Dec. 5, 1925. A porous clay clinker is used as an aggregate in concretes which are rendered porous by generation of gas within them. Cf. C. A. 20, 3793.

Plaster. G. H. WHITTLE. Brit. 262,195, Sept. 8, 1925. A plaster for coating walls or ceilings, making dental molds, etc., comprises powd. quickly calcined gypsum, powd. rock alum and powd. rock niter; Na_2CO_3 and coloring substances also may be added. The alum and niter are preferably used in the proportions of 19 and 16 lbs., resp., per ton of dry calcined gypsum.

Flooring covering. H. H. DUKE. U. S. 1,642,845, Sept. 20. A layer comprising granulated cork 4 and rubber 1 part, together with vulcanizing ingredients, is united and vulcanized together with another layer of soft rubber and coloring substances.

Paving blocks comprising rubber. H. H. DUKE. U. S. 1,642,846, Sept. 20. A rubber-tread surface is vulcanized to blocks formed mainly of a compn. comprising rubber 1 and granular cork 4 parts.

Compositions for floors. H. SCHUSTER. Brit. 262,315, March 23, 1926. Structural features are specified of tiles which may be made of sawdust, MgO and MgCl_2 , laid on a concrete foundation and covered with a layer of magnesite and sawdust compn.

Sectional rubber pavement. A. F. MASURY and A. H. LEHERT. U. S. 1,643,024, Sept. 20. Rubber blocks are held under compression by a retaining covering which may be formed of sheet metal.

Bricks, tiles, heat- or electric-insulation, etc. F. MULLIGAN. Brit. 262,224, Oct. 14, 1925. A gypsum cement such as described in Brit. pat. 238,949 (C. A. 20, 2058) is used with sand or other aggregate and coloring matter; portland cement and asbestos may be added.

Artificial stone. P. MEYER. Can. 272,199, July 5, 1927. Artificial stones are manifold by mixing stony raw material with a phenolic compd. and an aldehyde, adding a catalytically acting substance, molding the mixt. by pressure and heating the molded body.

Volcanic stone castings. C. KRUGER. Brit. 262,413, Dec. 2, 1925. In producing castings from volcanic rocks or slags, the temp. is so regulated that the more infusible cryst. particles do not melt but serve as inoculation centers for the recrystn. of the remaining material.

Wood preservation. L. P. CURTIN. Can. 272,773, Aug. 2, 1927. Wood is preserved by impregnating it with an aq. soln. contg. water-sol. components capable of reacting on exposure to the atm., and with progressive increase in basicity to deposit within the body of the wood, a Cu-As compd. of low soly. and high toxicity. Cf. C. A. 21, 1339.

Tank and dry kiln for preserving and drying wood. G. E. RICE and C. L. SIMMONS. U. S. 1,643,174, Sept. 20.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

A French national liquid fuel policy. G. KIMPFLEIN. *Chaleur et industrie* 8, 437-48(1927).—Discussion of measures by which France could become self-sustaining as regards her supply of liquid fuels for internal combustion and explosion engines.

A. PAPINEAU-COUTURE

Liquid fuels in their relations to motors. M. DUMANOIS. *Ann. office nat. comb. liquides* 2, 9-20(1927).—An address.

A. PAPINEAU-COUTURE

Manufacture of motor benzene. E. L. HALL. *Chem. Met Eng.* 33, 289-92(1926).—The system of recovery and purification of benzene employed by the Portland Gas Light & Coke Co., Portland, Ore., is described and illustrated. Factors affecting scrubber size are: velocity of gas flow, time of contact and amt. of wash oil circulated. With tower scrubbers it is usually impossible to obtain a satn. of the light oil in the absorption oil of more than $3\frac{1}{2}$ -4% and still maintain a high recovery efficiency. The efficiency of absorption is dependent on the vapor pressure of the benzene in the gas and in the absorption oil. By maintaining the benzene content of the wash oil below 0.5% the recovery efficiency is 95-97%. The principal requirements of a good absorption oil are: (1) low sp. heat; (2) low viscosity at all temps.; (3) olefine content not over

(4) high initial b. p. (not below 204°); (5) low mol. wt. W. H. BOYNTON

Motor fuels. J. B. HILL. *Ind. Eng. Chem.* 19, 1114-5(1927).—An address.

W. F. FARAGHER

Ignition temperature of domestic fuels. RYUJI KADA. *J. Fuel Soc. Japan* 6, 619-31(1927).—The ignition temp. of the most common domestic fuels used in Japan which included various samples of charcoal, peat, lignite, coke, anthracite and briquet was detd. The new briquet prepd. by K. had many advantages over charcoal.

NAO UYEI

Utilization of marine animal and fish oils (as fuels) in motors. GEORGES LUMET and HENRI MARCLET. *Compt rend* 185, 418-20(1927); cf. *C. A.* 21, 1890-1.—Calorific values, flash- and burning-pts., d., Engler viscosities and results of bench tests in 4- and 10 h. p. Diesel-Hindl motors are tabulated for oils of *Centhorinus maximus* (Gunner), *Centrophorus granulatus* (Mull. and Henl.), *Hexanthus griseus* (Rafin) and *Dorosoma* (Bloch.), fat of Trey-Pra from Kompong-Chuang, Trey-Reach from Kompong-Chuang, Trey-Reach from Prey-Veng and Trey-Lenh from Kompong-Thon, squalene hydrocarbons extd. from centrophorus oils and gas oil (for comparison). The power developed by the motors with the fish oils was practically the same as with the gas oil. The sp. consumption was slightly higher with the fish oils and approx. inversely proportional to their calorific value. Operation of the motors was more flexible with the fish oils (as has been observed with vegetable oils), and the shock of the explosion was not so sharp. The only difficulty encountered with the fish oils was due to their relatively high viscosity, and could be eliminated by preliminary heating of the oil in a closed vessel (on account of the disagreeable odor); preliminary filtration of the fish oils also necessary. The fish oils are perfectly and efficiently utilized, the exhaust being colorless and practically odorless.

A. PAPINEAU-COUTURE

Fuel value of certain Mauritius woods. G. CRAIG. *Rev. agr. Maurice* 4, 77-82(1927).—Moisture, ash, volatile matter, fixed C and fuel value were detd. for 14 different kinds of native woods. The fixed C content, which is important in the production of charcoal, was highest for *Leucocna glauca* (13.8%), *Eucalyptus robusta* (12.62%), and *Psidium cattleianum* (12.78%). The fuel values, on the basis of 10% moisture in the wood, ranged from 3938 cal. (*Albizia lebbek*) to 4419 cal. (*Casuarina equisetifolia*).

F. W. ZERBAN

Studies on peat. II. Distillation under reduced pressure of certain constituents of peat. JOSEPH REILLY and JOAN SULLIVAN. *Sci. Proc. Roy. Dublin Soc.* 18, 383-8(1927); cf. *C. A.* 21, 2781.—The peat was first fractionated into its leading constituents, each of which was rapidly distd. under reduced pressure and the products of distn. were collected in 2 receivers—one kept at 60°, and the other immersed in a freezing mixt. of ice and salt. Distillate collected at 60°, distillate collected at 0°, and gas were the crude products in each case. Humic acid and the HCl ext. of peat gave very little tar. Humic acid gave the highest percentage of coke and the alc.-sol. portions of humus the lowest. Humic acid and insol. humin gave the largest vols. of gas. The quantity of each distillate and gas is shown in tables.

L. W. RIGGS

Nitrogen as a catalyst in the determination of sulfur in coal by the bomb-washing method. J. P. KOHOUT. *Ind. Eng. Chem.* 19, 1065-6(1927).—Working on the as-

assumption that oxides of N formed in the O-bomb act catalytically in the oxidation of the S in the coal, K. tested 35 bituminous, 4 semi-bituminous coals and 1 coke for their S content by the usual O-bomb method and by adding N sufficient to raise it to 10-15% of the atm. of the bomb. Details of procedure and data on the 40 samples tested are given. In most cases the % S obtained was slightly higher when the N-O mixt. was used; especially was this true with the high-S coals. This modification brings results for % S in coal by the bomb-washing method into closer agreement with detns. for S by the Eschka and Na_2O_2 methods as recommended by the A. S. T. M. (cf. C. A. 21, 2370). W. W. HODGE

Total carbon in coal. G. B. WATKINS. *Ind. Eng. Chem.* 19, 1052-4(1927).—The methods available for detg. the total C in coal and in combustible org. compds. are outlined. Detailed descriptions with sketches of app. used, manipulations employed, and calcus. involved are given for detg. total C by measurement of the vol. of the gas and analysis for its CO_2 content which is formed when the material is burned in an O-bomb calorimeter. After taking the readings required for the B. t. u. test less than $\frac{1}{2}$ hr. more time is needed to det the total C by this method. Comparative data are given for 5 coals, BzOH and sucrose. Total C in the coals detd. by this method checked the Bureau of Mines values within 0.1%. W. W. HODGE

Coal in relation to its parent material and to the degrees of transformation. K. PATTEISKII AND F. PERVATEL. *Glückauf* 61, 1585-94(1925); *Chem. Zentr.* 1926, II, 180.—A discussion of the classification of various types of coal according to their origin, the coals including: (1) anthracites, which are subdivided into vitrain and clarain; (2) cannel coals (durain); (3) fibrous coals (fusain) and (4) clayey trench coal ("Schramkohle"). Coal seams in which anthracite predominates throughout contain as a rule a mixt. of these types. Each of these types of coal underwent a geochem. transformation, which included the progressive formation of the coal, the formation of bitumen or conversion to anthracite. The extent of the transformation of the parent material to coal was influenced by temp. and pressure. Coals from various kinds of parent materials are compared with one another with respect to the degree of their transformation, including gas-flame, gas, fat and lean coals and anthracite, and their technical utilization is discussed. C. C. DAVIS

Enhancing the value of coal. O. NAUSS. *Gas u. Wasserfach.* 70, 832-4(1927).—A review of the use of coal as a raw material for the production of low-temp. coke, tar, oils and gas of high calorific value, as well as the hydrogenation of coal (Bergius process) and the Fischer synthesis of hydrocarbons. R. W. RYAN

Carbon ratio. MURRAY STUART. *J. Inst. Petroleum Tech.* 13, 308-10(1927).—The "carbon ratio" has frequently been used in recent literature to designate the ratio of C to H in coal. White (C. A. 9, 1291) introduced this expression; by it he meant the % of fixed C in coal if moisture and ash are neglected. This is very different from the ratio C:H. BRIAN MEAD

Observations on the so-called "algae" of boghead coals. HELLMERS AND POTONIC. *Z. angew. Chem.* 40, 895-7(1927).—A discussion of the morphology, reactions and origins of certain substances obtained in the maceration of boghead coals with Schulze's mixt. H. L. OLIN

Pulverized coal. P. R. MIDDLETON. *Commonwealth Eng.* 15, 5-10(1927).—Advantages are pointed out for pulverized coal, resulting in fuel economy of 20-50%. The unit and multiple systems are briefly outlined. Drying, pulverizing, transporting and burning methods are described. Pulverized coal seems best adapted for firing boilers of a water-tube type. Units of a multiple system are illus. W. H. BOYNTON

Utilization of North Carolina coals. F. C. VILBRANDT. *J. Elisha Mitchell Sci. Soc.* 42, 126-30(1926).—Deep-river coal is high grade for by-product use but gives too much smoke to be desirable for steam purposes. Low-temp. distn. produces large quantities of heavy hydrocarbons. The initial and secondary decompn. points of this coal are 540° and 700° , resp. Eight samples from different parts of this field were analyzed and one of them was subjected to coking tests at various temps. The better samples contained volatile matter 27.80-37.80, fixed carbon 51.95-66.00, ash 5.37-9.03, S 0.22-2.76% and yielded 13,450-14,330 B. t. u. A. L. MEHRING

Coal mining in China. MANJI YOSHIMURA. *J. Fuel Soc. Japan* 6, 659-69(1927).—The name and distribution of mines, the amt. of production and the properties of coal are described in detail, numerous data being used. NAO UYI

Modern coal and ore washing processes. GEORGES RANWEZ. *Technique moderne* 19, 522-8(1927).—Description of the various types of app. used. A. P.-C.

Coal and coke. R. W. MORRIS. *Mineral Ind.* 35, 112-49(1926).—A review of the industry in the U. S. and foreign countries. A. BUTTS

Report of Committee D-5 on coal and coke. A. C. FIELDNER AND H. C. PORTER, *et al.* *Proc. Am. Soc. Testing Materials* (preprint), No. 6, 45 pp.(1927).—A report presented at the 30th Annual Meeting in June, 1927. It embraces proposed (1) standard, (2) definitions of terms relating to coal and coke, (3) tentative methods for detn. of S in coal and coke, (4) revised methods of sampling and analysis. Of special interest is the method for detg. S in the bomb washings. Cf. C. A. 21, 2370. H. L. OLIN

The study of cenospheres. V. The carbonization of particles of coal. F. S. SINNATT, A. McCULLOCH AND H. E. NEWALL. *J. Spc. Chem. Ind.* 46, 331-5T (1927).—Previous work on the study of cenospheres is reviewed. Expts. are described of coking particles of coal in atm. of coal gas, H₂ steam, coal gas at a reduced pressure, and coal mixed with different per cents of electrode C, briquetted and then pulverized. A description and dimensioned drawings of the app. used and 8 photomicrographs of the untreated and treated particles are given. Reduction of pressure and an atm. of steam inhibit the formation of the typical "cenosphere" window and lattice structure, but atm. of N₂, coal gas and H₂ do not appear to have this inhibiting effect. In mixts. made with coal and increasing amts. of electrode C the cenospheres become reduced in size and modified in structure. Pulverization and briquetting appear to cause the formation of small cenospheres within a larger particle, the larger particle having the appearance of a "blackberry." Each surface protuberance appears to be an individual cenosphere, either fully formed or in the process of formation. The study of cenospheres produced from mixts. of coking coals with inert material may be of value in problems of blending mixts. of coals in coke manuf. W. W. HODGE

Cleaning of natural gas. H. B. MILAM. *Am. Gas J.* 126, 608-11(1927).—History and description of the development of a scrubber for removing dust by bubbling gas through mineral-seal oil. The oil scrubber removes 99.6% of the dust and a thirty-inch unit cleans nine million cu. ft. per day. R. A. BAXTER

The combustion of methane to formaldehyde. OTTO ROELEN. *Abhandl. Kenntnis Kohle* 7, 111-6(1925); *Chem. Zentr.* 1926, II, 1398.—A compilation of the literature. C. C. DAVIS

Gas producers and water-gas generators with built-in boilers. C. MARISCHKA. *Gas u. Wasserfach* 70, 826-32, 849-52, 884-8(1927).—The producer is water-jacketed and provided with water tubes in an outside jacket through which the hot gases are circulated. The internal diam. of the producer is 6½ ft. and produced 1.32 kg. steam per kg. coke gasified (at 90-lb gage). Revolving grates are used as well as an inner replaceable lining on the inside of the shell opposite the grate. Combination water-gas generator-boilers are in use and are economical in space and cost, in small sizes. It is suggested that these combinations may have general applications in industrial plants, especially where cheap water gas is required. Cf. C. A. 21, 3264. R. W. R.

Some experiences in the operation of waterless gas holders. J. G. O'KEEFE. *Proc. Am. Gas Assoc.* 1926, 1244-9.—Comments are made on the operation of the new improved waterless gas holder of 15,000,000 cu. ft. capacity at Harrison, N. J. It is maintained that these holders are sound in principle and design. H. L. OLIN

The measurement of large volumes of gas. M. E. BENESH. *Proc. Am. Gas Assoc.* 1926, 1273-6.—A preliminary report. Air from a large holder was measured in series by (1) orifice, (2) rotary displacement, (3) wet drum, (4) venturi-tube, (5) Thomas Electric and (6) Bureau of Standards nozzles. The data obtained are being analyzed for a future report. H. L. OLIN

Dehydration of manufactured gas. F. W. SPERR, JR. *Proc. Am. Gas Assoc.* 1926, 1250-73. See C. A. 21, 641, 1535. H. L. OLIN

The importance of various materials in the gas industry. R. DÜNKEL AND E. PRÄTORIUS. *Gas u. Wasserfach* 70, 822-6(1927).—The characteristics of a good oven refractory must be resistance to the highest operating temp., const. vol., insensitiveness to temp. fluctuations, good heat cond., and resistance to chem. attack. Clay, quartz and silica refractories are evaluated on the basis of these properties. Corrosion of metals is discussed. In many cases metals can be replaced by ceramic materials or concrete, especially pipes made of a 4 to 1 cement-asbestos fiber mixt. Sheet metals and their protection as well as safe-boiler construction are also discussed. R. W. R.

Improvements in the control of the heating value (of gas). KRANZ. *Gas u. Wasserfach* 70, 801-8(1927).—A description of the latest Junkers automatic calorimeter and of a hand calorimeter with automatic water cut-off. R. W. RYAN

Requirements as to the uniformity of gas in a single distribution district. KARL FUNKE. *Gas u. Wasserfach* 70, 797-801(1927).—Statistics are given as to the av. values and max. variations of heating value, d., inerts, O, H₂S, NH₃ and naphthalene in a large no. of German cities. The following specifications are suggested. Heating value may

vary not over $1\frac{1}{2}\%$ (as measured); d. not over 0.015 (measured) with reference to 0° and 760 mm.; the quotient (heating value) divided by the square root of the d. should not vary over 1.5%; inerts less than 12%; O_2 never over 0.5%; H_2S in extreme cases not over 2g./100 cu. m., NH_3 0.5 g. per 100 cu. m. and naphthalene not over 5g./p per 100 cu. m. (p is pressure in atm.). R. W. RYAN

Michell crankless gas engines and boosters. ANON. *Gas J.* 179, 385-7(1927).—The Michell crankless gas engine, as developed in Australia, operates on the 4-cycle system with a volumetric efficiency of 90% and a mech. efficiency of 87%. It may be run at 250 to 800 r. p. m. The reciprocating motion of the pistons is transformed to circular motion by means of a "slant" or "tilt." Engines of 280 h. p. (12 cylinders) have been built. They operate on coal-, water-, producer-, coke-oven- or blast-furnace gas. R. W. RYAN

Gas in industry. L. J. TERNEDEN. *Het Gas* 47, 432-4(1927).—Tabulated statistics are given on gas consumption by industries in the Netherlands; the total 1926 figure was 8.8 million cu. m. B. J. C. VAN DER HOEVEN

Leading away products of combustion from gas fires. P. SPALECK. *Gas World* 87, 124-5(1927).—A study of chimney design and operation was made. From the viewpoint of the relation between draft and resistance and the time taken in warming up the chimney the mason-work chimney is inferior to the 2-in. diam. sheet metal pipe R. W. RYAN

Examination of products of combustion from typical gas appliances. I. ARTHUR SMITHELLS, et al. *Inst. Gas Eng. 15th Rept.* 1926, 99-161.—A detailed account is given of work on the detn. of small amts. of CO by means of the I_2O_5 method; the accuracy claimed is a few parts in a million for less than 50 per million concn. The rate of flow of the mixt. was one l. per hr. for 4 to 6 hrs. 80 g. I_2O_5 was used between 120° and 220° ; the I_2 liberated was caught over KI soln. and titrated with 0.002 N $Na_2S_2O_3$. The CO content of lab. air was found to be rather high (18 parts per million); outside atm. contained 5 to 10. Several gases were examd. as to their action on I_2O_5 when dild. with pure air; illuminating gas, H_2 (slight action), CH_4 , unsatd. hydrocarbons and C_2H_6 were all found to reduce the pentoxide more or less than CO. S or N oxides present are other sources of discrepancies. Previous work on aeration of high-pressure lighting burners (Keith 1000 c. p.) was continued; the results are given in air-gas ratios (from 2.85 to 4.58) for different operation positions (68-inch pressure). The best illuminating power was for an aeration of 3.48 (theory 3.91). B. J. C. v. d. H.

The production of gas from coal and coke. ERWIN RUSS. *Metall u. Erz* 24, 205-15 (1927).—A discussion of the effects of type of fuel used, fineness of particles, gas pressure, type of generator and temp. upon the production of gases. C. G. K.

Physico-chemical studies of ammonium sulfate production from sulfuric acid and gases containing ammonia. (The Burkheiser ammonium sulfate-bisulfate process.) ERNST TERRES and WALTER SCHMIDT. *Gas u. Wasserfach* 70, 725-8, 762-6, 784 6, 808 13(1927).—Soly. and vapor-pressure measurements were made on the ternary system $NH_4-SO_3-H_2O$ (including both excess acid and NH_3) from 0° to 100° (except in case of excess of NH_3) and diagrams prepd. Crystals of $(NH_4)_2SO_4$ sep. in the NH_3 region and in the H_2SO_4 region up to 20-22% by wt. of free H_2SO_4 . With acid concns. from 22% up to 55-60% a double salt $NH_4HSO_4(NH_4)_2SO_4$ seps. and at higher acid concns. only NH_4HSO_4 seps. Vapor pressures of satd. $(NH_4)_2SO_4$ solns. contg. various percentages of H_2SO_4 were detd. by a modified Brehmer-Frowein tensimeter. The vapor pressures of such solns. decrease with increase of free H_2SO_4 . From these vapor pressures the acid concn. of the $(NH_4)_2SO_4$ saturator and its working temp. may be detd. The partial aq. pressure of the bath must be equal to the partial pressure of the water vapor in the gas if loss or gain of water is to be avoided. When hot coal gas (satd. at $75-80^\circ$) is used as in the direct process the saturator may contain 7-9% free H_2SO_4 and must be operated at 100° or above. With cool gases, as in the half-direct process, the saturator is operated at $40-50^\circ$. The ammonium sulfate-bisulfate process is feasible and possesses advantages over the ammonium sulfite-bisulfite process. R. W. R.

Cycle process for the collection of ammonia from coke oven gases. L. FOKIN. *Chem. Ind. (Russia)* 2, 210 99; *Chem. Zvesti.* 1926, 7, 2070.

and is then evolved in a distn. column, the water again trickles down through a scrubber and so on in a cycle process. In this way, contamination of the scrubber by lime and magnesia and of the distn. column by lime is avoided, burdensome waste waters are eliminated, the installation of heat recovery app. is made possible and lime is saved. The gas water is led with the water from the scrubbers through the distn. column. The

soln. in the column is evapd. by the steam available, but the water evapd. simultaneously with the NH_3 does not balance the gain in vol. of water, and the excess, which contains 0.2–.5% NH_3 (chiefly as $(\text{NH}_4)_2\text{SO}_4$), is used for wetting the coal in the coke ovens. In this way the NH_3 contained in this water is not lost, but the complete recovery of this NH_3 is not accomplished, and in the calcs. it is ignored. The wash water of the scrubbers which passes through the cycle and which contains "fixed" NH_4 salts absorbs NH_3 to the same extent as fresh water in the ordinary process. The "fixed" NH_3 is represented only by that combined with H_2SO_4 , for NH_4Cl is volatile with steam. Since the hot water from the distn. column entrains no small particles, it can be conducted through a tube recuperator where it preheats the water from the scrubbers. The process has been in operation since the early part of 1925 in several coking plants. The yield of NH_3 increased from 0.14% (based on dry coke) to 0.21%, and the cost of the NH_3 diminished 20–30%. The annual production of NH_3 by the new process is about 3000 tons. C. C. DAVIS

Some notes on sulfate of ammonia. (Production of aqueous solution) of ammonia. G. WALMSLEY. *Gas J.* 179, 391–2(1927).—Details are given for a plant to produce 10–12% NH_3 soln. (household NH_3) from NH_4 sulfate. A charge of 14 lb. of sulfate NH_4 will yield 3 to 4 gal. of NH_3 soln. R. W. RYAN

Low-temperature distillation. W. RUNGR. *Mech. Eng.* 49, 875–8(1927).—Descriptions are given of low-temp. distn. processes in the rotary kiln, concentric-drum, and horizontal stationary types of retorts. The heating value of coke, gas, uses for other products obtained in these processes, also necessary selling prices, cost estimates and the economics of location of plant and of markets are discussed. W. W. HODGE

Early theories of coking. G. E. FOXWELL. *Gas World* 87, No. 2244, Coking and By products Sect., 10(1927).—A review. R. W. RYAN

The asphaltic substances in coal tar. GUSTAV ŠEBOR. *Petroleum Z.* 23, 890–7 (1927).—The asphalt content of coal tar has been detd. by different methods with varying results. A method has been developed in which 1 g. tar is dissolved in 10 cc. CS_2 in a 250-cc. Erlenmeyer flask, 100 cc. MeOH added, and the mixt. shaken and exposed to the light for 2 hrs. The clear liquid is filtered off and the residue washed with cold MeOH, and dissolved in pure warm anhyd. benzene. The benzene is evapd. in a Pt crucible and the residue weighed after drying at 105° . The properties of asphaltic substances in the coal tar from the Franz mine in Přívoz have been detd. and the asphalt content has been compared with that of other coal tars. M. B. HART

Naphthalene formation in coal tar. YASABURO KOSAKA AND YOSHIKIYO OSHIMA. *J. Fuel Soc. Japan* 6, 3–8 (English Section)(1927).—Benzene, phenol or any fraction of low temp. acid tar, heated at 850° in contact with coke gave rise to C_{10}H_8 . Benzene and anthracene were also formed from phenols and the cresol fraction. Benzene and toluene were polymerized into C_{10}H_8 and anthracene. In order to explain the formation of C_{10}H_8 in coal tar the following reactions are assumed: $\text{MeC}_6\text{H}_4\text{OH} + \text{H}_2 \rightarrow \text{PhMe} + \text{H}_2\text{O}$; $\text{MeC}_6\text{H}_4\text{OH} + \text{C} \rightarrow \text{PhMe} + \text{CO}$; PhMe polymerizes to C_{10}H_8 with evolution of H_2 ; $\text{PhMe} + \text{H}_2 \rightarrow \text{C}_6\text{H}_6 + \text{CH}_4$; $\text{MeC}_6\text{H}_4\text{OH} + \text{H}_2 \rightarrow \text{PhOH} + \text{CH}_4$, C_6H_6 and PhOH are converted into C_{10}H_8 . NAO UVEI

Preparation of tar for roads. W. O. R. FILLING. *Gas World* 87, 146–7(1927).—Tar for road use is dehydrated at $250\text{--}300^\circ$ in a lead bath heated to $330\text{--}70^\circ$ and provided with light oil and water condensers. Analyses of the tars are given. R. W. R.

The removal of phenol from coke-works waste water. F. RASCHIG. *Z. angew. Chem.* 40, 897–8(1927).—The usual methods of disposing of the Ruhr coke-works waste water contg. phenols and pyridine, which involve their final discharge into the Rhine, create a nuisance that has provoked bitter complaint from the fishery interests, particularly those of Holland. In 1913 the total discharge of water was 5,400,000 cu. meters contg. 27,000,000 kg. of phenol. Acid treatment of the still waste after NH_3 removal in which the phenol is fixed as the lime salt to liberate the phenol is unduly costly and, moreover, the pyridine is not removed. A tentative exptl. plant not yet completely successful treats the raw waste from the ovens with 30% of its vol. of benzene in a counter-current washing tower which effects a 60–70% extn. of the phenol and pyridine. These are later sep'd. from the phenol by distn. and the latter is returned to the washer. Contemplated improvements which include increasing the heights of the washing tower and the fractionating column and the perfecting of methods for removing tar from the raw waste are expected to raise the effectiveness of phenol removal to 80–90%. H. L. OLIN

The comparative utility of cokes, carbonized in five different types of carbonizing plant, as water-gas fuel. R. T. HASLAM, J. T. WARD AND J. H. BOYD, JR. *Proc. Am. Gas Assoc.* 1926, 1083–1104.—Coke produced by carbonization of a Pittsburgh

coal in different types of retort, viz., "D" type at Lowell, Mass., the small Koppers type, the U. G. I., Intermittent Vertical and the Woodhall-Duckham types, were tested as to their utility as water-gas fuels. Comparisons were made first of heat retention during the air blow at varying rates, and second, of other steam-decomp. abilities during the run. As the air-rate increased the percentage of heat retained by the fuel bed decreased especially with the denser cokes, but there was little variation in their reactivities to CO_2 and in their steam-decomp. properties. H. L. OLIN

The determination of phosphorus in coke. "CHYMIST." *Gas World* No. 2240, Coking and By-products Sect., 11-12(1927).—A critical review. It is suggested that the Pb molybdate method be used in which the P is weighed in the form of its equiv. of Pb molybdate. V, Ti and As may cause erroneous results, when present, unless special precautions are taken. R. W. RYAN

Determination of the porosity of coke. N. A. ROSS. *Gas World* 87, No. 2248, Coking and By-products Sect., 15-16(1927); cf. *C. A.* 16, 2982; 17, 2044.—Porosity = [(true sp. gr. — apparent sp. gr.) 100/true sp. gr.] The best way of detg. the apparent sp. gr. of the coke is by means of Hg displacement, as in the water method some water is sure to penetrate into the coke. The real sp. gr. is detd. by boiling the mixt. of coke and water in the sp. gr. bottle for 1 hr. under reduced pressure. R. W. RYAN

Elimination and recovery of phenols from coke-plant ammonia liquor. R. M. CRAWFORD. *Ind. Eng. Chem.* 19, 966-8(1927); cf. *C. A.* 21, 814.—For phenol extn. from ammonia liquor it is now recommended to use light tar oil instead of motor fuel. The extn. efficiency is up to 93%, the soly. in the liquor 1%, no emulsions are formed. B. J. C. VAN DER HOEFEN

Advantages and disadvantages of dry quenching of coke. A. M. BEEBE. *Gas J.* 179, 284(1927).—The Sulzer-Freres coke-cooling plant at the Rochester (N. Y.) Gas and Elec. Corp'n. has a daily capacity of 425 tons of coke. Considerable coke breakage results but as coke is sold to the domestic market this is no disadvantage. Better efficiency is obtained with dry coke in water-gas and producer-gas plants. 1000 lb. of hot coke has given an av. of 420 lb. of steam at 139.2 lb. pressure. R. W. RYAN

Calculation of the theoretical combustion temperatures (Drossback) 2. Production of lubricating oil from coal (NIELSON, BAKER) 22. Utilization of molasses (CROSS) 28. NH_4CNS from coking plants (GLUUD, KLEMP) 18. Progress in ore dressing and coal washing in 1926 (RICHARDS, LOCKE) 9. Alcohol as a by-product of paper manufacture (ANON.) 23. RICHARD, A.: Les automobiles sans pétrole; l'alcool d'industrie. Paris: Masson & Cie. 222 pp. 18 francs. Reviewed in *Rev. prod. chim.* 30, 569(1927).

Liquid fuels. CARBURANTS ECONOMIQUES, SOC. ANON. Brit. 261,781, Nov. 21, 1925. Liquid fuels such as petroleum, tars, "benzoles and other coal oils," animal and vegetable oils, and alcs. which may be mixed with gasoline, are caused to burn more completely by addn. of a small proportion of substances such as oil of turpentine, oil of capcut, oil of cloves, oil of copaiba, oil of cinnamon, $(\text{CH}_3)_3\text{N}_4$ and its homologs, cymenes, eugenol, isoeugenol, cinnamic aldehyde and similar substances or compds.

Liquid fuel for internal-combustion engines. E. G. E. MEYER. Brit. 262,363, June 12, 1925. Mineral oil or coal-tar distillates b. about 160° or higher are mixed with small proportions of ether and NH_3 or other volatile basic material, with or without MeOH , C_2H_5 or S.

Fuel mixture of coal-tar pitch and fuel oil. T. H. BUTLER, F. J. W. POPHAM, J. C. MANN and H. W. ROBINSON. Brit. 261,907, Nov. 17, 1925. Pitch is heated to a temp. substantially above its m. p. and fuel oil from petroleum or asphaltic material is gradually added. Solid hydrocarbons of the $\text{C}_{16}\text{H}_{34}$ or $\text{C}_{14}\text{H}_{28}$ series, up to 15%, also may be added. A fuel mixt. is obtained which is homogeneous at temps. above 150° . Cf. *C. A.* 20, 2064.

Carbonizing fuel briquets. W. E. TRENT. Brit. 261,954, Feb. 8, 1926. Briquets are heated first to a relatively low temp. (about $230\text{--}300^\circ$) in the presence of O and then to a higher temp. (about $600\text{--}650^\circ$) in the absence of O. An app. is described in

which steam jets may be used to quench the carbonized briquets and prevent overheating of the bottom of the retort used.

Regulating air and fuel supplies in combustion of powdered and atomized fuels. E. S. SUFFERN. Brit. 261,807, May 29, 1925.

Destructive hydrogenation of solid fuels. I. G. FARBENINDUSTRIE AKT.-GES. Brit. 262,099, Nov. 26, 1925. In destructive hydrogenation of fuels contg. moisture such as lignite, peat and moist coal, all or part of the H_2O is first removed by pressing or centrifuging a mixt. of the raw material with liquid hydrogenation products formed from it. The pressing may be effected at 300 atm. pressure and the same pressure may be utilized for forcing the material in the hydrogenation app. where it may be treated with H at a temp. of 400° under 300 atm. pressure.

Fuel briquets. PARK E. WELTON and GEORGE H. WADSWORTH. U. S. 1,642,055, Sept. 13. Granulated or shredded oil refinery residue wax 3 is mixed with sulfite by-product liquor 2 parts, to form a putty-like mixt., and this is mixed as a binder with coal culm 100 parts and with H_2O ; briquets are formed from this mixt. and are set and baked.

Submersible burners for liquid or powdered fuels (for use in steam generation, chemical concentration, etc.). C. F. HAMMOND and W. SHACKLETON. Brit. 261,808, June 2, 1925.

Cracking and carbonizing coal and oil. W. F. TRENT. Brit. 262,302, Feb. 15, 1926. In combined cracking and carbonizing, the heat required is generated at a single source (e. g., a boiler plant), a portion being used to crack the oils and the remainder to carbonize the coal which is agglomerated with the residue from the cracking operation. An app. is described. Cf. C. A. 21, 1348.

Asphaltic materials from destructive hydrogenation of coal, etc. DEUTSCHEN BERGIN-AKT.-GES. FÜR KOHLE- UND ERDOLCHEMIE. Brit. 262,738, Dec. 11, 1925. Asphaltic bituminous materials such as those obtained in the destructive hydrogenation of coal, after removal of H_2O and substances of low b. p., are mixed with gas oil or similar material and allowed to stand to permit solids to settle out. Residual gas oil may be removed from the asphaltic material by distn. with steam.

Inclined preheating chambers and vertical retorts for coking coal. S. W. PARR and T. E. LAYNG. Brit. 261,799, July 30, 1925.

Gas mixture. J. WEBER, H. SCHRADER and E. WIEDBRAUCK. Can. 272,173, July 5, 1927. Gas mixts. rich in ethylene, propylene and butylene are produced by passing the vapors of a hydrocarbon mixt. through and in intimate contact with a bath of molten metal maintained at a temp. of at least 600° , and immediately sepg. the resulting gaseous products from elemental C liberated by the decompn.

Purifying gases and producing ammonium sulfate. F. W. SPERR. Brit. 261,755, Nov. 18, 1925. H_2S is removed from gases by absorption in a wash liquor contg. NH_3 and an Fe or other metal compd. The sulfided liquor is distd. to recover NH_3 and is then aerated to regenerate the wash liquor. The NH_3 used in the latter may be absorbed from the gas being purified, such as coke-oven gases. An app. and numerous details and modifications involving the formation of various NH_4 salts are described.

Apparatus for charging horizontal gas retorts. F. G. MATTHEWS and J. G. W. ADEPINE. Brit. 262,625, Jan. 29, 1926.

Gas producer and rotary agitator construction. FIRM OF H. REHMANN. Brit. 261,797, Nov. 23, 1925.

Gas producer plant. H. F. SMITH. Brit. 262,781, Dec. 14, 1925.

Water-jacketed gas producer or shaft furnace. WOODALL-DUCKHAM (1920), LTD. AND J. W. REBER. Brit. 262,668, July 7, 1926.

Wood-consuming gas-producer. J. R. F. M. LASMOLLES. Brit. 262,088, Nov. 27, 1925.

Apparatus for analysis of flue gases, etc. SIEMENS & HALSKE AKT.-GES. Brit. 262,092, Nov. 27, 1925.

Artificial mineral oil. ANON. *Petroleum Times* 18, 277-8(1927).—Progress is reported in the use of the Bergius process for the treatment of coal with H₂ as developed by the I. G. Farbenindustrie A. G. M. B. HART

Water flooding practical in shallow fields of high-grade oil. L. C. UREN. *Nat. Petroleum News* 19, No. 34, 62-4, 56-8, 60(1927).—A review of the literature and work done, with special reference to the Bradford field. M. B. HART

Sulfur in Esthonian oil shale (kukersite) and in its distillation products. M. WITTLICH. *Acta Comment. Univ. Dorpatensis* 8, AVIII, 6, 1-12; *Chem. Zentr.* 1926, II, 303.—The various oil shale beds and the distn. products in the production of coke and tar were analyzed for their S content. C. C. DAVIS

An analytical examination of some South Dakota cretaceous shales. CHARLES WATERMAN. *Black Hills Eng.* 15, 166-71(1927).—A series of assays indicate that the 700-ft. bed of Graneros and the 1200-ft. bed of Pierre shales underlying South Dakota east of the Black Hills contain only a trace of oil and a negligible quantity of N. R. A. BAXTER

Investigation of the crude from Nienhagen, Kreis Celle (Hannover). L. ROSNER. *Petroleum Z.* 23, 940-1(1927).—Distn. and refining data show that this crude may be distd. and treated without danger of cracking or emulsion formation. M. B. H.

Further formolitic analyses on crude naphtha. A. M. NASTIUKOV. *Tekh. Ékon. Vestnik (Russian)* 6, 501-6(1926); cf. C. A. 20, 498.—This is the continuation of a study on the detn. of the formolitic number of various crude oils. J. S. JOFFE

Determination of sulfur in mineral oils and liquid fuels. L. BOISSELET. *Ann. office nat. comb. liquides* 2, 37-45(1927).—A crit. review of different methods, with a detailed description of the method used at the lab. of the École Nationale Sup. du Pétrole et des Combustibles Liquides. A. PAPINEAU-COUTURE

A new sulfur test for oils. JAMES SCOTT. *Petroleum World (London)* 24, 347-8 (1927).—A discussion of the method for the detn. of S in petroleum products as presented by E. S. Squire (C. A. 21, 2786). Photomicrographs of crystals of the compds. formed are presented. M. B. HART

The index value and the index value calculation. E. KROCH. *Petroleum Z.* 23, 936-9(1927).—A reply to Ostwald (cf. C. A. 21, 2786). M. B. HART

West Texas development calls for best of engineering skill. A. R. McTEE. *Oil Weekly* 46, No. 8, 41(1927).—Gas found in Crane and Upton Counties contains about 12% H_2S as it comes from the well. Methods used in treating it include the use of soda soln. or soda with kerosene. Various soda-treating plants are described. The chem. analysis of water from shallow wells in McCamey Field, and Pecos River, Upton County, is also given. M. B. HART

Industry's technicians responsible for extraction methods. G. S. REID. *Refiner Natural Gasoline Mfr.* 6, No. 8, 59-60, 64(1927).—Com. absorption methods for the betn. of natural gasoline in gas are reviewed. M. B. HART

Gasoline absorption plant (M. M. Tikhvinskii's process). G. SARKIS'YANZ. *Azerbejdj. Oil Industry* 1927, No. 6-7, 55-63.—An inert gas slightly preheated is forced through a stream of crude oil and thus satd. with gasoline. The preheating is done by compressing slightly the well gas contg. a certain amount of gasoline vapor. The final extn. of gasoline from gas is obtained by compression and cooling. This method is applied to gas-lift oil wells to strip the crude oil from a part of the gasoline. A. A. BOEHLINGK

Recent improvements in crude-oil refining. WILTON SHELLSHEAR. *Chem. Eng. Mining Rev.* 19, 397-402(1927). E. H.

Application of process steam in petroleum refining. A. G. PETERKIN, JR. *Chem. Met. Eng.* 34, 544-5(1927). E. H.

First plant for the removal of benzine from petroleum in Schubany. V. SHPEROVICH. *Neftyanoe Khozyaistvo* 10, 93-6; *Chem. Zentr.* 1926, II, 304.—Before shipping crude petroleum from the Schubany fields, 17% is removed by distn. on the spot, for otherwise the low-boiling fractions would be lost in large quantities during transport in conductor pipes. This 17% of the distd. product is used as benzine. C. C. DAVIS

Kerosene-distillation plant with a regenerative system. S. ZADOLIN. *Azerbejdj. Oil Industry* 1927, No. 6-7, 39-44.—In a continuous distn. plant heat exchangers are extensively used and other improvements added. Claims are made of 65% economy in fuel. A complete layout of plant with drawings is given. A. A. BOEHLINGK

Rectification of gasoline from crude oil. G. TOROSYAN. *Azerbejdj. Oil Industry* 1927, No. 6-7, 48-51.—A rectifier adapted to a continuous distn. unit is described with equations, drawing, layout, etc. A. A. BOEHLINGK

The kerosenes of Grozny. L. SELSKII. *Neftyanoe Khozyaistvo* 9, 742-53(1925); *Chem. Zentr.* 1926, I, 2990.—On economic grounds the kerosenes have recently all had removed, for use in benzine, the fractions boiling up to 200°, and in many cases have had the fractions up to 225° removed. The effects of these changes on the combustibility and illuminating power of the kerosene were investigated. To utilize the kerosene as a light oil after such treatment, the fractions boiling above 270° must also be removed. The product between these narrow limits has a flash point of about 60° and a long "latent" period up to the point where the illuminating power reaches its max. If the fractions above 270° are not removed, a special burner, with preheating of the kerosene, must be employed. Data on the kerosene contents of Grozny petroleum are included. C. C. DAVIS

Grozny crude oils and the refining process. S. A. VYSHETRAVSKY. *Azerbejdjanskoe Neft. Khoz.* 1927, No. 3, 53-9.—Tests on diff. fractions in diff. stages of the refining process are described. Grozny crude oils are paraffin base, semi-paraffin base and non-paraffin base. A. A. BOEHLINGK

Export-gasoline from the first distillation. N. A. ALEXEYEV. *Azerbejdjanskoye Neft. Khoz.* 1927, No. 3, 49-53(1927).—Vapors from the still pass through a dephlegmator surrounded by a jacket contg. a const-boiling liquid. Sepn. from heavy ends obtained that way. For export-gasoline the const-boiling liquid is toluene. Full data are given on equipment, yields, etc. A. A. BOEHLINGK

Sulfur in gasoline and water-white oil from Bak. L. GOOKHMANN AND V. KAMENOV. *Azerbejdjanskoye Neft. Khoz.* 1927, No. 5, 63-7.—Gasoline and water-white oil from Surakhany, Balakhany and Bibi-Eibat were tested for S. Foreign gasolines and water-white oil tested in Bak were higher in S. The highest corrosion by sulfur in water-white oil was caused by the water-white oil from Surakhany followed by Balakhany and Bibi-Eibat. In gasoline only the sample from Bibi-Eibat showed corrosion. The Döbner test is not a proof for corrosive action of S. A. A. BOEHLINGK

Calculations for a tube still for gasoline and water-white oil. A. I. KHMELNIKOV AND V. P. VOINOV. *Azerbejdjanskoye Neft. Khoz.* 1927, No. 4, 50-62.—The following are given, complete calcn. for a tube-still equipment, preliminary calcn. on heat required, fundamentals on the heating and evapn. of oil products, conditions for heating

and evapn. temps., amount of oil in the heat treatment, heat capacity of oil, heat of evapn. of oil, amount of heat required by the oil. Equations and tables are included.

A. A. BOEHLINGK

Utilization of the heat in flue gases. S. S. KRIVOSHÉIN. *Azerbeidjanskoye Neft. Khoz.* 1927, No. 4 38-42.—A review of the problems in connection with heat exchangers and utilization of flue gases for preheating of oils. Data are given on gasoline, water-white oil, petrolatum, asphalts, lubricating oils and steam superheaters.

A. A. BOEHLINGK

Utilization of flue gases for preheating oil. N. A. ALEXÉYEV. *Azerbeidjanskoye Neft. Khoz.* 1927, No. 1, 43-8.—Full information is given with regard to equipment; equations and drawings are included. Flue-gas heat-exchangers are suggested to preheat distillates used for water-white oil. These exchangers are to be connected behind the usual heat exchangers.

A. A. BOEHLINGK

Rectification of water-white oil. K. V. KOSTRINE. *Azerbeidjanskoye Neft. Khoz.* 1927, No. 3, 35-46.—From his own expts. and from information from other sources K. concludes that: (1) The yield of water-white distillate is increased considerably and color and mixt. of fractions will be of a much higher grade if rectification columns are used for water-white distn. from crude oil. (2) The rectification columns eliminate from the water-white the heavy ends from the gasoline and the light ends from the solar-oil fraction. The phlegma is stripped off the light ends of the water-white. From gasoline they eliminate the light water-white fractions and from the phlegma the gasoline. (3) Therefore both rectifying columns have to be provided with some equipment for additional evapn. for the phlegma. Superheated steam is used and an additional equipment for rectification. (4) The spray liquid has to be pumped to the top of the columns; it consists either of gasoline or water-white distillate. (5) The columns for gasoline or water-white distn. should be filled up with bricks, providing a very large surface. (6) The use of rectification columns will considerably increase the fuel and steam consumption.

A. A. BOEHLINGK

Scheme of a gasoline topping plant for diatomic crude from Binagady. G. A. SARKISSIANTZ. *Azerbeidjanskoye Neft Khoz.* 1927, No. 2, 69-72.—In a proposed plant for a continuous distn. of gasoline the still is heated with superheated steam (170°) in 2 sets of coils covered with corrugated iron sheets. The crude oil is run by gravity from a tank, flows through jets and drops on the hot iron sheets. The partly stripped crude flows down and comes into contact with the sheets on the lower steam coil. The escaping gasoline vapor has a temp. of 150°. The stripped crude leaves the still through the bottom, passing a heat exchanger, to a storage tank. A bubble tower is provided to give close cuts of gasoline. Calens., cost figures, a full description and a drawing of the plant are given.

A. A. BOEHLINGK

Investigation of the residue after the purification of petroleum benzine. A. DOBRVANSKII AND ALIEV. *Neftyanoe Khozaystvo* 9, 229-32(1925); *Chem. Zentr.* 1926, II, 676.—Two hydrocarbons were isolated, one of which was identified by its b. p. of 226.5-74.5°, its *n* value and its analysis as 2-phenylheptane.

C. C. DAVIS

Continuous treatment of light oils. Y. E. EMMUIL. *Azerbeidj. Oil Industry* 1927, No. 6-7, 64-7.—In a plant for continuous treatment of gasoline and water-white oil, 5 towers, connected in parallel, are filled with H₂SO₄. The acid enters the towers on the upper part and is continuously withdrawn from the bottom. The oil enters the towers through fine holes in the lower part, passing the acid in very fine drops and having a large surface for reaction. The oil collected on the top part of the towers is lead through pipes to a tower contg. soda soln. This tower works on the same principle. As no stirring is required and the whole process is carried out in closed containers, the loss in oil is extremely small.

A. A. BOEHLINGK

Ryan refining process manufactures marketable products without customary treating. C. A. ZIMMERMAN. *Oil Age* 24, No. 8, 27, 72(1927).—The Ryan distg. process produces finished gasoline without treating and consists in distg. crude in 2 stills, the first taking off gasoline, and the second kerosene, engine distillate and stove distillate. The residuum is pumped into fuel oil storage. H₂O in amts. averaging 4% or more is added to the crude, and forms steam for use in sepg. S and C from the light vapors and is said to convert the S from a corrosive to a non-corrosive form. The fuel oil residuum makes good cracking stock.

M. B. HART

Arizona halloysite suitable for clay pulp contact filtration. H. L. KAUFFMAN. *Refiner Natural Gasoline Mfr.* 6, No. 8, 68-9, 72-4(1927); cf. *C. A.* 20, 3562.—Halloysite, a clay from Eastern Arizona, has been compared with 100-mesh Georgia fuller's earth to det. its filtration efficiency. Fifty % acid-treated halloysite pulp, prep'd. by the addn. of 50% 66° B. H₂SO₄, dilg. to 20% acid concn., digesting for 5 hrs. at 200°

F. and washing with 4 portions of H_2O at $180^\circ F.$, has proved to be 10 times as efficient as fuller's earth on a neutral cylinder stock having a viscosity of 133 at $210^\circ F.$, 9.4 times on a Calif. asphaltic base neutral oil with viscosity of 200 at $100^\circ F.$, 5.7–7.0 times on paraffin base neutral oil, 5 times on a $440^\circ F.$ long residuum, acid stage. M. B. H.

Fire fighting in oil refineries. F. A. EPPS. *Quarterly Nat. Fire Protection Assoc.* 21, 32–40(1927).—A summary of tank fire records shows a great superiority of air-tight steel roofs. Fifty-five% of the tank fires are caused by lightning; 93% of these are in tanks not gas tight, mostly with wooden roofs. An outline is given of proper construction, operation and fire protection for tanks and distn. equipment, with notes on the limitations and methods of use of dry chem. and stored liquid foam systems. C. L. J.

Autoxidation and anti-oxygen effect. XXIII. Autoxidation of liquid fuels when heated. Application to the problem of "knock" in motors. CHARLES MOUREU, CHARLES DUFRAISSE AND RENÉ CHAUX. *Chimie et industrie* 18, 3–12(1927); cf. C. A. 20, 3374, 3625; 21, 1914, 2380, 3451.—The exptl. work on autoxidation of liquid fuels (paraffin, hydrocarbons, vegetable and marine animal oils) and on the anti-O and pro-knock power of various substances, particularly those known to possess anti-knock or pro-knock properties, which is referred to in paper XXIV of the series is given in greater detail, the app. used and method of carrying out the tests being described and the results given graphically. A. PAPINEAU-COUTURE

Blending of gasoline with aromatics. V. I., SHIPEROVICH AND G. R. WEINSTEIN. *Azerbaidzanskoye Neft Khoz.* 1927, No. 1, 40–3.—A blend of 20% benzene and 80% gasoline from Grozny (paraffin-base) crude oil gives an anti-knock motor gasoline of high quality. Crude benzene is purified by distg. off 90% 3 times in succession, treating with 3% H_2SO_4 , washing, neutralizing, washing and steam-distg. 99%. The following figures give, resp., sp. gr. and initial b. p.: Grozny light export gasoline 0.7208, 54° ; the same blended with 20% benzene 0.7492, 54° ; Grozny heavy export gasoline 0.7445, 61° ; the same blended with 20% benzene 0.7631, 64° ; Grozny gasoline grade II 0.7311, 59° ; the same blended with 20% benzene 0.7506, 48.5° . A. A. BOEHLINGK

Gas oil-fuel oil blends to make road oil. H. L. KAUFFMAN. *Refiner Natural, Gasoline Mfr.* 6, No. 8, 88, 90(1927).—Fuel oil bottoms, from Simpson Ridge (Wyo.) crude oil, having the following properties: A. P. I. gr. 13.6° , flash $565^\circ F.$, fire $655^\circ F.$, Saybolt Universal viscosity at $210^\circ F.$, 1002, % asphalt of "100 penetrations" 96.8, have been blended with gas oil bottoms resulting from the rerunning of Dubbs pressure distillate having A. P. I. gr. 31.9° , flash $205^\circ F.$, fire $275^\circ F.$, and the flash, fire, viscosity, and asphalt content of the products detd. The most satisfactory oils from the standpoint of asphalt content are those blends in which the ratios of fuel oil and gas oil are 5:25 and 62.5:37.5. M. B. HART

The cracking of Gabian petroleum by the anhydrous aluminum chloride process. ANDRÉ GRAETZ. *Ann. office nat. comb. liquides* 2, 69–91(1927).—(In treating dehydrated and refined (with H_2SO_4 and NaOH) Gabian petroleum (which has an initial b.p. of 217°) with increasing proportions of $AlCl_3$, the max. yield (74.5%) of light products (above up to 210° in the de Luynes-Bordas app.) was obtained with 9% $AlCl_3$, wt. in crude petroleum, the same degree of max. cracking was obtained, but with 11–15% $AlCl_3$, the increase in $AlCl_3$ consumption was due to the action of H_2O and S and oxygenated compds. in the crude. On distg. the crude to 340° and treating the distillate (without refining) with $AlCl_3$, the same max. cracking was obtained with 12% $AlCl_3$, because of evolution of considerable H_2S during distn. of the crude. Investigation of the formation of metal chloride complexes with petroleum led to the following conclusions: (1) Sn^{IV} , S, Hg^+ , Cu^+ , Fe^{III} and Na chlorides and bleaching powder form complexes with the cracking oil on heating for a suitable length of time; (2) these complexes are sol. in the Cl derivs. of CH_4 , C_2H_6 and C_3H_8 , in which all the H has not been substituted by Cl, and they are insol. in the Cl derivs. in which the H has been completely substituted; (3) in order that cracking may be catalyzed by a metal chloride, the latter must be volatilized or decompd. between 190° and 210° . The mechanism of the cracking may be considered as due to the formation of a hydrocarbon-metal chloride complex, which is decompd. at the distn. or decompn. temp. of the metal chloride, with a breaking up of the C chain into lower-boiling products. The min. cracking temp. of oil is 160° , and at 200° the reaction is well started; the complexes formed by chlorides boiling at a lower temp. (e. g., $SnCl_4$, $SbCl_5$) decomp. before the min. cracking temp. is reached; the complexes formed with high-boiling chlorides (e. g., $FeCl_3$) are very stable, so that cracking cannot take place below 250 – 60° ; the $AlCl_3$ complex can crack into lighter products. Investigation of the decompn. of the $AlCl_3$ -hydrocarbon complex showed that at atm. pressure it begins at 150 – 60° , is fairly active at

190–210° and is complete at 230–40°. It would therefore be preferable to carry out the cracking at 240–5°. Because of limitations of the lab. equipment used, the results obtained are less favorable than would be obtained on an industrial scale. G. considers that under ordinary circumstances the process could not compete economically with other processes (e. g., Dubbs'); but that it might be of considerable use in emergencies.

A. PAPINEAU-COUTURE

Cracking in the liquid phase at atmospheric pressure. A. G. ZAKHARENKO AND K. V. MISTCHENKO. *Azerbeidzanskoye Neft. Khoz.* 1927, No. 4, 42–50.—Fuel oil contg. some water-white is not suitable for cracking under atm. pressure. Cracking begins after the stripping of the light ends (water-white) and raising of the oil temp. in the still to 380°. The rate of cracking doubles with every 10°. Not more than 50% of the fuel oil should be distd. off; distn. of more than this makes it difficult to remove the residue left in the still. Too high temps. are harmful to the still. Distn. curves and other data are given.

A. A. BOEHLINGK

Manufacture of light concentrated extracts of sulfonic acids from vaseline oil. P. MONTAG. *Azerbeidzanskoye Neft. Khoz.* 1927, No. 1, 48–51.—The reagent "Kontakt" is a pitch-black to dark-blue, viscous liquid, with SO₂ odor. It contains sulfonic acids over 40%, mineral oil 15%, H₂SO₄ 3%. It is used in soap manuf., and the textile industry particularly for silks and woollens. In its manuf. vaseline oil is treated successively 4 times with H₂SO₄ and 20% SO₃, and the sulfonic acids are extd with H₂O. The acid-treated oil is cooled each time to 15–20°. The first and second extns. are carried out with fresh H₂O, the third and fourth with extracts of acid from the first two extns. The process is covered by Russ. Patent No. 803,428.

W. F. FARAGHER

The production of turbine oils. V. VLASSENKO. *Neftyanoe Khozaystvo* 10, 243–4, *Chem. Zentr.* 1926, II, 306.—Directions are given for the production of turbine oils T and L from machine oil and spindle oil, and the production of turbine oil M by mixing T and L grades. With these methods, decolorizing powders are unnecessary.

C. C. DAVIS

Method of estimating lead in lubricating oils. ALFRED E. LEVEY. *Chemist-Analyst* No. 47, 7(1926); *Chem. Zentr.* 1926, II, 1711.—Carefully ignite 3 g. of material, leach the ash with 100 cc. of 4 N HNO₃, dil. to 150 cc. and electrolyze.

W. T. II.

Production of lubricating oil from coal. HARALD NIELSON AND STANLEY BAKER. *Engineering* 123, 665–6(1927).—The lubricant was refined by Sensible Heat Distillation Ltd., London, from crude oil prepd. by them from cannel coal by the "L and N" process. On distn. this oil gave in % by vol. and on dry basis, resp.: up to 300° 16.5, 17.5; 300–350° 13.6, 14.6; 350–370° 9.8, 10.5; above 370° 41.70, 45.0; pitch 7, 7.5; water and loss 12.5, loss 4.9. The distillate above 370° was refined for lubricating oils. The tar acids, amounting to 20% by vol., were removed by NaOH and the residue was refined with 3% H₂SO₄, leaving 70% of the original material or about 30% of the anhydrous crude oil. The treated oil was redistd. and the first 25% discarded to kerosene. The remainder was filter-pressed at about –5°, and the wax-free oil redistd., giving a dark red oil with a marked green fluorescence. Some medium oil of d₁₅ 0.981 from this distillate was compared with some refined mineral oil of d₁₇ 0.901 in the National Physical Lab by journal friction tests. Comparison curves show a min. coeff. of friction of about 0.0015 up to 800 lb./sq. in. load with each oil, the lubricant from coal being slightly inferior at low and slightly superior at high bearing pressures as compared to the particular mineral oil tested. Also in *Mech. Eng.* 49, 1109–10(1927).

R. A. BAXTER

Asphalt. PREVOST HUBBARD. *Mineral Ind.* 35, 75–82(1926).—Gives data on production and trade, and tests and specifications.

A. BUTTS

The constitution of the asphalt micelle. F. J. NELLENSTEYN. *Chem. Weekblad* 24, 414–21(1927).—The 3 components of asphalt, i. e., medium, protective substances and the C particle, are arranged in such a way that the medium forms the outer layer. The protective substances with the C particles form the asphalt micelle, in which the C is placed at the center. The relation between micelle and medium is principally ruled by their interfacial tension. Reversible flocculation is caused by adding liquids which have a low surface tension and which increase the interfacial tension. Irreversible flocculation occurs by destruction of the micelle and depends upon the adsorption qualities of the reagents. The carbon, as the center of the micelle, stabilizes the whole

system and must be considered as an essential component. The definition of asphalt as a highly protected oleosol is confirmed in all respects. M. ACHTERHOF

Filler for asphalt mixtures. E. BARTON HACK. *Commonwealth Eng.* 15, 29-31 (1927).—Expts. were conducted to obtain a filler, commercially procurable, corresponding in fineness to hydrated lime without the objectionable features unseparable from that material. The function of a filler for bituminous asphalt is so to multiply the no. of voids that their vol. is so negligible that they are non-permeable to water and form a solid mass, approx. coördinate with the surrounding aggregates. From ascertained wts., it is possible to calc. a table of figures, based upon the logical assumption that the sp. gr. of the fine particle remains the same as the mass in the matrix. Objections to such materials of extreme fineness as lime, stone dust, slate dust, ground silica, dust from crushing plants, etc. are the tendency to "ball" after drying and pulverizing. Marls and ground material from crushing plants usually contain talcy or micaceous particles that are unstable and split and open out through the tensions set up under the compression and expansion of the roadway. W. H. BOYNTON

The softening point of pitch and asphalt according to G. Kraemer and C. Sarnow. HEINRICH MALLISON. *Z. angew. Chem.* 40, 927-8(1927).—For the softening point detn. of K. and S. a heating rate of 1° per min. is recommended; deviations as high as 3° were found on heating at a rate of 2° per min. B. J. C. VAN DER HORVEN

Action of catalyzers in the distillation of wood. G. DUPONT and R. LASCAUD. *Ann. office nat. comb. liquides* 2, 21-36(1927); *Bull. inst. pin.* No. 37, 145-51.—The expts. were carried out on pine sawmill waste (12 cm. wide by 3.5 cm. thick) in a 30-l. steel retort, placed on a wood-fired brick furnace. Distn. lasted 6 hrs. and was conducted so as gradually to heat the wood to 500° as shown by a pyrometer placed in the mass of wood. The catalyzer was added by immersing the wood 30 min. in boiling water, transferring to the soln. of reagent, withdrawing at the end of 48 hrs., and allowing to dry for 8-10 days. Comparison of the action of various catalyzers (all used at a concn. of 1%) showed: (1) hot water alone appears to reduce the tar and AcOH yields slightly and to increase the MeOH yield slightly; (2) NaOH increased the MeOH yield about 5 fold, but reduced the tar and AcOH yields by about 33% each; pulp mill black liquor had approx. the same effect; Na₂CO₃ was somewhat less active; (3) CaCl₂ reduced the tar yield without appreciable improvement in AcOH or MeOH yields; (4) NaHSO₄ and phosphoric acid slightly increased the MeOH yield but reduced the tar and AcOH yields. The MeOH yield is max. with 1% NaOH in the impregnating soln., while with 2-3% NaOH it is practically the same as without catalyzer; the AcOH and tar yields are greatly reduced (loss of 33-50%) with 1% NaOH, and then the reduction proceeds more slowly with greater concns. The charcoal yield depends on too many other factors to judge how it was affected by the treatment. Comparison of the action of NaOH on pine and on a no. of hardwoods (oak, hornbeam, elm, poplar, beech, plane and balsam "sapin") showed a much smaller proportional increase in MeOH yield, old wood showing a much greater increase, on the whole, than young wood; the yield of AcOH was not affected to any great extent; while the tar yields were increased in some cases and reduced in others. The possible economic importance of the results is discussed. A. P.-C.

Machine for testing lubricating oils (ANON.) 1. Cracking and carbonizing coal and oil (Brit. pat. 262,302) 21. Strainer for gasoline (U. S. pat. 1,642,433) 1. Drying SO₂ [for use in refining hydrocarbons] (Brit. pat. 261,732) 18. Fire-extinguishing device for use in oil tanks, etc. (Brit. pat. 262,697) 18. Apparatus for treating acid sludge with salt solution (U. S. pat. 1,642,060) 1.

ASCHER, R.: *Les lubrifiants*. Translated from German into French by George Lohr. Paris: Ch. Béranger. 249 pp. Reviewed in *Ann. office nat. comb. liquides* 2, 330 2(1927).

MICHELL, A. G. M.: *Viscosité et lubrification*. Translated from English into French by A. Troller. Paris: Gauthier-Villars & Cie. 68 pp. Reviewed in *Ann. office nat. comb. liquides* 2, 450-1(1927).

Oil purification. L. H. CLARK. *Can.* 271,998, June 28, 1927. Impure oil contg. ely divided C is purified by dispersing throughout the oil an aq. reagent having a weak alk. reaction and having the property of facilitating the passage of carbonaceous impurities from the oil into the aq. phase of the resulting mixt. The aq. phase is then sep. from the oil.

Refining mineral oils. T. HELLTHALER. U. S. 1,643,272, Sept. 20. Oils are

treated at room temp. with TiCl_4 or other Ti tetrahalide dild. by "inert substances" such as fuller's earth, activated C, infusorial earth, clay, Na_2CO_3 or CaCO_3 .

Treatment of petroleum residues. F. M. ROGERS. Can. 272,004, June 28, 1927. The crude-oil residue, obtained by distn. and representing not more than 10% of the original crude oil, is dild. with hydrocarbon oil of lower viscosity, and the dild. oil is treated with H_2SO_4 . The diluent is removed from the settled oil.

Prevention of emulsions in petroleum products. E. B. COBB. Can. 273,542, Aug. 30, 1927. H_2SO_4 -treated oils are maintained at a temp. of $350\text{--}500^\circ\text{F}$. until such emulsion-inducing compds. are decompd. The oil is then washed with an acid soln.

Hydrogenation of coal and oil; synthesis of oils from carbon monoxide and hydrogen, etc. J. TRAUTMANN. Brit. 261,786, Nov. 21, 1925. Heat required for various processes is supplied to the reacting substances by finely divided heated metal which may be in the form of powder, liquid or vapor. Coaxial nozzles may be used, through the inner of which the reagents pass while the hot metal is supplied through the outer. Brit. 261,787 specifies carrying out similar reactions while employing molten Sn or other suitable catalyzers which may be brought into contact with reacting substances by "threshing" or centrifugal action. An app. is described.

Cracking oils. U. S. JENKINS. Brit. 262,666, June 25, 1926. In distn. or cracking under pressure, the residuum in a retort is continuously removed to an evaporator where the lighter fractions are evapd. under reduced pressure by latent heat. An app. is described. The oil may be mixed with an absorbent such as fuller's earth, lime, clays or SiO_2 gel.

Cracking hydrocarbons. C. P. TOLMAN. U. S. 1,643,036, Sept. 20. Hg vapor, superheated to above the cracking temp. of the oil, is brought into contact with vapor of the oil to effect cracking of the latter. An app. is described.

Purification of cracked hydrocarbons. T. T. GRAY. Can. 273,411, Aug. 30, 1927. Cracked hydrocarbons are passed in vapor form into contact with a body of solid absorbent material, thus depositing a polymerized compd. on the material. The pressure of the vapors in the presence of the material is regulated so as to produce condensation of a portion of the same. The condensate is passed through the material to remove the polymerized compd., the vapors and liquids emerging from the material being sepd.

Conversion of heavy into lighter hydrocarbons. V. W. NORTHRUP. U. S. 1,642,624, Sept. 13. Vapors of heavy hydrocarbons such as those of fuel oil in mixt. with H or natural gas or other gas contg. available H are passed through an electrifying zone and then through an independent catalyzing zone which may contain Fe and Al or other catalysts.

Retort for distilling oil shale, etc. H. J. McELVAIN and H. C. McELVAIN. U. S. 1,642,457, Sept. 13.

Device for collecting average samples of liquids passing from oil stills, etc. D. J. ELLIOTT and G. C. JONES. Brit. 261,784, Nov. 21, 1925.

Revivification of fuller's earth used in treating hydrocarbon oil. F. W. HALL. Can. 271,630, June 14, 1927. The occluded coloring matter is removed by treating with a solvent consisting of a large proportion of gasoline and a small proportion of acetone. Can. 271,631 specifies as solvent benzene instead of gasoline.

Lubricant. C. A. MILLER and C. B. KARNS. Can. 272,855, Aug. 2, 1927. A solid lubricant comprises a viscous hydrocarbon oil and sodium stearate in equal proportions, with H_2O and free alkali in quantities of less than 1% each.

Preserving lubricating and transformer oils, etc. F. HOFMANN and M. DUNKEL. Brit. 262,107, Nov. 24, 1925. Darkening and polymerization and sludge formation in oils which are exposed to air at elevated temps. are lessened by the addn. of 5% of $(\text{CH}_3)_4\text{N}_4$, 1% of $(\text{CH}_3\text{O})_3$, 1% of urea or similar small proportions of other compds. such as aldehydes and their condensation products, bases, nitriles, oxamides, acids or their derivs.

Emulsions of bitumens, oils, rubber, etc. G. BAUME, P. CHAMBIGE and D. BOUTIER. Brit. 262,724, Dec. 8, 1925. In making emulsions for treating roads or for other purposes, the operations of melting the raw material, heating H_2O and mixing and emulsifying the ingredients are all carried out in a pitch furnace or other single container.

Bituminous mixture. R. CROSS. Can. 272,245, July 12, 1927. A mastic is composed of a mixt. of asphaltic cement and not less than 10% of a vesicular inorg. material.

Asphalt slabs and sheets. F. C. J. DE BORT. U. S. 1,643,059, Sept. 20. A substantially pure mass of asphalt is poured in heated condition to form a sheet, partially cooled to a plastic condition, and the thickness of the sheet is then gradually reduced and it is smoothed in successive stages and cut into slabs or plates.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Nitrocellulose collodions and celluloid films. ANDRÉ BRÉGUET. *Rev. gén. mat. plastiques* **2**, 215-25, 297-302, 429-35, 507-13, 563-7, 629-43, 679-85(1926); **3**, 71-7, 368-71, 487-98(1927); cf. *C. A.* **19**, 3590.—After a review of the stability and viscosity of nitrocellulose (I) collodions, B. describes in detail an extended series of expts. which he carried out with a view to det. the causes and mechanism of the evolution of I collodions and of celluloid films on aging. The results are presented in tabular form and graphically and are discussed at length. The action of moderate heat and light on celluloid, and particularly on movie films, chiefly brings about a modification in the colloidal structure of the product, without any great change in the volatile matter content or in the N content of the I. This modification is revealed by a progressive fall in the viscosity of the Me_2CO sols. Light and heat cause a similar progressive reduction in the viscosity of Me_2CO collodions of I, which further justifies the assumption that celluloid is a solid colloidal dispersion of I in camphor. Addn. of small quantities of NH_3 , or of $\text{C}_6\text{H}_5\text{N}$ also reduces the viscosity of I collodions with time; but in this case the phenomenon is complicated by a chem. reaction between the added base and I. Fractional pptn. of I *via* Duclaux and Wollmann (*C. A.* **14**, 3154) furnishes a method of following the colloidal modification undergone by collodions or celluloid under the effects of heat or of light. Pptn. of Me_2CO sols. of I by progressive addn. of C_6H_6 generally gave 4 ppts., the 1st 2 having high and the last 2 low viscosities. After moderate action of light or of heat on collodion or on a celluloid film, and also on a movie film which had been worn out by use, the N content of the several ppts. was hardly changed; but on the other hand the proportion of the high-viscosity fraction decreases and the proportion of the low-viscosity fraction increases, and at the same time the viscosity of all the ppts. is decreased. Comparative study of the evolution, under the action of light, of collodions prep'd. from the several fractions obtained by fractional pptn. of a sample of commercial I showed that the evolution of the collodion prep'd. from the 1st fraction is slower than that of the collodion from any of the other fractions. In this connection, the following complementary observations were made: (1) rhodamine regularizes in all cases the evolution of collodion; moreover it noticeably retards the evolution of collodions obtained from the 2nd and 3rd ppts., but exerts no protective action on the collodion prep'd. from the 1st ppt.; (2) an Me_2CO soln. of I is a negative colloid, and the micelles of the collodion prep'd. from the 1st ppt. are the ones which move most rapidly under the effects of the elec. field. The behavior of rhodamine is explained as follows: addn. of rhodamine immediately increases the degree of dispersion quite considerably, but at the same time it retards the reduction in the degree of swelling of the granules; in other words, the Me_2CO -rhodamine system constitutes a new and excellent solvent of I because the latter is highly dispersed and highly swollen when dissolved in the mixt. There is a very decided relationship between the age of cellulose and the properties of the I which is obtained from it (cf. Meunier and B., *C. A.* **19**, 893). The size of the micelles in colloidal I sols. varies considerably, and in connection with each micelle must be considered the degree of polymerization and the degree of swelling, which depends on both concn. and temp. The smallest micelles, which are but slightly polymerized and slightly swollen, contain the simplest I mols.; while the large micelles, which are highly polymerized and highly swollen, contain the most complex I mols. The possibility of fractionating a given I, therefore, seems to depend, at least in part, on the presence, in the raw material used in its manuf., of a whole series of celluloses of different ages. Collodions and celluloid have a reticular structure; the lattice is made up of the large micelles; and the interstices are filled with a dispersion of the small micelles in the I solvent. In the products, the phenomena of aging, which are amplified under the action of heat, light or mechanical treatment, are explained by a disintegration of the lattice following upon the depolymerization and deswelling of the micelles; as the lattice becomes weaker, the phys. qualities of the products are partially destroyed. In order to avoid premature aging of collodions and celluloid, they should be prep'd. from I giving a large amt. of 1st ppt. on fractionation, or better still, they should be prep'd. from this 1st ppt. only. One of the chief impurities causing instability of I is H_2SO_4 , either absorbed or combined as nitrosulfuric esters. The product can be stabilized by neutralizing the acidity of these esters by prolonged washing with hard water (B. and Collin, *C. A.* **18**, 3715), but I thus stabilized is hardly suitable for the manuf. of collodion. The combined H_2SO_4 content of the ppts. obtained by fractionation of I decreases from the 1st to the last fraction: B. infers from this that, during nitration, H_2SO_4 esteri-

fies the secondary alc. groups of cellulose, and HNO_3 then reacts with the sulfuric esters; as the reactivity of the most highly polymerized mol. (which are the ones to be pptd. first in fractionation) is smaller than that of the least polymerized mol., the latter are more completely nitrated than the former. This accounts not only for the higher H_2SO_4 content of the 1st ppt., but also for the fact that this 1st fraction has a very slightly lower N content than the other fractions.

A. PAPINEAU-COUTURE

A new cellulose ester. P. ANIER. *Peintures, pigments, vernis* 4, 376-9(1927).—A brief outline of the properties of benzylcellulose and of the advantages of its application in the manuf. of varnishes and molded plastics.

Cellulose compounds. L. LILIENFELD. U. S. 1,642,587, Sept. 13. A cellulose-xanthic acid is treated with a mono-halogen deriv. of a fatty acid as monochloroacetic acid to obtain a product which forms coatings, etc., insol. in H_2O . U. S. 1,642,588 specifies bringing a soln. of a cellulose-xantho-fatty acid in an aq. liquor into the form of films or threads or other desired artificial material and then effecting deposition of solid material from the soln., e. g., by drying. Cf. C. A. 20, 2411.

Cellulosic composition. E. E. REID. Can. 271,948. June 28, 1927. A compn. contains a cellulose ester and a Bu phthalate.

Cellulose ester. H. HEINMAN and A. BAYERL. Can. 273,515, Aug. 30, 1927. Cellulose to be esterified is subjected to a treatment with lactic acid of 80% strength.

Treating cellulosic materials with sulfuric acid and aliphatic acids. C. DREYFUS. Brit. 262,157, June 6, 1925. Cotton, cotton yarn, cotton fabrics, cotton paper, filter paper, wood cellulose, etc., are treated, with or without heating to substantially above ordinary room temp., with a mixt. of concd. H_2SO_4 and an aliphatic acid such as acetic, formic or propionic, together with not more than 5% H_2O which may be introduced with substances such as ZnCl_2 , Na_2SO_4 or $\text{Al}_2(\text{SO}_4)_3$ as H_2O of crystn. The material may be treated under tension and the acid subsequently removed by dil. NH_3 . After drying, the material may be pressed or calendered.

Alpha cellulose pulp. C. A. BLODGETT and H. H. HANSON. Can. 273,013, Aug. 9, 1927. Sulfite pulp is subjected to an aq. soln. contg. a reactive compd. of S in alk. soln., the sol. products of reaction being subsequently sepd. from the residual cellulosic solids.

Cellulosic capsules or other hollow articles. KALLE & Co. AKT.-Ges. Brit. 262,741, Dec. 14, 1925. Capsules such as those prepd. as described in Brit. 261,047 (C. A. 21, 3462) are given a metallic luster by adding to the starting material mica or mosaic gold or both.

Hydrolysis of cellulosic material. J. LEFRANC. Can. 273,538, Aug. 30, 1927. Finely powdered cellulosic material is mixed with an aq. soln. of a sulfuric compd. of an acid nature; the paste thus obtained is stirred while drying at 100-120° until the H_2O

content is reduced to about 50–60%. The acid substances present are neutralized and the sol. hydrolyzed products are livigisted.

Cellulose fiber. C. DREYFUS. Can. 273,366, Aug. 23, 1927. Material formed from an org. substitution deriv. of cellulose is treated with a soln. which is a swelling agent for the material and contains a metal salt. The material is subsequently treated with Na_2HPO_4 and Na_2SiO_3 to fix corresponding insol. salts in it.

Cellulose fiber. C. DREYFUS. Can. 273,367, Aug. 23, 1927. Material formed from an org. substitution deriv. of cellulose is treated with a soln., including $\text{C}_{10}\text{H}_{14}\text{O}_8$, which is a swelling agent for the material and acts to fix an insol. salt therein. The material is subsequently treated with tartar emetic to increase the effect of the first treatment.

Composition for stiffening and fireproofing cellulosic sheet materials. C. R. FELIX. U. S. 1,643,116, Sept. 20. A compn. suitable for treating paper or cloth is formed of 10% B_2O_3 , Na silicate soln. 1 qt., Na tungstate 46 g. and a stabilizing substance such as H_2BO_3 together with about 2 gals. of H_2O .

Wood pulp. I. G. FARBEINDUSTRIE AKT.-GES. Brit. 262,693, Sept. 17, 1926. In making bisulfite pulp, boiling is continued until no more bisulfite remains as indicated by the Sander test. After completion of the boiling, free SO_2 is blown and absorbed and none is allowed to escape during the boiling. The use of a mixt. of Ca and Mg bisulfites is preferred.

Pulping wood. F. G. RAWLING. Can. 271,900, June 28, 1927. Wood chips are submerged in and heated with an aq. soln. of a normal sulfite and a salt of a weakly ionized polybasic acid at a temp. of 100–125°, after which the chemical treating liquor is removed and the woody material is heated to a higher temp.

Material similar to vulcanized fiber. K. ZARFEL. Brit. 261,959, Feb. 15, 1926. A material suitable for use in stuffing boxes or as an elec.- or heat-insulating material is prepd. by boiling cellulosic fiber with NaOH in a closed vessel, sepg. the liquid, and washing, grinding and compressing the treated fiber.

Fertilizer from sulfite liquor. M. P. NITSCHKE. Can. 271,893, June 28, 1927. A fertilizer is produced from the waste liquors obtained in the manuf. of sulfite cellulose by first liberating the H_2SO_3 from the waste liquors by means of an acid sulfate, for instance, KHSO_4 and recovering the H_2SO_3 for carrying on the process.

Viscose material. J. VOSS and O. SCHNECKO. Can. 271,593, June 14, 1927. Non-transparent, hollow bodies of viscose, which dry up with a glossy surface, are made by dipping the cellulose bodies first into a bath of BaCl_2 and then into a bath contg. a sulfate.

Viscose product. L. LILIENFELD. Can. 272,611, July 26, 1927. Viscose is acted upon with H_2SO_4 contg. at least 55% of $\text{H}_2\text{SO}_4 \cdot \text{H}_2\text{O}$. Can. 272,612 specifies 45–55% $\text{H}_2\text{SO}_4 \cdot \text{H}_2\text{O}$.

Viscose threads. W. H. GLOVER and G. S. HEAVEN. Can. 271,955, June 28, 1927. In the production of viscose artificial threads or filaments, a viscose is used which contains a small proportion of a high-boiling non-solid petroleum substance.

Artificial silk. H. SCHMIDT. Can. 272,495, July 19, 1927. Artificial silk, bands, etc., are manufd. by spinning threads or bringing bands, ribbons, etc., of $\text{CuO} \cdot \text{NH}_3$ -cellulose solns. made from wood pulp, straw, etc., into a bath at a temp. below 30°.

Apparatus for making filaments of artificial silk. BRYLSILKA, LTD. and F. W. SCHUBERT. Brit. 262,369, Aug. 4, 1925. H_2O or other liquid used in the manuf. of artificial silk is cooled and deaerated by vacuum treatment. Cf. C. A. 21, 3129.

Artificial threads. S. A. NEIDICH. U. S. 1,643,080, Sept. 20. A colloid filament is formed by extrusion of a compn. with more than 8% hydrated cellulose, into an aq. coagulating medium contg. H_2SO_4 and of at least 50% greater acidity than usually employed for producing solid filaments; each portion of the filament is allowed to remain submerged in the bath until its exterior is coagulated to form a skin and reversion and termination of moisture from the colloid are continued until the core mass within the skin sep. from the latter and forms a distinct filament and the skin forms a continuous cellular sheath sepd. from but coaxial with the core.

Spinning artificial silk. H. P. BASSETT and T. F. BANIGAN. U. S. 1,642,290–1, Sept. 13. Mech. features.

Paper and paper boards. G. F. BLOMBERRY. Can. 271,472, June 14, 1927. A film of liquid dope constituted of rubber suspended in a slurry of colloidal clay is applied to paper or paper boards.

Paper-making apparatus. N. J. NIKS. U. S. 1,641,986–7, Sept. 13.

Crinkling paper. E. H. ANGER. U. S. 1,643,147, Sept. 20. Mech. features.

Apparatus for pulping and deinking waste paper. O. C. WINSTOCK. Brit. 262,-270, Dec. 10, 1925.

Forming paper from asbestos fiber. J. A. HEANY. U. S. 1,642,495, Sept. 13. Mech. features.

Removable lining shell for Jordan engines. A. L. BOLTON. U. S. 1,642,327, Sept. 13.

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

A new and direct method of testing detonators. LOTHAR WÜHLER. *Z. ges. Schiess-Sprengstoffw.* 20, 145-50, 165 9(1926), 21, 1-5, 35 8, 55-7, 97-9, 121-3(1927).—The method was designed as a simple lab. method for detg. the initiating power of detonators by direct test on a series of samples of a standard explosive desensitized to different degrees. Practical tests of about 5000 detonators showed the method to be uniform and exact. The standard explosive used is TNT carefully recrystallized from a mixt. of 90% EtOH (d. 0.815) and 10% C₆H₆ (d. 0.880) by an exactly prescribed method, washed with solvent, dried and screened, and that portion retained which passes a sieve with 0.85-mm. openings and remaining on a sieve with 0.50-mm. openings. Fifty-g. portions are treated with varying amounts of paraffin oil (d₁₅ 0.890, viscosity 32.1 Engler at 16.4°) in Et₂O soln., the mixt. is thoroughly incorporated and the Et₂O evapd. at 50° with frequent stirring. The paraffin-oil content of the series of TNT samples varies from 1 to 8.75% in 0.25% increments. Uniform crystal size is important since with equal amounts of oil the smaller surface of coarse crystals carries a thicker layer of oil, which results in greater desensitization. This was definitely shown by tests. Two g. of the desensitized TNT is pressed at 100 kg. per sq. cm. in a Cu shell 10 mm. diam × 55 mm. deep, having walls 0.15 mm. and base 0.5 mm. thick. A cavity of proper diam. to receive the detonator to be tested is pressed in the center of the TNT so that the detonator charge is completely embedded in the TNT. The outer shell is placed upright on a Pb plate 40 × 40 × 5 mm., which is weighed before and after the detonator is fired. The wt. of Pb struck out of the plate is detd. in a series of tests on TNT with increasing content of paraffin oil, until a sharp break in the plotted curve of results shows that complete detonation of the TNT no longer occurs. The tests are made at a temp. of about 10°. The min. oil content which permits complete detonation is a measure of the initiating action of the detonator. More than 9% of the desensitizing oil cannot be used as it will exude on pressing the TNT. Where detonators of high brisance demand an explosive of greater insensitiveness, recrystallized trinitroxylenes treated in a similar manner with paraffin oil is used instead of the TNT mixts. The latter are suitable for testing all commercial detonators up to and including No. 8 size. Many tests were made on specially loaded detonators of various types. The use of a detonator shell with deeply indented base does not give an increased initiating effect on the explosive to be detonated, even though such detonators show greater perforating effect when tested directly on a lead plate. Pressing of detonator charges, particularly tetryl and tetranitropentaerythrite, at high pressures (up to 2000 kg. per sq. cm.) gives increased initiating effect. In a comparison of commercial No. 8 detonators, one type charged with 0.9 g. TNT and 0.5 g. Hg(ONC)₂ was compared with another containing 0.85 g. tetryl and 0.3 g. PbN₆-Pb trinitroresorcinate mixt. The former showed an initiating action corresponding to 6.5% paraffin oil as against 9% for the latter.

C. G. STORM

The reliability of methods employed for the measurement of the initiating effect of detonators. M. SUCHAREVSKII. *Der Krieg und die Technik* 1926; *Z. ges. Schiess-Sprengstoffw.* 22, 17.—Commercial and military detonators of various types, made in different countries, were studied to det. the effect of storage in moist air for 45 days, storage in water for 25 days, and heating at 50° for 100 hrs. (8 hrs. per day). Tests made included the sand test, lead-plate test, mail test, Trauzl test, and a test based on Hess's method using TNT desensitized with varying amounts of paraffin oil. S. concludes that (1) Hg(ONC)₂ detonators suffer very little from exposure to moisture, and even from immersion in water, if dried before use; (2) PbN₆-TNT detonators should not be loaded in Cu shells, as the Cu is seriously attacked on exposure to moisture, resulting in 75% failures; (3) PbN₆-TNT or PbN₆-tetryl detonators without trinitroresorcinate are ignited only with difficulty; (4) the use of an inner capsule increases the efficiency of fulminate detonators, as does also a concave depression 5 mm. deep

in the base of the shell; (5) fulminate-tetryl detonators showed the greatest resistance to the effects of moisture and of storage at 50°; (6) the use of an Al shell increases the efficiency of detonators, probably as a result of the heat of combustion of the Al; (7) PbN_6 -TNT (or tetryl) detonators seem to have no marked advantage over fulminate detonators, but the addn. of trinitroresorcinate to the former offers promise; (8) no conclusion can be reached as to the most suitable method for detg. the efficiency of detonators. S. notes numerous objections to the method of Wöhler (preceding abstract), and proposes a method in which the detonators to be tested are used to initiate the explosion of TNT desensitized with from 1 to 5% of paraffin oil and pressed in blocks 31 mm. diam \times 41 mm. high, the effect of the charge in compressing Pb cylinders being noted.

C. G. STORM

A new and direct method of testing detonators by Lothar Wöhler. M. LUPUS. *Z. ges. Schiess-Sprengstoffw.* 21, 213-5, 221-2 (1926).—Controversial (cf. second preceding abstract).

C. G. STORM

The importance of explosives manufacture. PAUL PASCAL. *Army Ordnance* 8, 103 (1927).—An abstract of a review of the explosives industry in France during the war, when 1,200,000 tons of explosives and 300,000 tons of smokeless powder were manufd.

CHARLES E. MUNROE

Fundamental properties of military high explosives. G. C. HALE. *Army Ordnance* 8, 115-6 (1927).—A statement of the properties desired, the reasons why and exptl. means for their ascertainment.

CHARLES E. MUNROE

Explosive ammonium salts. H. KAST. *Z. ges. Schiess-Sprengstoffw.* 21, 205-9 (1926); 22, 6-9, 30-4, 56-61, 77-80, 99-102, 131-5 (1927).—A summary is given of the literature on the formation and properties of NH_4 azide, nitrite, nitrate, chlorate, perchlorate, permanganate, dichromate and trichromate. Values are given for the heats of formation and explosion, explosion temp., sp. energy, detonation velocity, brisance and sensitiveness to shock, friction and heat. For NH_4NO_3 complete detonation could not be obtained, nor could a definite detonation velocity be found by either the chronographic or Dautriche methods. With mixts. of NH_4NO_3 and $(\text{NH}_4)_2\text{SO}_4$ the detonation velocity varied with the cu. d. of the charge, being, for the 60/40 mixt., 1900 and 2430 m./sec. for cu. densities of 0.88 and 0.90, and, for the 70/30 mixt., 2600 and 2860 m./sec. for cu. densities of 0.76 and 0.87. NH_4ClO_4 is not so hygroscopic as the nitrate, but more hygroscopic than KClO_3 . NH_4ClO_4 is more stable in hot storage than NH_4NO_3 , and the decompn. is hastened by the presence of the oxy-chlorine decompn. products. Comparative data are given for the ignition points of KClO_3 and NH_4ClO_4 and NH_4NO_3 , alone and in the presence of certain hydrocarbons, metals, metallic compds. and combustible organic compds. Mixts. of KMnO_4 and NH_4NO_3 may interact to form the very sensitive and explosive NH_4MnO_4 . No definite dividing line can be drawn between explosive and non-explosive mixts. of NH_4NO_3 with other ammonium or alkali salts, as the mode of ignition, degree of confinement, and size of grain are important factors. The use of blasting to break up mixts. of NH_4 salts that have set hard is deprecated.

B. C. A.

Calculation of the "force" and some other essential constants of explosives. NORIHI YAMAGA. *J. Faculty Eng., Tokyo Imp. Univ.* 17, 79-88 (1927); cf. *C. A.* 19, 1630.—With a knowledge of the compn. of the powder and the heats of formation of its constituents, the characteristic consts., such as "force," explosion temp., and sp. vols. of evolved gases, can be calcd. by solving graphically the following 3 equations: $K = [\text{CO}] \cdot [\text{H}_2\text{O}] \cdot [\text{CO}_2] \cdot [\text{H}_2] = (A_c - x) (A_o - A_c - x) / x [A_h - (A_o - A_c - x)]$, $Q_o = 10,110x + A_o q_{o0}$, $(A_o - A_c) q_{H_2O} - q = \int x (C_{CO_2} - C_w - C_d + C_h) + (A_o - A_c) C_w + (A_c + A_h) - (A_h - A_o + A_c) C_h dT$, where C_{CO_2} , C_w , C_h and C_d = sp. heats of CO_2 , H_2O , H_2 and diatomic gases other than H_2 , resp.; A_c , A_o , $2A_h$ and $2A_d$ = at. percentages of C, O, N and H, resp.; x = no. of mols. of CO_2 in the explosion gas; Q = heat of explosion of the powder; and q = heat of formation of the powder. This paper presents graphically the results obtained in the application of these formulas to (1) smokeless powders contg. various percentages of nitroglycerin and volatile matters, (2) smokeless powders of nitrocellulose contg. various percentages of volatile matters and diphenylamine, and (3) nitrocellulose contg. various percentages of N.

CHARLES E. MUNROE

Supposed law of flame speeds. A. G. WHITE. *Nature* 119, 674 (1927).—A reply to letters received from W. Payman and R. V. Wheeler (cf. *C. A.* 21, 2560). J. W. S.

Study of instantaneous evolution of fire-damp. E. LEMAIRE. *Ann. mines Belgique* 27, 849-60 (1927); *Chimie et industrie* 18, 228 (1927).—From a discussion of the explosion theory (Stassart and Lemaire, *Ann. mines Belgique* 15 (1910), CH_4 or CO_2 present as such in the pores of the coal) and of the pressure in the seam theory (originally due to Morin, according to which the evolution of the gas is primarily due to the

orogenic tension of the formation) L. considers that the 2 theories can be conciliated and are not mutually exclusive. According to L. instantaneous evolution of gas from coal may be due to permanent or momentary gas tensions, and particularly: (1) to the amt. of gas contained in the seam (free, dissolved or adsorbed); (2) to the resistance of the seam to total or partial disintegration; (3) to the difference between the resistance of the seam to disintegration and the permanent or momentary gas tension to which it is subjected.

A. PAPINEAU-COUTURE

The Acton bitumen fumes explosion. ANON. *Gas J.* 179, 505-6(1927).—A short-circuited elec. feeder caused the gasification of bitumen in which it was embedded. This gas found its way along a service cable into a nearby shop, forming an explosive mixt. which was ignited in some way and wrecked the shop.

R. W. RYAN

Fire hazards from hydrogen peroxide solution of high concentration. G. AGDE AND E. ALBERTI. *Z. angew. Chem.* 40, 949(1927); cf. *C. A.* 20, 3815.—Expert opinion now reserves the term "high concn. solu. of H_2O_2 " for solns. contg. 45% or more H_2O_2 . The 30% soln. ought not to be so designated. It is preferable to give the actual % of H_2O_2 present.

W. C. EBAUGH

A primer on lacquer spraying (MILNE) 26. Fire fighting in oil refineries (EPPS) 22.

Explosives. A. C. SCOTT. *Brit.* 262,491, Aug. 12, 1925. Explosive cartridges are formed with a charge of $KClO_3$ or $KClO_4$ or NH_4NO_3 , compressed and impregnated with a nitro compd. such as $PhNO_2$, trinitrobenzene, mononitrotoluene, dinitrotoluene, trinitrotoluene, trinitroxylene or picric acid, the distribution of which in the charge may be assisted by addn. of kerosene or other mineral oils (which may have an asphalt base) and xylene. Desensitizing oils such as castor or linseed oil, liquid paraffin, wool fat, or lanolin and "cooling agents" such as nitrates or oxalates or chloride of Na, K and NH_4 may be added (but no NH_4 salt should be used together with a chlorate). Cf. *C. A.* 21, 652.

Preventing explosions in mines. W. E. TRENT. U. S. 1,642,912, Sept. 20. Mine surfaces are treated, for entrapping and retaining coal dust, with a hydrocarbon oil of high b. p. and high flash point.

Blasting cartridge. P. T. McLAUGHLIN and W. ANDERSON. U. S. 1,642,341, Sept. 13. Structural features.

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Reports of research work on the fastness to light of dyestuffs on woolen and worsted fabrics. Introductory note. The British Research Association for Woolen and Worsted Industries. *J. Soc. Dyers Colourists* 43, 253-4(1927).—This paper has been divided into 10 sections so that each piece of work might be given its true significance. I. Comparison of the fading of dyestuffs in tropical and in English sunlight and by artificial light. S. G. BARKER AND H. R. HIRST. *Ibid* 254-61.—The tests show that the present system of artificial fading does not agree in results with those obtained from sunlight, and that there was actually less fading in the tropics than at country stations in England. This discrepancy is attributed to the greater humidity in England. II. Atmospheric humidity and the fading of dyestuffs. J. J. HEDGES. *Ibid* 261-2.—Increase of color loss with increase of humidity is an important variable in fading conditions. It is essential therefore to prescribe a standard humidity for all fading tests. III. Relation between time of exposure and loss of color due to fading. S. G. BARKER, H. R. HIRST AND P. N. LAMBERT. *Ibid* 263-4.—Under standard conditions the loss of color has a direct relationship to the time of exposure. This relation is not linear as color loss in the earlier stages is more rapid than later. In standardization of color fastness sufficient time should be given to the exposure to allow the fading to be in excess of the initial more rapid fading action. IV. Relation between initial depth of shade and loss of color due to fading. *Ibid* 264-6.—The total color loss is the same for all shades; therefore this loss is a much higher percentage of the total color in the pale than in the deep shades. This explains the statement that deep shades are faster than pale shades. V. Effect of ultra-violet radiation on the fading of dyed fabrics. LEONARD HILL. *Ibid* 266-7.—Increased fading occurred with increase of the quantity of ultra-violet radiation both from the point of view of percentage transmitted and the distance further down the spectrum into the ultra-violet region. Moisture increases the fading. For the results to be comparable

with sunlight fading, any artificial fading lamp must transmit to the pattern only such radiation in the ultra-violet as exists in the solar spectrum. Vitaglass is a good filter for this purpose. VI. Transmission of sunlight through glass and its effect on fading of dyestuffs. I. O. GRIFFITH AND R. C. G. JENKINS. *Ibid* 297-9.—Plate glass windows cut out a large amt. of the ultra-violet and almost entirely the far ultra-violet from sunlight, and decrease the luminous portion of the spectrum by at least 10%. Apparent increase in fading power behind glass in some cases is due to other causes, *viz.*, humidity and atm. conditions. Vitaglass stops very little of the solar spectrum and justifies its use in the new fading lamp for rapid tests. Quartz is translucent to all solar radiations, but is costly and difficult to obtain in large even sheets. VII. Radiation from gas-filled electric lamps. GEN. ELEC. CO.'S RESEARCH LAB., LONDON. *Ibid* 299-300.—Radiation from gas-filled lamps for shop lighting carries almost no ultra-violet rays and therefore would cause less fading than direct sunlight. VIII. An exposure cabinet for outdoor fading tests. S. G. BARKER AND H. R. HIRST. *Ibid* 300-1.—A cabinet is described which protects the patterns from dirt, soot and rain. The transparent protective screen in front of the patterns should be of vitaglass which admits the entire solar spectrum. IX. Humidity and temperature tables. *Ibid* 301-2.—These tables give the av. relative humidity and av. temp. for each month in over 50 cities representing all continents. X. The guild trichromatic colorimeter. J. PERRY. *Ibid* 159; cf. C. A. 21, 2079. L. W. RIGGS

Fastness to rubbing and washing of Naphthol AS dyes. W. ROIGER. *Z. ges. Textil. Ind.* 1925, 654; *Melliands' Textilber.* 7, 787(1926).—The fastness to rubbing and washing shown of Naphthol AS dyes (cf. Kielbasinski, C. A. 21, 2987) is improved most satisfactorily by completely removing excess of the naphthol soln. from the surface of the textile material before coupling with the diazotized base, but improvement may also be effected by the addn. of 2-4% of Verapal or 0.2-0.4% (calcd. on the wt. of soln.) of Cycloran to the soap and soda soln. used for soaping the dyed material. The addn. of tannic acid has a similar effect but darkens the resulting shade. B. C. A.

Practical hints on the production of bright colors on textile fabrics. XXIX-XXXII. RAFFAELE SANSONE. *Am. Dyestuff Rept.* 16, 408-10, 419-20, 445-50, 479-80, 532-5 (1927); cf. C. A. 21, 2800.—These papers are mainly descriptions of plants, machinery and factory processes. L. W. RIGGS

Discussion of some (modern) tinctorial processes. MARCEL BADER. *Rev. chim. ind.* 36, 182-90(1927).—Discussion and explanation of the reactions involved in dyeing by means of ice colors and vat dyes. A. PAPINEAU-COUTURE

Is digallic acid as a mordant for basic dyes identical with tannin? P. P. VIKTOROV. *Z. angew. Chem.* 40, 922-5(1927); cf. C. A. 21, 824.—Comparative expts. were made on the mordant action of tannin and digallic acid. It was found that *m*-digallic acid (prepd. according to Fischer) is absorbed by cotton (3 g.) in 1% soln. (50 cc.) to an extent of from 16.2 to 19.2% of the initial amt. present in 1/2 up to 24 hrs. Tannin absorption by cotton appears from the literature also to increase with time. Comparative dyeing expts. with both substances using a variety of basic dyes (1% soln. of mor. ant., 0.125% dye of fiber weight for 1/2 hr., fixation with 0.5% tartar emetic) gave closely parallel results. It is concluded that the tannin action is due to the digallic acid liberated from this substance. This conclusion is substantiated by a recalcn. of data of Sanin (*Ber. Ges. Ford. d. Text. Ind. Moskau* 1908 and 1909) on the relative amts. of tannin and tartar emetic used in dyeing. The possible mordant action of Turkish tannin, pentagalloyl- β -glucose, as compared with Chinese and Japanese tannin (pentadigalloyl- β -glucoses), an open question. B. J. C. VAN DER HOEFEN

Dyeing cotton-wool and cotton-silk mixtures with Sirius colors. PAUL RABE. *Melliands' Textilber.* 8, 693-4(1927).—The special fastness of the Sirius colors adds to their desirability for union dyeing. At the boil, Sirius Yellow 5G, GG and G, Red BB and 4B, Rubin R, Bordeaux 5B and Brown GR dye wool and cotton evenly, while wool is dyed less than cotton by Yellow R, RR and T, Orange 5G, G and GR, Scarlet B, Rubin B, Rose BB and G, Red Violet R and B, Blue B, 6G, BRR and G, Brown G, GR and R and Grey G and R. For two bath union styles, certain Sirius colors have practically no affinity for wool. These may with advantage be applied at 20-30° with the addn. of Na₂SO₄ and Na₂CO₃, or at 50-70° with 2 to 3% Katanol W. For silk unions, soap and Na₂CO₃ restrain the affinity for the silk and temps. of 60-70° are possible. In one bath work on half-silk, level baths are obtainable with Sirius Yellow 5G, GG and G, Rubin R, Violet BL, Red BB and 4B, Red Violet BBL and Brown G and GR. E. R. CLARK

Use of Neolan colors in wool and silk printing. H. BERNHARD. *Melliands' Textilber.* 8, 699-702(1927).—The Neolan dyestuffs are Cr derivs. of *o*-oxyazo colors. Ap-

plied to wool from strongly acid baths, they yield fast shades, superior in brightness to those obtainable from the Cr mordant dyes. Silk, differing from wool, is advantageously dyed with these products from baths acidified with HCOOH or AcOH rather than with H_2SO_4 . Weighted and unweighted silk are dyed to the same depth, and silk dyed with the Neolan colors does not lose luster and handle as when Cr mordanted. These properties make fast prints on silk more practical than heretofore. Discharge styles are produced with $\text{Na}_2\text{S}_2\text{O}_4 + \text{HCOOH}$ prepns. Illustrative samples are affixed. E. R. C.

Palatine fast colors for wool-dyeing. J. NUSSLEIN. *Melliands' Textilber.* 8, 708-9 (1927).—This (cf. preceding abstr.) is another series of fast wool colors dyed in strongly acid baths (8-10% H_2SO_4), showing the properties of the Cr mordant dyes without the faults due to mordanting. Samples are affixed. E. R. CLARK

Colored naphthol AS discharges. F. STRENG. *Melliands' Textilber.* 8, 708-9 (1927).—The discharging of a dyeing made with a Naphthol AS-D ground coupled with Fast Red KB Base, with Rongalit and Indanthrene Golden Orange GK is typical of many possibilities. Several such combinations are illustrated by samples. E. R. CLARK

Chroming of wool and silk by steaming. Dyeing in colors with chroming. JOS. POKORNY. *Rev. gén. mat. color.* 31, 212-5, 249-52 (1927); cf. *C. A.* 17, 212.—The author's paper of 1921 is reviewed and applications of the alkali chrome mordant to the dyeing of cotton are described. Specifications from sealed notes are quoted showing the application of the chromate method and steaming to the dyeing of wool and silk. The present paper is largely a plea for the practicability of the method and for the author's priority. L. W. RIGGS

The "soluble vat" dyestuffs on acetate silk. C. E. MULLIN. *Am. Dyestuff Rept.* 16, 575-8 (1927).—A description is given of these dyestuffs with formulas and methods used in dyeing and printing acetate silk and cotton-acetate silk union materials. Six methods for handling these dyestuffs are described in detail. L. W. RIGGS

Bleaching and dyeing knit goods without detriment to their structure. GEORGE RICE. *Am. Dyestuff Rept.* 16, 578-9 (1927). L. W. RIGGS

Function of enzymes in bleaching and dyeing. GEORGE RICE. *Am. Dyestuff Rept.* 16, 555-6 (1927).—The topics discussed are the soln. of starch and gums by aid of enzymes, rapidity of action, production of "diastase" and "polyzyme," and the mech. operation of the goods during enzyme treatment. L. W. RIGGS

Bleaching with hydrogen peroxide. H. G. SMOLENS. *Am. Dyestuff Rept.* 16, 545-9 (1927).—Seven specifications of H_2O_2 for bleaching purposes are stated. Since H_2O_2 may act as a reducing agent in acid solns. and thereby cause many undesirable reactions to the injury of the goods, it is necessary that the bath be kept continuously alk. Five specifications of the alkali are given, the choice of alkali depending to some extent on the acids present with the H_2O_2 . During bleaching the bath must be controlled from time to time so that the alkali does not combine chemically or act physically on the material being bleached. Directions are given for the avoidance of underbleaching, overbleaching, harshness and spoilage. L. W. RIGGS

Bleaching straw for braids. SHUMPU UTAKE. *Repts. Imp. Ind. Research Inst. Osaka, Japan* 7, No. 11, 1-27 (1927).—Various reagents and factors in bleaching straw for braids have been studied in detail and optimum conditions for each reagent detd. NAO UYEI

Chemical theory of the dyeing of cotton. PAUL BARY. *Tiba* 5, 847-53 (1927).—Cellulose is essentially amphoteric, possessing OH groups replaceable by acid radicals (formation of cellulose esters) and H atoms replaceable by metals (formation of alkali celluloses). In strongly acid medium cellulose has a tendency to give off OH^- and acquire a + charge; in alk. (or weakly acid) medium it has a tendency to give off H^+ and acquire a - charge. As the isoelec. pt. of cellulose is at a fairly low p_{H} , it forms esters more readily than alkali celluloses. Most of the cotton dyes are substantive (e. g., Congo red) and form collo-electrolytic solns., i. e., though they are crystn., their solns. contain undissoc. micellas of the type $(\text{Na}_2\text{R})_n$, the same micellas dissoed. into negative granules and Na^+ , simple undissoc. mol. of the type Na_2R , and the same mol. dissoed. into R^- and Na^+ . The dyeing of cotton is attributed to a combination between the dye and the fiber, as for wool and silk, but differs from the latter in 2 particulars: (1) the isoelec. pt. of cellulose is such that it combines more readily with acids than with alkalies; (2) the dyes which can be fixed by cotton consist almost exclusively of compds. contg. numerous acid radicals, giving rise to complex soly. phenomena with simultaneous presence of dissoed. and undissoc. simple and polymerized mols., each class having a different electrolytic dissoen. coeff., which varies with temp., concn., etc. This latter property accounts for the fact that the amt. of dye fixed is not proportional to

the mol. wt. of the dye (since the true mol. wt. of the solid cryst. dye is unknown), and that complete exhaustion of the bath cannot be obtained. A. PAPINEAU-COUTURE

Spontaneous production of a pink coloration on bleached cotton. J. PINTÉ. *Tiba* 5, 863(1927); cf. C. A. 21, 2066.—Cotton bleached with $\text{KMnO}_4\text{-Na}_2\text{SO}_3\text{-Na}_2\text{O}_2$ turns pink, as does that bleached with hypochlorites, though to a less extent but only in the presence of traces of acid, particularly formic acid. A. PAPINEAU-COUTURE

Bleaching and dyeing of viscose stockings with cotton tops, toes and heels. P. CUYVELEY. *Tiba* 5, 973-9(1927).—Detailed description of the technic to be followed together with a no. of dyeing formulas. A. PAPINEAU-COUTURE

Preparation of raw materials for the manufacture of brushes, etc. BORSTER-BRISTLE. *Tiba* 4, 1047, 1049, 1307-17, 1437-47(1926); 5, 27-33, 301-5, 565-9, 823-5(1927).—A detailed description of the chem. treatments of hog bristles, etc.

A. PAPINEAU-COUTURE

The physicist and wool fiber. H. A. GOODMAN. *Am. Dyestuff Rept.* 16, 579-80(1927).—A review of the work of Speakman and others. L. W. RIGGS

Specific action of the various acids on wool. C. E. MULLIN. *Am. Dyestuff Rept.* 16, 515 20, 550-4(1927); cf. C. A. 21, 499.—A review of the sp. action of H_2SO_4 , HCl , H_3PO_4 , HNO_3 , H_2CrO_4 , HOAc and $\text{C}_{14}\text{H}_{10}\text{O}_4$ on wool fiber. Tables of ionization consts. of the various acids at different temps. are quoted, and the amt. of acid combined with wool at various H-ion concns. is shown. L. W. RIGGS

The chemical analysis of cotton. Action of hot dilute sodium hydroxide solutions on modified cotton cellulose. D. A. CLIBBENS, ARTHUR GEAKE AND B. P. RIDGE. *J. Textile Inst.* 18, 277-87T(1927); cf. C. A. 21, 2192.—Oxycelluloses suffer a fall of viscosity in cuprammonium solns. when boiled 6 hrs. in 1% NaOH soln., and differ in this respect from hydrocelluloses and normal-bleached cotton. The amt. of viscosity change varies with the manner in which the oxycellulose is formed but is very great for neutral hypochlorite oxycelluloses, the most frequently occurring type of technically oxidized cotton. An exactly similar behavior is observed when the alkali boil is replaced by treatment used in the detn. of the Cu number (Braid's method). This test for the nature of modification may be made by comparing the viscosity of a sample of cotton with that of the material remaining after the detn. of its Cu no. The enhanced Cu nos. of modified celluloses are reduced on the av. to $1/3$ of their original value as a result of 6 hrs. treatment with boiling 1% NaOH under atm. pressure, and to about 0.1 by a similar treatment at 20 lbs. per sq. in. excess of pressure. Generally methylene blue absorption of modified cellulose rises in consequence of alkali boiling. This rise appears to be connected with the concurrent fall of Cu no. The percentage loss of wt. by modified cottons on boiling 4 hrs. with 1% NaOH at ordinary pressure is about 6 times the Cu no. when the latter does not exceed 2.5. For modification which results in a Cu no. greater than 2.5, hydrocelluloses experience a greater and oxycelluloses a smaller loss of wt. than corresponds with this relation, and the divergence increases with increasing cellulose modification. L. W. RIGGS

Hygroscopic properties of cotton and its charred products. S. V. GORBACHEV AND E. N. VINOGRADOVA. *Biochem. Z.* 186, 413-8(1927). S. MORGULIS

The sizing of textiles. G. BRUGÈRE. *Russa* 2, 687-91(1927).—Brief discussion of the function of sizing of textiles, particularly viscose and silk yarn, and of the relative merits of dry and aq. sizes, with an outline of the proper method of carrying out the operation. A. PAPINEAU-COUTURE

Desizing with activin. RICHARD FEIBELMANN. *Melliands' Textilber.* 8, 714-5(1927).—According to the recommended method, a soln. contg. 0.2 to 0.3% each, on the weight of cloth, of activin and Na_2CO_3 is circulated through the cloth while maintained at 80° . Colored yarns in bleach fabrics are not affected, and tensile variations parallel those experienced in the more common forms of desizing treatments. E. R. COOLEY

Balancing process steam and power in a coated-fabric plant. L. C. COOLEY. *Chem. Met. Eng.* 34, 551-3(1927). E. H.

Coated textiles. HAMILTON BRADSHAW. *Ind. Eng. Chem.* 19, 1109-10(1927).—The three principal types of coated textiles are the pyroxylin, or so-called "artificial leather," the linseed oil and the rubber-coated fabrics. The chem. problems involved in the industry and its important contributions to the present-day automobile are discussed. RUBY K. WORNER

Mothproofing fabrics and furs. A consideration of the procedures that have been proposed by others and a description of a new process. L. E. JACKSON AND HELEN E. W. GERRARD. *Ind. Eng. Chem.* 19, 1175-80(1927).—A report of the work carried on under the Multiple Industrial Fellowship established by the Mundaetchnical Society of America at the Mellon Institute of Industrial Research. Of the chemicals and mixts. of chem-

icals studied, only the cinchona alkaloids and their derivs. have the following necessary properties for effective clothes-moth repellents: They are inodorous, adhere evenly and can be put on like dyestuff, are unnoticeable, do not dust off, do not affect adversely the phys. properties of the fiber, can be made sol. in inexpensive org. solvents as well as in H_2O , are non-toxic to human beings, are excellent clothes-moth repellents, and are economical to use industrially.

Phormium tenax (New Zealand flax). P. DE SORNAY. *Rev. agr. Maurice* 4, 55 (1927).—A brief outline of cultural practices and the prepn. of fiber from this plant is presented. It could probably be grown profitably in Mauritius. RUBY K. WORNER F. W. ZERBAN

Anthraquinone derivatives (Brit. pat. 262,119) 10. Preserving vegetable oils [for use in coatings for fabrics] (Brit. pat. 261,863) 27. Composite yarns of ramie or rhea and artificial silk (Brit. pat. 262,256) 30. Bleaching pulp or other fibrous material (U. S. pat. 1,642,978) 18. Composition for stiffening and fireproofing cellulosic sheet materials (U. S. pat. 1,643,116) 23.

PANNIZON, GIACOMO: Guido per il tintore moderno. Milan, 1927: Ulrico Hoepli. 706 pp. 32 lira. Reviewed in *Rev. prod. chim.* 30, 570(1927).

Dyes. I. G. FARBENINDUSTRIE AKT.-GES. Brit. 262,457, Dec. 4, 1925. Thio-indigoid dyes are prep'd. by condensing 4,5,6,7-tetrahalogen-3-hydroxy-1-thionaphthene with a cyclic α -diketone such as isatin, 2,3-diketodihydrothionaphthene or a substitution product or reactive α -deriv. The products may be further halogenated. They dye cotton from the vat violet to brown shades.

Dyes. I. G. FARBENINDUSTRIE AKT.-GES. Brit. 261,769, Nov. 19, 1925. Azo dyes are made by coupling a diazo component with a coupling component, at least 1 of the components contg. 1 or more carboxylic ester groups (excepting the dyes described in Brit. pat. 243,758 (C. A. 21, 179) and in Brit. pat. 256,272 (C. A. 21, 2989) and those obtained by coupling diazo salts of aminobenzoic ester with 1,8-hydroxynaphthalene-4,6-disulfonic acid and by coupling diazo salts of anthranilic ester with β -naphthol. The dyes may also be made by esterifying the free COOH group or groups in finished azo dyes contg. such groups. Numerous examples are given and dyes may be obtained, from different components, suitable for pigments, or for dyeing wool, silk or cellulose acetate, or having the character of substantive dyes.

Dyes. I. G. FARBENINDUSTRIE AKT.-GES. Brit. 261,770, Nov. 19, 1925. Azo dyes suitable for dyeing fibers of all kinds and for use in making lakes are made by coupling a diazo comp'd. with a 1-(4'-chloro-5'-methyl-2'-sulfo-) phenyl-5-pyrazolone, in which the 3-position is substituted by a methyl, carboxylic or carboxylic ester group. Several examples are given. The pyrazolones used may be obtained by condensing the corresponding hydrazine with an ester of acetoacetic or oxaloacetic acid (employing a mild non-sapon. agent such as Na_2CO_3 when the carboxylic esters are desired).

Dyes. I. G. FARBENINDUSTRIE AKT.-GES. Brit. 262,141, Nov. 28, 1925. Thiazole derivs. of 1,4-naphthoquinone are obtained by condensing 2-amino-3-mercapto-1,4-naphthoquinone with an aldehyde such as benzaldehyde, glyoxal, 1-naphthaldehyde, *or*-tetrahydronaphthalene-1-aldehyde, 4-aminobenzaldehyde, 4-dimethylaminobenzaldehyde, 2-chloro-4-dimethylaminobenzaldehyde or terephthalic aldehyde. The intermediate products first obtained pass into thiazoles by the action of atm. O and may be used directly for vat dyeing. 2-Amino-3-mercapto-1,4-naphthoquinone is obtained by treating 2-amino-3-chloro-1,4-naphthoquinone with Na sulfide.

Dyes. BADISCHE ANILIN & SODA FABRIK. Brit. 262,030, Oct. 9, 1925. Isodibenzanthrone dyes are obtained by treating Bz 1-chloro- or Bz 1-bromo-benzanthrone or other Bz 1-halogen benzanthrone having a free 2-position with metal arylides such as K anilide or Na anilide and Me anilide. Examples are given for the production of dyes giving violet shades on cotton. Directions for prepg. the starting materials are given.

Dyes. SOC. ANON. POUR L'IND. CHIM. A BALZ. Brit. 262,774, Dec. 8, 1925. Violanthrone is chlorinated at temps. above 80° in the presence of $PhNO_2$ or other liquids which are not miscible with H_2O , to introduce at least 3 atoms of Cl into the mol. The products yield marine-blue dyeings which are fast to H_2O . S chlorides as well as Cl may be used for the chlorination, which may be effected at $135-40^\circ$.

Dyes. BADISCHE ANILIN & SODA FABRIK. Brit. 261,888, Oct. 9, 1925. Bz-1-Chlorobenzanthrone or other Bz 1-halogenbenzanthrone having free 2-positions are

treated with mixts. of caustic alkalies and alkali alcoholates, *e. g.*, KOH and PrOH, in the presence of C_6H_6 or other inert diluents.

Azo dyes. BRITISH DYESTUFFS CORPORATION, LTD., M. MENDOZA and K. H. SAUNDERS. Brit. 262,243, Nov. 13, 1925. The *m*-diamines obtained by reducing the dinitrosulfones resulting from the condensation of the sulfonic acids derived from *o*-oxyarylcarboxylic acids with aromatic dinitro compds., contg. a labile halogen atom, as described in Brit. pat. 245,865 (*C. A.* 21, 504) are used as end components in the manuf. of azo dyes. Several examples are given of dyes which dye wool from an acid bath orange and brown shades becoming fast to milling when after-chromed.

Chromium compounds of azo dyes. I. G. FARBENINDUSTRIE AKT.-GES. Brit. 262,418, Dec. 1, 1925. The dyes are heated with salts of trivalent Cr, with or without pressure, in the presence of dissolved salts of metals which are not known to form metal compds. with the dyes other than salts of sulfonic or carboxylic groups present in the dye. The dye from diazotized 4-nitro-2-aminophenol-6-sulfonic acid and β -naphthol may be heated in an autoclave with a soln. of Cr formate and NaCl to obtain a product which dyes wool fast black.

Chromiable brown disazo dye. W. NEELMEIER, T. NOCKEN and W. REBNER. U. S. 1,643,222, Sept. 20. By coupling 3-diazo-5-sulfo-2-hydroxybenzoic acid with 1-naphthylamine-6-sulfonic acid, rediazotizing the monoazo dye formed and coupling with salicylic acid, there is obtained a dye which when printed on cotton with Cr compds. yields fast brown shades.

Treating effluents from dye works. P. MAHLER. Brit. 262,382, Dec. 3, 1925. Effluent solns. are decolorized with activated C and the latter is revived for reuse. A pptg. agent such as milk of lime and alum or Fe or Cr salts may be used to assist the decolorization and settling of the C. The C is added at or immediately after the formation of the flocculent ppt. The C may be revived by a chlorate or HCl and may be lixiviated to recover the dye.

Benzanthrone derivatives. I. G. FARBENINDUSTRIE AKT.-GES. Brit. 261,757, Nov. 17, 1925. Halogen substitution products of benzanthranyl-mercaptans, -sulfides and -disulfides or their derivs. are condensed with a phenol, a mercaptan, or an alc. Condensation products thus formed yield vat dyes when treated with alk. condensing agents. Dibromobenzanthranyl sulfide (made by melting dibromobenzanthrone with Na disulfide) is condensed with PhOH in the presence of K_2CO_3 and the product subjected to EtOH potash fusion to produce a dye giving bluish violet shades on cotton from the vat. By using β -naphthol instead of phenol a dinaphthoxybenzanthranyl sulfide is obtained which on alkali fusion yields dinaphthoxyisodibenzanthrone which also dyes cotton blue-violet. Dibromobenzanthranyl sulfide and *p*-cresol form a condensation product which when fused with EtOH potash yields a dye dyeing cotton reddish blue. Cf. *C. A.* 21, 2907.

Colored coating compositions containing nitrocellulose. BRITISH DYESTUFFS CORPORATION, LTD., H. JACKSON and D. CARTER. Brit. 262,601, Dec. 18, 1925. Uni- or multi-colored effects are produced on materials by bringing them into contact with solns. of celluloid or other nitrocellulose compn. contg. pigments or other colors and floating on H_2O .

Dyeing. I. G. FARBENINDUSTRIE AKT.-GES. Brit. 262,476, Dec. 7, 1925. Fibrous material is treated with a free amine such as aniline, H_2O and a solubilizing agent such as the Na salt of diisopropyl-naphthalenesulfonic acid or *N*-dibutylanilinesulfonic acid and then oxidized. The process is applicable to various dyeing and printing processes.

Dyeing and printing textile materials. AKT.-GES. FÜR ANILIN-FABRIKATION. Brit. 262,537, Sept. 17, 1925. The material is impregnated with an azo coupling component and a nitrite and treated in a sep. bath with an acid in the presence of a diazotizable amine. The process is applicable to cotton, cellulose acetate and similar materials. Several examples and modifications are described.

Dyeing furs, skins, hairs and feathers. O. KALTWASSER and H. KIRCHHOFF. U. S. 1,643,246, Sept. 20. Material to be dyed, in the presence of an oxidizing agent such as H_2O_2 and NH_3 , is treated with a soln. of diamino-2-hydroxynaphthalene obtained by dinitrating naphthalene 1,2-diazoxide, carefully treating the product with Na sulfide, and then reducing the NO_2 groups. Brownish dyeings are obtained.

Treating cloth with dyeing, bleaching or other liquids. C. H. CROWELL. U. S. 1,643,360, Sept. 13. A web of fabric such as sheeting is stretched and passed over a carrier roll and treated with material such as an aq. dyeing, bleaching or coating soln. which is forced into the material while on the carrier roll; the damp-treated fabric is rolled into a bundle roll while in peripheral contact with the carrier roll to prevent lateral

shrinkage of the fabric. U. S. 1,642,361 relates to an app. for drying, of the steam drum type.

Dyeing artificial silk and other materials. HEBERLEIN & Co., AKT.-GES. Brit. 261,792, Nov. 21, 1925. The process for varying the dyeing properties of vegetable fibers, described in Brit. pat. 255,453 (C. A. 21, 2805), is applied to various kinds of artificial silk which after this treatment loses its affinity for substantive dyes and acquires affinity for basic dyes. "Acetate silk" is particularly susceptible to the treatment. Brit. 261,793 specifies treatment of vegetable fibers or artificial silk with a halogen compd. of P in connection with either a preceding or a following treatment with alkali and with an intervening washing (and in some cases drying). Brit. 261,794 specifies a treatment of either vegetable fibers or artificial silk by a similar process in which treatment with a halogen compd. of P is effected in the absence of an alkali but in some cases in the presence of CaCO_3 or other salt or compd. which neutralizes liberated acid. "Acetate silk" thus treated acquires an affinity for basic dyes, while viscose is made insensitive to substantive dyes.

Apparatus for treating artificial-silk yarns with liquors for washing, bleaching, dyeing, etc. J. BRANDWOOD. Brit. 261,778, Nov. 20, 1925. For treatment with liquors under pressure or vacuum, the yarn may be wound on a bobbin formed of rods and end flanges of material resistant to corrosion such as Monel metal, ebonite or bakelite or varnished material. Brit. 261,779 also relates to app. in which similar bobbins may be used with circulating liquor.

Dyeing with aniline black. G. ARIS. U. S. 1,643,233, Sept. 20. Textile material to be dyed is treated with a bath contg. both aniline and an azo aromatic compd. such as an azo deriv. of aniline, toluidine or xylidine which is used in about 2% or less the quantity of the aniline and serves to increase the affinity of the color for the fiber dyed.

Dyeing cellulose acetate. G. H. ELLIS. U. S. 1,641,965, Sept. 13. A vat dye of the anthraquinone series is applied to the material in the unreduced state and is solubilized by a pretreatment, e. g., with Na sulfocinnolate. Cf. C. A. 21, 1361.

Dyeing cellulose acetate, etc. BRITISH CELANESE, LTD., AND G. H. ELLIS. Brit. 262,506, Sept. 7, 1925. In dyeing or printing with vat dyes fabrics contg. cellulose acetate with or without other materials such as cotton, the strong alkalies such as usually employed are replaced wholly or in part by salts of aromatic hydroxy derivs. such as Na or K phenates, cresolates, xylanolates, catecholates, resorcinates, guaiacولات, quinolates, α - and β -naphtholates, Na *p*-chlorophenate and di-Na leucoanthraquinonate. Numerous details are given.

Dyeing cellulose acetate. J. W. LEITCH & Co., LTD. AND A. E. EVEREST. Brit. 261,822, Aug. 11, 1925. Dyeing is effected by treatment with a soln. or suspension of a dinitroamino compd. in which the NO_2 groups are disposed adjacent to and at each side of the NH_2 group, e. g., 4-amino-3, 5-dinitro-1-methylbenzene, 4-amino-3, 5-dinitro-1-chlorobenzene or 1-methyl-3,5-dinitrodiaminobenzene. The dyeing is selective, cotton or "viscose silk" remaining undyed, and dyeing may be effected with or without heating. Production of yellow, orange and red shades is described and details are given.

Patterned effects on fabrics. HEBERLEIN & Co. AKT.-GES. Brit. 262,477, Dec. 5, 1925. Nitrated vegetable fibers are used in weaving fabrics and the fabric is then locally treated with an alkali so that the nitrated threads can be subsequently removed by heating and steaming.

Printing fabrics containing acetylcellulose. BRITISH DYESTUFFS CORPORATION, LTD., AND L. SMITH. Brit. 262,254, Nov. 25, 1925. White or colored discharge effects are produced on materials formed in whole or in part of acetylcellulose by adding thiocyanates to the usual Na formaldehyde sulfoxylate discharge printing pastes. Several examples are given.

Waterproofing textile materials and paper. C. J. MORETON AND WATERPROOFERS (MORETON'S PROCESS), LTD. Brit. 262,605, Dec. 24, 1925. A H_2O -proofing compn. comprises a soap-like emulsion together with Karaya gum. Textile materials may be treated with this compn. and subsequently treated with a soln. of Ti sulfate, ZnSO_4 , or alum. Paper may be passed through the emulsion and then calendered or the emulsion may be added to the pulp from which the paper is manufactured. Cf. C. A. 21, 2070.

Bandages or other fabrics with non-fraying edges. W. SPONHOLZ. Brit. 262,034, May 11, 1926. Threads of artificial silk are woven into (or laid upon) a fabric at places where edges are to be formed by cutting and these threads are caused to adhere by treatment with a solvent such as acetone or EtOAc .

Mercerizing yarns and fabrics. E. GMINDER. Brit. 262,154, Nov. 30, 1925. In mercerizing or similar operations of swelling by acids or alkalies, the material is cooled

in the stretching zone by passing over well-cooled surfaces, to avoid the decomp. effect of the heat otherwise developed.

Apparatus for mercerizing fabrics. MASCHINENFABRIK BENNINGER AKT.-GES. Brit. 262,343, June 24, 1926.

Conditioning textile fibers by oil atomized with steam under pressure. R. B. SMITH. U. S. 1,642,092, Sept. 13.

26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

Oxys. V. Oil films considered colloid-chemically. A. EIBNER AND H. MUNKERT. *Chem. Umschau Fette, Oele, Wachse u. Harze* **34**, 183-9, 206-11(1927); cf. C. A. **21**, 2071.—An examn. of various 6 months' old oil films and of their drying oils is discussed, with tables of analysis.

	Wood oil	Linseed oil	Boiled linseed oil	Wood oil film	Tokyoil oil film	Linseed film	Boiled linseed film	Boiled eleostearic acid film
I no.	151.1	173.5	63.7					
Acid no.	3.8	2.3						
Sapon no.	193.3	191.5						
Hexabromide no.		50.7						
% sol. in ether and alc.				60	86	36	64.5	76
% sol. in ether and alc.				40	14	64	35.5	24
% sol. in hot H ₂ O				2.5	2.0	4	3.5	(acetone)
% sol. in ether				10.5	8.0	10	8.0	
% sol. in alc.				27	4.0	50	24.0	

The ether-sol. portion of the films consisted largely of satd. fatty acids, while the alc.-sol. portion contd. mostly hydroxy-glycerides. Kept in a closed bottle a linseed-oil film became a brown sirup in 2 yrs.; boiled linseed oil films and boiled wood oil films remained essentially unchanged after 7 yrs. The % of sol. and insol. portions in young dry films is tabulated:

Film	Drying time	% sol.	% insol.	% insol after 6 months
Fresh wood oil	1½ days	85	15	60
Tokyoil	1-2 hrs.	83	17	86
Fresh linseed oil	7 days	72	28	36
Boiled linseed oil	12 days	50	50	64

These films are solid solns., formed by a flocculation reaction; the amt. and nature of the gels vary with the oil and the sols are glycerides of β -eleostearic acid (in wood oil) and α - and β -linolic acid (in linseed oil). Wood oil dries more rapidly at low O₂ absorption because it gelatinizes more readily than linseed oil and keeps absorbing O₂ through its surface up to a 14% increase in wt., followed by no essential decrease. Linseed oil gelatinizes less readily and dries therefore at max. oil absorption (17.5%) and decrease in wt. follows. Analysis of the wood oil film exts.: (1) H₂O ext. acid no. 82.2, I no. 3.68. (2) Alc. ext. acid no. 123.74, sapon no. 205.9, ester no. 82.2, I no. 3.68. (3) H₂O ext. acid no. 90.13, sapon no. 203.37, ester no. 113.3, I no. 2.00. A wood oil film 6 months' old, was placed in a closed jar where it developed a sharp acid odor after 2 weeks and became sticky. Microscopic, ultra-microscopic and Röntgen ray examn. could be practiced more extensively in connection with paint films. P. ESCHER.

Automobile finishing. H. C. MOUGEY. *Ind. Eng. Chem.* **19**, 1102-3(1927).—The relation of the chemist to the paint and varnish industry is reviewed. Black baking enamels and lacquers for automobiles are discussed, advantages of lacquer over varnish both, and further work for the chemist is pointed out. R. J. MOORE.

Cellulose varnishes and paints for automobiles. MAURICE DESCHIENS. *Rev. gen. mat. plastiques* **3**, 233-6, 297-300, 437-9, 498-501(1927).—A discussion of their raw materials, properties, compn., prepn., applications and mode of applying.

The application of water japan. W. J. MISKELLA. *Fuels and Furnaces* **5**, 1203-6, 1927).

A primer on lacquer spraying. W. D. MILNE. *Quarterly Nat. Fire Protection*

Assoc. 21, 55-72(1927).—A summary of hazards in spraying pyroxylin lacquers, regulations, fire record classified as to causes, and a discussion of the effectiveness of sprinkler operation in connection with lacquer and varnish spraying fires. It is accompanied by a record of 19 such fires leading up to the \$2,000,000 Briggs body plant pyroxylin lacquer fire. C. L. JONES

Synthetic resins. A. V. H. MORY. *Ind. Eng. Chem.* 19, 1106-9(1927).—An address covering the use of phenol condensation products in the automotive industry. General properties and applications of the resins are reviewed, together with the forms in which a large class of resin materials is offered to the fabricator of finished parts. Future possibilities are discussed. R. J. MOORE

Proper fusing of enamel vital. F. W. MANKER. *Iron Age* 120, 531-4(1927).—A brief illus. description of enameling and japanning operations at the plant of the Detroit-Michigan Stove Co., Detroit, Mich. Three coats of enamel are usually burned on at temps. varying from 760° to 870° in 3-5 min., by gas with the air supply regulated by venturi-meter proportioners. Temps are regulated by automatic pyrometer controls. Japanning is conducted at about 232° for approx. 50 min. W. H. BOYNTON

The oleo-resinous secretory system of the maritime pine. H. DEVAUX AND A. BARGUES. *Bull. inst. pin.* No. 37, 131-5(1927); *P. I. A. Abstracts* 1, 1(1927).—The location and movement of resinous secretions were studied by staining secretions taken from a year-old twig with suitable stains. The oleo-resinous secretion is not entirely localized in the cells that border the secretory canals, but is a property of all the living cells of the stem except those that produce tannin. The living parenchyma of the medullary and cortico-bast regions communicates with the secretory canals by means of the medullary rays, which, with their elongated cells and delicate walls, are so constituted as to allow the passage of the oleo-resin to the canals. The secretion is acid only in the canals, and is neutral in all the other living portions. The change does not actually occur until the resin reaches the canal, although a premature change sometimes occurs in the cells immediately bordering the canals. The finding of neutral substances in the cells bears out the work of Dupont (*C. A.* 19, 648), who suggested the presence of a neutral (probably aldehydic) parent substance, or "mother of resin," in the tree. A. PAPINEAU-COUTURE

The process of flow of turpentine (oleo-resin) from some species of the conifer family. A. E. ARBUZOV. *Bull. inst. pin.* No. 37, 137-9(1927); *P. I. A. Abstracts* 1, 1-2(1927).—A method of collecting oleo-resins without loss of volatile constituents was devised, consisting essentially in removing the dead bark, boring a hole 4 cm. in diam. and 1.5 cm. deep through the cambian layer, and immediately inserting an Fe pipe with side tube leading to a graduated tube. Working on *Pinus sylvestris*, in the state of Kasan (Russia), A. found that the period of flow is represented by a parabolic curve, and practically ceases after 11 hrs. He does not consider the oleo-resin has any cicatrizing action on wounds in trees. Measurement of the pressure in the resin canals by means of a Hg manometer gave values of up to 3.5 atm. (and the true values are probably even higher than indicated), max. pressure being usually obtained after 3-4 hrs. Measurements at different heights showed a decrease in pressure from base to top, which was attributed mainly to a general lack of oleo-resins in the resin canals. Measurements on a recently felled tree showed only a weak pressure, which rapidly fell to zero. With firs the rate of flow was found to be much slower (5-6 days required to reach a max.), and the max. pressure observed was 2 atm. A. considers that the pressure developed in the resin canals is due to the tension of the turgescient tissues which surround the canals, and that the greater yields obtained during periods of low barometric pressure are really due to the increased humidity that usually accompanies such a condition. This, together with a longer growing season, probably accounts for the better yields obtained from *P. maritimus* of France than from *P. sylvestris* of Russia. The oleo-resin obtained crystd. quickly, despite efforts to prevent it, but no other apparent changes occurred. Crystn. occurred more quickly in moist than in dry weather, presumably owing to lower temp. The oleo-resin as it exists in the resin canals is thought to be a supersatd. soln. of solid resin acids in terpenes. A. P. C.

Composition of the turpentine (oleo-resin) of *Pinus sylvestris*. B. A. ARBUZOV. *Bull. inst. pin.* No. 37, 140-2(1927); *P. I. A. Abstracts* 1, 2-3(1927); cf. preceding abstract. —A study of the oleo-resin collected as described above. The colorless viscous filtrate sepd. from the cryst. portion of the resin had n_D^{20} (100-mm. tube) —12.44° to —18.62°, coeff. of rotatory dispersion (α_1/α_0) 2.16-2.61 and contained 50% turpentine. After carefully warming at 140-50° to redissolve all the cryst. ppt. the whole resin had n_D^{20} —33.89° to —60.97° and contained up to 37% turpentine (steam and vacuum distn. gave identical results). The turpentine contained 87% α -pinene and no β -pinene. The

rotatory dispersion of the 1st fractions (80–90%) was const. at 1.97, and is suggested as a test for the quality of Russian turpentine, but would probably not be suitable for turpentine contg. much β -pinene. α -Pinene obtained by repeated fractionation b_{767} 155.7° and had d_{20}^{20} 0.8580, $[\alpha]_D + 40.79^\circ$, α_1/α_0 1.969. α of the rosin varied with temp. of distn., quality of the oleo-resin and nature of solvent used: $[\alpha]_D$ and α_1/α_0 of the pure rosin (no solvent) were -10.44° , 2.68; in EtOH soln. -4.96° to -74.70° , 2.37–2.52; in C_6H_6 -3.73° , 2.52, resp. The white, cryst., powdery mass sepd. from the oleo-resin as collected had $[\alpha]_D$ (in alc.) -60° to -94.5° , m.p. 118–30°, α_1/α_0 2.37, α_2/α_1 1.168. On keeping in a glass-stoppered bottle the cryst. portion turned yellow and acquired a sour odor. $[\alpha]_D$ (in C_6H_6) immediately after filtration and at the end of 11.5 months changed from -41.69° to $+12.86^\circ$. The solid portion of a sample of oleo-resin that had been kept in a cork-stoppered bottle for 41 yrs. had $[\alpha]_D$ (in C_6H_6) -45.89° , α_1/α_0 2.37.

A. PAPINEAU-COUTURE

Contribution to the study of abietic acid. Influence of water and of solvents on the rotatory power of abietic acid: a physico-chemical study of the question. G. DUPONT, G. ROUTIN and J. DUBOURG. *Bull. inst. pin* No. 38, 157–62 (1927); *P. I. A. Abstracts* 1, 15–7 (1927).—Previous work by D., R. and D. has shown that ordinary abietic acid exists, not as the anhyd. $C_{20}H_{30}O_2$, but probably as the more complex hydrated form $4C_{10}H_{16}O_2 \cdot H_2O$. Cryoscopic measurements have shown that it exists as a double mol. in C_6H_6 soln. Results of vapor-pressure measurements on solns. of fused abietic acid in various solvents are given, and the effects of diln. in various solvents on the α of abietic acid are shown graphically. In each case the cryst. acid has greater l -rotatory powers, which might be due to the formation of a slight amt. of d -pyro-abietic acid during fusion or to absence of H_2O which seems to increase the l -rotation. The α was found to be practically unaffected by a variation in concn. in the case of solns. in C_6H_{12} , petroleum ether and CCl_4 . The variation in values obtained with the other solvents is attributed to mol. association in the solvent and subsequent disson. of the complex mol. on diln.

A. PAPINEAU-COUTURE

Linoxyn and linoleum. A. D. LUTTRINGER. *Caoutchouc & gutta-percha* 24, 13,636–9, 13,668–72 (1927); cf. *C. A.* 21, 2808.—Large-scale app. and equipment are described.

C. C. DAVIS

Electrolytic white lead (ANON.) 4. A new cellulose ester [for the manufacture of varnishes] (ANIEF) 23. Enamelled leather (Brit. pat. 262,780) 29. Artificial masses, lacquer, etc. (Can. pat. 272,494) 18.

SABIN, ALVA HORTON: **The Industrial and Artistic Technology of Paint and Varnish.** 3rd ed., revised and enlarged. New York: John Wiley & Sons, Inc. 459 pp. \$5.00; 25s.

SABIN, ALVA HORTON: **Red Lead.** How to Use It in Paint. 3rd ed., revised and enlarged. New York: John Wiley & Sons, Inc. \$2.00; 10s.

SABIN, ALVA HORTON: **White Lead.** Its Use in Paint. 1st ed. New York: John Wiley & Sons, Inc. \$1.25; 5s. 3d.

Paint. J. BLUMENFELD. Can. 272,238, July 12, 1927. A liquid coating material is prepd. by adding to Ti_2O_3 and linseed oil a metallic O_2 compd. which is capable of reacting with acids to liberate H_2O_2 .

Submarine paint for ships, etc. E. GIOVAGNOLI. Brit. 262,486, Dec. 7, 1925. Boiled oil and oil varnish are used with turpentine, beeswax, zinc white, resin, natural cement, "liquid para" and As_2O_3 .

Lithopone. W. C. HOOGY. Can. 271,610, June 14, 1927; Brit. 263,119, Dec. 15, 1925. In the manuf. of lithopone, the end point of the reaction between the $ZnSO_4$ soln. and the BaS soln. in the pptg. step is detd. by testing the filtrate of a sample of the crude pulp for OH and SH radicals.

Lithopone. W. C. HOOGY. Can. 271,611, June 14, 1927; Brit. 263,120, Dec. 15, 1925. In the manuf. of lithopone, the alky. of the finished lithopone is controlled to a desired extent by establishing in the crude pulp at the end point of the pptg. step such a predetd. excess of and ratio between the OH and SH radicals as will give the desired alky. to the finished lithopone after calcination.

Coating with nitrocellulose lacquers. WOLFF & CO. AND H. SCHULZ. Brit. 262,440, Dec. 4, 1925. A preliminary binding layer which adheres firmly to wood, metal or other surface, and which contains nitrocellulose having a N content above 12.6%

and incomplete ether-alc. soly. is first applied, and overlying coatings of different character may then be applied.

Forming inlaid linoleum. C. F. HUMPHREYS and J. C. MCCARTHY. Brit. 261,950, Feb. 2, 1926. Mech. features.

Filler for wood and metal. A. HINZE. Can. 272,153, July 5, 1927. A filler compn. for wood and metal is composed of 45-65 parts of a filler base, 8-15 parts of a soft resin, and a volatile solvent of the resin. Cf. C. A. 20, 3242.

Coating composition. J. M. KESSLER. U. S. 1,642,155, Sept. 13. A coating compn. suitable for use on metal or other surfaces comprises a fused fossil resin such as kauri, congo, or copal 100 together with solvents and a softener comprising China wood oil and linseed oil, 20-25 parts.

Synthetic resin. J. MCINTOSH and E. Y. WALFORD. U. S. 1,642,078, Sept. 13. An initial condensation product is formed from glycerol and PhOH or other suitable phenolic compd. and the initial condensation product is subjected to further condensation in the presence of a hardening agent such as $(CH_2)_6N_4$ to obtain a solid infusible product. U. S. 1,642,079 (J. MCINTOSH) specifies the production of a dense infusible product insol. in alc., acetone, C_6H_6 and other ordinary org. solvents.

Purified rosin. W. B. LOGAN. U. S. 1,643,276, Sept. 20. In order to render wood rosin more suitable for use as a substitute for gum rosin in sizes, etc., it is heated to about 150-160° until the "nigre" is rendered sol. in solvents for rosin.

Purifying liquid rosin. L. H. BJÖRKGREN, G. U. SELANDER and J. H. MELLQUIST. Can. 272,392, July 19, 1927. Liquid rosin is dissolved in benzine and HCl is introduced, and the soln. is exposed to the action of fuller's earth. The ppt. is removed and the benzine driven off.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

What is a refined oil? HERMAN ASPGREN. *Oil and Fat Ind.* 4, 298-303 (1927).—This is a discussion of the impurities and specifications of the N. Y. Produce Exchange, the New Orleans Cotton Exchange and Interstate Cottonseed Crushers Assoc. From the manufacturers' point of view the expression "refined oil" is a broad definition and means quite different qualities from those it represented 20 or 40 yrs. ago. E. S.

Contribution to the chemical study of (oil-bearing) Malvaceae. J. PIERAERTS. *Mat. grasses* 18, 7611-4, 7640-3, 7667-9 (1926); 19, 7724-8, 7752-4, 7778-80, 7808-13, 7834-6, 7882-5, 7890-3 (1927).—The investigation was concerned primarily with the specificity of the Halphen test. Analyses of a large number of different kinds of seed oils (obtained by hot, and by cold extn. with anhyd. Et_2O) were made. Conclusions. (1) Halphen's reagent is characteristic of Malvaceae, rather than merely of Malvaceae; (2) contrary to Ubbelohde, Malvaceae do not all give a positive Halphen test; (3) no Tiliaceae give the test, but all Bombaceae give it very strongly; (4) some members of the genus *Hibiscus* give positive and others negative tests, and similarly with the genus *Sida*; (5) the negative results given by Samarkand cottonseed oil must be due to the age of the seed examd.; (6) all Sterculiaceae (except those belonging to *Theobroma* and *Cola* genera) give very intense Halphen tests; (7) nearly all the Bombaceae and Sterculiaceae oils are non-drying. Analyses are given of various parts of the plant *Heritiera littoralis*, Ait.

A. PAPINEAU-COUTURE
Solvent extraction of the soy bean. A. K. SCHWARTZ. *Oil and Fat Ind.* 4, 284-8 (1927).—The process described was developed in Germany and has been in operation for 10 years. It is based on the principle of continuous operation and counter-current flow and is divided into 3 semi-independent units: extn. proper, solvent recovery from extd. meal, and oil recovery or distn. unit. The extractor is a large bucket elevator, the buckets having false bottoms and filled from a hopper above the extractor, while at the highest point of their flight. They descend on the right side, being simultaneously treated with oil solvent effluent obtained from the left side of the extractor. In the ascending side the material is treated in counter-current with fresh solvent. The bucket ascending past the solvent zone goes through a draining period and upon again reaching its highest point is dumped in a hopper below, from which it is delivered to the drying app. The whole is enclosed in an iron casing. The drying app. consists of a series of specially designed, jacketed tubes, within which the meal is heated and steamed. After traveling the full length the meal is delivered through a lock as finished meal. Evaporators, fractionating columns, heat exchangers, H_2O separator, surface

condensers and an oil scrubbing tower for solvent recovery from vented air constitute the recovery unit. A mixt. of benzene and alc. is used. The alc. enables the recovery of vegetable phosphatides. A table of 6 months operation is given representing 8000 tons. Extd. meal analyzes 8.60 to 15.53% H_2O , 0.40 to 0.90% fat, 47.20 to 48.45% protein, 3.53 to 5.0% fiber and 5.10 to 5.4% ash. No solvent is left in the meal and it is used for human consumption and commands a premium over pressed soy meals. E. S.

Experiments on sunflower seed oil. H. F. FRENCH AND H. O. HUMPHREY. Missouri Univ. Eng. Expt. Sta., *Bull.* 25, 27 pp. (1926).—A study was made to det. the industrial uses of sunflower seed oil. KOH proved the best bleaching agent followed by a method using fuller's earth and activated C. The oil has a disagreeable odor when heated and smokes at a low temp. Steam distn. did not improve the taste, nor make it suitable for salad oil. Partial hydrogenation of the purified and steam-distilled oil gave a product which was satisfactory as a frying oil. It was not satisfactory as a drying oil. It dried slower than linseed oil and is not suitable for paints. J. J. SKINNER

Tea-seed oil and its uses as an adulterant of olive oil. H. A. CAULKIN. *Pharm. J.* 118, 769-70; 794; *Chemist & Druggist* 107, 39-40 (1927).—J. COFMAN-NICORESTI. *Pharm. J.* 119, 58 (1927).—The phys. and chem. const. of 4 samples of tea-seed oil (1), pressed or extd. from seeds, are recorded. However, neither these const. nor the proposed color tests for A (cf. C. A. 14, 2099; 16, 1019) permit detection of the adulteration of olive oil with A. C.-N. points out that olive oil is now low in price compared with A, which precludes its present use as an adulterant. He upholds the usefulness of his color test. S. WALDBOTT

"Aouara." ANON. *Bull. agence gén. colonies* 19, 1180 (1926); 20, 73 (1927); *Bull. Imp. Ind.* 25, 157 (1927).—"Aouara" is the name applied by the natives of French Guiana to the palm, *Astrocaryum aculeatum*, Mey., which is the "Tucum" of Brazil or "Tucumua" of British Guiana. The fruit contains 23.3% pericarp, 52.5% shell and 24.2% kernel. The pericarp contains 9.3% H_2O and 34.38% of brown semi-solid oil (by extn.) m. 22-3°, d_{20}^4 0.887, sapon. no. 184. The oil-free pericarp contained 9.75% protein on the dry basis. The kernel (3.8% H_2O) contained 24.5% of white to creamy-white solid fat m. 32°, acid no. 1.18, sapon. no. 211-4, I no. 9.56-10.0, unsapon. matter 0.6%, Reichert-Messl no. 0.6, d_{17}^4 0.915. The meal from the extn. of fat from the kernels contained 6.65% of proteins on the dry basis. A. PAPINEAU-COUTURE

Dry rendering of animal products. R. P. BENNETT. *Oil and Fat Ind.* 4, 275-83 (1927). The dry-rendering process has the following advantages over the wet-rendering system and has therefore become popular in a short time: (1) the dry system is far more rapid, its products are more valuable; its products are of higher grade; it requires less labor, it requires less machinery, power, and steam; it requires less floor space; it requires less investment; it is simpler and it is odorless and clean. E. SCHERUBEL

Advantages of purely absorptive carbon in decolorizing. J. P. HARRIS. *Oil and Fat Ind.* 4, 273-4 (1927).—While there is no complete bleaching agent for cottonseed oil without a catalytic action tending to oxidation, there is a non-acid, vegetable activated decolorizing C, which produces decolorizing by pure absorption. It possesses a strong affinity for resins, albuminoids, phosphatides, mucilaginous matter, and natural pigmentation. Temp. has little effect upon it and it can be used below 180° F. No flavor is imparted to the oil. E. SCHERUBEL

The bleaching action of bleaching earths (clays) upon oils. GUSTAV KEPPELER. *Angew. Chem.* 40, 409 (1927).—Supplementing Neumann and Kober's article on the same subject (C. A. 21, 2811), it is shown that clays contain certain colloidal humus substances, that these are concerned in the bleaching action, and that they are altered or destroyed when exposed to high temps. The change in the bleaching power of a clay at high temp. is therefore to be considered as due to the above action rather than to a change in the adsorptive qualities of the clay. W. C. EBAUGH

Determination of some physical constants of oils from marine animals. HENRI MCKELET. *Compt. rend.* 185, 455-7 (1927).—Heats of combustion, flash points, fire points, sp. grs., fluidities and viscosities are tabulated for 29 marine oils. E. R. S.

Reply to J. Davidsolhn's remark on "Detection of fish oils." MITSUMARU TSUJIMOTO. *Chem. Umschau Fette, Oele, Wachse u. Harze* 34, 217 (1927).—The cause of D.'s failure to detect fish oils by T.'s method lies probably in the use of a faulty reagent, D. used I in ICl; the reagent should not contain an excess of I but rather an excess of Cl. Additional tests confirmed the conclusions in T.'s former publication (C. A. 21, 661). P. ESCHER

Deodorizing menhaden fish oil. E. E. RANDOLPH. *J. Elisha Mitchell Sci. Soc.* 42, 1 (1926).—A successful method for deodorizing menhaden oil consists of gently heating it with CH_2O and a small proportion of HCl and then blowing superheated

steam through it. An acid with the formula $C_{17}H_{33}O_2$ was sepd. from this oil and is thought to be the chief cause of the fishy odor. A. L. MEHRING

The quality of the fish oils from the standpoint of the hardened oil industry of Japan. II. The sardine oil. SEI-ICHI UENO AND KIYOJI YASUHARA. *J. Soc. Chem. Ind. (Japan)* 30, 348-50(1927).—The characteristics of 75 samples of the commercial sardine oils of Japan are given in a table. The oils had d. 0.927-0.933, n_D^{20} 1.479-1.481, sapon. values 187-197, I values 160-190, acetyl values 18-30, and Hehner values 95-96. The Reichert-Meissl value was always under 1.0. The acid value was irregular, but generally lower than that of the herring oil. From the values obtained, the commercial sardine oils often contain some herring oils. Y. NAGAI

The hardened fats. A. BOURGOM. *Bull. fed. ind. chim. Belg.* 6, 305-10(1927).—A survey. A. L. HIENNE

Notes on titer test of fatty acids. L. A. SPIELMAN. *Chemist-Analyst* No. 47, 7; *Chem. Zentr.* 1926, II, 1705.—The method is that of the Am. Assoc. Agr. Chemists. Heat the glycerol-KOH mixt. to 150° in a 1. Erlenmeyer flask, instead of a dish or beaker, add the melted fat and saponify completely. Dissolve the resulting soap by adding hot water and siphon off the aq. soln. upon which the fatty acids floats. Wash the acids and titrate in the usual manner. W. T. H.

Sulfonated oils and the technical preparations made from them. H. POMERANZ. *Seifensieder-Zig.* 54, 272-3, 289-90(1927).—By a modified Grün method of sulfonating oil with $ClSO_3H$ P. converted castor oil into a product completely sol. in H_2O , highly resistant toward acids Ca, Mg and electrolytes but unsuited for Turkey red oil on account of its yellow tint. A pure sulfonic acid product from pure ricinic acid and $ClSO_3H$ formed in H_2O a glassy transparent solid gel. P. suggests that 2 mols. of $ClSO_3H$ split off HCl, the SO_3 adds to the double bond and the product is hydrolyzed to an acid contg. the group $-(HO)CHCH(SO_3H)-$. This assumption harmonizes better with the facts than the older theories. P. ESCHER

Fat splitting by means of naphthasulfonic acids. G. S. PETROV, S. I. DIMAKOV AND F. T. TAKSA. *Seifensieder-Zig.* 54, 163-6, 182-4, 204-5, 221-2, 241-2, 261-2, 284-5(1927).—Naphthasulfonic acids are formed during the refining of petroleum distillates with concd. or fuming H_2SO_4 , when dehydration, sulfurizing, sulfonation and polymerization occur. Treatment of the sludge with more H_2SO_4 seps. the oily constituents, which are washed with dil. alc. or acetone, and from the latter soln. the sulfonic acids are extd. Technical sulfonic acids are viscous and transparent, sol. in alc., ether, C_6H_6 and H_2O , producing a lather on shaking. When heated, they dissolve 80-90% mineral oil and then form permanent emulsions. Naphthasulfonic acids from solar oil have the formula $C_{20}H_{33}SO_4$ and are satd. monosulfonic acids, used as a Twitchell reagent for splitting fats. *Effect of varying quantities of "contact" reagent in splitting coconut oil.*—The highest yield of free fatty acids (91.2%) is obtained with 2% reagent and 0.45% H_2SO_4 at the end of 10 hrs. with a H_2O : oil ratio of 0.4 to 1.6; increase of reagent to 10% does not increase the yield of free acids but slows down the reaction at times. Sweet H_2O settles well up to 0.9% reagent, then forms emulsions from 1 to 5%, and seps. again from 5 to 10%. *Effect of varying the amt. of H_2SO_4 .*—The highest yield was obtained with 0.50% H_2SO_4 , with a H_2O : oil ratio of 1.05 to 1.15; greater amts. of H_2SO_4 do not go parallel to the yield. Factory yields for tallow, palm oil, bone grease and coconut oil are tabulated; they range under varying conditions from 83.4 to 94.5%. Addition of sulfates of Ba, Na, or Ca retard the reaction in sunflower oil at below 100°. The presence of metallic Pb, Zn, Fe or Al retards the reaction at 85° with sunflower oil, and part of the metal is found in the ash of the fatty acids. *Temperature.*—There occurs little splitting at 60° but it increases to 85% yield at 90°. A comparative test of mechanical stirring against direct steam stirring showed slightly in favor of steam. The use of Ba, Al or Ca naphthasulfonates diminished the yield, especially during the 2nd period. A portion of the fatty acids was mixed with neutral fat, some H_2SO_4 added and the operation continued; the newly split acids gave a measure of the splitting power, and the results showed that the greater part of the sulfonic acids had migrated into the fatty acids and caused splitting. In using "Contact" reagent without any H_2SO_4 the following results were obtained: 1%, 2% and 3% reagent yielded 39.3, 40.18 and 90.06% fatty acids with sunflower oil, while 2 and 3% yielded 77.48 and 92.61%, resp., with tallow. *After-darkening of the fatty acids.*—Up to 91% yield the "Contact" reagent does not darken the fatty acids any more than the autoclave method with Zn and ZnO ; the dark color is considerably bleached by washing with 15-20% H_2O contg. 0.05-0.10% Na_2CO_3 . The dark color increases with increasing H_2SO_4 , and still more with increasing sulfonic acid content in the fatty acids, probably by re-forming H_2SO_4 . Fe salts greatly darken the color. The key for light color

of the product lies in the use of a pure reagent and of well purified oil. By adding some color-absorbing agent to the "Contact" reagent, acids of the same color are obtained as by sapon. though not equal to the color of the original oil. Comparing "Contact" reagent from various sources with "Idrapid" agent: "Idrapid" agent is not a 100% sulfonic acid and its H_2SO_4 content is higher than that of the "Contact" reagent from American and Russian oils, and without any extra H_2SO_4 it can split only oils that have been purified by H_2SO_4 , forming SO_2 esters and retaining some free H_2SO_4 . A tabulation of the N content of oils commonly split shows variation between 0.012 and 0.024% N. Sunflower and linseed oils were purified with varying strengths of H_2SO_4 and then split. The results show that the drying and semi-drying oils which have been purified by alkalis are unfit for "Contact" splitting and that the best results are obtained on oils purified by 20–50% (of the oil) of 1–5% H_2SO_4 or by HCl. Cleavage of coconut oil in the presence of 6–50% free glycerol showed after 4 hrs. only 78.48 to 57% yield as against 82.11% under normal conditions. Addition of equal parts of stearic or oleic acid to sunflower or linseed oil retards the reaction still more than glycerol. Cleavage by "Contact" reagent is due to hydrolysis speeded up by the 2 catalysts H_2SO_4 and sulfonic acid assisted by the emulsifying power of the latter. Salts which neutralize emulsification or acidity are detrimental. Stirring may be accomplished by direct steam or with a mechanical stirrer. Increase of H_2SO_4 does not increase the reaction in oils contg. satd. fatty acids but increases it in oils contg. unsatd. acids. Oils should be purified with dil. acids. The H_2O used for cleavage should be free from Ca, Mg and Fe. P. E.

Glycerol content and specific gravity of glycerol lyes. WILLY PRAGER. *Chem.-Ztg.* 51, 589–90(1927).—Stiepel's formula is discussed. The sp. gr. of glycerol lye depends on the glycerol content, the ash, and the org. residue, and in the formula the latter is disregarded. Results compared with actual detns. show that the formula is inaccurate.

E. SCHERUBEL

Complete saponification in the manufacture of soap base. C. STIEPEL. *Seifensieder-Ztg.* 54, 360(1927). HANS PIEPER. *Ibid* 375–6.—Comments on the work of Davidsohn (C. A. in print). Reply. J. DAVIDSOHN. *Ibid* 376, 414. P. ESCHER

The analysis of soap. L. V. DOUAU. *Rev. parfumerie* 7, 327–31(1927).—Brief outline of the usual methods of analysis.

A. PAPINEAU-COUTURE

Flake soap and washing compounds. J. H. FRYDLENDER. *Rev. prod. chim.* 30, 561–4, 601–7(1927).—Descriptive of mfg. methods, properties and methods of analysis.

A. PAPINEAU-COUTURE

The finishing of grained soaps by the tongue test. R. KRINGS. *Seifensieder-Ztg.* 54, 581–2(1927).—By means of the tongue test a practical soap boiler will pronounce 0.2 to 0.3% free NaOH in the kettle charge as being a mild excess; 0.3–0.6% as medium to strong; 0.6–0.8% as strong and 0.8–1.0% as a very strong excess of alkali.

P. ESCHER

Determination of potassium and sodium in pure shaving soaps. W. OTT. *Seifensieder-Ztg.* 54, 584–5(1927).—When a shaving soap contains no mineral filler, the % K_2O and % Na_2O can be detd. by the method of "indirect analysis" from the % fatty acids, their mean mol. wt., and the % ash ($K_2CO_3 + Na_2CO_3$).

P. ESCHER

Acetin and dichromate methods for glycerol analysis. O. SACHS and K. RIEMER. *Z. deut. Oel Fett. Ind.* 46, 739–40(1926).—Referring to Prager's article (C. A. 20, 3827) and R. cite examples from routine factory control in which parallel analyses by the acetin and dichromate methods of concd. glycerol from well-purified lyes furnished practically identical results, the acetin method receiving preference.

Catalytic transformation of triglycerides. CHRISTIAN VAN LOON. Dutch 16,708, Aug. 15, 1927. Internal ester rearrangements in fats and oils are performed by the catalytic effects of (1/2 to 1%) metal salts (Cd, Sn, Zn, etc.), Na ethylate, sulfonic acids, etc., at temps. around 200° to 250° and reduced pressure if necessary.

Reaction products from cashew-nut shell oil. M. T. HARVEY. Brit. 262,184,

Nov. 28, 1925. Reaction products varying from jelly-like materials to hard rubber-like products are formed from the oil found in the shell surrounding the kernel of the cashew nut and glycerol. Reaction may be induced by heat or by the action of H_2SO_4 or other acids or by NH_3 . The reaction products, including vulcanized products, are sol. in solvents such as CS_2 , naphthol, $PhOH$ and C_6H_6 and form tough elastic films when a soln. is spread on a surface and dried at 100° . Cf. *C. A.* **21**, 3476.

Preserving vegetable oils. G. E. SCHARFF and NOBEL'S EXPLOSIVES CO., LTD. Brit. 261,863, Sept. 3, 1925. Vegetable oils used in coatings for fabrics, paper, etc., (and which may be assocd. with nitrocellulose, camphor, and pigments or fillers) are preserved by the addn. of about 2% of an aromatic non-hydroxy-nitro compd. such as dinitrotoluene, dinitrobenzene, nitronaphthalene or dinitrochlorobenzene.

Sulfo-aromatic fatty acids. G. PETROFF and P. SIESTAKOFF. U. S. 1,642,595, Sept. 13. In order to obtain products suitable for use in splitting fats, impure sulfo-aromatic fatty acids such as those from $C_{10}H_8$ are dissolved in a mixt. of benzene and C_6H_6 , the sulfo-aromatic fatty acids are extd. from the soln. by adding an aq. soln. of $EtOH$ or other alc. of low mol. wt., the mixt. is allowed to stand, the aq. layer of sulfo-aromatic fatty acids in soln. is sep'd. and the acids are recovered from the soln., e. g., by evapn.

Soap. A. WELTER. Can. 272,139, July 5, 1927. A durable air-resisting soap is produced by adding a fat solvent and pulverized calcined soda, whose content of H_2O does not exceed 30% of its wt., to highly split or distd. fatty acid, the quantity of soda being sufficient but not more than double the amt. required for sapon. These ingredients are intimately mixed until a perfectly uniform soapy mass results, to which grain soap or soap paste is added and the product milled. Cf. *C. A.* **21**, 2813.

Soap. H. H. VON KORNATZKI. Can. 271,920, June 28, 1927. Succinic soap is produced by adding to an ordinary fresh soap mixt. spirit, essential oil and an aq. soln. of succinic acid.

Soap tablets. C. DAVIS. Brit. 262,178, Sept. 2, 1925. A casing of starch and froth-producing material such as soap or cetylsulfonic acid or other froth-producing material contains a filling which may comprise glycerol, Na perborate and talc or other vegetable, animal or mineral emollients.

28- SUGAR, STARCH AND GUMS

F. W. ZERBAN

Future development of the sugar industry (Mauritius). H. A. TEMPANY, *et al.* *Rev. agr. Maurice* **4**, 100-21 (1927).—A report on measures to be taken, on the basis of exhaustive economic data for Mauritius and other countries producing cane sugar.

F. W. ZERBAN.

Manufacture of "extra fine" sugar. J. DE SPEVILLE, *et al.* *Rev. agr. Maurice* **4**, 121-31 (1927).—Calcs. are given in the form of tables, showing the cost of and profit to be derived from the manuf. of different grades of white sugar, and of raw sugar, taking into consideration only the operating costs, but not the cost of first installation.

F. W. ZERBAN.

Improvements in chemical control. LOUIS BAISSAC, *et al.* *Rev. agr. Maurice* **4**, 132-43 (1927).—Practically all the Mauritius sugar factories have some sort of chem. control, but even in the best of them the methods used leave much to be desired. Java and Hawaii get much better yields, because of stricter control; in Mauritius the results could also be greatly improved by the introduction of modern methods. It would pay to engage more chemists and to install a system of mutual control based on uniform methods.

F. W. ZERBAN.

The luminescence of sugar and sugar-house products. K. ŠANDERA. *Z. Zucker-ind. czechoslovak. Rep.* **51**, 237-45 (1927); *Listy Cukrovar.* **44**, 569 ff. (1925-6).—The soln. was placed in a test tube in a box, and was illuminated at an angle of 45° by ultra-violet light. It was viewed at 90° to the incidence of the ultra-violet. The intensity of the fluorescence was measured by inserting glass slips of equal thickness between the source and the sample until the sample matched a standard. Standard A was quinine-HCl, one part to two million parts of H_2O . Standard B (10% molasses) had a fluorescence 22 units greater than A, and was taken as zero in the work on sugar-house products. Detns. were made at several concns., plotted on log. paper, and extrapolated to 100° . Refined beet sugar had a fluorescence of 3 at 0.1%, rising in a smooth curve to 40 at 100% . Cane sugar showed higher fluorescence. Colonial sugar was higher

at low concns., passed through a max., and was lower (25-35) at 100°. Thirty samples of refined sugar were measured direct, but no correlation was found between fluorescence and ash (cf. Lundén, *C. A.* 20, 305). For the same sugar the finest fractions had a fluorescence of 10, while crystals of about 1 cu. mm. were as high as 40. Molasses absorbed ultra-violet, noticeably in layers 0.006 mm. thick, and 100% in a layer 5 mm. thick. This accounts for the low fluorescence of dark-colored sugars or fine grain. Refined sugar showed a noticeable phosphorescence 3-6 sec. after removing the source of ultra-violet light, raw sugars much less, and molasses none. The fluorescence of sugar-house products increases regularly from diffusion juice to molasses. Fusca coloring matter had no fluorescence. Colloids obtained from molasses by dialysis had a strong fluorescence in aq. or ether-alc. soln. The fluorescent substance may be obtained by extg. raw sugar or molasses with concd. AcOH, evapg. in vacuum, extg. with CHCl₃, evapg. to dryness, and extg. with Et₂O. A few drops of this soln. added to refined sugar causes a brilliant fluorescence. Simple condensation products of amino acids, also products formed by the action of alkali on invert, showed strong fluorescence. Thin sections of sugar crystals were examd. under the microscope and fluorescence was found only in the surface layers. Since, to a certain extent, fluorescence follows the non-sugars, the examn. of a sugar in this way may be of practical value. W. L. B.

Evaluation of sugar house products by measurement of fluorescence. HARALD LUNDÉN. *Z. Zuckerind. czechoslovak. Rep.* 51, 304-6. K. ŠANDERA. *Ibid* 323-4(1927).—Polenic regarding the above article. W. L. BADGER

Improved methods of sugar cane cultivation in North Bihar. WYNNE SAYER, KASANJI D. NAIK, AND HARDAVAL SINGH RANDHIROT. *Agr. J. India* 22, 5-16(1927).—Under Bihar conditions the sucrose content of the juice was increased 0.31-0.88% by planting the cane in October as compared with cane planted in February. K. D. J.

Purchasing cane. H. A. TEMPANY. *Rev. agr. Maurice* 4, 155-8(1927).—Cane is generally purchased in Mauritius on the basis of a fixed no. of kg. of sugar per ton of cane. Under these conditions the factories pay too much when prices are low, and too little when prices are high. The scale of prices should be revised; it would be best to establish a board appointed by the government which would det. equitable prices to be paid on the basis of the av. price for the campaign. F. W. ZERBAN

Starch in sugar cane. F. HADDON. *S. African Sugar J.*; *Rev. agr. Maurice* 4, 6-2(1927).—Starch occurs in such quantities in the Uba cane of Natal that it interferes with mfg. operations. But it is found only in cane from acid soils. Ripe cane contains less than immature cane. Even the unrefined sugars from such canes contain starch. The juices should be filtered, and hot maceration should not be used. Mn salts added to the soil do not prevent starch formation in the cane, but do increase the purity of the juice. F. W. ZERBAN

Steam distribution and economy, and the proportioning of pans in white sugar manufacture. L. J. COUTANCEAU. *Rev. agr. Maurice* 4, 173-98(1927).—To produce "extra fine" sugar, the capacity of the pans, crystallizers and centrifugals must be increased. Complete steam balances are worked out for various types of effects. Under the same conditions, the factory producing "extra fine" sugar requires 20% more steam than a raw sugar factory. With 12.25% fiber in bagasse, the latter requires no extra fuel, but the white sugar factory needs from 3 to 4.25% of cane, of wood, according to the evaporator equipment. Steam losses can be reduced in various ways. It is necessary to work with at least 6 pans, of equal capacity, 0.5 ton of massecuite per ton of cane per hr. F. W. ZERBAN

A technical study on the decomposition of invert sugar by lime. V. ČTYROKÝ. *Zuckerind. czechoslovak. Rep.* 51, 230-6(1927); *Listy Cukrovar.* 44, 501 ff.(1925-6).—Soln. contg. 0.3% invert and 15% sucrose was treated with CaO at diff. temps. and analyzed at frequent intervals. To stop action in the sample withdrawn it was dild. and neutralized with tartaric acid. At 21°, 2% of the invert was destroyed in 2 min.; the action was practically complete (96%) after 48 hrs. Levulose is decompd. more rapidly than dextrose. The rate of decompn. increases rapidly with temp., so that 50% is decompd. after 4 min. at 70°, and after 2 min. at 86°. When 1% of invert is present, 92% is decompd. in 9 min. at 86°. When CaO is added to pure sucrose solns. in the cold, heated slowly to 86°, and then invert added, more CaO passes into soln. and the rate of decompn. of invert is increased. W. L. BADGER

Date palm work in Kotchandpur. KALIDAS ROY. *Ann. Rept. Dept. Agr. Bengal* 1925-26, pp. 40-3(1927).—Expts. on the production of sirup and sugar from date-juice are briefly discussed. K. D. JACOB

The utilization of molasses. W. E. CROSS. *Rev. ind. agr. Tucumán* 17, 81-122

(1926).—The following are discussed: the value of molasses and markets for its sale; the use of molasses as an animal food and for the manuf. of alc.; alcohol as an internal-combustion fuel; manuf. of abs. alc.; denaturation of alc.; the by-products of alc. manuf. The manuf. of yeast, lactic acid and Ca lactate; molasses as a fuel; disposal of molasses which cannot be utilized.

MARY JACOBSEN

The principle of bagasse treatment with hot media. V. KHAISOVSKY. *Arch. Suikerind.* 35, 811-34(1927).—A brief sketch of the history of hot maceration is given. Two types of equipment which have lately been tried out in Java are described and illustrated. One of them has not been very successful in operation. The other, devised by Nobel, is being installed by other factories. Here the carrier between the last 2 mills is completely inclosed to prevent losses of heat and of material. It runs only one-fourth as fast as an ordinary carrier, and the bagasse layer is 4 times as thick. Hot H_2O is applied near the highest point of the carrier, next to the last mill. It passes through the layer of bagasse directly underneath, and the juice is caught in a small tank where it is reheated and limed. Then it is pumped back above the carrier to a point a little further removed from the last mill, and the entire operation is repeated several times. Finally the juice is used for imbibition. The macerator may be used not only in front of the last mill, but also in front of the one next to the last. It remains to be seen whether the increased extn. more than pays for the cost of operation. It appears strange that hot H_2O should do better than cold, because it has always been supposed that all the cells of the cane are ruptured by the heavy milling pressures used. Therefore, new plasmolysis expts. were made, with improved technic, and they have shown that bagasse contains many living cells. The expts. are illustrated by photomicrographs and microfilms. An explanation is offered for the presence of living cells, based on the mechanics of milling and taking into consideration also the hydrostatic pressure exerted by the extd. juice. About 25% of the total sugar in bagasse is contained in the living cells. This was proven by extg the juice from the open cells with cold H_2O , alternately applying vacuum and pressure in rapid succession. It follows that, to ext. all the sugar, it is necessary to kill the living cells by heating to at least 50° . In practice this is not easy to do, because heat penetrates bagasse very slowly. It would be best to agitate the bagasse in hot H_2O , or use other means by which the H_2O is thoroughly mixed with the bagasse. It would also be well to remove the air bubbles which keep the H_2O from entering the bagasse. The heat treatment might not be applied just to final bagasse, but directly after the 1st mill, or even after the crusher; here the use of steam may be preferable. The counter-current principle should be applied throughout. The heat treatment has the further advantage that it weakens microorganisms and enzymes. A no. of variations suggest themselves for the heat treatment of bagasse. It remains to be seen, however, how it will affect the mech. properties of the bagasse, as it is quite possible that treated bagasse may cause difficulties in milling. Suggestions are offered for the possible soln. of these problems also. A bibliography of 56 titles is appended.

F. W. ZERRBAN.

Technology of starch making. P. NOTTIN. *Rev. sci.* 65, 363-7(1927).—Brief discussion of the technology of the manuf. of starch from potatoes, with a plea for its scientific control, particularly as regards losses and their prevention.

H. B. MERRILL

Contribution of leather to the automobile. NORMAN HERTZ. *Ind. Eng. Chem.* 19, 1104-5(1925).—A discussion of the manuf., and properties of, and specifications for upholstery leather, particularly that used in automobiles. H. B. MERRILL

Tanniferous plants of Madagascar. CARLE. *Cuir tech.* 16, 379-85 et seq.(1927); cf. *C. A.* 21, 1389.—Description of, and analytical data for, a large no. of species, are given. H. B. MERRILL

Tanning materials of Australia. D. COGHILL. *Australian Council Sci. Ind. Research, Bull.* No. 32, 5-138(1927).—A very extensive study of the entire flora of Australia from the point of view, economic and technical, of tannin production. Analyses of over 800 samples, from 221 species, are given. No new materials of com. importance have been discovered. H. B. MERRILL

Technic of tannin manufacture. F. CHEMNITUS. *J. prakt. Chem.* 117, 83-96(1927); cf. *C. A.* 21, 2166.—A description of methods and app. for extn. of tannic acid from oak galls and similar material. H. B. MERRILL

Preliminary report on the treatment of redgum or marri kino (*Eucalyptus calaphylla*) for the preparation of tanning extract. D. COGHILL. *Australian Council Sci. Ind. Research, Circular* No. 9, 1-14(1927).—After treatment with hot aq. $\text{Na}_2\text{S}_2\text{O}_8$, alone or mixed with Na_2SO_3 , either at atm. pressure or in an autoclave, marri kino dissolves in hot H_2O forming a stable soln. The resulting ext. (best sample) contained H_2O 10%, insol. matter 1.2, sol. tannin 61.8, sol. non-tannin 27, ash 6.1%. The product resembles quebracho. H. B. MERRILL

The preparation of quebracho extracts. G. BALDRACCO. *Boll. industria pelli* 4, 187-90; *Chem. Zentr.* 1926, II, 854.—The heart of quebracho wood contains 20% tannin, the sap-wood 2.2% and the bark 4.5%. The ext. is now produced chiefly in Argentina. Its water content should not exceed 22%. The literature on its production, research and commerce is given. C. C. DAVIS

Hide powder. W. R. ATKIN AND F. C. THOMPSON. *J. Intern. Soc. Leather Trades Chem.* 11, 300-8(1927).—In the manuf. of hide powder from skin, collagen inevitably undergoes some degradation, the extent of which varies in different batches. With degradation, the no. of open COOH and NH_2 groups increases. At any p_H value higher than the isoelec. point, hide powder is combined with alkali. The quantity of alkali so held increases with the no. of free COOH groups—i. e., with the "degradation." Upon treatment with tannin soln., this alkali combines with the non-tans, and passes into the filtrate, causing the wt. of non-tans found to be high. Variations in the extent of degradation are thus the cause of variations in analytical results yielded by different batches. These differences can be overcome by bringing all batches to p_H 5.5, where the combined alkali is practically nil. H. B. MERRILL

Acid determination in tan liquors by means of dialysis. O. L. STEVEN AND E. WACKER. *Collegium* 1927, 300-1; cf. *C. A.* 18, 2264.—Ten cc. of the liquor is placed in a 16×100 mm. diffusion thimble (S&S 579) and suspended overnight in a beaker contg. 150 cc. of water. A second extn. for 5 hrs. is then made. The dialyzates are treated to phenolphthalein with 0.1N NaOH. There is no color interference. I. D. C.

The mechanical analysis of leather. G. POVARNIN. *Collegium* 1927, 125-47.—The no. of samples required for a given accuracy and the location from which they should be taken are discussed in detail. The work of Gubarew, Bobarykow and Kopeliowitsch on sampling and the effect of moisture content on phys. properties is reviewed. I. D. C.

Stalagmometric examination of some fats of the leather industry. WILHELM SCHÜLLER. *Collegium* 1927, 288-300.—Results by the drop weight method are given, showing the influence of temp., NaOH, NaHCO_3 , soap and sulfonated oil on the interfacial tension between oil and water. Fish liver, neatsfoot, olive and vaseline oils were used. The following quant. sepn. is suggested: Shake out with alc. contg. a little KOH. The residue is unchanged fat. The alc. extd. after treating with a little AcOH is extd. with petroleum ether to sep. fatty acids, then with CHCl_3 or CCl_4 to remove sulfofatty acid. I. D. C.

Purification of tannery sewage. DIENERT. *Cuir tech.* 16, 376-8(1927).—A description of the process employed in the Griess-Pfleger tannery, Chicago. H. B. M.

Anthrax. R. H. PICKARD. *Leather Trades Year Book* 25, 80-3(1927).—Anthrax bacilli and spores occur most often in dried, seldom in salted, skins. The methods proposed for disinfection include treatment in the soak with acid, alkali, and specific bactericides. The latter method is ineffective, as the disinfectant usually combines so rapidly with the skin that complete sterilization is almost impossible of attainment.

The first 2 methods are effective, but likely to cause damage to the skin. A good sterilization method involving neutral solns. is much to be desired. H. B. MERRILL

Measurement of the adhesive strength of glue. C. E. LANYON. *Ind. Eng. Chem.* 19, 1191-3 (1927).—Briquets made from 400 g. of 40-mesh Al oxide and 60 g. of 60% glue soln., and then dried 6 weeks in air at 60% relative humidity and 25°, were broken in a Richlé testing machine. Tests were duplicated within 2%. The max. briquet strength was at p_H 7.5. There is no parallelism between viscosity, tensile strength, briquet strength, or jelly strength. "The results point to the existence of wide differences in the adhesive strength of glues of the same grade obtained from different manufacturers. This, as well as the results of over 200 other tests (not given here), shows the futility of relying on viscosity or jelly strength measurements alone for testing the suitability of glues for joints of the specific type." It is not yet detd. whether these differences are due to variations in the raw hide stock, or in mfg. methods. J. A.

The rapid viscometer of Klever for glue and gelatin. GUSTAV GÜNTHER. *Chem.-Ztg.* 51, 526-7 (1927).—The Klever viscometer consists of a measuring pipet with metal capillary surrounded by a heating bath up to 100°. The actual detn. takes around 1 min.; only 30 cc. soln. is required. The accuracy is about 0.02 to 0.03 Engler degrees for a viscosity around 4 to 5. B. J. C. VAN DER HOEVEN

Composition of leather and rubber (Brit. pat. 261,879) 30. Preheater and evaporator for concentrating tanning liquors (Brit. pat. 262,608) 1.

Imitation leather. G. A. SALLMANN. Brit. 262,783, Dec. 8, 1925. A fabric suitable for use in the manuf. of gloves, after dyeing and as a last stage in its treatment, is passed while dry through rubber pressure rolls which give it a smooth-mat surface.

Artificial leather. P. MAGNUS. Can. 273,283, Aug. 23, 1927; Brit. 263,004, Mar. 22, 1926. Cleaned scrap leather, in a proportion of approx 25%, is added to a heated incorporated mixt. of glue 70, glycerol 12.5, boiled linseed oil 10, carbolic oil 2.5, $(NH_4)_2Cr_2O_7$ 2.5 and $CaCl_2$ 2.5%; the mass is subjected to suitable pressure subsequent to the blending.

Enameled leather. C. P. KELLEY and E. W. WHITE. Brit. 262,780, Dec. 8, 1925. Successive coatings are used which may be formed of linseed oil, pyroxylin, naphtha and coloring materials such as powd. Al or bronze powder which may differ in the different coatings.

Waterproof material for shoe soles, etc. A. F. E. DE ST. DALMAS. Brit. 261,028, Dec. 15, 1925. Material suitable for use as an insole comprises leather or fabric coated or impregnated with plaster of Paris and adhesives such as rubber, gum, dextrin, resin, pitch and wax or oleaginous substances.

Treating hides. F. W. WEBER. U. S. 1,642,054, Sept. 13. Hides are treated with NaCl and a soln. of a rare earth compd. other than Ce, e. g., with chlorides of rare earth metals in the presence of soap, to produce a soft-white leather.

30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

The spiral structure of rubber and the relative saturation capacity of shell aggregates. HEINRICH FEUCHTER. *Kautschuk* 1927, 98-101, 122-4; cf. C. A. 21, 1898, 1902, 1903.—The structure of the latex particle and of rubber gel is an unsatd. shell aggregate produced by the eccentric spiral binding of valences, similar to the crystal structure with diagonal screw axes deduced by Weissenberg. Amorphous colloids and amorphous crystalloids are unsatd and satd shell aggregates, resp., proceeding from eccentric and concentric spiral structures. The formation of a fiber structure in racked rubber may be considered as an anisotropic phase crystn. which progresses by linear arrangement of disperse mol. chains or threads. This idea, illustrated by diagrams, may be extended to account fully for highly racked rubber, which is insol. and does not swell, and for the reversibility of stretching and racking. G. I. CLARK

Ultramicroscopic studies of the theory of vulcanization. H. DANNENBERG. *Kautschuk* 1927, 104-5, 128-30.—By refined technic, D. was able to observe thin transparent layers of rubber mixts. under the ultramicroscope at temps. up to 160° at a magnification of 240. The mixts. were 100 parts light crepe, 5 S and 100 crepe, 5 S, 1 ZnO and 1 accelerator (diphenylguanidine or Vulkazite P). By warming at 60°, the S first dissolves in the rubber; in the mixt. with 5% S all dissolves at 95°. The soln. and

dispersion take place with a rapidity which discountenances the theory that S melts. When the soln. so obtained is heated to a higher temp., a colloidal substance separates at 120° for unaccelerated mixts. and at lower temps. for accelerated. The beginning of vulcanization coincides with this colloidal sepn. By longer heating at the vulcanization temp., further increased sepn. does not ensue, but the colloidal particles form small chains. Upon cooling part of the S separates, usually as spheres of solid amorphous S with diams. of 5 to 50 μ . These and other exptl. results are interpreted to indicate that vulcanization is accompanied by the transformation $S_A \rightarrow S_\mu$ and the sepn. of colloidal S_μ . Accelerators are substances which accelerate the transformation. Vulcanized rubber is a colloidal system in which raw rubber is the dispersion medium and S_μ is the dispersum. Superficially this theory does not seem to account for the fact that vulcanized rubber is insol. in org. solvents. There are many colloid examples, however, which prove that the soly. of a substance in the colloidal state is far less than in the massive state; e. g., colloidal Au unamalgamated by Hg; the insoly. of Ag of the photo-chloride in dil. HNO₃. A good analogy of raw and vulcanized rubber is that of Fe and steel. In both cases the addn. of a second highly dispersed phase results in an increase in elasticity and an increased resistance to chem. attack.

Review of works on the chemistry and technology of rubber for the year 1924.

B. RUIZOV. *J. Chem. Ind. (Russia)* 1, No 3, 24-8 (1925); *Chem. Zentr.* 1926, II, 829.

C. C. DAVIS

Foreign patents of interest to the rubber trade. ANON. *India Rubber & Tire Rev.* 27, No. 8, 58 (1927).—A list of recent German, Canadian, French, Austrian, Czechoslovakian, Dutch and Swiss patents.

C. C. DAVIS

The use of the chemical washing process in the rubber industry. GEORG WEISSBERGER. *Kautschuk* 1927, 222-5, 248-51 (1927); cf. *C. A.* 21, 2816.—The phys. and chem. principles involved, vapor pressure curves of binary mixts. and an illustrated description of the technic and app. for large-scale operation are included. C. C. D.

The constitution of rubber. RUDOLF PUMMERER. *Kautschuk* 1927, 233-6.—A summary, describing in a brief way several fields of investigation, the results of which have not previously been published. To purify rubber, latex was let stand 16 hrs. at 60° with 20% NaOH, the hydrocarbon removed, the process repeated, the NaOH removed by dialysis, and the product fractionated by exhaustive extrn. with Et₂O. The purified rubber still contains impurities which can be detected by optical means. The gel-rubber is the component responsible for the toughness of rubber and the sol-rubber for the elasticity. When gel-rubber is dissolved in C₆H₆ and pptd. with EtOH, it becomes partially sol. in Et₂O, and becomes more completely sol. if basic or acidic substances like piperidine, EtNH₂, NH₃ or AcOH are added. Furthermore mastication of gel-rubber in CO₂ renders it sol. in Et₂O. This suggests that the mol. chain can be ruptured by mech. means though this disaggregation is colloidal or crystallographic, i. e., intramol. rather than intermol. When not stretched, neither gel-rubber nor sol-rubber show any x-ray evidence of crystal., but like ordinary rubber they show interference points when stretched. Disaggregation and aggregation are reversible, for among the fractions obtained by evapg. an Et₂O soln. of rubber are found, after standing, traces of gel-rubber insol. in Et₂O. This gel-rubber is rapidly disaggregated by piperidine or NH₃. This slow process of aggregation involves the gradual formation of intramol. colloid.-chem. or cryst. arrangements, with accompanying changes in soly., which is to be distinguished from association. Gel-rubber and sol-rubber probably have the same structural mol., and both these and diffused rubber were found to have mol. wts. of 1000-1600 by the Rast-camphor method. With menthol, in which rubber is readily sol. without swelling, the mol. wts. were 1200-1600 for 2% solns., but only 600 for 0.5-1% solns., the latter value being of significance in connection with a similar value also obtained during hydrogenation expts. and suggested by Hauser and Mark from osmotic studies. Detsn. of the osmotic pressure and the diffusion of dil. C₆H₆ solns. of rubber indicated mol. wts. of 30,000-50,000, and yet sol-rubber can be dialyzed from its C₆H₆ soln. Rubber probably has a parent mol., which by aggregation and disaggregation, association and disassociation, accounts for the various phenomena. The probable org. chemistry of this parent mol. is discussed.

C. C. DAVIS

The constitution of highly polymerized compounds, particularly rubber. H. STAUD-
Kautschuk 1927, 237-8.—A discussion in answer to a paper by Pummerer (preceding abstr.), and based for the greater part on previous publications of S. (cf. *C. A.* 21, 1271; *Kautschuk* Aug.-Sept., 1925). Reply by PUMMERER. *Ibid* 238.—Discussed by STAMBERGER. *Ibid* 238.

C. C. DAVIS

The oxidation of rubber from the scientific and from the technical standpoint

F. KIRSCHOF. *Kautschuk* 1927, 239-45, 256-61.—An elaboration of an abridged article appearing elsewhere (cf. C. A. 21, 3141) which describes a wide field of experimentation. The rate of oxidation of vulcanized rubber in ultra-violet light and air or O increases with the time of vulcanization, and is also greatly increased by extn. with Me_2CO . Furthermore, it varies greatly with the kind of rubber, vulcanized crepe oxidizing far more rapidly than vulcanized Para rubber, probably because ultra-violet light penetrates the former much more readily. The difference in the rate of oxidation of unextd. and extd. vulcanized rubber is probably closely related to the condition of the S and to the absorption of ultra-violet light, for it is known that ultra-violet light is completely absorbed by a vulcanized mixt. which reflects it before vul. anization and that CS_2 contg. S absorbs ultra-violet light, while CS_2 alone transmits it. This suggests a means of detg. whether S is chem. combined or in soln., and indicates that chem. combination occurs during vulcanization. The primary yellow products of oxidation in ultra-violet light are converted by boiling dil. H_2SO_4 to the same brown substances which are obtained on oxidation at 70° in darkness. The immediate onset of oxidation in ultra-violet light is in contrast to the induction period in O. The gain in wt. occurring during oxidation in ultra-violet light ceases long before the O reaches the proportion represented by $\text{C}_6\text{H}_8\text{O}$. Extensive tests on the sp. influence of different compds. on aging are merely summarized, but serve to show that Fe, Cr, Pb, Sn, Zn, Cu and Mn differ in their action, and that the influence of any particular metal depends upon the negative radical, i. e., upon the particular salt. The rate of oxidation of vulcanized rubber in O at 70° is about double that in air at 70° , and in ultra-violet light and air at $40-45^\circ$ it is about 3 times that in air in 70° in darkness. For the ready detn. of small differences in the state of cure and for testing antioxidants, oxidation in ultra-violet light and air is considered the best artificial test. Less pronounced differences in quality, which depend upon the rubber resins, accelerators and after-vulcanization, can be studied better by an artificial test in air or O at 70° . There is a marked difference in the chem. and phys. properties of the oxidation products of low and highly cured rubber. Thus the yellow, sticky Me_2CO -sol. oxidation product of rubber cured a short time gives a positive pyrrole test, while the red-brown, shellac-like Me_2CO ext. of the same rubber at a much longer cure gives a negative test. The Me_2CO ext. of the oxidized rubber increases in its degree of acidity and its intensity of color with the time of cure. The % Me_2CO ext. of oxidized rubber and the swelling power in Me_2CO of the insol. residue increase to a max. at a certain cure and then decrease as the cure progresses. C. C. DAVIS

New trends in the x-ray spectrography of rubber and rubber-like elastic substance. The amorphous rings and their changes during stretching. J. R. KATZ. *Chem.-Ztg.* 51, 381-5(1927).—K. first reviews all information concerning the significance of the broad, diffuse diffraction rings obtained with liquids and other amorphous substances. Keesom first gave explt. evidence that in liquids the interferences measure the av. sepn. of mols. If these are considered as spheres, the x-ray spacing a should agree with $b = 1.33 \sqrt{M/d}$. This is true only for truly spherical mols. and for the lower members of the normal aliphatic compd. series. Longer-chain compds. give approx. a const. dimension of 5.6 A. U. The diam. of the broad ring for substances with side chains, such as triolein, agrees with that for the side chain alone (oleic acid). The diams for unpolymerized and polymerized substances are the same, but a new inner ring appears for the latter, corresponding to the a part of the middle points of the large aggregate. Following are some measurements on the principal ring: heat polymerized erythrene rubber 28.3 mm., 5.6 A. U.; erythrene 28.5, 5.6; dimer (6-membered ring) 25.0, 6.3; heat polymerized isoprene rubber 26.1, 6.0; isoprene 26.2, 6.0; dimer 23.2, 6.7; Me-rubber 23.4, 6.7; dimethylbutadiene 24.2, 6.5; dimer 21.8, 7.1; Hevea rubber 26.1, 6.0; rubber from other plants 26.1, 6.0; cyclo-rubber 22.6, 6.9; hydro-rubber 26.0, 6.0. The last value shows that H attaches at double bonds without changing the dimensions, while cyclo-rubber is distinctly different. Upon stretching, synthetic rubbers produce diagrams similar to that of gelatin in that the broad amorphous ring broadens and intensifies at right angles to the direction of elongation. Heat-polymerized Me-rubber, glass-clear and unmastered, produces 2 cryst. interferences on the equatorial line, in addn. to the above. These phenomena all indicate a transition state between amorphous and cryst. G. L. CLARK

From coal to rubber. FRITZ HOFMANN. *Mitt. Schlesischen Kohlenforsch. Kaiser-Wilhelm Ges.* 2, 235-48(1925); *Chem. Zentr.* 1926, II, 830-1.—An address. All research directed toward the synthesis of rubber is based on isoprene, which is obtained in small quantities as a decompn. product in the distn. of rubber. In work covering 2 yrs., a technical process for the prepn. of isoprene was developed, and by heating under pressure the isoprene was polymerized to rubber. The latter could then be decompd. to

the same products as those obtained by Harries by the action of O_2 on natural rubber. The synthesis of rubber from coke through CaC_2 , C_2H_2 , AcH , $AcOH$, Me_2CO , $NaOEt$, 1, 3-butanol, butanol and β -methyl-1, 3-butadiene is described. Reference is also made to methyl-rubber, which was used technically during the war. The quality of synthetic rubber was found to be excellent for the manuf. of hard rubber goods, but unsatisfactory for soft rubber goods. C. C. DAVIS

Nature of maturated slab rubber and the accelerating power of potassium salts. C. C. DAVIS. *Rubber Age* (N. Y.) 21, 453, 458(1927).—An English commentary version of an article by Bruni and Levi (*C. A.* 21, 2815). C. C. DAVIS

Rubber-filler systems. A contribution to the colloid problems of the rubber industry. P. STAMBERGER. *Kolloid-Z.* 42, 295-300(1927); cf. Klein and Stamberger, *C. A.* 19, 1064.—When thoroughly milled rubber is mixed with a filler and the mixt is immersed in a solvent, all of the rubber and part of the filler disperse throughout the solvent, the remainder of the filler forming a sediment. The proportions dispersed and pptd. and the time required depend upon the filler and its quantity, the higher the filler content in the rubber, the less the proportion dispersed and the more pptd. Furthermore these proportions, which are peculiar to each filler, bear no relation to the particle size or to the d. of the filler, and the rubber must have a sp. action, *absorption* probably occurring. The following values are the % filler dispersed under typical const. conditions: ZnO 98, $BaSO_4$ 0.4, kaolin 2.0, PbO 44.1, MgO 44.0, $MgCO_3$ 87.5, C black 100. With C black, adsorption probably involves the formation of a new gel structure, the structure of the original rubber, which has been destroyed by milling, being in effect restored. C. C. DAVIS

Rubber as a dielectric material. ST. REINER. *Kautschuk* 1927, 261-3.—A general discussion, with particular reference to the controversy over the V.D.E. specifications (cf. Esch and Miosga, *C. A.* 21, 2818). C. C. DAVIS

The electrodeposition of rubber and the anode process. H. P. STEVENS. *Bull. Rubber Growers' Assoc.* 9, 514-6(1927).—A concise review of the development of the anode process and the principles involved. C. C. DAVIS

Rubber-insulated conductors for high currents and the specifications of the V. D. E. PAUL MIOSGA. *Gummi-Ztg.* 41, 2371-2(1927).—Further discussion (cf. *C. A.* 21, 2818). C. C. DAVIS

Spreading doughs and adhesive solutions. WERNER ESCH. *India Rubber J.* 74, 293-4(1927).—An English version of *C. A.* 20, 3839. C. C. DAVIS

Carbon black produced from natural gas in 1926 (HOPKINS) 18. Preparation of aldehyde-ammonia (SOROKIN) 18. Paving blocks comprising rubber (U. S. pat. 1,642,846) 20. Floor covering (U. S. pat. 1,642,845) 20. Carbon black (Can. pat. 272,468) 18. Reaction products from cashew-nut shell oil (Brit. pat. 262,134) 27. Sectional rubber pavement (U. S. pat. 1,643,024) 20.

Synthetic rubber. W. O. HERRMANN and W. HAEHNEL. Can. 271,571, June 14, 1927. Polymeric vinyl compds. are treated with S compds.

Porous rubber. H. BECKMANN. Brit. 262,179, Sept. 2, 1925. Latex is coagulated to a homogeneous cohesive jelly which is then vulcanized without allowing it to become dry. Coagulation may be effected with SO_2 or by adding alum, $ZnSO_4$, $FeCl_3$ or like substances to form a thick, paint-like pulp and then coagulating with liquid or viscous acid. Cf. *C. A.* 21, 3141.

Rubber compound. A. B. COWDERY. Can. 271,759, June 21, 1927. In the compounding of rubber, rubber stock is mixed with a tar-distn. residue contg. about 60% of uncombined C and 40% high-boiling hydrocarbons. Cf. *C. A.* 20, 3842.

Rubber emulsion. W. B. PRATT. Can. 271,797, June 21, 1927. Rubber is dispersed in non-aq. substances which are non-solvents of rubber by first incorporating a colloid in a rubber mass and then mixing the rubber-colloid mixt. with the non-solvent substance at a temp. at which the substance is sufficiently liquid for such purpose.

Rubber articles. C. W. AVERY and D. O. MOODY. U. S. 1,642,666, Sept. 20. Articles such as steering wheel rims are made with a core of fibers and rubber, and with a casing of rubber, all vulcanized.

Rubber conversion product. H. L. FISHER. U. S. 1,642,018, Sept. 13. Rubber is heated with trichloroacetic acid and a phenol to produce a thermoplastic material suitable for making molded articles, waterproof coatings, etc.

Rubber substitutes. CONSORTIUM FÜR ELEKTROCHEMISCHE INDUSTRIE GES. Brit. 261,748, Nov. 23, 1925. Polymerized vinyl alc., or a deriv. or homolog such as an

ether, ester or acetal, is heated with S or a S compd. such as S monochloride. Catalysts or vulcanization accelerators may be added, *e. g.*, piperidine.

Curing hollow rubber articles while filled with heated water. R. R. JONES. U. S. 1,642,614, Sept. 13.

Apparatus for curing hollow rubber articles with steam. R. W. BROWN. U. S. 1,643,196, Sept. 20.

Thermoplastic rubber derivative. H. GRAY. Can. 273,208, Aug. 16, 1927. *p*-Toluenesulfonyl chloride is caused to react with comminuted vulcanized rubber scrap under such conditions as to produce a heat-plastic product.

Composition of leather and rubber. R. MEYER. Brit. 261,879, Sept. 28, 1925. Dried disintegrated leather waste is incorporated with rubber soln. to form a paste which is kneaded and used for making molded articles which may be vulcanized by the addn. of a suitable vulcanizing agent to the compn.

Treating latex. K. D. P., LTD. Brit. 262,487, Dec. 7, 1925. Fillers are incorporated in untreated, stabilized, thickened or vulcanized latex, without coagulation, by adding equiv. proportions of sol. materials which react and ppt. solid particles in the latex, *e. g.*, $(\text{NH}_4)_2\text{SO}_4$ soln. may be added to a mixt. of S, ZnO and latex paste, followed by the addn. of $\text{Ba}(\text{OH})_2$ soln. to ppt. BaSO_4 . Lithopone, CaCO_3 , silicic acid, Ca oxalate and BaCO_3 also may be used as fillers.

Vulcanizing rubber. H. W. ELLEY and D. H. POWERS. U. S. 1,643,205, Sept. 20. An accelerator is formed by the combination of a nitrosodialkylaryl-amine such as *p*-nitrosodimethylaniline and *n*-butylamine or other aliphatic amine, which may be caused to react in alc.

Vulcanizing rubber. L. B. SEBRELL. Can. 272,862, Aug. 2, 1927. The vulcanization of rubber is accelerated by an aminopolyhydroxy aryl condensation product. Cf. C. A. 21, 1031.

Composition for uniting rubber. R. M. WITTHYCOMBE. Can. 272,308, July 12, 1927. A compn. for applying to metal or other objects consists of a vulcanizable rubber soln. to which is added about 5-10% asphaltum.

Composite yarns of ramie or rhea and artificial silk (for use in making pneumatic tires). DUNLOP RUBBER CO., LTD., W. H. PAULL and R. TRUESDALE. Brit. 262,256, Nov. 28, 1925.

Apparatus for making sheet material of rubberized fiber. P. BEEBE. U. S. 1,642,008, Sept. 13.

Impregnating and vulcanizing fabric. D. F. HENNESSY. U. S. 1,642,546, Sept. 13. A rubber soln. and a vulcanizing agent such as H_2S and S chloride are simultaneously forced into a fabric so that the fabric is impregnated as the rubber is vulcanized.

Vulcanizing tire casings. G. H. ELLINWOOD. U. S. 1,642,541, Sept. 13. Mech. features.

Di-*p*-xylylguanidine. W. SCOTT. U. S. 1,642,180, Sept. 13. This compd. is an accelerator of rubber vulcanization, m. 170-170.5°, and is made by reaction of NH_3 or NH_4OH with di-*p*-xylylthiorea in the presence of PbO or other basic Pb compd.

CHEMICAL ABSTRACTS

Vol. 21.

NOVEMBER 20, 1927

No. 22

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

The rotary kiln and its operation. SCHUSTER. *Chem.-Ztg.* **51**, 666-7, 708-10, 727 8(1927).—S. discusses the methods of feeding, refractory linings, accumulation of deposits on the walls of a kiln, the foundation, etc. In most modern practice the kiln is inclined at a gradient of 4-5% with the horizontal. It is built widest at its mid-section (calcination zone) to permit thorough and uniform heating of the charge before it enters the hottest zone. To dry a new kiln requires at least 8 days heating with a small fire. On the last day the temp. must be kept above 100° to prevent condensation of water vapor. Gas and oil are replacing coal firing.

DAVID GORDON

Hempel gas apparatus without absorption bulbs and its use in the examination of commercial oxygen. R. C. FREDERICK. *Analyst* **52**, 400-1(1927).—A simple modification of the Hempel app. is suggested that can be used in some cases. The measuring buret has a simple stopcock at the top and a 3-way stopcock at the bottom. At the bottom connection is made to the leveling buret and also independently to a separatory funnel. Directions are given for using this simplified app.

W. T. H.

A circulating gas system for exact gas analysis. P. RASSEFELD. *Gas u. Wasser-fach* **70**, 949-51(1927).—App. is described by means of which a large vol. of gas may be measured with a high accuracy and automatically circulated over the desired absorbing reagent.

R. W. RYAN

Apparatus for determining water vapor in gases. H. STRACHE AND J. CARMANN. *Feuerungstech.* **15**, 121-2(1927); cf. *C. A.* **17**, 1879.—By immersing the sampling container in the gas, a sample is taken at the (known) temp. of the gas. The container is then immersed in cold water of known temp., and the vol. of water drawn in on opening a cock is noted. The water vapor content can then be computed.

E. W. T.

An interferential dilatometer employing automatic photography. R. H. SINDEN. *J. Opt. Soc. Am.* **15**, 171-7(1927).

E. J. C.

Measuring colors in industry. Photo-colorimetry, a method independent of the eye. ANON. *Rev. gen. mat. color.* **31**, 287-93(1927).—A description is given of the construction and use of the T. C. B. photo-colorimeter.

L. W. RIGGS

A simple colorimeter. R. C. FREDERICK. *Analyst* **52**, 469-70(1927).—The instrument is provided with 2 colorless and graduated tubes placed close together under and over reflecting mirrors and connected by rubber tubing with 2 reservoirs which can be raised or lowered. The images are observed in the upper mirror and after filling one reservoir with the unknown soln. and the other with the standard, the 2 are raised or lowered until the 2 images match.

W. T. H.

A micropyrometer. H. v. WARTENBERG AND H. MOEHL. *Z. physik. Chem.* **128**, 445-8(1927).—A pyrometer was constructed using a lens of short focal length giving a small image magnified 100 times by a microscope. The total length of the pyrometer is 20 cm. The pyrometer can be used with a min. object distance of 8 cm. Constructional details and a diagram, and calibrations for various object distances are given.

ROBERT F. MEHL

An apparatus for the adjustment of x-ray cameras. A. K. BOLDUIREV. *Z. Arch.* **65**, 117-8(1927).—A description of a tube and mirror to make the adjustment of the x-ray beam easier and to avoid exposure of the eyes.

L. S. RAMSDALL

Rapid extraction. A. G. KUHLMANN. *Z. anal. Chem.* **72**, 20-7(1927).—An app. shown which is suitable for the extrn. of substances in quant. analysis and weighing the residue. The bottom of a glass vessel is provided with a glass filter plate and 2 glass covers for both the top and bottom. The use of the app. is illustrated by 10 of typical analyses, the results of which compare favorably with those obtained the usual Soxhlet extrn.

W. T. H.

Surface tension balance. E. L. WARREN. *Phil. Mag.* [7], **4**, 358-86(1927).—The method used is a modification of Jaeger's method, and has been designed primarily

for the exptl. detn. of the temp. coeff. of surface tension, and for the investigation of the dependence of the surface tension of solns. on their concn. The chief feature of the method is that it enables all such measurements to be expressed in terms of the surface tension of some appropriate standard liquid such as water. The app. consists of 2 small circular jets of the same cross-section, which are in gaseous connection with each other. The jets are immersed separately in the liquids to be measured. The air in the bottle supplying the gas pressure is maintained at a pressure of a few mm. of Hg above that of the atm. A pinch-cock is opened until bubbles of gas escape at intervals of about 5 sec. from one of the jets. The depth of immersion of one of the jets is adjusted until the bubbles escape approx. alternately from the 2 jets. This arrangement enables the surface tension of the liquid in the one beaker to be balanced against that of the liquid in the second beaker. The balance is independent of the pressure maintaining the bubble system. In order that this may be so it is essential that the 2 jets should be identical in size and shape. The surface tension of H_2O is detd. as a function of temp. and of $NaCl$ as a function of concn. GEORGE GLOCKLER

The surface energy and heat of solution of sodium chloride. II. A new type of adiabatic calorimeter. S. G. LIPSETT, F. M. G. JOHNSON AND O. MAASS. *J. Am. Chem. Soc.* 49, 1940-9(1927). The app. described in a previous paper (C. A. 21, 3814) has been improved so that the $NaCl$ is kept dry before soln., and the previous work has been checked with greater accuracy. J. H. MOORE

Design of a constant-temperature moist closet. W. F. PURKINGTON. *Public Roads* 7, 250-1(1927). A. E. GRAY

Copper-constantan thermocouples and the hydrogen thermometer compared from 15° to 283° absolute. W. F. GIAUQUE, R. M. BUFFINGTON AND W. A. SCHULZE. *J. Am. Chem. Soc.* 49, 2343-54(1927).—A H thermometer was prepd. and calibrated and the thermocouples were compared with it and with each other. Advantages are pointed out of such thermocouples particularly in connection with continuously calibrated fixed-resistance thermometers for low-temp. work. A. P. SACHS

Hydrogen gas thermometer compared with the oxygen and hydrogen vapor-pressure thermometers by means of a copper-constantan thermocouple. W. F. GIAUQUE, H. L. JOHNSTON AND K. K. KELLEY. *J. Am. Chem. Soc.* 49, 2367-72(1927).—A Cu-constantan thermocouple (cf. preceding abstr.) was compared with O and H vapor-pressure thermometers with complete agreement with O, and also with complete agreement with H down to $25^\circ K.$, below which error is caused apparently by adsorption of H in the thermometer. A. P. SACHS

A new apparatus for determining the thermal expansion of solid bodies. HOFFMANN. *Glasindustrie* 34, 84(1926).—The expansion of the test piece is compared with that of a quartz rod. Samples up to 100 mm. long may be used. By means of a reflecting prism resting upon both test piece and quartz rod and an auto-collimating telescope expansion measurements are made. An accuracy of 0.5% is claimed. H. F. K

A new form of thermostat and observation tubes for polarimetric work. T. S. PATTERSON. *J. Chem. Soc.* 1927, 1717-20.—The polarimeter tube in its support of flanges and rods, of which there is a detailed description and sketch, is placed so as to be in direct contact with the liquid in the thermostat. For work at 0° or lower, an arrangement has been devised whereby a slow current of air is circulated near the end plates to prevent a deposit of moisture on them. Thus a clear view through the polarimeter tube may be obtained. The device is efficient even when a freezing mixt. of CO_2 and alc. is used as cooling agent. The app. gives accurate results, is easy to manipulate, can be used for a wide range of temps., is quickly adjustable to the desired temp., and can be maintained within about $1/10$ of a degree of the desired value for a long period of time. RUBY K. WERNER

Laboratory apparatus for the electrolytic preparation of oxygen and of ozone. O. R. WULF. *J. Optical Soc. Am.* 15, 119-24(1927).—The O_3 generator is an electrolytic cell contained in a 5-l. glass jar; the electrolyte is dil. H_2SO_4 . A Pb collar of large diam., which serves as the cathode, is suspended by Pb arms from the edge of the jar. The anode is contained in a glass guard-tube which is passed down through the electrolyte and makes a complete turn, coming up under a glass bell in which the O_3 rises. The anode is made of a small Pb cylinder cast around a sharp bend in a piece of small Cu tubing. This generator has been used with loads up to 12.5 amps., and concns. up to 3% by vol. of O_3 have been obtained. In the O_2 cell, which is of the same general appearance as the above, the electrodes are of sheet Ni, and the electrolyte is a 12% soln. of pure NaOH in distd. H_2O . CO_2 from the air is not excluded from this cell. J. H. PERRY

A new mercury volumeter. E. J. WHEELER AND A. H. KUECHLER. *J. Am. Ceram. Soc.* 10, 807-12(1927).—Lowering a piston into a Hg well submerges the test piece and the displaced Hg is forced into a buret. C. H. KERR

Continuous centrifugals. OTTO PANKRATH. *Centr. Zuckerind.* 35, 274-6, 302-4, 330-1(1927).—A general discussion. W. L. BADGER

New theory for the centrifugal pump. A. F. SHERZER. *Proc. Am. Soc. Civil Eng* 53, 1775-1803(1927). E. J. C.

Industrial furnaces. V. J. AZBE. *Mech. Eng.* 49, 1079-81(1927).—A furnace must be divided into heat-generating and heat-absorbing portions, when the overall efficiency is to be detd. Curves show the efficiency of a boiler as a heat absorber, and the sensible heat loss with different terminal temps. of gas leaving the furnace, with oil as fuel: when burned with no excess air; no loss of heat by radiation; and no steam used for oil injection and atomization. The greatly increased loss of heat in the products of combustion with higher terminal temps. is emphasized in a curve. The effect of excess air and incomplete combustion, and the effect of various amts. of steam in a gas producer on loss of efficiency and capacity of lime or cement kiln are shown. Fuel oil, next to natural gas, is the ideal industrial furnace fuel. The necessity for speed in attaining furnace temps. and the ability to vary at will and within narrow limits the atm. required in heat processes are important matters in fuel control. W. H. B.

Acetylene generator. O. KAAS. U. S. 1,644,062, Oct. 4.

Colorimeter. W. L. PATTERSON. U. S. 1,643,515, Sept. 27.

Specific-gravity balance. T. F. MANNS. U. S. 1,643,343, Sept. 27.

Apparatus for gravity separation of oil and water or of other liquids of different specific gravities. B. D. COMYN. U. S. 1,645,093, Oct. 11.

Apparatus for determining specific gravity of gases. G. B. LINDERMAN, JR. U. S. 1,644,684, Oct. 11.

Optical pyrometer. G. KEINATH. U. S. 1,644,340, Oct. 4.

Mercury boiler. R. H. COLLINGHAM. U. S. 1,645,092, Oct. 11.

Annealing-furnace. T. STASSINET. *Brit.* 262,803, Dec. 12, 1925. The furnace outlet is heated or heat-insulated to maintain it at a temp. above the condensation point of vapors which may be formed within the furnace.

Filter for solutions for artificial silk manufacture or other liquids. W. H. FURNESS. U. S. 1,643,299, Sept. 27.

Oil filter. C. B. JAHNKE. U. S. 1,644,728, Oct. 11.

Filter for gasoline or other liquids. A. BLACKMAN. *Brit.* 263,017, May 10, 1926.

Float device for decanting and filtering. S. L. GOLDMAN. U. S. 1,644,248, Oct. 4.

System of gas circulation for tunnel kilns. J. KELLEHER. U. S. 1,643,775, Sept. 2.

Jaw crusher for stone and ore. H. J. H. NATHORST. *Swed.* 62,957, May 10, 1927.

Device for introducing or discharging materials to or from reaction vessels operating under high pressures. BADISCHE ANILIN & SODA FABRIK. *Brit.* 262,901, Nov. 5, 1926. A plunger device is provided for ingress and egress of materials from vessels which may operate under 100 atm. pressure or over, e. g., for hydrogenating soft coal or other to produce liquid fuels.

Storage tank for gases and oils or other volatile liquids. J. H. WIGGINS. U. S. 1,643,213, Oct. 11.

Pulp thickener. E. L. OLIVER. U. S. 1,644,854, Oct. 11.

Apparatus for determining turbidity, color or like visual characteristics of fluids. W. G. EXTON. U. S. 1,644,330-1, Oct. 4.

Concentrating apparatus for coal or other minerals. E. DRISTER. U. S. 1,644,112-3, Oct. 1.

Apparatus for sublimation of anthracene, anthraquinone or other substances. F. G. FELD. U. S. 1,644,518, Oct. 4.

Drying apparatus with mechanical transportation of the materials. B. J. F. JONSSON. *Swed.* 61,694, Oct. 12, 1926.

Drying tower. O. NORDSTRÖM. *Swed.* 62,270, Jan. 18, 1927. The materials dried are passed downward between two concentric perforated cylinders. Hot air is introduced into the inner cylinder and by means of a fan are forced through the apertures into the housing surrounding the cylinders from which a part of the gas may be taken out and returned through the fan into the inner cylinder for complete utilization.

Apparatus for drawing off the condensate from cylindric driers. P. O. T. SYLWAN. Swed. 63,122, June 8, 1927. Mech. features.

Centrifuges in which the admixture of air into the separating liquid is prevented. AKTIEBOLAGET SEPARATOR. Swed. 63,049, May 24, 1927.

Centrifuge for the purification of liquids in a closed system for air circulation. AKTIEBOLAGET SEPARATOR. Swed. 63,483, July 19, 1927.

Refrigerating apparatus. PLATEN-MUNTERS REFRIGERATING SYSTEM A.-B. Swed. 62,714, April 5, 1927.

Refrigerating apparatus. AKTIEBOLAGET ARCTIC. Swed. 62,426, Feb. 22, 1927.

Absorption refrigerating apparatus. AKTIEBOLAGET ARCTIC. Swed. 62,933, May 10, 1927. A supplement to Swed. 60,582. A semi-permeable permits passage of the refrigerating medium, for instance NH_3 , in the vapor state but not the liquid.

Absorption refrigerating apparatus. D. W. BERLIN. Swed. 63,609, Aug. 30, 1927.

Cooling chamber with double walls between which the air from the chamber is passed. F. O. LEVANDER. Swed. 61,941, Nov. 16, 1926.

Continuously working apparatus for the analysis of gases. SVENSKA AKTIEBOLAGET MONO. Swed. 61,864, Nov. 2, 1926.

Apparatus for gas analysis, working intermittently, with electric indicating or registering device. SVENSKA AKTIEBOLAGET MONO. Swed. 61,629, Oct. 10, 1926.

Continuously operating gas-analyzing apparatus. OLAF RODHE. U. S. 1,644,951, Oct. 11. An app. is specified which is adapted for detg. CO_2 and other constituents in flue gases, etc.

Apparatus for estimating carbon in iron and steel by measuring its magnetic properties. C. J. G. MALMBERG and J. G. HOLMSTROM. Swed. 63,325, July 12, 1927.

Carbon-monoxide detector. C. S. GORDON and J. T. LOWE. U. S. 1,644,014, Oct. 4. A vessel of easily frangible material such as glass contains salts including Pd chloride, which may be assoc. with NaCl , H_2O and acetone. This vessel is covered with light colored absorbent material and in use the frangible container is crushed and the degree of discoloration indicates the concn. of CO present.

Rectifier or other low-pressure electric discharge tubes. C. G. SMITH. Brit. 263,109, Dec. 21, 1925. A photoionizing filament of W may be placed within a hollow cathode, to facilitate unilateral cond., and reverse currents may be suppressed by a gas such as A having an ionizing potential higher than the normal operating potential of the device. The interior of the cathode may be reflecting and it may be coated with Cs or a Cs alloy or with an alk. earth metal or oxide. Other details and modifications are described. Brit. 263,110-11 also relate to somewhat similar devices. Cf. C. A. 21, 676.

Illuminable thermometer. H. H. ZEAL. U. S. 1,645,211, Oct. 11.

Thermocouple. V. K. ZWORTKIN. U. S. 1,643,734, Sept. 27. Mech. features.

Thermocouple unit adapted for use with recording apparatus, etc. C. A. MARTIN. U. S. 1,643,582, Sept. 27.

Thermostatically controlled valve. W. W. CARSON, JR. U. S. 1,644,325, Oct. 4.

Thermostatic electric switch. R. W. MCBRIEN. U. S. 1,645,201, Oct. 11.

Thermostatic valve. C. R. SHORT. U. S. 1,644,751, Oct. 11.

Thermostatic valve. H. C. MALLORY. U. S. 1,644,786, Oct. 11.

Thermostatically controlled valve. H. R. WHITTIER. U. S. 1,644,501, Oct. 4.

Thermostatic valve control devices. W. B. DALE, R. A. HOPKINSON AND HOPKINSONS, LTD. Brit. 263,058, July 31, 1926.

Thermostat for controlling flow of water in cooling systems, etc. E. J. LEVY. U. S. 1,644,533, Oct. 4.

Thermostatic couple. C. E. FRY. U. S. 1,643,809, Sept. 27. Elements of Ni-Cu and Ni-steel alloys are used together.

Thermostat regulating system for water heaters. H. R. TROTTER. U. S. 1,645,263, Oct. 11.

Thermostatic electric switch. A. J. MOTT LAU. U. S. 1,645,290, Oct. 11.

Thermostatic electric switch. B. H. SMITH. U. S. 1,643,792, Sept. 27.

Electrically operated valve. H. J. SAUVAGE. U. S. 1,643,523, Sept. 27.

Electric remote control for gas valves, etc. H. K. CALDWELL. U. S. 1,644,171, Oct. 4.

Thermostatic control for gas furnaces. H. J. SAUVAGE. U. S. 1,643,858, Sept. 27.

Thermostatic control for furnaces fired with oil or other fluid fuel. H. J. SAUVAGE. U. S. 1,643,859, Sept. 27.

X-ray tube. F. DESSAUER. Brit. 262,906, Nov. 16, 1925.

X-ray tube. G. HOLST. U. S. 2,643,453, Sept. 27.

X-ray tube. JOSEPH SLEPIAN. U. S. 1,645,304, Oct. 11.

2—GENERAL AND PHYSICAL CHEMISTRY

GEORGE L. CLARK

Professor Albrecht Kossel. A. P. MATHEWS. *Science* 66, 293(1927).—An obituary.
E. J. C.

Andrea Naccari. ALESSANDRO AMERIO. *Nuovo cimento* [N. S.] 4, 49-59(1927).—
A brief account of the life and investigations of Andrea Naccari with portrait. L. T. F.

The centenary of Berthelot. ANON. *J. pharm. d'Alsace Lorraine* 54, 144-8
(1927).—An account of the celebration of the centenary at the Sorbonne. S. W.

Marcellin Berthelot. GABRIEL HUMBERT. *J. pharm. d'Alsace Lorraine* 54,
111-5(1927).—A review of B.'s work. S. WALDBOTT

Francesco Piola. QUIRINO MAJORANA. *Nuovo cimento* [N. S.] 4, 153-9(1927).—
Obituary notice with portrait. L. T. F.

V. S. Petrov, a Russian physico-chemist of the beginning of the nineteenth century.
B. N. MENSCHUTKIN. *Ann. inst. anal. phys. chim.* 3, 1-13(1926).—Historical. In an
extensive work on the combustion of substances *in vacuo* and inert gases (1801) Petrov
proved that P did not burn (and was not luminous) in the absence of O. In 1803
he described the oxidation of metals between the poles of a voltaic pile (Davy, 1813).
BASIL C. SOVENKOFF

The Nobel prize winners in physics and chemistry in 1925-1926. OLOF SVANBERG.
Industriidningen Norden 55, 377-9(1926).—A brief review of the works of Richard
Zsigmondy, Jean Perrin, The Svedberg, James Franck and Gustav Hertz.

The uniform indexing of papers. J. HANAUER. *Z. angew. Chem.* 40, 1036-7
(1927).
C. A. ROBAK
E. J. C.

Recent advances in science: physics. L. F. BATES. *Science Progress* 22, 197-
201(1927).—A review of recent work on ionization by collisions of the second kind
and on the rate of growth of crystals. JOSEPH S. HEPBURN

The element "mosandrum" of J. Lawrence Smith. R. C. WELLS. *J. Wash.*
Acad. Sci. 17, 385-8(1927).—"When all the facts are considered, it appears that J.
Lawrence Smith should be given credit for recognizing the existence of a new element
in samarskite, although his own preps. were impure and his characterization of the
element was indefinite. The element he named 'mosandrum' was in fact not one
but at least two elements later given the new names samarium and gadolinium."
R. H. LOMBARD

Florentium. LUIGI ROLLA AND LORENZO FERNANDES. *Z. anorg. allgem. Chem.*
163, 40-2(1927).—See C. A. 21, 2404. C. C. DAVIS

Element 61. WALTER NODDACK AND IDA TACKER. *Metallbörse* 16, 985-6; *Chem.*
Zentr. 1926, II, 12.—After a general survey of the history of the discovery of the rare
earths, their place in the periodic table and their properties, the results which have
been accomplished in the search for element 61 are discussed. There is included a
short communication from B. S. Hopkins who had already made known that he had
succeeded in identifying it spectroscopically in Nd-Sa fractions and had named it
dysprosium. According to the research of Hopkins, element 61 occurs in very small
amount in the earths, in conformity with its uneven order no. and its position in the
periodic system. C. C. DAVIS

Review relating to the elements and their structure for the years 1923-1926.
W. HERZ. *Fortschrittsber. Chem. Ztg.* 1927, 69-78. E. J. C.

The derivation of the fundamental relativity-theory laws from de Broglie's hy-
pothesis of phase-waves. ARTHUR HAAS. *Physik. Z.* 28, 632-4(1927). R. J. H.

Molecular transpositions and electronic theories of valence. A. GILLET. *Bull.*
chim. 41, 927-32(1927).—Since 1921 G. has advocated theories of reactions (e. g.,
conjugated bonds, hydrogenation, addition, induced polarity, inequality of C valences,
etc.) formed from conclusions obtained by making a complete list of the data published
concerning a given reaction, submitting them to an objective critical study and formulat-
ing inductive rules. These rules he shows to be in harmony with more recent elec-
tronic interpretations by Prévost, Vavon and Henri. W. T. RICHARDS

A valence-name-formula-solubility chart. G. N. QUAM. *Proc. Iowa Acad. Sci.* **33**, 170(1926).—The chart includes the names and symbols of all the common radicals used in general chemistry courses arranged in a definite order according to valence. Each small rectangular space formed by horizontal and vertical lines including a positive and negative radical represents a compd. and contains a symbol representing the soly. in g. per 100 g. of H_2O at 18° . Each large rectangular space represents compds. having a common type formula. The primary purpose of the chart is to aid the student in acquiring speedily a working knowledge of valence, radicals and formula writing.

W. G. GAESSLER

Valence and addition compounds. JEAN PERRIN. *Compt. rend.* **185**, 557-61 (1927).—P. advances a theory of semi-valence, which reconciles theories of intermediate-compd. formation with the older conception of valence.

C. H. G.

Coördination compounds. N. V. SIDGWICK. *Chemistry and Industry* **46**, 799-807; *Chem. News* **135**, 161-6, 177-83(1927).—The importance of the modern electronic interpretation of the theory of coördination throughout the field of chemistry is emphasized.

RUBY K. WORNER

The methods of study of the relationship between physical magnitudes. B. P. VAINBERG. *Ann. inst. anal. phys. chim.* **3**, 174-80(1926)—A theoretical introduction

BASIL C. SOVENKOFF

Physicochemical studies with tin. IX. The transition temperature of gray tin \rightleftharpoons white tin. ERNST COHEN AND K. D. DEKKER. *Z. physik. Chem.* **127**, 178-82(1927).—The transition temp. of the system gray Sn \rightleftharpoons white Sn has been detd. by the dilatometric method to be between 12° and 14.3° , and is probably very close to 13° .

J. H. PERRY

The polymorphism of zinc. G. I. PETRENKO. *Z. anorg. allgem. Chem.* **162**, 251-2 (1927).—Various investigators have found indications of transformation in Zn at about 175° and 300° . To study these transformations microscopically, 20 to 30 g. Zn is melted and cooled slowly to 380° , 250° and 146° , held at each temp. 20 to 30 min. and then quenched in an ice-NaCl mixt. The sections are etched in dil. $K_2Cr_2O_7$ and HNO_3 . The specimen quenched at 380° showed large polyhedral crystals, with a no. of bright spots probably corresponding to centers of the transformation which takes place at about 300° . Upon the surface of the specimens quenched at 250° and 146° are a great many small polyhedrons. The photomicrographs indicate a transformation point at 300° but none at 175° .

H. STOERTZ

Thermal expansion of silver between -101° and -253° . W. H. KRESOM AND A. F. J. JANSEN. *Verslag Akad. Wetenschappen Amsterdam* **36**, 484-8(1927); cf. C. A. **21**, 2581.—The coeffs. of linear expansion of Ag are for 0° to 100° , 0° to -100° , 0° to -180° , -100° to -180° , -180° to -250° , 19.14, 17.63, 16.89, 15.94 and 10.37×10^{-6} , resp.

G. CALINGAERT

The fusion of carbon. A. THIEL. *Sitz. ges. Beförd. ges. Naturw. Marburg* **1925**, 9 pp.; *Chem. Zentr.* **1926**, 1, 2552-3.—A criticism of works by Lummer (cf. *Verflüssigung der Kohle und Herstellung der Sonnentemperatur*, C. A. **9**, 143), Fajans and Ryschke-witsch (*Z. Elektrochem.* **31**, 54, 63(1925); cf. C. A. **19**, 3505) and Kohn and Guckel (C. A. **19**, 11), with expts. the aim of which was to explain the differences of the m. p. on a basis of capillary elec. phenomena. Conclusion: The m. p. of C in the crater is a function of the d. of the charge at the spot. The scintillations observed by Lummer are attributed to alternate fusion and solidification resulting from local differences in the d. of charge. The local changes in luminosity are caused by the different emission power of the solid and liquid. According to Thiel (*Z. Elektrochem.* **12**, 257(1906)) there is, because of the differing states of charge and surface tensions, a flow of the surface from the areas of lower surface tension to areas of higher surface tension. Moreover the liquid C flows by capillary forces from the locations of highest elec. charge to those of smaller charge. By enlargement of the crater through increase of the current strength, the fusion phenomena which are visible are attracted towards the crater walls. The ideas of T. are only hypothetical, for it is not yet proved that the great temp. differences in detns. of the m. p. of C can be explained by capillary elec. phenomena.

C. C. DAVIS

(Crystal) structure information from 1913 to 1926. P. P. EWALD AND C. HERMANN. *Z. Krist.* **65**, Special supplements, 1-32, 33-48, 49-64(1927).—This represents the beginning of a list of all crystal structure detns. from 1913 to 1926. The order to be followed is (A) elements; (B) compds. of type AB ; (C) type AB_2 ; (D) type A_nB_m ; (E) compds. with more than 2 kinds of atoms, but without a decided complex arrangement; (F) compds. with 2 or 3-atom radicals; (G) 4-atom radicals; (H) 5 or more atom radicals; (L) alloys; (M) mixed crystals. The first installment explains the notation

used, and the sub-division of the groups into various types, while the second and third cover group (A), the elements. The data given include complete references to all investigations, with a brief description of the methods used and the results obtained.

An x-ray investigation of copper, silver and gold. H. JUNG. *Z. Krist.* **64**, 413-29 (1927).—The lattice constns. of Cu, Ag and Au were again checked as 3.62, 4.070 and 4.068 Å. U. These values hold irrespective of the method of prepn. Mixed crystals of Ag-Au occur. Au exists in only one modification, and this is not eutropic with Cu and Ag. Similar relationships hold in other rows of the periodic table, e. g., Co, Rh, Ir; Ni, Pd, Pt; and Cr, Mo, W. Co, Ni and Cr all show a definite contraction in at size as compared with the two remaining elements in each series.

L. S. RAMSDELL

The hexagonal crystal structure of thallium. G. R. LEVI. *Z. Physik* **44**, 603-6 (1927).—In contradiction to Becker's assertion (*C. A.* **21**, 2204) that Tl has a tetragonal structure, the expts. of L., Terpstra, Asahara, Sasahara and Westerlink all agree in assigning to Tl a hexagonal structure.

R. J. HAVIGHURST

The space lattice and lattice constants of artificial and natural nickel and iron alloys. A. O. JUNG. *Z. Krist.* **65**, 309-34 (1927).—The lattice constns. for Ni, Fe and a series of Ni-Fe alloys were detd. by the powder and the Seeman-Bohlin methods. J. finds that the face-centered lattice of Ni persists down to 16-6% of Ni, whereas Andrews (*C. A.* **16**, 1384) found the Fe body-centered lattice for this range. Meteoric tenite, which analyzed Ni 40.8%, Fe 57.8 and P 0.49, is face-centered with $a = 3.601$ Å. U. kamacite (meteoric hexahedrite from Mt. Joy), with 5.32% Ni-Co, has the body-centered Fe lattice with $a = 2.859$, while an artificial alloy with 6.71% Ni-Co has the face-centered Ni lattice, with $a = 3.607$ Å. U. A relatively rapid method for the isolation of tenite is by means of hot 5% H_2SO_4 .

L. S. RAMSDELL

The density, crystal structure and nature of oxygen compounds with oxides of antimony. A. SIMON. *Z. anorg. allgem. Chem.* **165**, 31-40 (1927).— Sb_2O_3 is formed when Sb_2O_4 is heated to 385°, decomposes at 780° to form Sb_2O_4 , which in turn goes over into Sb_2O_5 at 920°. These changes are explained by assuming that an equil. exists between the thermal forces and those tending to maintain the lattice relations of Sb and O atoms. Debye photographs show the 4 oxides have the same lattice structure, the intensity and position of the lines being practically identical. Excepting Sb_2O_4 , which is pseudo-cubical, their crystal structure is cubical. X-ray photographs show Sb_2O_3 to be doubly refractive, while the remaining show no trace of so being. The 5th O atom, in Sb_2O_5 , is so loosely held in the lattice, that the dimensions of the latter are not noticeably influenced by its presence or absence, as shown by its chem. behavior. Density detns. are carried out with a pycnometer and a high-boiling petroleum, as described by Biltz and Wein (*C. A.* **17**, 2376); Biltz and Birk (*C. A.* **18**, 1930). Sb_2O_3 ds. from these and x-ray calcns. are 5.19 and 5.49, resp., the difference being unexplainable. That of Sb_2O_4 increases with the time of heating and at 840° is 5.99 after 1 hr. and up to 7.50 for 150 hrs. Heating Sb_2O_3 at 690°, for 3 hrs. gives a d. of 5.20 and for 6 months, 6.22. Technical Sb_2O_3 , at 840° gives 5.21, while samples contg. 1% of crystn. give values varying from 3.799 for 1 hr.'s heating, up to 5.116 for many hrs. Change of the amorphous to cryst. substance* with increase in time of heating accounts for these variations.

J. BALOZIAN

The structure of zinc hydroxide. C. GOTTFRIED AND H. MARK. *Z. Krist.* **65**, 21 (1927).— $Zn(OH)_2$ is orthorhombic, with a unit cell of the dimensions $a = 6.73$, $b = 5.73$, and $c = 8.47$ Å. U. There are 8 mols. in the cell, which has the symmetry space group V_h^{16} .

L. S. RAMSDELL

The symmetry and the unit cell of stannic iodide. R. G. DICKINSON. *Z. Krist.* **64**, 100-4 (1927).—D. presents evidence to show that the structure proposed by him (*C. A.* **17**, 1740) is correct, rather than those proposed by Ott (*cf. C. A.* **20**, 3108) and Mark and Weissenberg (*C. A.* **17**, 2660).

L. S. RAMSDELL

The crystal lattice of lithium nitride. RUDOLF BRILL. *Z. Krist.* **65**, 94-9 (1927).— Li_3N is cubic, with $a = 5.50$ Å. U. The unit cell contains 4 mols. Two possible structures are given: 4 mols, each with the symmetry C_3 can be placed in space group T_d , or one polymerized mol. Li_3N_4 in group T_1 .

L. S. RAMSDELL

X-ray investigation of the iron carbonyl, $Fe_3(CO)_9$. RUDOLF BRILL. *Z. Krist.* **65**, 85-93 (1927).— $Fe_3(CO)_9$ is hexagonal with a unit cell of the dimensions $a = 6.45$ and $c = 15.8$ Å. U., which contains 4 mols. The space group may be C_{3h}^2 , C_{3h}^4 , C_{6h}^2 , C_{6h}^4 , or D_{6h}^4 . The nine CO groups are at the corners of two octahedrons with a com-

mon face. The Fe atoms are on the trigonal axes perpendicular to this common face.

L. S. RAMSDELL

The crystal structure of Heusler alloys. LEIV HARANG. *Z. Krist.* **65**, 261-85 (1927); cf. *C. A.* **20**, 2266.—In a series of Al-Mn-Cu alloys three cubic lattices were found: face-centered with a varying size; body-centered, composed of Mn and Al, with $a = 2.975$ Å; and a simple cubic lattice of Al and Cu, with $a = 8.71$. The assumption of Heusler that the magnetism is tied up with a compd. $(AlM_3)_x$, where M_3 is an isomorphous mixt. of Cu and Mn is improbable, for the magnetic character cannot be attributed to any single lattice. The structure of Sn-Mn-Cu alloys is partly worked out. A high Sn content gives a hexagonal lattice, apparently due to a Sn-Cu compound, but all films show also many lines which cannot be assigned to any lattice.

L. S. RAMSDELL

The analysis of mixed crystals and alloys. ASLAK ERDAL. *Z. Krist.* **65**, 69-82 (1927).—The system $KBr-NH_4Br$ forms true mixed crystals of the NaCl type for consns. of 0-40% NH_4Br . The results of Vegard are confirmed in that there is no evidence of any regular substitution of NH_4 for the K atoms. The additive law of Vegard holds for these mixed crystals. In the system Ag-Cu true mixed crystals are formed only up to about 6.5% of either component in the other. This figure is obtained from the measured deformation of the lattice by means of the additive law.

L. S. RAMSDELL

A probable relation between twinning and the atomic structure in cubic heteropolar compounds. KARL CHUDOBA. *Z. Krist.* **65**, 133-9 (1927).—No reason for twinning of cubic crystals lies in the crystal lattice. All cubic heteropolar compds. of elements which are near the noble gases in the periodic table, and which have the electronic configuration of these gases, are characterized by lack of twinning. Sylvite is an apparent exception to this rule.

L. S. RAMSDELL

The space group of $(CN_2H_2)_2$ and the crystal structure of $CaCN_2$. U. DEHLINGER. *Z. Krist.* **65**, 286-90 (1927).—Dicyanodiamide is monoclinic (pseudoorthorhombic) with a unit cell belonging to space group C_2^2 , C_2^3 or C_{2h}^2 . The axial ratio is 3.14:1:1.41, and $a = 13.8$, $b = 4.4$ and $c = 6.2$ Å. U. There are 4 mols. in the unit cell. $CaCN_2$ is rhombohedral, with $a = 5.11$ Å. U. and $\alpha = 43^\circ 50'$, or in terms of a hexagonal unit cell, $a = 3.91$ and $c = 14.10$ Å. U. The rhombohedral unit contains 1 mol. with Ca at 000, C at $\frac{1}{3}\frac{1}{3}\frac{1}{3}$ and N at uuu and $-\bar{u}$, $-\bar{u}$, $-\bar{u}$, where $u = 0.37$.

L. S. R.

The symmetry of methane derivatives with four equal groups. K. WEISSENBERG. *Naturwissenschaften* **15**, 662-4 (1927).—X-ray work has shown the pyramidal configuration of constituents around the central atom of pentaerythritol. For amorphous materials evidence for a pyramidal type of C atom in Ca_4 can be derived from the measurement of dipole moments. These moments can be expected in the symmetry groups C_{4v} , C_{2v} and C_4 ; the groups T_d , T , D_{4h} , V_d , S_4 , D_4 , C_{4h} , V_h , V and C_{2h} will be dipole-free. This viewpoint is further discussed qualitatively. Conclusions as to possibilities of stereoisomerism and enantiomorphy due to pyramidal structure are derived.

B. J. C. VAN DER HOEVEN

The space lattice of tetraphenylsilicane. H. MARK AND H. NEHNER. *Z. Krist.* **65**, 455-60 (1927).— $Si(C_6H_5)_4$ is tetragonal, with $a = 11.50$ and $c = 6.97$ Å. U. There are 2 mols. in the unit cell, which belongs to space group V_d^4 or D_{4h}^9 , depending upon the crystal symmetry, which is not fully established.

L. S. R.

Static methods and their application to the study of crystal habits. A. SHUBNIKOV AND O. SHUBNIKOV. *Bull. Akad. St. Petersburg* [6], 1926, 363-84; *Chem. Zentr.* 1926, II, 920.—With wiluite as an example, it is shown that by measuring numerous crystals (335 being measured in the case cited) the most probable surface dimensions and therefore "normal" form of the mineral can be ascertained.

C. C. DAVIS

Investigations of metal crystals. V. Electric and thermal conductivity of single-crystal and polycrystalline metals of the cubic system. E. GRÜNEISEN AND E. GOENS. *Z. Physik* **44**, 615-42 (1927); cf. *C. A.* **20**, 2778.—Elec. and thermal resistance was measured for single-crystal and polycryst. samples of Au, Pt, Cu, W, Rh, Al, Fe, at temps. between -183° and -252° . The thermal resistance of good conductors is detd., as the temp. is lowered, more and more by the degree of purity and of tempering of the metal. An influence of the crystal grain size could not be demonstrated. Thermal resistance may be divided into a "metallic" and a "non-metallic" portion. The metallic portion obeys the Wiedemann-Franz-Lorenz law for cubic metals, independently of the degree of purity or the amount of hardening; the non-metallic portion depends upon the temp., but not upon the degree of purity or of hardening. Samples of one and the same metal, which differ in purity or degree of tempering, have specific thermal

resistance at const. temp. which is a linear function of the sp. elec. resistance.

R. J. HAVIGHURST

A lattice theory calculation of the electrolytic conductivity of the rock-salt crystal. WERNER BRAUNBEK. *Z. Physik* **44**, 684-99 (1927).—From the point of view that the electrolytic cond. of crystals of the NaCl type depends upon the ability of the ions to exchange places in the crystal lattice, a quant. theory of electrolytic cond. is developed. The following simplifying assumptions are made: The vibrations of the ions are linear; energy is statistically divided among individual ions; the Na ions only are in motion. The theory stands in good agreement with exptl. data on the change of cond. with temp. for NaCl.

R. J. HAVIGHURST

The structure of xenotime (YPO₄) and relation between chemical constitution and crystal structure. L. VEGARD. *Phil. Mag.* [7], **4**, 511-25 (1927).—Powder method and rotating crystal diagrams confirm previous results (*C. A.* **11**, 750, 2986) that xenotime and zircon have identical space-lattices. Further general discussion is given regarding chem. constitution and crystal structure.

GEORGE GLOCKLER

A demonstration model for illustrating the Laue effect. G. B. HAGEN. *Physik. Z.* **28**, 453-55 (1927).—A model is described in which the crystallographic planes of a cubic crystal are represented by glass plates arranged, in the proper geometric relations, about rods representing zone axes. When illuminated by a projection lantern, the model gives reflected spots upon a screen, the geometric arrangement of the spots corresponding to that of the Laue diagram.

R. L. HERSHEY

A general property function of aggregates without mixed crystals. JOH. DEJMEK. *Physik. Z.* **28**, 409-17 (1927).—D. presents a new treatment of Lichteneker's logarithmic law of mixts. for calculating the properties of mixtures free from mixed crystals. The elec. resistances of Cd-Sn and Cd-Pb alloys have been calcd. Calcs. for Ag-Bi alloys show a wide discrepancy, which may be due to the formation of solid soln. The logarithmic law requires fulfillment of the law of proportional change of a property of the aggregate; if two properties, a and b , are related by $a = ab^b$ and a is expressed by the logarithmic relation, b is also. The hardness of Zn-Sn alloys was expressed by the logarithmic relation, and qualitative agreement with some old exptl. detns. was obtained.

R. L. HERSHEY

Crystal structure in its relation to chemical problems. R. W. G. WYCKOFF. *Carnegie Inst. Wash. Geophys. Lab. Paper No.* **624**, 20 pp. (1927).—A discussion of crystal structure and its relation to the problems of chemical bondage, secondary valence, atomic radii, the structure of organic compounds, alloys and solid solns., colloids, etc. is given.

R. L. HERSHEY

Structure of silicates. W. L. BRAGG. *Proc. Roy. Inst. Gt. Brit.* (separate), 9 pp.; *ature* **120**, 410-4 (1927); cf. *C. A.* **21**, 1907 (1927).

R. L. HERSHEY

The crystal structure of the trigonally crystallizing heteropolar compounds of the composition MG₃LR₆, MG₃D₂LR₆ and MG₃D₂LR₆. O. HASSEL AND J. R. SALVENSEN. *Z. physik. Chem.* **128**, 345-61 (1927).—Some lines on the rotation diagrams of MgSiF₆·6H₂O and MgTiF₆·6H₂O lead to the conclusion that the true unit cell is a larger rhombohedron than previously reported (cf. Hassel, *C. A.* **21**, 3500). Unit cell dimensions (in A. U.) on this basis, detd. by rotation and spectrographic photographs, are: MgSiF₆·6H₂O, $b = 9.56$, $D = 9.89$; MnSiF₆·6H₂O, $b = 9.66$, $D = 9.75$; FeSiF₆·6H₂O, $b = 9.62$, $D = 9.68$; CoSiF₆·6H₂O, $b = 9.31$, $D = 9.69$; NiSiF₆·6H₂O, $b = 9.26$, $D = 9.50$; ZnSiF₆·6H₂O, $b = 9.32$, $D = 9.64$; MgTiF₆·6H₂O, $b = 9.77$, $D = 9.85$; ZnTiF₆·6H₂O, $b = 9.55$, $D = 9.88$; ZnZrF₆·6H₂O, $b = 9.77$, $D = 10.11$; MnZrF₆·6H₂O, $b = 9.77$, $D = 10.02$; ZnSnF₆·6H₂O, $b = 9.71$, $D = 10.19$; Co(NH₃)₆·4Co(CN)₆, $b = 10.89$, $D = 10.81$; Co(NH₃)₆Cr(CN)₆, $b = 11.15$, $D = 10.90$; Co(NH₃)₆·4Co(CN)₆, $b = 10.74$, $D = 10.85$; Co(NH₃)₆H₂O·Fe(CN)₆, $b = 10.74$, $D = 10.84$; Co(NH₃)₆(H₂O)₂Co(CN)₆, $b = 10.62$, $D = 11.01$. b is one-half the face diagonal of the rhombohedral unit cell and D is the space diagonal. The rhombohedral angles in all cases are between 112° and 113°.

R. L. HERSHEY

The crystal structure of potassium dihydrogen phosphate. S. B. HENDRICKS. *Am. J. Sci.* **14**, 269-87 (1927).—Laue, rotation and powder photographs were taken. The lattice is body-centered tetragonal; $d_{(001)} = 6.97$ A. U.; $d_{(100)} = 7.42$ A. U. There are 4 mols to the unit cell. Intensity analysis gives the space group as 4d-12, with P atoms at (a), K at (b) and O at (c). Calcs. to det. the true time of exposure of the different parts of a plate 10 cm. from the crystal, perpendicular to the incident beam and parallel to the axis of rotation are made and a chart of the results is given.

R. L. HERSHEY

The crystal structure of mercuric oxide. WILLIAM ZACHARIASEN. *Z. physik. Chem.* **128**, 421-9 (1927).—HgO was examd. by the powder method. It is found to

be rhombic, with 2 mols. to the unit cell; $a = 3.296$ A. U.; $b = 3.513$ A. U.; $c = 5.504$ A. U.; d. calcd. is 11.22. The Hg atoms form a body-centered lattice; several possibilities are discussed for the O atoms. The conclusion of G. R. Levi that red and yellow PbO are crystallographically identical is verified.

R. L. HERSHEY

The crystal structure of magnesium telluride. WILLIAM ZACHARIASEN. *Z. physik. Chem.* **128**, 417-20 (1927).—MgTe was prepd. directly from the elements in an atm. of H_2 . Powder pictures show MgTe to be of the wurtzite type: $a = 4.52 \pm 0.02$ A. U., $c = 8.33 \pm 0.04$ A. U. An assumption of 2 mols. per unit cell gives a d. of 3.86; u is about $\frac{1}{8}$; the Mg-Te distance is 2.76 A. U. Mg atoms are at $(\frac{1}{2}, \frac{1}{2}, 0)$, $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2})$; Te atoms are at $(\frac{1}{2}, \frac{1}{2}, u)$, $(\frac{1}{2}, \frac{1}{2}, u + \frac{1}{2})$.

R. L. HERSHEY

The crystal structure of palladium oxide. WILLIAM ZACHARIASEN. *Z. physik. Chem.* **128**, 412-6 (1927).—Powder pictures have been taken of a mixt. of PdO and Pd. PdO is tetragonal; $a = 3.209 \pm 0.005$ A. U.; $c = 5.314 \pm 0.005$ A. U. There are 2 mols. per unit cell; d. calcd. is 8.31. The metal atoms form a body-centered lattice; the positions of the O atoms are not definitely detd. PdO is probably isomorphous with SnO and red PbO.

R. L. HERSHEY

The cleavage of rock-salt crystals in rhombic dodecahedral and octahedral surfaces. V. D. KUZNETZOV. *Z. Physik* **42**, 905-9 (1927).—To cleave rock-salt crystals in the (110) surfaces requires 1.76 times as much energy as a step-wise cleavage, in which the planes of the steps are parallel to the cube sides; hence the actual cleavage in (100) planes always occurs in the step-wise manner. The energy required for experimental cleavage is thus somewhat less than the theoretical: $\sigma_{(110)} = 2.50\sigma_{(100)}$, theoretically, $\sigma'_{(110)} = \sqrt{2}\sigma_{(100)}$ practically. $\sigma_{(hkl)}$ is the surface energy of the face (hkl). Similarly for cleavage on the (111) planes, 3.36 times as much energy is necessary for the cleavage on (111), as for a cleavage surface consisting of small triangular pyramidal elevations and depressions, the pyramid sides being parallel to the cube faces. The actual experimental value is $\sigma'_{(111)} = \sqrt{3}\sigma_{(100)}$ instead of $\sigma_{(111)} = 5.81\sigma_{(100)}$ which theory predicts.

R. L. HERSHEY

Note on investigations into the strength of rock salt, quartz and fluorspar. W. EWALD. *Glasindustrie* **34**, 7 (1926); cf. *C. A.* **20**, 3253.—The transverse strength of a square prism of rock salt, quartz and fluorspar, cut parallel to a crystal face, when bent across one edge of the prism was approx. 1.25 times as great as when bent across one face. The ultimate tensile strength of rock salt was 570 g. per sq. mm. and the transverse strength 1190 g., confirming the values obtained by Voigt.

H. F. K.

Study of muscovite mica by means of X-rays. CHARLES MAUGUIN. *Compt. rend.* **185**, 288-91 (1927).—Rotation diagrams show the lattice to be monoclinic; the unit cell edges are: $a = 5.17$ A. U.; $b = 8.94$ A. U.; $c = 20.0$ A. U.; the plane of cleavage is parallel to the plane ab ; the angle ac is 96° . There is no pure symmetry plane, but a glide plane of symmetry; there are 2 mols. per unit cell. The relations between the crystal structure and other observed properties are discussed.

R. L. HERSHEY

The crystal structures of mercuric and mercurous iodides. M. L. HUGGINS and P. L. MAGILL. *J. Am. Chem. Soc.* **49**, 2357-67 (1927).—The crystal structures of tetragonal HgI_2 and Hg_2I_2 have been detd. with the aid of data from special photographs and Laue photographs. Results are in agreement with those of Bijvoet, Claassen and Karssen (*C. A.* **20**, 2264), Havighurst (*C. A.* **20**, 526, 2925) and Hylleraas (*C. A.* **20**, 852).

R. J. H.

Single iron crystals. III. The magnetization in various crystal directions. R. DUSSLER and W. GERLACH. *Z. Physik* **44**, 279-85 (1927); cf. *C. A.* **21**, 2591. The rectilinear ascent of the magnetization curve, the sharp break, and the vanishing remanence, previously observed as characteristic of Fe crystals, are confirmed. The initial permeability in the tetragonal direction is greater than in the digonal. Satn. in the tetragonal direction occurs earlier than in the digonal but both have approx. the same magnitude. The break in the magnetization curve for the tetragonal direction occurs at higher magnetization but at approx. the same field strength as for the digonal. The results of Honda and Kaya, though less positive, are interpreted as confirming these conclusions, the discrepancies being explained as due to mechanical destruction of the Fe crystals in the specimens used by H. and K. New results obtained by extending the measurements to high and low temps. are: the initial magnetization is independent of the temp. within a few %; the breaks in the magnetization curve become sharper with increasing temps. but occur at lower intensities of magnetization; satn. decreases with increasing temp. and is reached at lower fields, e. g., for the tetragonal direction at 20° , satn. is reached at approx. 150 gauss; at 629° , at 4.5 gauss; at 680° at 3.5 gauss; and for 739° , at 2.5 gauss.

W. W. STIFLER

Historical review of the subject of recrystallization. J. CZOCHRALESKI. *Z. Metallkunde* 19, 316-20(1927).—The work done on this subject down to the end of the year 1921 is discussed and tabulated.

H. STOERTZ

X-ray analysis of chromium-carbon systems. ARNE WESTGREN AND GÖSTA PHRAGMÉN. *Kgl. Svenska Vetenskapsakad. Handl.* 2, No. 5, 11 pp.(1926); *Mineralog. Abstracts* 3, 336.—Three Cr-C compds. are indicated by x-ray data: cubic with $a = 10.638$ Å. U. and 24 Cr₄C mols. in the unit face-centered cube; hexagonal with $a = 13.98$, $c = 4.523$ Å. U. and $c/a = 0.324$ with 8 mols. of Cr₇C₃ in the structure, and orthorhombic with $a = 2.821$, $b = 5.52$, $c = 11.46$ Å. U. corresponding to $a:b:c = 0.246:0.480:1$ with 4 mols. of Cr₃C₂ in the unit cell.

J. F. SCHAIERER

Theory of gases and equation of state. II. J. DUCLAUX. *J. phys. radium* 8, 336-43(1927).—It is sought to establish a theory of gases on the following hypothesis: there is no action at a distance between the mols. of gases. Either the mols. are completely independent or they are chemically combined. The combinations follow the general laws of chem. mechanics. As it has previously been shown, this hypothesis leads, for the compressibility and expansion of gases, to results in complete accord with expt. It represents with the same success the variations of the specific heat, either with pressure, or with temp. It is successful with viscosities.

L. D. R.

Pressure, volume and temperature chart. ANON. *Power* 66, 544-5(1927).—A Cartesian nomogram illustrates the approx. interrelation of temp. in degrees F., pressure in lbs. per sq. in. and vol. of an ideal gas.

D. B. DILL

Hydrodynamics and the kinetic theory of gases. YVES ROCARD. *Ann. phys.* 8, 5-120(1927).—Mathematical and a review.

J. H. PERRY

Tables for the reduction of gas volumes to 0°, 760 mm. mercury. N. LEROY AND L. PLANTÉFOL. *Ann. physiol. physicochim. biol.* 3, 377-80(1927).—Tables are given for the correction of barometric pressure to a temp. of 0°, and for a reduction of vol. of gas satd. with H₂O vapor to 760 mm. and 0°.

H. J. DEUEL, JR.

The influence of diffusion of oxygen on the rate of combustion of solid carbon. I. T. WARD AND J. B. HAMBLÉN. *Ind. Eng. Chem.* 19, 1025-7(1927).—Previous expts. which led to the hypothesis that the rate of combustion of solid C must be detd. by the rate at which O can diffuse through the film to the surface of the C are reviewed and theoretical considerations are discussed. An illustrated description is given of the app. designed to obtain direct exptl. data on this problem. A capillary quartz tube was sealed to a block of C placed in a furnace. The gas evolved upon heating the C was carefully collected and analyzed in a special directly connected precision gas analysis app. The data obtained in 6 runs and computations of these gas analyses on the basis of 100 mols. of N and O-N ratio are tabulated. Conclusion: When solid C burns, the controlling variable is not the rate of chem. interaction of C and O, but is the rate of diffusion of the combustion gas through the gas film.

W. W. HODGE

Dissociation of carbon dioxide at high temperatures. W. T. DAVID. *Nature* 120, 15-19(1927).—D. believes that Fenning and Tizard's (*C. A.* 21, 3300) assumption of chem. equil. at the time of max. pressure in CO + O₂ explosions is erroneous and that therefore their results on CO₂ dissocn. are much too high. Unpublished expts. by R. A. Smith between 1600° and 3000° with CO + varying amts. of air showed that the amt. of uncombined gas at max. pressure in completely combustible mixts. is at least 10% of the original charge below 2000° and increases with temp. It is assumed that below 2000° this is due to incomplete combustion and that above 2000° an additional CO₂ dissocn. effect sets in. The expts. were performed in a spherical 6-in. vessel, the gas mixt. being at atm. temp. and pressure.

B. J. C. VAN DER HORVEN

The theory of streaming of an elastic liquid in a Couette apparatus. MARKUS REICLER AND RASSA RIWLIN. *Kolloid Z.* 43, 1-5(1927).—An elastic liquid and a plastic material only differ in that the former on slight pressure acts like an elastic solid while the latter at high pressure flows as a true liquid. On this basis a formula has been derived which can apply to the Couette app. The criterion for elasticity of a liquid is given by the velocity of rotation of the outside cylinder of the app. necessary to cause all the material to adhere to it.

R. H. LAMBERT

A general relation between an adiabatic coefficient of elasticity and the absolute melting temperatures for several metals. L. P. SIEG. *Phys. Rev.* 25, 251-2(1925).—A relationship is derived connecting Young's modulus with the ordinary isothermal modulus. The former as calcd. from published data for Al, W, Cu, Fe, Ag and Pt remains const. till about 1/3 of the abs. m. p. is reached when a sudden increase occurs.

F. O. A.

Preparation of electrolytically pure water. E. F. KRAUZE AND A. V. NOVOSELOV. *Russ. Phys.-Chem. Soc.* 58, 1222-9(1926).—The following app. was used: a spiral

condenser of pure tin, a U-tube with 2 Pt electrodes for checking the cond. of small amts. of distd. water, storage bottles for electrolytic water. The outside air (pure air) was connected with the usual absorbers for CO_2 , etc. All rubber connections were boiled in water before the expt. Storage bottles (of opaque glass) were steamed out for 5-6 days. The Pt electrodes used for measuring the resistance were of a modified E. Pfeifer type (*Ann. Chem. Phys.* 25, 232(1885)). The still was of sheet copper (60 l. capacity) with a cover of pure tin. 50-55 l. of freshly distd. water was used. The receiver was connected with the fresh-air line (distn. started in $1\frac{1}{2}$ hrs.). After the distn. the water was kept at 25° in a thermostat and air free from CO_2 blown through for 2 days, when const. cond. was reached. Sp. cond. before air treatment was 0.7 to 0.9×10^{-6} and 0.2 to 0.3×10^{-6} after.

A. A. BOEHTLINGK

The molecular pressure of associated liquids. K. STAKHORSKII. *Ukrainskii Khim. Zhurnal* 1, 544-52(1925); *Chem. Zentr.* 1926, II, 157.—The internal pressure B of liquids is calcd. from the equation: $B = 427.8 T_a/(xV)$, where T_a is the b. p., x the degree of assocn., V the mol. vol. in cc., B being expressed in atm., and values of x already found (*C. A.* 20, 2769) being utilized. B is equal to 77.75γ , where γ is the surface tension (cf. Walden, *C. A.* 3, 2077). For the capillarity const. a^2 , there is derived an equation: $xM^2/T_a\zeta = \text{const.}$, which is similar to the Walden equation (cf. *C. A.* 3, 266), and in which M is the mol. wt., T_a the m. p., and ζ the diam. of the mol. or the atom.

C. C. DAVIS

Attempt at a comparative study of vapor pressure curves. I. BERKMAN. *Ukrainskii Khim. Zhurnal* 1, 553-78(1925); *Chem. Zentr.* 1926, II, 170.—If T_a is the b. p. of a liquid at the pressure p , and T_b is the b. p. of another liquid at the same pressure, then according to Ramsay and Young: $T_a = cT_b^2 + dT_b$, where c and d are consts. which are independent of the pressure and temp. When $T_a = (1 - d)/c$, $T_a = T_b$, i. e., the temp. curves intersect, and therefore the consts. c and d can be calcd. from this intersection. For homologous compds. c has practically the same value (0.0001 for esters of fatty acids, 0.0006 for phenyl halides, etc.), while d increases uniformly with increase of mol. wt. if water is chosen as the liquid of reference. Only alics. have negative c values (based on water); the c values are positive and highest in the paraffin series, decreasing from the hydrocarbons to the esters to the acids, decreasing therefore from the normal type of compd. to that with associating groups.

C. C. D.

The physical properties of some cyclohexane derivatives. N. N. NAGORNOV AND L. A. ROTINYANTZ. *Ann. inst. anal. phys. chim.* 3, 162-73(1926).—The crit. temp. of $\text{C}_6\text{H}_{11}\text{Me}$ is 301.5° ; b_{760} 100.8° ; $dp/dt = 21.1$ mm. at b. p.; $d_{-78.4}$ 0.8540 , d_0 0.7865 , $d_{19.8}$ 0.7696 and $d_{100.6}$ 0.6971 . $\text{C}_6\text{H}_{11}\text{Cl}$ m. -43.9° , b_{760} 142.9° , $dp/dt = 19.9$ mm. at b. p.; crit. temp. is 314.25° , probably due to decompn. at high temps., d_0 1.0180 , $d_{19.2}$ 0.9994 , $d_{100.1}$ 0.9193 . $\text{C}_6\text{H}_{11}\text{OH}$ b_{760} 160.6° ; $dp/dt = 22.5$ mm. at b. p.; crit. temp. 377° ; d_{25} 0.9440 , $d_{138.6}$ 0.8235 . Ratios of the abs. temps. and vols. at equal pressures are nearly const. except for $\text{C}_6\text{H}_{11}\text{OH}$, which belongs to assocd. liquids. Albertosi's relationship does not accord with the thermal expansion of $\text{C}_6\text{H}_{11}\text{Me}$ at low temps.; the law of Cailletet and Mathias, on the other hand, holds well at temps. corresponding to the vapor pressures below 100 mm. Mol. vols. of C_6H_{12} derivs. exceed those of C_6H_6 and derivs. by 21. The compds. studied are normal in the vapor state.

BASIL C. SOYENKOFF

A critical analysis of equations for the design of fractionating columns. L. H. SHIRK AND R. E. MONTONNA. *Ind. Eng. Chem.* 19, 907-11(1927).—An $\text{EtOH-H}_2\text{O}$ mixt. was distd. in a lab. column and the data obtained were calcd. by the methods of (A) McCabe and Thiele (*C. A.* 19, 1970), (B) Rodebush (*C. A.* 16, 4288), (C) Murphree (*C. A.* 19, 3040), (D) Lewis (*C. A.* 16, 2561), (E) Peters (*C. A.* 18, 136), and (F) Leslie ("Motor Fuels," *C. A.* 17, 1543). Method (A) was the most practical. Method (B) was more accurate for a small no. of plates but more difficult to use. Method (C) gave results identical with (A) but required much longer calcs. Method (D) was in error for a small no. of plates, and has no advantage over (A). Method (E) contains errors, and when these are corrected the results check (D) for a rectifying column but give absurd results for an exhausting column. Method (F) is very long, but gives results more like (A) and (B) than the other mathematical methods.

W. L. BADGER

Structure in surfaces of liquids. J. W. MCBAIN. *Nature* 120, 362(1927).—A reply to the criticism of Hatschek on the general hypothesis of rigidity in colloidal solns. absent in true liquids. McB. believes the more general view preferable whatever the form of ramifying aggregates is present.

R. H. LAMBERT

The viscosity of liquids above their boiling points. IV. TOSHIZO TITANI. *Bull.*

J. Chem. Soc. Japan **2**, 225-9(1927); cf. *C. A.* **21**, 3506.—In part II of the paper (cf. *A. 21*, 3291) the following equations were obtained, expressing the relations between the mol. fluidity ϕ defined as the reciprocal of $\eta \cdot V^{1/3}$ and mol. vol. V or temp. T : $\phi = K(V^{2/3} - B^{2/3}) \dots (I)$ and $\phi_K - \phi = C(T_K - T)^{1/3} \dots (II)$, where K and C are arbitrary consts., and ϕ_K , T_K , crit. consts. B , an effective mol. vol. in equation (I), is of additive nature. It can be computed by assuming $C = 6.9$, $H = 5.1$, $O = 7.5$, $Cl = 20.0$, $F = 10.5$, double linking = 3.0, iso-grouping = 0. The resp. const. in the vol. and temp. relations becomes independent of the nature of the substance when it is expressed in reduced form. From the vol. and temp. relations of the mol. fluidity, the reduced equations of the following form have been obtained: $\phi_r = k_r(v_r^{2/3} - b_r^{2/3})$; $1 - \phi_r = c_r(1 - t_r)^{1/3}$; $\phi'_r = k'_r(v_r^{2/3} - b_r^{2/3})$; $\phi'_{Kr} - \phi'_r = c'_r(1 - t_r)^{1/3}$. A. L. HENNE

The molecular constitution of liquids. VL. KISTYAKOVSKII. *J. chim. phys.* **24**, 200-21(1927).—Depending on assocn. and cond. liquids may be grouped as follows: (1) the least polymerized liquids, as the satd. hydrocarbons from pentane to decane and the rare gases, except He; (2) slightly polymerized, as the cyclic hydrocarbons and halogen derivs.; (3) those appreciably polymerized, as the halogen acids and most of the elements; (4) highly polymerized, including H_2O , the alcs. and amines; (5) those polymerized in both liquid and gaseous states, as S, As, Se, P, etc.; (6) ionized liquids, as the fused salts; (7) electronic liquids, consisting of the fused metals. Variations from the Guldberg-Guye relationship ($T_K/T_B = 1.5$) cannot be used to classify liquids. Nor does a study of the heat of vaporization assist in grouping. Certain equations for mol. vol., temp. and d. aid in distinguishing liquids of groups 1, 2 and 3. Liquids of groups 1-5 can be distinguished from v. p. relationships. E. G. VANDENBOSCHÉ

The molecular association in liquid state. K. M. STAKHORSKII. *J. chim. phys.* **24**, 204-8(1927).—For the same liquid mixts. the degree of assocn., that is the factor to replace the mixts. of the various mols with a compd. mol. of the same mol. wt., decreases with increasing temp. J. A. SZILARD

Solubility and surface tension. I. TRAUBE, ILSE SCHÖNING and L. J. WEBER. *Ber.* **60B**, 1808-11(1927).—The solubilities of 25 Na salts of org. acids in org. solvents as well as the solubilities of aniline-HCl in isoamyl alc. and in paraldehyde have been studied at 18°. In general, the greater the soly. increase, the greater is the lowering of the surface tension of the H_2O by the salt concerned. Exceptions to this are the cases of Na benzoate and Na salicylate. The soly. of Na benzoate in alcs. increases in the series: octyl, amyl, butyl alcs. J. H. PERRY

Vapor pressures of diphenyl and of aniline. F. J. GARRICK. *Trans. Faraday Soc.* **23**, 560-3(1927).—In the course of comparing the vapor pressures of high-boiling org. substances with that of Hg by means of the Ramsay-Young rule, an anomaly was observed with diphenyl, the data of Jacqueroed and Wassmer (*Ber.* **37**, 2533(1904)) being used. The curve obtained by plotting T_1/T_2 against T_1 (where T_1 and T_2 are the abs. temps. at which diphenyl and Hg, resp., have the same vapor pressure) showed a sharp change of slope at about 224°, the 2 arms being nearly straight lines. As the ratio T_1/T_2 only changes by about 2% for 100°, the graph can be made on a very large scale and is therefore very sensitive to small inaccuracies. A break such as is observed would therefore correspond to a discontinuity in the actual vapor pressure too small to be noticed on smoothing. Consequently the vapor pressures of diphenyl and of aniline have been redetd. and tabulated. The graphs obtained show no anomalies. In the following data, the temps. in °C. and the vapor pressure in mm. are given, resp. *Diphenyl*: 150.00, 33.02; 155.00, 40.73; 160.00, 49.65; 165.00, 59.88; 170.00, 71.75; 175.00, 85.49; 180.00, 101.13; 182.00, 107.89; 184.00, 115.01; 186.00, 122.54; 188.00, 130.39; 190.00, 138.58; 192.00, 147.40; 194.00, 156.62; 196.00, 166.07; 198.00, 176.19; 200.00, 186.75; 202.00, 197.93; 204.00, 209.62; 206.00, 221.74; 208.00, 234.58; 210.00, 248.00; 212.00, 261.95; 214.00, 276.78; 216.00, 292.13; 218.00, 308.38; 220.00, 325.24; 222.00, 343.11; 224.00, 361.56; 226.00, 380.92; 228.00, 400.92; 230.00, 421.77; 232.00, 443.15; 234.00, 466.24; 236.00, 490.26; 238.00, 514.90; 240.00, 540.68; 242.00, 567.62; 244.00, 595.76; 246.00, 624.99; 248.00, 655.25; 250.00, 686.53; 252.00, 719.25; 254.00, 753.81. *Aniline*: 96.00, 37.43; 98.00, 40.69; 100.00, 44.53; 102.00, 48.39; 104.00, 52.00; 106.00, 57.25; 108.00, 62.18; 110.00, 67.46; 112.00, 73.09; 114.00, 79.13; 116.00, 85.88; 118.00, 92.47; 120.00, 99.80; 122.00, 107.68; 124.00, 115.99; 126.00, 124.88; 128.00, 134.36; 130.00, 144.42; 132.00, 155.12; 134.00, 166.41; 136.00, 178.46; 138.00, 191.15; 140.00, 204.95; 142.00, 219.15; 144.00, 234.53; 146.00, 250.58; 148.00, 267.64; 150.00, 285.81.

A. L. HENNE

A relation between orthobaric densities. II. JURÔ HORIUCHI. *Bull. Chem.*

Soc. Japan **2**, 213-24(1927).—H. proves the validity of the equation $\psi = RT \ln V_0/V_i = A\{[1/(V_i - E)] - [1/(V_0 - E)]\}$ (cf. *C. A.* **21**, 680), by making the actual calcs. for many substances, at various temps. The substances investigated were: CO_2 , N_2O , NH_3 , SO_2 , COCl_2 , C_3H_{12} , C_6H_{14} , diisopropyl, diisobutyl, C_7H_{16} , fluoro-, bromo-, iodobenzene, CHCl_3 , CCl_4 , CS_2 , HCOOMe , EtCOOMe , Me isobutyrate , AcOEt , EtCOOEt , AcOPr , MeCOMe . They all agree well with the equation except at temps. immediately near the critical temp. The consts. E have been tabulated for 42 substances; it is shown that their value may be computed satisfactorily by means of the following additive consts.: $\text{H} = -0.54$, $\text{C} = 12.1$, $\text{O} = 4.0$, $\text{F} = 4.35$, $\text{Cl} = 2\text{F} = 8.70$, $\text{Br} = 3\text{F} = 13.05$, $\text{I} = 4\text{F} = 17.4$, double bond = -1.6 , $\text{OH group} = 16.2$, ring formation = -13.7 .

A. L. HENNE

Volume studies in homologous series. F. WRATSCHKO. *Pharm. Presse* **32**, 251-5, 268-74(1927), cf. *C. A.* **21**, 2826.—Numerous equations are developed and discussed bearing on the relationship between the density and constitution of oxygenated hydrocarbons. The calcd. results are given in great detail and tabulated form.

W. O. E.

Fluctuations of dielectric constant in liquids and theories of molecular scattering of light. K. R. RAMANATHAN. *Indian J. Physics* **1**, 413-36(1927); cf. *C. A.* **21**, 2847.—The question of fluctuations of dielec. const. of a small vol. element of a liquid is discussed with reference to the theories of mol. scattering of light. Reasons are given for concluding that the fluctuations of dielec. const. responsible for scattering cannot be detd. by differentiating Lorentz's relation between dielec. const. and d but that the factor $(K + 2)/3$ must be omitted from the expression δK . Revised expressions for the intensity and polarization of the scattered light are given in terms of the mol. theory. Gans's phenomenological method of treatment is outlined and discussed and the assumptions underlying it are pointed out. If the omission of the $(K + 2)/3$ factor of the expression for δK be accepted, Gans's theory and mol. theory lead to identical results. It is shown that if the mols. of a liquid are anisotropic, small vol. elements must necessarily possess accidental deviations from isotropy; the relation between them, the consts. of mol. anisotropy and the Kerr const. of double refraction are worked out. Similar arguments should hold in the case of binary liquid mixts. and the fluctuations of concn. accidentally occurring in such a mixt. cannot be assumed to be identical with the changes of dielec. const. with concn. obtained from expts. on liquids in mass. Revised expressions for scattering are given.

M. F.

Dielectric constants of gaseous ethyl ether and ethyl alcohol. R. SÄNGER. *Physik. Z.* **28**, 455-57(1927).—The dielec. consts. of Et_2O and EtOH for a const. d and with varying temp. have been measured. Plots of $(E - 1) \cdot 10^5$ vs. $10^3/T$ show agreement with the simplified Debye equation $(E - 1) = A + B \cdot (1/T)$ over the whole temp. range for Et_2O , deviations occurring at temps. below 393°K . for EtOH . These deviations, in which $(E - 1)$ rises above the linear values, are attributed to associative effects. These effects depend upon the relative sizes of the elec. moment and the mol. The elec. moment in comparison with the mol. size is much less for the ether than for the alc.; hence deviations appear only in the latter. Considerations of the const. A show that measurements of the dielec. consts. of dil. solns., if only the dependence of the const. on concn. is known, are inadmissible as a basis for calcg. the elec. moment.

R. L. HERSHEY

Dielectric constants of dilute aqueous electrolytic solutions. R. SKANCKE AND E. SCHREINER. *Physik. Z.* **28**, 597-604(1927).—The theory of the Wheatstone bridge method with high-frequency current for the detn. of the dielectric consts. of dil. electrolytic solns. is given. The app. used is described in detail. Exptl. results obtained with dil. solns. of LiCl , KCl , BaCl_2 , $\text{La}(\text{NO}_3)_3$, MgSO_4 and $\text{K}_4\text{Fe}(\text{CN})_6$ are given in the form of curves of the dielec. consts. plotted against the concns.

E. R. SMITH

The dependence of the dielectric constants of certain gases upon temperature. HANS-JOACHIM V. BRAUNMÜHL. *Physik. Z.* **28**, 141-9(1927).—Gases are divided into 2 classes on the basis of the dependence of their dielec. consts. on temp. The one kind shows a change in the const. which is attributable entirely to the d . change due to thermal expansion; the other shows additional changes. The behavior of gases of the second kind is given by the Debye expression $(1/4\pi)(m/\rho)(E - 1) T = aT + b$, where m is the mass of the mol., ρ the d , T the abs. temp. and a and b are consts. Measurements have been made on H_2 , A , CO , CO_2 , N_2O , H_2S and HCl over a temp. range of from 290°K . to 400°K . The results verify the linear character of the Debye function. H_2 and A are gases of the first kind, b , the dipole component, being zero. Values of a and μ , the elec. moment, calcd. from $b = (1/3)(\mu^2/k)$, where k is the Boltzmann const., are: A , $a = 1.68 \times 10^{-24}$, $\mu = 0$; CO , $a = 1.96 \times 10^{-24}$, $\mu = 0.124 \times 10^{-18}$.

CO_2 , $a = 2.09 \times 10^{-24}$, $\mu = 0.145 \times 10^{-18}$; N_2O , $a = 2.83 \times 10^{-24}$, $\mu = 0.249 \times 10^{-18}$; H_2S , $a = 0.69 \times 10^{-24}$, $\mu = 1.101 \times 10^{-18}$; HCl , $a = 1.40 \times 10^{-24}$, $\mu = 1.180 \times 10^{-18}$.

R. L. HERSHEY

The dielectric constants of binary mixtures. III. The electric moments of certain organic molecules in carbon tetrachloride solution. I. J. KRCHMA AND J. W. WILLIAMS. *J. Am. Chem. Soc.* **49**, 2408-10(1927); cf. *C. A.* **21**, 3151.—The results obtained from the dielec. const. and density data with CCl_4 as a non-polar solvent for certain org. mols. are in all respects similar to those obtained where benzene was used as the solvent. With benzene and toluene as solutes the molar polarization is const. throughout the whole range of concn. With the other solutes, CHCl_3 , Et_2O , AcOMe , AcOEt , acetone, EtOH and isoamyl alc., the calcd. molar polarization varies with the concn. The elec. moments of each of the solute mols. in CCl_4 have been calcd., the Langevin-Debye modification of the Clausius-Mossotti law being used.

IV. Benzene as a solvent for certain solid substances. J. W. WILLIAMS AND R. J. ALLGEIER. *Ibid* 2416 22.—The solutes are benzoic acid, phenol, I , SbI_3 , SnI_4 and AgClO_4 . Although the limited soly. of the solutes limited the measurements to a small range of concn., it was possible, except in the case of SbI_3 , to det. by extrapolation the molar polarization of the solutes. For each of the 5 solutes this molar polarization is const. over the range of its soly. The elec. moments of each of the solutes has been calcd. as in the paper abstracted above.

JAMES M. BELL

The chemistry of solid substances. Polymorphic transitions in mercuric iodide and sulfur. H. W. KOHLSCÜTTER. *Kolloidchem. Beihefte* **24**, 319-64(1927).—The transitions of polymorphic solids are considered as ideal cases of topochem. reactions. Macroscopic and microscopic observations were made on single crystals of yellow HgI_2 . The latter were prepd. from red HgI_2 by sublimation at low pressure or in a stream of indifferent gas. At room temp. the yellow modification slowly changes from lemon-yellow to bright yellow and then to red. The change is more rapid for large crystals than for small ones. The transition HgI_2 (red) \rightarrow HgI_2 (yellow) is sharp at 129-130°. Previous detns. of the transition temp. (127°) were made with finely divided material. The transition from yellow to red is more rapid in an atm. of H_2 than in O_2 . A white modification (Tamman, *C. A.* **14**, 2450) was confirmed but could not be established as a definite allotropic form. A tetragonal orange modification was prepd. by gradually cooling the vapor. This modification is very stable. The S_{III} modification of S (Muthmann, *Z. Krist.* **17**, 336) was prepd. and its transition to rhombic S observed.

J. E. SNYDER

The equation of state of solids. IV. Heats and pressures of vaporization, sublimation and fusion down to zero temperature; their relation to Nernst's theorem. J. VAN LAAR. *Verslag Akad. Wetenschappen. Amsterdam* **36**, 311-28(1927); cf. *Ibid* **35**, 159, 403(1926).—A continuation of previous papers. Equations are developed for the three equilibria $\text{V}-\text{I}$, $\text{V}-\text{S}$ and $\text{L}-\text{S}$ for $\log p$ as a function of temp., heat of transformation and the van der Waals constants "a" and "b." Separate solns. are given for higher and for low temps. The improper use of extrapolation (including chemical constants," $1.75 \log T$ term, etc.) as practiced in many applications of Nernst's theorem is particularly criticized. Only solid phases show degeneration (Debye T^3 term in internal energy) at low temps., no degeneration or quantum effect ever occurs for liquids and gases.

B. J. G. VAN DER HOEVEN

Information on physico-chemical properties of mercurisulfosalicylates. I. SOPHIE BERGMAN AND H. ZOCHER. *Kolloid Z.* **42, 309-22(1927); cf. *C. A.* **20**, 3611.—The swelling phenomenon of mercurisulfosalicylate with time does not show a max. but does indicate a very steep gradient at the start. Dark-field study of the colloidal soln. under the microscope shows very long, interwoven, seemingly liquid crystals comparable to soap gels. An azimuth stop was used to det. the dimensions of the very small particles. Illustrations of double refraction of this material are given. Surface tension, influence of concn., temp. changes and various chlorides were studied with respect to double refraction. A good summary is given. II. *Ibid* **42**, 322-8.—Such properties as the relation between rate of streaming, aging, concn. and previous treatment can be measured quite exactly. Flowing double refraction increases steadily with increase of rate of streaming. Conc. of the sol has a strong influence on streaming anisotropy. Mechanical stirring reduces double refraction while addition of dyes increases it. Conductivity and viscosity are roughly proportional to double refraction. The properties of the acid and its salts as a prototype of a class of colloids are sketched.**

R. H. LAMBERT

Volume considerations in chemistry with respect to power of aggregation. I. TRAUB. *Ber.* **60B, 1815-6(1927).—Force of aggregation of large mols. is considered**

from a vol. viewpoint. The assocn. factor is compared to the terms for vol. in the van der Waals equation. Force of aggregation does not act as bound force from atom to atom but depends on the decrease of its covol. The latter tends to become zero for flocculation processes or submicron formation from single atoms. R. H. L.

The passivity of chromium. W. J. MÜLLER AND ERICH NOACK. *Monatsh.* **48**, 293-313(1927).—Goldschmidt's Cr was electrolyzed in H_2SO_4 soln. at diff. temps. with the following results: The Cr anode becomes passive at $\epsilon_A = \approx 0$. There exists for each Cr anode a crit. strength of current (i_k), above which the anode becomes passive. Between 0° and 35° $\log i_k$ is proportional to the temp. The current (i) decreases when i_k is exceeded, sometimes in several steps. The Cr anode remains active during the fall of i . The rapid decrease of i was registered with the aid of a Siemens' oscillograph. It is inferred that Cr dissolves first as chromous salt, which yields H^+ ions (largely removed by migration) and chromic salt. The latter hydrolyzes to $\text{Cr}(\text{OH})_3$, which seps. on the anode, thus forming an insulating layer. This layer extends over the surface and increases the c. d. till the crit. value is exceeded, when the Cr becomes passive (between $\epsilon_A = 0$ and 1.25 v.). At $\epsilon_A = 1.25$ approx. the Cr goes into soln. as chromate. H. S. v. K.

The passivity of iron mirrors. H. FREUNDLICH, G. PATSCHKE AND H. ZOCHER. *Z. physik. Chem.* **128**, 321-44(1927).—A method is given for the prepn. of iron mirrors by the deposition from $\text{Fe}(\text{CO})_5$ upon glass. A number of these mirrors were prepd. and studied in connection with the passivity of Fe towards HNO_3 . The addn. of air to a newly formed mirror produced a visible effect. The mirrors prepd. were of various thicknesses, but ordinarily uniform in any one mirror. In transmitted light they were brownish gray. The ultramicroscope showed that their structure was not continuous, and this was supported by x-ray diffraction examn., which revealed a very fine-grained structure (of α -iron), and also by elec. cond. measurements, which gave a sp. cond. of 1.4 to 1.5 reciprocal ohms for films from 16 to 63μ thick, a value only $1/7$ that of compact Fe. They oxidized in an open flame to brown transparent mirrors. Similar oxide mirrors were obtained by decompng. the $\text{Fe}(\text{CO})_5$ in the presence of air. The Fe mirrors dissolved completely in HCl and H_2SO_4 , oxidized in water in the presence of air, but remained unaffected in dichromate- H_2SO_4 for days even at 90° . Rendered passive in HNO_3 the mirrors were in general similar to passive Fe wire. Carefully protected from air, however, they showed no passivity effect, the "vacuum-mirror" (from which air had been excluded) dissolving completely in HNO_3 of all concns., whereas the "air-mirror" showed the usual passivity. The difference between the 2 types of mirrors was discernible in similar reactions towards HNO_3 vapor, but the difference was not so sharp. In contact with the test acid (HNO_3 , d. 1.20) the vacuum-mirror dissolved immediately whereas the air-mirror dissolved only after a time. The superior activity of the vacuum-mirror is designated as the "vacuum-activity," and the passivity of the air-mirror as the "air-passivity." The vacuum-activity is not destroyed by CO_2 , H_2O (vapor), or N_2 . Such mirrors remain chem. unchanged in air-free water for months though losing their mech. coherence. The time of contact with air necessary to induce air-passivity is less than 10 sec. The air-passivity is not destroyed by evacuation to 10^{-3} mm Hg. Mirrors rendered passive in HNO_3 were unaffected by evacuation, but vacuum-activity was reestablished by evacuating to 10^{-3} mm Hg and heating to 28° for $1\frac{1}{2}$ hrs. Rinsing tends to remove the passivity induced by HNO_3 . Very fine brownish membranes frequently left after the soln. of the Fe mirrors in HNO_3 were identified with the passive protective layer. These results are taken to be in accord with the oxide theory of passivity. ROBERT F. MEHL.

The stability of suspensions. II. The rate of sedimentation of kaolin suspensions containing colloidal silicic acid. WM. O. KERMACK AND WM. T. H. WILLIAMSON. *Proc. Roy. Soc. Edinburgh* **47**, 202-21(1927); cf. *C. A.* **19**, 2433.—The previous work on sedimentation in the absence of silicic acid was repeated and extended to include the effect of all alkali metals except Rb. In acid suspensions the action in inhibiting sedimentation is least in the case of Cs and greatest in the case of Na. This is in accord with the Gedroiz-Wiegner theory of base exchange in soils and stability of clay suspensions. The theory is that the p. d. of the Helmholtz double-layer is proportional to the effective distance between the layers. The highly hydrated ions such as Na are unable to approach very near the surface of the clay; they form stable suspensions. The order of stabilizing influence on clay is $\text{Cs} < \text{Rb} < \text{K} < \text{NH}_4 < \text{Na} < \text{Li}$. The ions which approach most closely to the clay and stabilize least are most difficult to displace from the clay. Normally a small concn. of silicic acid protects colloidal clay slightly. Under some conditions the effect of the silicic acid is to produce the pptn. of a film of insol. material on the surface of the particles of clay. Such films cause

abnormally rapid sedimentation. Under other conditions the silicic acids prevent pptn. In addn. to the data on alkalis, data are given on sedimentation in the presence of silicic acid by CaCl_2 , CaSO_4 , $\text{CaH}_2(\text{PO}_4)_2$, AlCl_3 , FeCl_3 and LaCl_3 in the presence of HCl ; and $\text{CaH}_2(\text{PO}_4)_2$ in the presence of H_3PO_4 and a mixt. of CaSO_4 and $\text{CaH}_2(\text{PO}_4)_2$ in the presence of HCl . Seventeen figures are given, graphically depicting the behavior of the clay under varying concns. of these salts and varying concns. of the H-ion for each concn. of salt.

F. F. BROWN

A study of stability of suspensions of dispersed coarse particles in solution. II. Determination of colloids by the help of rate of clarification. HANS WERNER. *Ber.* 60B, 1930-33(1927); cf. *C. A.* 21, 2829.—The effect of concn. of starch and ovalbumin on the rate of clearing was studied. The limits of measuring depend on the nature of the substance. Errors are due to reading and are less for the steeper curves.

R. H. LAMBERT

Studies on the flocculation of the suspension of mastic resin. A. BOUTARIC. *J. chim. phys.* 23, 851-70(1926).—Suspensions of mastic resin were prep'd. by dilg. with H_2O to one l. 40 cc. of an alc. soln. of 16.7 g. resin per l. The degree of flocculation was measured by means of a Fremy spectrophotometer, for the wave length $\lambda = 0.59$. The velocity of flocculation (v) is increased by the addn. of H_2SO_4 , KCl and CaCl_2 , with increasing concn. of the suspension; they decrease v , however, if the size of the particles in the suspension increases. The increase of the temp. decreases v when H_2SO_4 is added to the suspension, increases v with BaCl_2 and has no effect with KCl . Blue radiation accelerates v ; red radiation has a retarding effect. Agitation and the addn. of electrolytes increases v , if the concn. of the suspension is kept const. Increasing quantities of gum arabic show a protective action. Increasing quantities of gelatin increase v at first; the curve of v has a max., then decreases until it disappears; from this point gelatin has a protective action on the suspension. Increasing quantities of starch, albumin, glucose and casein accelerate v .

J. A. SZILARD

The drop number and emulsifiability. R. C. SMITH AND MISS I. C. DOW. *J. Phys. Chem.* 31, 1263-6(1927).—Ability to be emulsified depends on 2 factors: (1) ease with which the disperse phase is dispersed and (2) the stability of the resulting emulsion. The drop no. is not a true indication of emulsifiability for, being a measure of surface tension, it takes account of (1) but not of (2).

E. G. VANDENBOSCHE

Physical chemistry of color-lake formation. I. General principles. H. B. WEISER AND E. E. PORTER. *J. Phys. Chem.* 31, 1383-99(1927).—Preliminary to the study of color-lake formation, investigations were made of the effect of p_{H} on the adsorption of sulfate ion and oxalate ion, both separately and simultaneously by the hydrous oxides of Cr, Al and Fe, and the effect of Ca ion on the adsorption of the anions at const. p_{H} . The adsorption of anions is greatest at low p_{H} values, falling off rapidly on the alk. side of the neutral point and being completely nullified at a p_{H} value of 9.2. However, the hydroxyl, sulfate or oxalate ions are adsorbed in the alk. range. In Loeb's investigations on the proteins, the sp. effect of anions other than hydroxyl were overlooked since he worked with relatively low concns. of salts. From simultaneous adsorption studies it was found that the sulfate ion is adsorbed more strongly than the oxalate ion in the alk. and neutral range. The ratio is 128.0 to 1 at $p_{\text{H}} = 7$ and 1.1 to 1 at $p_{\text{H}} = 2.5$. The sum of the simultaneous adsorptions approaches a mean between their sep. adsorption at the same p_{H} , contrary to the conclusion of Mehrotra and Sen. Müller's conclusion that the taking up of anions by hydrous oxide gels is a solid-soln. phenomenon has been disproved. The relationship between p_{H} value and the pptn. concns. of sulfate and oxalate ions has been studied. Conclusions based on pptn. or adsorption data obtained with the hydrous oxides are of questionable value unless the observations were made at the same p_{H} values.

H. B. W.

Cation and anion exchange on the interfaces of permutite. HANS JENNY. *Kolloidchem. Beihefte* 23, 428-72(1926).—A discussion of the history, methods of investigation and analysis, and compn. of various permutites is given. The relations of the equil. const. and adsorption of various ions by different permutites are developed through the application of the familiar adsorption equations. A linear relation between the const. and the ion vols. is pointed out. J. investigates particularly the effect of H and OH ions on the adsorption and charge of the particles. Copious data, curves and schematic diagrams of the conditions existing on the surface of the particles are presented. Many anomalies in behavior of the permutites are explained and a modification of the Helmholtz double-layer concept is advanced.

W. J. SWENEHY

Conditions under which the classical iodine-starch reaction fails. M. J. GRAMENITZKI. *Biochem. Z.* 185, 427-9(1927).—The blueing of starch by I_2 which disappears

upon heating the soln. can be radically altered in the sense that the blue becomes more intense upon heating, provided the reaction mixt. contains KI, H_2O_2 and acid (HCl). Tincture of I_2 cannot replace the KI. It is assumed, therefore, that HI is really responsible for the bluing reaction, and is destroyed at heating temp. because of the dissocn. of the III. This view is further confirmed by the fact that the presence of acid, preventing this dissocn., makes it possible for the blue color to remain even at high temps. S. MORGULIS

Weighing of powdery substances in air and in vacuo. E. ZINTL AND J. GOUBEAU. *Z. anorg. allgem. Chem.* **163**, 105-19 (1927).—A technic has been devised for accurately weighing powders both *in vacuo* and in a gaseous atm. Comparisons are made between KNO_3 cooled from a melt and in the form of powder. The difference in wt. on a 4-g. sample is of the order of 0.04 mg. per g. of material. The app. for weighing *in vacuo* is described in detail. Tests of KNO_3 and KCl powders show that per g. of substance the difference between wt. in air and *in vacuo* is not const. and is positive for the former but negative for the latter. R. H. LAMBERT

The results of the investigation of the movement of small spheres in gases and their electric charge. F. EHRENHART. *Z. Physik* **39**, 603-6 (1926).—Previous detns. of the motion of particles of radius of less than 10^{-5} cm. are summarized. All follow the same law as larger particles. The charge of particles of radius of less 3×10^{-6} cm. is less than the so-called elementary quantum. Liquid drops have the same d as in mass. F. R. B.

The motion of solid spheres of radius up to 10^{-5} cm. and their electric charge. HEINRICH TREBITSCH. *Z. Physik* **39**, 607-22 (1926).—T. uses Se particles and comes to the conclusion of the preceding abstract. He replies to Mattauch's criticism (*C. A.* **20**, 3264). F. R. B.

The motion of droplets of high density of radius up to 10^{-5} cm. and their electric charge. MAX REISS. *Z. Physik* **39**, 623-30 (1926).—R. uses droplets of a soln. of $BaHgI_4$ and comes to the conclusion of the preceding abstract. F. R. B.

Measurement of particles below 150 μ in diameter with an interference microscope. ULRICH GERHARDT. *Z. Physik* **44**, 397-402 (1927).—The mirror of a Michelson interferometer is placed above the objective of the microscope, care being taken to have all parts exactly centered. Particles smaller than 150 μ can be measured directly with the eye or photographed as well as differences in diameter of 1%. A suitable correction for the light ring around the particles is required. F. O. A.

Mathematical methods of frequency analysis of size of particles. II. Application to silver bromide precipitate. R. P. LOVELAND AND A. P. H. TRIVELLI. *J. Frank. Inst.* **204**, 377-89 (1927).—It is demonstrated that the graphical methods of size-frequency analysis recommended in Part I (cf. *C. A.* **21**, 3001), when applied to the size-frequency measurements of a group of AgBr pptns. varying in several controlled factors, was sufficient to display relationships not otherwise obvious and to indicate the nature of their quant. expression. R. P. LOVELAND

Theory of lyophilic colloids. M. VOLMER. *Z. physik. Chem.* **125**, 151-7 (1926).—A thermodynamic theory of stable colloidal solns. is developed. J. A. SZILARD

The centenary of the discovery of Brownian motion. REINHOLD FÜRTH. *Kolloid-Z.* **42**, 197-209 (1927).—A brief but very concise history of the development of the theory for Brownian motion is given. R. H. LAMBERT

Theory of the Brownian movement for systems with several different coexisting temperatures. L. S. ORNSTEIN. *Z. Physik* **41**, 848-56 (1927).—A theory of the Brownian movement is given for systems of two or more coupled parts with different temp. It is shown that the square of the fluctuation is a linear function of the temp. J. A. SZILARD

Aerosols. V. KOHLSCHÜTTER. *Kolloid-Z.* **42**, 209-23 (1927).—A close analogy is shown between hydrosols and sols in which the continuous phase is a gas. Too narrow limits as to size of particle are not to be recommended in defining aerosols although one must differentiate between them and "aerogels." Hydrosols and aerosols differ principally in the properties of the resp. media and the elec. behavior of the particles. Data have been collected on various dispersed dusts in air showing the decrease in no. of particles with time. Photomicrographs of dust show the influence of pressure and nature of the medium on the size of particle. The charge on particles is demonstrated by showing lines of force when ZnO is allowed to deposit on a magnetized metal plate. The effect of temp. on aerosols is also discussed. R. H. L.

Atmospheric disperse systems and their physicochemical characteristics, especially those electrical. A. STÄGER. *Kolloid-Z.* **42**, 223-9 (1927).—S. discusses various atm.

disperse systems and related processes. He divides twilight into day, night and astronomical and describes them. A relation is given between polarization and extinction of the sun and sky radiation. The charge on particles may be obtained from absorption of ions, ultra-violet light, water falls and whirling dust clouds. Moisture and degree of dispersity favor the formation of a charge. Some problems are proposed for further study.

R. H. LAMBERT

The influence of the concentration of colloidal solutions on the quantity of electrolyte necessary for flocculation. A. BOUTARIC AND MISS G. PERREAU. *J. chim. phys.* 24, 496-506 (1927); cf. *C. A.* 20, 2438.—For $\text{Al}(\text{NO}_3)_3$, FeCl_3 and ThCl_4 there is a decrease in α (the min. quantity of electrolyte causing pptn.) with increased concn. of the $\text{Fe}(\text{OH})_3$ sol, while such salts as KCl , KNO_3 , K_2SO_4 and K_2CO_3 have the opposite effect. In pptg. As_2S_3 α for AlCl_3 increases and α for KCl , LiCl and BaCl_2 decreases with increased concn. It is impossible to assign a value for pptg. power to a given ion. In general the ratio α/C diminishes as the concn. of the sol increases.

E. G. VANDENBOSCHE

The possibility of modifying at will the sign of the electrical charge of colloids. A. BOUTARIC. *Rev. gén. colloïdes* 5, 585-91 (1927).—See B. and Perreau, *C. A.* 20, 3257; 21, 2086; B. and Dupin, *C. A.* 21, 1577.

A. PAPINEAU-COUTURE

Comment on the molecular weight of gelatin in cresol. R. O. HERZOG AND H. COHN. *Z. physiol. Chem.* 169, 305 (1927).—The diffusion velocity of gelatin dissolved in cresol and dialyzed against cresol shows that the particles are of considerable size. Gelatin was found to be polydisperse; hence the mean mol. wts. reported in the literature are not applicable.

A. W. DOX

The colloid chemistry of viscose solutions. III. Syneresis in viscose gels. TAKAYOSHI MUKOYAMA. *Kolloid-Z.* 42, 79-86 (1927); cf. *C. A.* 21, 3456.—"A method of studying syneresis is described in which the vol. proportion of the sepd. liquid (and therefore of the remaining solid) in the mixed system is measured. The influence of concn., alkali content, and age on this condition was observed. The velocity of syneretic sepn. increases with increasing diln. of cellulose and alkali. At const. alkali content, increasing cellulose concn. increases the velocity and magnitude of the syneresis. The reverse takes place on increasing the alkali content and keeping the cellulose concn. const. From that it follows that in diln. series in which alkali and cellulose content vary simultaneously, the shortest time to the beginning of syneresis is observed at intermediate concns." **IV. Gel coagulation.** *Ibid* 180-3.—The change in state of viscose solns., known as "gel coagulation," is described. Gel coagulation is most rapid in solns. of intermediate alk., that is about 5%. It sets in sooner the lower the concn. of cellulose in the soln. Addn. of glycerol accelerates gel coagulation while the addition of aged viscose solns. to fresh solns. hinders it. **V. The viscosity minima of viscose solutions and their change with time.** *Ibid* 350-3.—The min. in the viscosity of viscose solns. is reached more slowly the larger the amt. of alkali present. Diln. with H_2O favors the early attainment of the min. Agitation not only gives a lower viscosity but also retards the attainment of the min. All influences that increase the velocity of gelation hasten the attainment of the viscosity min. The min. viscosity results from the combined effects of desolvation and of gelation. **VI. The surface tension of viscose solutions.** *Ibid* 353-5.—The surface tension of viscose solns. is somewhat less than that of H_2O or of alkali soln. of corresponding concn. It does not change on aging. When the surface tension is measured by the stalagmometer method, the drop no. varies with the velocity of the drop formation. As the speed of drop formation is decreased, the drop no. falls off, but at very slow speeds increases again.

F. L. BROWNE

Dispersed systems of the lead halides: lead iodide, lead bromide and lead chloride.

F. VON VEIMARN, T. L. CHEN, Y. KIDA AND K. YASUDA. *Kolloid-Z.* 42, 305-9 (1927). The dispersions were made by mixing aq. solns. of $\text{Pb}(\text{NO}_3)_2$ and the Ca halides under uniform exptl. conditions. Particle size was detd. by measurements on electron micrographs of the ppts. Observations were made immediately after mixing the solns. and again 8 hrs. later. The concn. of the solns., which were used in equiv. proportions, was varied from 0.0054 N to 0.02 N for PbI_2 , from 0.67 N to 1 N for PbBr_2 , and from 0.15 N to 0.5 N for PbCl_2 . Immediately after mixing, there is a max. particle size in the ppt. at an intermediate concn. of the solns. After 8 hrs. the particle size increases continuously as the concn. decreases, the rate of increase being most rapid in the region of low concn. In the most dil. mixt., observation under the ultra-microscope shows an optically empty field at the instant of mixing, then a Tyndall effect appears and becomes brighter with the lapse of time and finally fades out again as microscopic crystals form. Among the 3 Pb halides the rule holds that, if the

specific supersatn. remains the same, the less the soly. of the ppt. the smaller the particles of the dispersed phase.

F. L. BROWNE

Preparation of colloidal silver halides by electrolysis. TH. WEREIDE. *Z. Physik* **41**, 864-6(1927).—During the electrolysis of a H halide soln. with Ag cathode, colloidal Ag halide is formed as a light cloud, which moves toward the cathode; at the same time the cond. of the soln. changes. The mobility for an electrode distance of 10 cm. and a field strength of 22 v./cm. was 450×10^{-5} cm. sec./v. cm. for a measured path length of 0.2 cm., and 300×10^{-5} cm. sec./v. cm. for 0.5 cm. The mobility is about the same as that of H ion; it is decreased by the addn. of gelatin or agar. The formation of colloidal Ag halide was observed with both a. c. and d. c.; with the latter the phenomenon is discontinuous and the border line of the Ag-halide cloud against the rest of the soln. is more diffuse.

J. A. SZILARD

Colloidal lead. DOMENICO CANASSINI. *Boll. soc. med.-chir. Pavia* **1**, 1397-1403 (1926); *Ber. ges. Physik. exptl. Pharmakol.* **40**, 598—G. has not succeeded in prepg stable colloidal Pb, either by the method of Blair Bell or by means of the elec. arc or a. c., or chemically from $\text{Na}_2\text{PbO}_2 + \text{Na}_2\text{SnO}_2$ or by heating $\text{Pb}(\text{CH}_3\text{O})_2$. The slate-gray solns. thus obtained soon turned white or yellowish, and $\text{Pb}(\text{OH})_2$ and basic carbonate were found in the ppts. which always formed.

MARY JACOBSEN

Complexities and micelles. A study of the compounds of hydro-oxy-ferric chloride as a typical example of the colloidal state. G. MALFITANO AND SIGAUD. *J. chim. phys.* **24**, 173-203(1927); cf. *C. A.* **21**, 3294.—The periodic nature of the change of FeCl_3 soln. to $\text{Fe}(\text{OH})_3$ ppt., through the colloidal phase, and the reverse change, is studied by means of the ultramicroscope. The cond. and osmotic pressure of the fractions obtained by ultrafiltration of different types of this colloid show the distinct difference in these types, and point to the truth of the theory of complexes. The structure of the dark red colloid, which loses Cl easily and in which flocculation is rapid, is thought to be $\{[(\text{Fe}(\text{OH})_3)_6\text{Fe}(\text{OH})_3]\text{Fe}\}^{++}\text{Cl}_2$. The yellow-ocher phase in which changes are slow is $\{[(\text{Fe}(\text{OH})_3)_6\text{Fe}(\text{OH})_3]\text{FeCl}\}^{++}\text{Cl}_2$, and the bright red phase that is more stable is $\{[(\text{Fe}(\text{OH})_3)_6\text{Fe}(\text{OH})_3]\text{FeCl}_2\}^{++}\text{Cl}$. The Donnan equil. and the action of multivalent ions on colloids are also correlated with the theory of increasing complexity.

AMY LE VESCONTE

Complexities and micelles. Generalization to all so-called colloids of the hypothesis of increasing order of complexity. G. MALFITANO AND SIGAUD. *J. chim. phys.* **24**, 259-68(1927); cf. preceding abstr.—Examples of the application of this theory to inorg., org. and biological chemistry are given. This theory is in accord with those which define colloids as globules of definite dimensions, since complexes of the higher order would be about this size. It explains the similarity of flocculation and crystn. suggested by Zsigmondy. The properties of proteins and starch, studied by Sgrenson, indicate that these colloids consist of complexes of a higher order, rather than a single large mol. Finally the theory is correlated with the periodic nature of at. structure.

AMY LE VESCONTE

Colloidal micellar state of gelatin. A. CHEVALLIER. *Compt. rend. soc. biol.* **97**, 484-5(1927).—Pure gelatin without salts (prepd. according to Smith, cf. *C. A.* **16**, 6), and at its isoelec. point is practically insol. in H_2O at temps. below 18° , but is sol. in abs. alc. By pptg. from this alc. soln. with H_2O or CHCl_3 and agitating, a micellar suspension of gelatin is obtained as a typical colloid. Such a suspension shows very marked Tyndall effect of the ultra microscopic granules, and these flocculate instantly under the influence of certain ions. If a soln. of gelatin is made in warm water and the gelatin is pptd. with alc., a characteristic micellar suspension is obtained.

I. W. RIGGS

Sols of barium sulfate in methanol. P. C. L. THORNE AND C. G. SMITH. *Kolloid-Z.* **42**, 328-31(1927).—The quantities of water and Ba sulfate were varied in the MeOH gels and the temp. at which coagulation occurs was found. In some cases no coagulation took place even at the h. p. Cataphoretic studies show that the particles carry a positive charge and that the concn. of added electrolytes has a profound influence. The sols behave in general like water suspensions. Peptization by an excess of ions of a higher valence is very pronounced. The viscosity of the sol is little different from that of the disperse medium.

R. H. LAMBERT

A vibrating soap jelly. E. H. BUCHNER. *Nature* **120**, 367(1927).—B. ascribed the phenomenon of a vibrating soap jelly as a crystn. to a network of crystal fibers giving rigidity sufficient to allow sound vibrations. Pitch is dependent on no. and size of crystals, which in turn depend on temp.

R. H. LAMBERT

The electric double refraction of colloidal benzopurpurin. TH. WEREIDE. *Z. Physik* **41**, 857-63(1927).—The double refraction of benzopurpurin was investigated

as a function of the time, diln., cond. and addn. of electrolytes. With increased diln. the double refraction changes more slowly than the concn.; its behavior resembles that of the elec. cond. With solns. of the same dyestuff concn. but different electrolyte concn. there is a reduction of the double refraction with increasing electrolyte concn.

J. A. SZILARD

Hydrolysis of proteins with 0.2 N acid and alkali. I. S. YAICHNIKOV. *J. Russ. Phys. Chem. Soc.* 58, 1377-83(1926).—The following proteins were treated with 0.2 N HCl and NaOH: gelatin, casein, keratin and silk. One percent solns. of protein in 0.2 N HCl or NaOH were subjected to splitting at 10° for several days and at 37°, 70° and 100° for several hrs. Five-cc. samples were neutralized with 0.2 N NaOH or HCl and further titrated by Sørensen's method. The splitting up is slower with 0.2 N NaOH or HCl than with normal acid or alkali. The splitting up with 0.2 N NaOH is faster than with 0.2 N acid. The splitting of casein with acid or alkali is slower than that of gelatin. The splitting of keratin and silk is better than that of casein and slower than that of gelatin. The equation of Schütz-Borisov $K_s = \alpha/t_{0.2}$ ($K_s = \text{const.}$, $\alpha = \text{amt. of splitting, corresponding to cc. of 0.2 N NaOH used in the formolite titration of 1 cc. of hydrolyzate, } t = \text{time}$). In hydrolyzing with acid, less acid is originally consumed than would correspond, for neutralizing, to the titer of 0.2 N alkali. The same happens with alkali. Therefore acid and alkali react with albumin; evidently intermediate compds. with protein are formed at the beginning of the hydrolysis of protein. The hydrolysis with acid requires more and more alkali for the neutralization, contrary to the alkali hydrolysis. The acid hydrolysis leads to an increase of acid compds., requiring for the neutralization more alkali. In the alkali hydrolysis the acid compds. bind the alkali (partly) and the neutralization requires a steadily decreasing amt. of acid.

A. A. BOEHTLINGK

Non-liquid disperse systems of the fatty oils. LASZLO AUER. *Kolloid-Z.* 42, 288-92(1927).—Film formation of fat oils is not an oxidation in a true chem. sense and depends on the gas concn. in the oil. A careful examn. is described of wood oil, used oil and sunflower oil as to surface tension, H-ion concn., microscopic examn., centrifuging and 1 no. The gel and sol conditions of these colloidal materials are very important in their drying properties.

R. H. LAMBERT

Selective adsorption of ions in colloidal clay. A. DEMOLON AND G. BARBIER. *Compt. rend.* 185, 149-50(1927).—In one case colloid isolated from brick clay was atd. with Ca ion by contact with $\text{Ca}(\text{HCO}_3)_2$ soln., and treated with solns. of alk. silicides, singly or in mixt. and at concns. equiv. to 2% KCl. In another case clay, freed of bases, was treated with solns. of each of the alk. chlorides, alone or in the presence of CaCl_2 . The cations of the complexes formed were detd. after repeated extr. with 0.2 N HCl. The satn. capacity of clay for cations appears const. and independent of the nature of the ion. In the case of mixts. of cations, a distribution phenomenon is observed, K and NH_4 being adsorbed in approx. equiv. amts., while Na is only slightly adsorbed in the presence of the former. The Ca of CaCl_2 , formed in reaction or introduced, limits more or less, depending upon its concn., the fixation of alk. ions. By varying the resp. concn. of each of the 4 essential ions, K, Na, NH_4 or Ca, it is possible to modify at will the degree of adsorption of each and thus produce phenomena of selective adsorption without a membrane. Similar distribution was found in mixts. of brick clay and sand.

P. R. DAWSON

Silicic acid gel and its adsorptive capacity. PAUL MAUTNER. *Kolloid-Z.* 42, 24-5(1927).—Comparisons are made of the adsorptive capacity of silicic-acid gels at various temps., for various substances and for several soln. media. A diagram is given of a plant for recovering benzene in gas manufacture. This gel will not explode in contact with liquid air and will adsorb as much gas as active charcoal.

R. H. L.

Adsorption of nitrous vapors by means of "silica gel." L. CAMBI AND L. SZEGÖ. *Ann. chim. ind. applicata* 9, 3-8(1926).—Silica gel adsorbs from mixts. of NO and NO₂ with air only the NO₂, which it transforms in part to HNO₃. The oxidation of NO to NO₂ is accelerated appreciably by the gel. The fact of a negative temp. coeff. for oxidation of NO to NO₂ in absence of the gel was verified. The velocity coeff., based on the termol. reaction, reaches its max. at 30-40° in the presence of gel satd. with NO₂.

ROBERT S. POSMONTIER

Adsorption at crystal-solution interfaces. II. Individual microscopic potassium alum crystals grown in the presence of gelatin and dyes. F. G. KEENAN AND W. G. FRANCE. *J. Am. Ceram. Soc.* 10, 821-7(1927); cf. *C. A.* 21, 3508.—Bismarck Brown in concns. of less than 0.01% decreased the rate of growth of the cube faces of K alum crystals to a much greater extent than those of the octahedral. Diamine Sky Blue (less than 0.01%) stopped the growth of cube faces without affecting the octahedral. The

adsorption depends upon both the nature of the crystal and the dye. Crystal faces, having alternating planes of like ions exhibit greater adsorbing power than those with a checkerboard arrangement of + and - ions. The ratio of rate of growth of the cube and octahedral faces of K alum has been found to be $V_{100}/V_{111} = 1.61$.

C. H. KERR

The heat of dilution of solutions of electrolytes. PHILIPP GROSS. *Monatsh.* **48**, 243-50(1927).—Theoretical. The exptl. data obtained for heats of diln. of solns. of electrolytes do not conflict with the new theory of strong electrolytes. The values of the heats of diln. are dependent on individual properties such as ionic dimensions, dielec. const. and their variation with the temp.

H. S. v. K.

The distribution coefficient and the effect of salt additions. W. HERZ AND ERNA STANNER. *Z. physik. Chem.* **128**, 399-411(1927).—A continuation and extension of work of Brown and Bury on the distribution of amines between H_2O and aromatic hydrocarbons (*C. A.* **18**, 493). Distribution coeffs. at 25° have been measured for Me_3N between H_2O and C_6H_6 , $PhMe$, m -xylene, and $PhEt$, of $MeNH_2$ between H_2O and C_6H_6 , and $PhMe$, of Pr_2NH between H_2O and C_6H_6 , and $PhMe$, of Et_3NH between H_2O and C_6H_6 , $PhMe$, and $PhEt$. These coeffs. are const. for Me_3N and Et_3NH but show a tendency to wander for $MeNH_2$, Me_2NH , and Pr_2NH . This behavior is not controlled by the basicity of the amines but is a sp. property of the amines, probably related to hydrate formation or to a difference in ionic activity. The coeffs. increase with increasing mol. wt. The effect of the mol. wt. of the hydrocarbon is small. The effects of salt addn. upon the distribution of, resp., Me_3N , Pr_2NH , $PhOH$, $BzOH$ and Me_2CO between H_2O and C_6H_6 have been detd. The effect of the salt addn. is to decrease the amt. of the distributed substance present in the water. The effect of the anions on the coeff. is in the decreasing order of Cl^- , Br^- , I^- throughout, which is the order of increasing at. vol. This is explained by the greater energy density of the smaller atoms resulting in a greater attraction for the water mols. The effect of the cations for Me_3N is in the increasing order of Li^+ , Sr^{++} , Ba^{++} , Na^+ , K^+ , which is the order of increasing at. vol. It is shown that the effect of salt addn. upon the distribution of Pr_2NH is paralleled by the effect upon the soly. of Pr_2NH in H_2O . For $PhOH$, $BzOH$ and Me_2CO the proportionality between the effect upon the distribution coeff. and the at. vol. is roughly in the order of the vols., but shows striking exceptions. No quant. explanation of these results is possible at present.

ROBERT F. MEHL

Cataphoresis in a mixed solution medium. A contribution to the theory of flocculation. J. J. BIKERMANN. *Kolloid-Z.* **42**, 203-5(1927).—A study was made of As_2S_3 in water- $PrOH$ mixts. The electro-osmotic potential is measured with concn. of KNO_3 used to dil. the sol and the crit. potential is found. Viscosity fluctuations do not affect the crit. potential. The actual relation between the dielec. const. and crit. potential is as yet not clear.

R. H. LAMBERT

The density of solutions of ammonium chloride. HANS JESSEN-HANSEN. *Compt. rend. trav. lab. Carlsberg* **16**, No. 11, 6 pp.(1927).—The ds. of aq. solns. of NH_4Cl at 18° have been detd. from 1 to 33 g. per 100 g. H_2O . The data are given tabularly and are referred to H_2O at both 18° and 4° . The data agree well with those of previous investigators.

J. H. PERRY

I. The effect of one salt on the solubility of another in ethyl alcohol solution. II. Quantitative discussion of the solubility of sodium iodide in the presence of sodium thiocyanate. F. E. KING AND J. R. PARTINGTON. *Trans. Faraday Soc.* **23**, 522-35(1927).—The influence of LiI and $NaCNS$ on the soly. of NaI in C_2H_5OH at 25° has been studied, and the conductivities and viscosities of one set of solns. (NaI and $NaCNS$) have been detd. together with soly. data. The results obtained indicate that the mutual solubilities of salts in concd. solns. depend upon more than one effect, the most interesting of which is the solv. product effect, concerning which the authors will report next.

J. H. PERRY

The theory of homogeneous normal substances and of normal and abnormal mixtures. P. N. PAVLOV. *Ukrainskii Khim. Zhurnal* **1**, 501-43(1925); *Chem. Zentr.* **1926**, II, 157; cf. *C. A.* **11**, 3136; **17**, 3119.—According to P., the van der Waals const. C is the same for all normal substances and is independent of the temp. It is moreover the same as the C of mixts. of normal substances. If this is not true, the substance is abnormal. Two new concepts are introduced: ω the no. of particles arising from 1 mol. of solute, and ϵ , the no. of mols. from 1 mol. (usually polymerized) of solvent. The van't Hoff factor i is ω/ϵ , and the law of diln. becomes $\frac{c_1}{c_2} = \frac{k(\omega + n\epsilon)}{v}$, where c_1 is the concn. of the solvates, c_2 the concn. of the non-hydrated mols., and n the no. of the polymerized mols. in a unit vol. of solvent.

C. C. DAVIS

Solubilities of the metallic derivatives of nitrosophenylhydroxylamine. II. A. PINKUS and F. MARTIN. *J. chim. phys.* **24**, 137-68(1927); cf. *C. A.* **21**, 3296.—The solubilities and properties of the comds. that cupferron forms with the cations of the first 3 analytical groups are detd. by methods previously described.

Cation	Color of ppt.	Soly. in. H_2O at 18° C. in g. at./l.	Action of acids and bases

As^{III} , As^V , and Sb^V do not ppt. By comparing results obtained by the direct and indirect methods it is concluded that the ppts. with Ag, Cu, Cd and Zn dissoc. normally in acid soln., while ppts. with Pb, Ni and Co form complex ions or mols. The potentiometric method of detg. soly. has very limited application. Cond. may be used if the soly. is less than 10^{-5} by the direct method, or less than 10^{-4} by the indirect method. The indirect colorimetric method is the simplest and most general, but is less exact.

AMY LE VESCONTE

Selective permeability of membranes. Influence of their interstice caliber. MILLER and CROCKFORD. *Compt. rend.* **185**, 502-5(1927).—When two solns. unequally concd. are connected by means of a syphon a certain e. m. f. is developed. When diffusion occurs through a permeable membrane, the voltage is different and may be reversed. For instance the couple $KCl|H_2O$ does not give any e. m. f., because the K and Cl ions have the same mobility. When the 2 liquids are connected through a membrane of gelatin, a positive e. m. f. is generated; the reverse happens when a basic gelatin is used. This phenomenon is explained by assuming that one kind of ions is retarded in its path through the gelatin by the elec. charges covering the interstices; this hypothesis is sustained by the fact that a more concd. gelatin with narrower interstices always increases the e. m. f. The same results have been obtained with HCl, K_2CO_3 , and $LiOH$.

A. L. HENNE

The occurrence of points of inflection in the concentration-vapor pressure curves of aqueous solutions of certain electrolytes. A. J. ALLMAND. *Trans. Faraday Soc.* **23**, 14-20(1927).—Calcd. and observed values of points of inflection in the p/m curves do not agree as shown for Li, Na and K chlorides. Minima for $(p_0 - p)/m$ vs. m do not in accord. This may be due to inaccuracy of vapor pressure data and to incorrect functional relations between activity and concn. in calcg.

R. H. L.

Certain physical properties of the mixtures of hydrochloric acid solutions with sodium and potassium hydroxides. N. A. TRIFONOV, K. I. SAMARINA, V. YA. ANOSOV and I. CHERNOV. *Ann. anal. inst. phys. chim.* **3**, 441-2(1926).—Viscosity, d , n , comp. and magnetic $[\alpha]$ of mixts. of 5 N solns. of the acid and the base were measured. All the curves consist of 2 branches intersecting at the 50% point to which also corresponds the max. deviation from the additive law.

BASIL C. SOYENKOFF

Rate of diffusion and the solvent. G. MUKHIN, G. FAERMANN, I. DOLGOPOLSKI and I. LEVIN. *Ukrainskii Khim. Zhurnal* **2**, 153-7; *Chem. Zentr.* **1926**, II, 2379; Part of the researches have already been described (cf. *C. A.* **20**, 3116). The diffusion of ethylene bromide and of CCl_4 in $EtOH$, in C_6H_6 , in $CHCl_3$, in $EtOH-C_6H_6$ (1:1) and in $EtOH-CHCl_3$ (1:1) was measured. Only with ethylene bromide in $EtOH-CHCl_3$ was there an approx. proportionality between the coeffs. of diffusion and the

fluidity, in the other cases the changes in the rate of diffusion from 1 solvent to another being obviously not dependent upon the viscosity alone. C. C. DAVIS

The effect of temperature on diffusion potentials. E. B. R. PRIDEAUX. *Trans. Faraday Soc.* (advance proof) Sept. 28, 1927.—The diffusion potentials of the principal types of strong electrolytes (acid, alkali, salts of strong acid and alkali, alkali and weak acid, weak base and strong acid, and a weak acid) have been found to have temp. coeffs. which are either zero, or not more than 0.5 millivolt (except for HOAc) for the temp. range 18–25°. This result is shown to be substantiated from the relation between temps. and ionic mobilities. J. H. PERRY

Electric endosmosis with sulfur. A. GERASIMOV. *J. Russ. Phys.-Chem. Soc.* 58, 201–6; *Chem. Zentr.* 1926, II, 2282.—The endosmosis of water and dil. HCl solns. through a S membrane was studied with an app. which was essentially a copy of that of Perrin (*J. chim. phys.* 2, 601). The thickness of the S layer was 18 cm. and the diam. 2.10 cm. The transport of the water was found to depend upon the time, for the potential distribution in the tube varied during the expts. as a result of changes in the concn. The new diaphragm apparently became more highly charged in very dil. HCl solns. than it did in water, which however might have been caused by a sort of "conditioning" of the diaphragm, for pure water also passed better through such a "charged" diaphragm than through a diaphragm not in this condition. Repeated passage of water did not change the activity of the membrane. Aside from the phenomena manifest in this "conditioning," the charging of S by HCl decreased continuously, to an extent which increased with the concn. of the HCl soln. C. C. D.

Corrections for the determination of ion concentrations in very dilute hydroxide solutions. ERICH LAUE. *Z. anorg. allgem. Chem.* 165, 305–24 (1927).—In view of the fact that in most cases the only contamination in cond. H_2O is H_2CO_3 , L. suggests that instead of using H_2O of high purity ($K = 0.06 \times 10^{-6}$) normal cond. H_2O ($K = 1.20 \times 10^{-6}$) be used with application of the correction $\beta = \Delta K - K_w$, in which ΔK is change in cond. due to H_2CO_3 . It is derived from the equation $1000 \Delta K = \Delta_{K_2}([K^+]_w - [K^+]_a) + \Delta([A^-]_w - [A^-]_a) + \Delta_H([H^+]_w - [H^+]_a) + \Delta_{HCO_3}([HCO_3]_w - [HCO_3]_a) - \Delta_{CO_3}[CO_3]_a - \Delta_{OH}[OH]_a$, K_a and A are cation and anion, resp. of the electrolyte being investigated; x = concn. of electrolyte if dissolved in pure H_2O ; w = when in cond. H_2O ; and e = actual concn. in soln. At the dil. solns. used less than 0.001 N complete dissocn. of all salts and bases is assumed. In cases of hydroxide solns. of fixed concn. (I) β is relatively large and positive in cases of satd. solns. in contact with solid, (II) β is approx. $-(1/3)$ dissocn. const. of H_2O . In II a negative correction α , which may be of considerable magnitude, must be applied for the concn. of the cation of difficultly sol. hydroxides $\alpha = \frac{([K^+]_a - [K^+]_w) \cdot 100}{[K^+]_a}$.

When soly. product = 10^{-12} $\alpha = -96\%$.

Conductance of hydrogen and hydroxyl ions at infinite dilution. A. FERGUSON AND I. VOGEL. *Phil. Mag.* [7], 4, 300–5 (1927); cf. *C. A.* 20, 323.—The most probable value for the conductances at infinite diln. of H^+ at 25° and of OH^- at 18° are 349.05 and 175.4, resp. GEORGE GLOCKLER

The reaction of sodium chloride if added to a solution of litmus and mercuric chloride. W. O. MOOR. *J. Am. Chem. Soc.* 49, 2355–7 (1927).—By dissolving some $ZnSO_4$ in a dil. soln. of blue litmus an easily reproducible soln. of violet litmus is obtained. 4–5 drops of a $HgCl_2$ soln. added to this gives the color a reddish cast. On adding quickly to this reddish soln. 1 cc. of satd. NaCl soln. the resulting liquid becomes blue, then slowly changes to violet. E. R. SCHIERZ

The viscosity of alum solutions. M. BOBTELSKY AND MALKOWA-JANOWSKAJA. *Z. anorg. allgem. Chem.* 165, 249–52 (1927).—The viscosity of solns. of K_2SO_4 and $Al_2(SO_4)_3$, and of equimol. mixts. of the two, is measured for concns. 0.05 M to 1.10 M and temps. 15°, 35° and 55°, the results being given in tabular and graphical form. The differences between the viscosity of each soln. and that of water may be added to give the difference for the mixt., which is strictly equal to that for a corresponding soln. of crystd. $KAl(SO_4)_2 \cdot 12H_2O$. Further measurements with H_2SO_4 in place of K_2SO_4 gave no evidence for complex-ion formation. Thus a soln. of crystd. alum behaves, as far as its viscosity is concerned, like a mixt. of K_2SO_4 and $Al_2(SO_4)_3$. F. A. J.

The creeping of solutions. E. R. WASHBURN. *J. Phys. Chem.* 31, 1246–8 (1927).—When an evapg. soln. wets the walls with which it is in contact it rises on them above the body of the liquid. On evapn. of this film there is formed a capillary space bounded by the crystal crust and the wall. Soln. rises through this space to a new height, causing the crust to grow. In some instances the crust climbs over the top

of the walls and down on the outside so that liquid is siphoned out of the container. Climbing does not occur if the walls are greasy. E. G. VANDENBOSCHE

Molecular scattering of light in aqueous solutions. I. S. VENKATESWARAN. *Indian J. Physics* 1, 235-44(1927).—The scattering of light by aq. solns. of H_2SO_4 , HNO_3 , and HCl has been detd. The optical anisotropy of the HNO_3 mol is much greater than that of the H_2SO_4 mol. This agrees with Bragg's results on the birefringence of cryst. nitrates and sulfates. As regards the scattering of light these solns. behave more like single liquids than binary mixts. II. *Ibid* 393-400.—Solns. of acetic, propionic and butyric acids have been investigated. In contrast with the acids of I they show the concn. scattering characteristic of mixts., its magnitude increasing rapidly from acetic to butyric acid. For butyric acid the variations of the intensity and depolarization in proceeding toward the crit. soln. point are in complete accord with theory. R. L. HERSHEY

Compressibilities of aqueous solutions of some fatty acids. S. VENKATESWARAN. *J. Phys. Chem.* 31, 1521-5(1927).—The adiabatic compressibilities of solns. of formic, acetic, propionic and butyric acids were detd. at pressures of from 1 to 2 atm. with a piezometer and the isothermal values were calcd. The results are tabulated.

R. R. SMITH

The activity of zinc chloride in concentrated solution. F. FOXTON AND W. J. SMITH. *Trans. Faraday Soc.* 23, 480-8(1927).—A type of electrolyte was chosen for study intermediate between aq. solns. and fused salts. Vapor pressure measurements of $ZnCl_2$ solns. from 0 to 40% chloride content were made at about 60° and 80° with an accuracy of ± 3 mm. Together with e. m. f. data the heat of formation of $ZnCl_2$ at 20° has been calcd. to be 97,300 cal. Abnormal results in cells with liquid junctions were obtained; they are believed to be due to complex-ion formation. The work is to be continued. R. H. LAMBERT

The significance of the activity coefficient. MERLE RANDALL. *Trans. Faraday Soc.* 23, 498-502(1927).—If the compn. of a soln. be expressed in terms of the mol. wts. of arbitrarily chosen mol. species, then the activity coeff. gives a simple numerical statement of the deviation of this soln. from the laws of the perfect soln. The laws based on different mechanistic hypotheses all tend to approach the law of the perfect soln. as a limit. The activity coeff. enables one to bring into agreement the various colligative properties of a soln., and is therefore a test and guide to the adequacy of different mechanistic proposals. J. H. PERRY

Methods of calculation of activity coefficients. MERLE RANDALL. *Trans. Faraday Soc.* 23, 502-7(1927).—Methods of calcg. the activity coeff. of the solute from that of the solvent are described, in which the results from all the different methods are on the same graph. This is accomplished by the use of the graphs of j/m vs. m and of $h/m^{1/2}$ vs. $m^{1/2}$, in which j is a property of the solvent and is equal to $1 - (\theta/\nu\lambda m)$, where θ is the f.-p. lowering or the b.-p. raising, ν is the no. of mols. formed per mol. of the solute, λ is a const. = 1.858, and m is the molality; h is the divergence function and equal to $1 + (55.51 \ln a_1)/(\nu m)$. The results of the previous methods and those from measurements which give the activity of the solute are correlated so as to superimpose the graphs and so select the best av. values. This is accomplished by the use of the $(\log \gamma + \text{const.})$ vs. $\mu^{1/2}$ graphs, where γ is the activity coeff. and μ is Brönsted's function. (C. A. 18, 779). A method of interpolating the activity coeffs. of strong electrolytes is suggested, wherein the graphs of $(\log \gamma) \mu^{1/2}$ vs. $\mu^{1/2}$ are used. J. H. PERRY

Calculation of activity coefficients from conductivity measurements. C. W. DAVIS. *Phil. Mag.* [7], 4, 244-50(1927).—On the Debye-Hückel theory $\log \gamma = -0.5 \sqrt{C_i}$, where γ is the square root of the product of the activity coeff. of cation and anion and C_i is the ionic concn. D. finds from cond. measurements for the const. 0.5 in the above equation 0.382 from formic acid, 0.393 from acetic acid and 0.372 from α -chloroacetic acid. Randall and Vanselow find 0.393 from f.-p. measurements on HCl (C. A. 19, 428). Nonhebel finds 0.39 from e. m. f. measurements on HCl at 25° (C. A. 21, 847). GEORGE GLOCKLER

The activity coefficients, ionic concentration and kinetic salt effects of formic acid in neutral salt solutions. H. S. HARNED. *J. Am. Chem. Soc.* 49, 1-9(1927).—The activity coeffs. of HCO_2H calcd. from results on the rate of hydrolysis of HCO_2Et in neutral salt soln., parallel previous detns. of the activity coeffs. of water in salt soln. The anomalous nature of the activity coeff. of OH^- is pointed out and is considered due to specific influence of the same type as that which produces undissocd. mols. F. R. B.

Activity coefficients of electrolytes. I. A bivalent salt and the ion attraction

theory. U. B. BRAY. *J. Am. Chem. Soc.* **49**, 2372-80(1927).—A description is given of a reproducible Pb-Pb sulfate electrode and the mean ion activity coeffs. for ZnSO_4 at 25° for dilns. from 0.0001 *M* to 3.5 *M*. Up to 0.005 *M* the results are in agreement with the Debye-Hückel ion attraction theory but at higher concns. important deviations arise.

A. P. SACHS

Report on conductivity of strong electrolytes in dilute solutions. P. DEBYE. *Trans. Faraday Soc.* **23**, 334-40(1927).—A demonstration of the adequacy of the inter-ionic attraction theory to explain the Kohlrausch law, cond. is proportional to the square root of the concn. The velocity of an ion in a conducting electrolyte is affected in 2 ways by its ionic atm.: (1) Movement of the ion causes a dissymmetry between the ion and its atm. and the electrostatic forces which are thus brought into play contribute a considerable amt. to the apparent frictional resistance of the ion. (2) The surrounding ions cause a movement of the solvent when an external field is applied (electrophoresis). Considering these 2 factors, D. deduces a formula wherein the migration velocity at infinite diln. is proportional to the reciprocal of the radius of the ionic layer and hence to the square root of the concn.

R. B. GIBSON

Report on a revision of the conductivity theory. L. ONSAGER. *Trans. Faraday Soc.* **23**, 341-9(1927).—O. takes the theory of Debye for cond. of electrolytes (cf. preceding abstr.) and modifies it by introducing a correction for the Brownian movements of the ions. He obtains a mobility formula which eliminates the arbitrary consts. from the limiting formula for cond. at infinite diln. The theory is tested by numerous examples and the agreement with the observed variation of cond. with concn. is excellent.

R. E. GIBSON

The ionization of some typical strong electrolytes. D. A. MACINNES AND I. A. COWPERTHWAIT. *Trans. Faraday Soc.* **23**, 400-4(1927).—From transference and conductance measurements the authors conclude that if the alkali chlorides and HCl are completely dissociated then HNO_3 and NH_4NO_3 belong to this class also. NaNO_3 , KNO_3 and AgNO_3 are not completely dissociated.

R. E. GIBSON

The activity coefficients of protein ions. G. S. ADAIR. *Trans. Faraday Soc.* **23**, 536-7(1927).—The activity and osmotic coeffs. for both isoelec. and ionized hemoglobin have been obtained in the molality region of 0.0002 to 0.005. The abs. values of the coeffs. do not agree with the Debye and Hückel formulas because both increase as the protein concn. increases. In the D and H formulas, the free energy of an ion is treated as the sum of two terms, the first being equal to the free energy of an ideal gas mol. and the second being dependent upon the elec. forces. It would seem probable that a third term must be added for large ions such as hemoglobin.

J. H. PERRY

The influence of a dissolved substance on the density of a solvent. H. GRUNERT. *Z. anorg. allgem. Chem.* **164**, 256-62(1927).—Naphthalene, phenanthrene and iodine were dissolved in $(\text{CH}_3)_2\text{CO}$, C_6H_6 , $\text{C}_6\text{H}_5\text{CH}_3$, CS_2 and CCl_4 . With those solvents of sp. gr. less than naphthalene the density of the soln. increased with the solute content. The solvent with a gravity higher than that of the solute gave a soln. whose density decreased with the quantity of dissolved substance. The plot of the d differences against percent solute is a straight-line function. At 20°, 40° and 60° the plot is practically the same. Phenanthrene acted in like manner. With I_2 the difference between the d of soln. and solvent increases approx. with the I_2 content. The soln. vols. of these solns. were detd., and it was found that they increased with temp. in all solvents.

C. E. P. JEFFERYS

New ideas in the theory of electrolytes. TEOFILO ISNARDI. *Anal. asoc. quim. Argentina* **14**, 193-238(1926).—An exposition of the Debye theory of electrolytes, its consequences and recent developments.

R. H. LOMBARD

Graphical methods and empirical formulas for the study of electrolytic dissociation. ERNESTO DENINA. *Notiz. chim.-ind.* **2**, 191-7(1927).—A graphical method of representation of the ideal dissociation formula is developed, and diagrams which show variations in the dissociation const. with variations in the diln. are discussed. It is shown to be advantageous to use logarithmic diagrams, in which the abscissas are the logarithms of the "total" ionic or neutral mol. diln. and the ordinates are the logarithms of a characteristic function of the degree of dissociation α , thus: $\log \eta_0 = \log[\alpha^2/(1-\alpha)]$, $\log \eta'_0 = \log[\alpha/(1-\alpha)]$, and $\log \eta''_0 = \log[\alpha/(1-\alpha)]^2$. Certain empirical formulas are derived from theoretical formulas by introducing an exponent other than 1, which varies from electrolyte to electrolyte. Various applications of these formulas to individual electrolytes are given. The expressions which can be derived from linear combinations of the preceding formulas are then considered, and a method for the graphical calcn. of the consts. is presented. It is shown that numerous known empiri-

cal formulas can be reduced to the types which the graphical methods and the accompanying discussion suggest as simple modifications of the principal 3 forms in which the ideal law can be expressed, and according to which the cause of the anomalies is attributed to ions, to neutral mols. or to the electrolyte as a whole in the dissolved state. New empirical formulas to complete those already known are derived to show the way in which the behavior of electrolytes approaches that of the ideal case when the diln. becomes sufficiently great. The phys. significance of the formulas discussed must be sought in the complexity of equilibria in the soln., for which arbitrary models can be developed. Combining then the various models, it is possible at times to supplement the elements of truth which they contain and thus obtain formulas which approach closer to the facts.

C. C. DAVIS

The amphoteric character of silver hydroxide. ERICH LAUE. *Z. anorg. allgem. Chem.* 165, 325-63 (1927).—From detns. of the soly. of AgOH in cond. H₂O, dil. NaOH KNO₃ solns. L. concludes that AgOH is amphoteric. Soly. of AgOH in H₂O at 20°, 25° is 1.14, 1.20, 1.39×10^{-4} eqivs. per l, resp., detd. by cond. at 25° by redposition 1.31×10^{-4} (corr.). In 0.01, 0.10, 0.50, 2.00 N KNO₃ solns. soly. is 0.190, 2.08 and 2.82×10^{-4} eqivs. per l, resp., at 25°. In alk. solns. 0.10, 0.506, 2.26, 5.20 N the soly. is 0.30, 0.91, 1.50, 2.86 and 4.23×10^{-4} eqivs. per l. These are all lower than those in the literature but L. thinks they are more accurate use of the correction which he has applied. From the soly. in H₂O the heats of neutralization, 17 cal./mol. at 18°, 20.2 cal./mol. at 25°. Mech. stirring of AgOH with H₂O did not seem to be peptized. This was removed by filtration through a Jena sintered glass filter which had been "stuffed" with fine Ag₂O. By means of Bjerrum's theory dissociation values have been calcd., $\text{Ag}^+ = 6-8\text{H}_2\text{O}$, $\text{AgO}^- = 11\text{H}_2\text{O}$. Activity of AgOH is 1.85×10^{-8} , that of argentic acid 2×10^{-8} ; hence the ratio of the two is 1.10×10^{-10} . Kossel's conception of inorg. amphoteric hydroxides is extended to the whole periodic system.

E. R. SCHIERZ

The Storch equation. A. FERGUSON AND I. VOGEL. *Phil. Mag.* [7], 4, 1-17 (1927).—Discussion of application to electrolytes of various types of mass-law equation, either with const. exponent or in a more general form with the exponent n considered a linear function of the concn. The equation considered is $((Ca)^n)/(C(1-\alpha)) = K$ with the usual significance of symbols. F. and V. find that it applies to certain electrolytes up to normal concns. For others it is valid to concns. of the order of 0.01 M and for a third type they show that the assumption $n = a + bC$ is applicable. On this basis diln. law is tested at limiting dilns.

GEORGE GLOCKLER

The influence of gum acacia on the specific conductivity of binary electrolytes and the effect of binary electrolytes on the viscosity of gum acacia solutions.* J. F. SPENCER AND R. DRUMMOND. *Kolloid-Z.* 42, 332-5 (1927).—Observations of viscosity and sp. cond. were made in solns. contg. gum acacia and one of the following electrolytes: HCl, NaCl or BaCl₂. The concns. of gum acacia were varied from 0 to 25% and at each concn. of gum, the concn. of electrolyte was varied from 0 to 0.5% for HCl and 0 to 1% for NaCl and BaCl₂. The viscosity was always decreased by the addn. of electrolyte. In some regions of gum concn. the viscosity passed through a min. with increasing electrolyte concn.; in other regions of gum concn. the viscosity decreased continuously. The sp. cond. of the mixt. of gum acacia and electrolyte was always less than the sum of the conductivities of the gum and electrolyte solns. taken separately.

F. L. BROWNE

Calculation of equivalent conductivities of strong electrolytes in aqueous solution at 0°, 18° and 25°. A. FERGUSON AND I. VOGEL. *Phil. Mag.* [7], 4, 233-42 (1927); cf. *ibid.* 20, 323.—In the equation $\lambda_0 = \lambda + BC^n$, F. and V. believe that both the const. B and n are variable from one electrolyte to the other. C = concn., λ = equiv. cond. at concn. C . By their methods of obtaining n and B they have calcd. λ_0 for various electrolytes.

GEORGE GLOCKLER

Base exchange in permutites. GEORG WIEGNER AND HANS JENNY. *Kolloid-Z.* 42, 268-74 (1927).—Base interchange depends on ionic interchange, which in turn depends on hydration of ions in soln. The higher the valence, the greater becomes the chg. charge. The relation between exchange in ions and at vol. of the ions is shown by the alkali metal group. The dehydration with alc. is a function of ionic interchange. A new formula for an equil. exchange shows that $(a - c) = k'(c/a - c/b)$, which shows the independence of diln. on the equil. not apparent in the Freundlich equation.

R. H. LAMBERT

The activity of hydrogen ion in mixed solvents. HORACE MILLET. *Trans. Faraday Soc.* 23, 515-22 (1927).—With the idea of detg. the influence of the solvent en-

vironment on activity, the H-ion activity of HCl and of picric acid has been detd. in $C_2H_5OH-H_2O$ mixts. by the e. m. f. method. Detns. were made for H-ion activities in $C_2H_5OH-H_2O$ mixts. contg. 0.05 *N* HCl, alone and in the presence of sucrose at 25° and 30° by means of the cell, $H_2 | 0.5 \text{ } N \text{ HCl-alcohol-H}_2O | \text{satd. KCl} | \text{normal calomel electrode}$. In the measurements with picric acid, a Biilman electrode was used. The min. activity obtained with HCl is shown to lead one to suspect the existence of a $C_2H_5OH \cdot 3H_2O$ compd. The rapid fall observed with the H-ion activities in mixts. rich in C_2H_5OH when the H_2O content is gradually increased is shown to be similar to the corresponding fall in H-ion mobilities. This effect is probably connected with the hydration of H ion. On this basis a calcn. is made of the H-ion activities that would be expected and the data obtained agree with the observed values. An empirical relationship of $k = (aD^2)/\Lambda$, where "*a*" is the activity coeff. of the H ion, *D* is the dielec. const. of the medium; Λ , is the equiv. cond. and *k* is a const. is found to be valid for HCl in $C_2H_5OH-H_2O$ mixts. J. H. PERRY

The electronic theory of valency. V. The molecular structure of strong and weak electrolytes (a) complete ionization. T. MARTIN LOWRY. *Trans. Faraday Soc.* 23, 508-15(1927); cf. *C. A.* 18, 2273.—Compds. in which neutralization of the ionic charges is prevented by the valence laws generally behave as "strong electrolytes" in soln. Poorly conducting solns may be obtained by dissolving a salt in a medium of low dielec. const. when abnormal variations of cond. with diln. are generally noticed. This is, of course, dependent upon the acceptance of the general validity of Walden's rule that a dissolved salt gives a definite value of Λ/Λ_∞ at a diln. which is inversely proportional to the cube of the dielec. const. of the solvent. Many fused salts are good conductors. Some of these, however, give values for the coeff. of ionization of over 100%; this may be due to the formation of ionic aggregates which have multiple charges. Some fused salts are, however, poor conductors, although the theory of valency would indicate that they should be completely ionized. The most probable explanation of this apparent anomaly is that the crystal lattice is broken down into neutral ionic doublets as soon as the material is fused. This effect is most likely to appear in salts which are easily vaporized, that is, those which readily dissoc. into volatile neutral doublets. From the point of view of the theory of complete ionization, the term "hydrolysis" has no real significance, unless the H ion or OH ion of water can be fixed by one of the ions of the salt with the formation of a covalent compd. A typical example of this case is NH_4Cl wherein the hydrolysis depends upon the conversion of NH_4OH into a covalent compd. An example of a "hydrolysis by dehydration" is the hydrolysis of a salt of a weak NH_4 base; this is then a thermal dissocn. into which H_2O does not directly enter. J. H. PERRY

Notes on the Soret effect. A. E. PORTER. *Trans. Faraday Soc.* 23, 314-6(1927).—The results of Tanner (*C. A.* 21, 1395) obey the equation: $d(nT^{1/2}) = 0$ (1) (*n* = mol. concn. at equil. and *T* = abs. temp.), deduced for the equil. existing when the local concn., at distance λ (the mean free path of solute mols.) in front and behind an inter-surface, is const. By introducing a factor *i*, dependent on the ionization, the small deviation, amounting to a max. of 0.007 for a drop of 20° in varying concns. of KCl, is negated and the equation becomes: $d(nT^{1/2})/nT^{1/2} + di/i = 0$. For H_2SO_4 , *di/i* is considerable. The temp. gradient is practically uniform. The concn. gradient is not, and is given by: $\Delta n/n = -\Delta T/2(T_1T_0)^{1/2}$, where T_1 and T_0 are the extreme temps., Δn and ΔT the differences in extreme values and *n* is defined as the normality. The cause of differences for different cases in the Soret effect is probably due to variations in the factor *i*. J. BALOZIAN

The solid solutions of cholesterol. P. A. MANDEL AND N. S. KURNAKOV. *Ann. inst. anal. phys. chim.* 3, 464(1926).—Cholesterol can be obtained in solid soln in substances of higher m. p. like naphthalene, AcOH, $C_{17}H_{35}COOH$, $p-NH_2C_6H_4CH_3$, α - and β -naphthylamines. Cholesterol also dissolves β -naphthol, β -naphthylamine, etc. BASIL C. SOYENKOFF

Chemical action at an interface: the production of acidity in neutral salt solutions. N. V. ACHAR AND F. L. USHER. *J. Chem. Soc.* 1927, 1875-82.—Development of acidity in neutral salt solns. where no detectable quantity of acid can be extd. is shown to be due to a chem. interaction of the ionic type. This is qualified by the fact that one kind of atom is non-diffusible. Studies were made on stearic acid suspensions in K_2SO_4 solns. Acidity decreases with diln. of the suspension and decreased concn. of K_2SO_4 . Observed acidity is probably due to exchange of the cations of the salt with H ion formed from dissociating mols. in the surface of the insol. acid. R. H. LAMBERT

The application of surface-tension measurements to the calculation of the heats

of dissolution of two partially miscible^a phases. RENÉ AUDUBERT. *J. chim. phys.* 24, 427(1927).—A. has already shown (*C. A.* 15, 1446) that the heat of vaporization of a liquid can be expressed as a function of its surface energy, and has demonstrated the validity of the expression he employed by calcg. mol. diams. comparable with those obtained from the kinetic theory and x-ray spectroscopy. The same reasoning is now applied to calc. the heats of dissoln. of two partially miscible liquids, since this may be regarded as work done against the force of cohesion. For the system water-ether a value of 6000 cal. is calcd. against 5800 cal. observed for the latent heat of dissoln.

W. T. RICHARDS

The mass unit of chemical potential. W. D. BANCROFT. *J. Phys. Chem.* 31, 69-80(1927).—The abs. value of chem. potential is never measured, only its change due to chem. reaction. The unit should be the one appropriate to that reaction.

F. R. BICHOWSKY

Analysis of the time laws of complex chemical reactions. MAX BODENSTEIN. *Ann. Physik* 82, 836-40(1927).—Reply to Skrabal's criticism (*C. A.* 21, 3525) of a paper by Herzfeld (*C. A.* 15, 1440).

JOHN T. STERN

The theory of the velocity of chemical reactions. FRANCESCO GIORDANI. *Rend. accad. sci. Napoli* 32, 70-82(1926).—A value of the critical increment E , deduced by Arrhenius' formula, from the variation of the reaction velocity k , as a function of T , will be in error if polymerization exists which is not taken into account. In such a case, it is shown that $E_1 = E + Q$ where E_1 is the effective value and E the exptly. observed value. Since, for polymerization reactions, Q is usually positive the observed critical increment will be less than the actual, and the value of ν , the frequency of the exciting radiation, will be too small. Such an error might occur in the case of III, where there is good reason to think that the reaction is the monomol. decompn. of the polymerized mol. H_2I_2 . It is suggested also that the no. of oscillators may not be equal to the no. of mols., but to the no. of valence electrons. If r is the no. of valence bonds in the ordinary chem. sense, it is proposed that the absorption of energy may be proportional to $\nu_p^{1/r}$, whence, $k = (\pi c^2/3m h \nu) (\eta \nu_p^{1/r})$. By applying this to data, at 672°, for the thermal, monomol., decompn. of PH_3 , $r = 3$, $k = 29.01 \times 10^{-3}$ as compared with exptl. value, 10.2×10^{-3} . The corresponding value for λ is 0.125×10^{-4} , which agrees better with the optical data than does that calcd. by the old method, 0.375×10^{-4} . For the monomol. decompn. of N_2O_6 , $r = 2$, the calcd. value of k is 1.3×10^{-4} , the exptl. value is 0.34×10^{-4} , and the calcd. value of λ is 0.582×10^{-4} . For the bimol. decompn. of O_3 , $r = 6$, λ is calcd. to be approx. 320μ as compared with the observed absorption band at λ 225 μ .

R. H. L.

Kinetics of reactions in crystal powders. KURT FISCHBECK. *Z. anorg. allgem. Chem.* 165, 46-54(1927).—Reactions involving solids can be divided into those which relate to changes of a single cryst. species and those which involve changes in 2 or more cryst. species. The first group has been studied intensively, and attention is here directed to the second class. The significant characteristic of these reactions is that they all involve changes in the lattices of one of the crystals to permit the introduction of other elements. The velocity of these reactions would be proportional to the diffusion if the reaction velocity proper were very great compared with the diffusion process. However, kinetic considerations based on diffusion alone do not yield satisfactory results. Dunn (cf. *C. A.* 20, 2934) from thermodynamic considerations has derived the following equation: $d \ln K/dT = -Q_s/RT^2$ or $K = e^{B-Q/RT}$ in which K is the velocity const. and Q is the heat of unlocking the lattice. This may be rewritten in the form $dy/dt = (e^{B-Q/RT})/y$. F. then considers the special forms which this equation takes for isothermal and adiabatic conditions, etc.

A. W. K.

The reaction between silver and sulfur mixed in the form of a crystalline powder. KURT FISCHBECK AND WERNER JELLINGHAUS. *Z. anorg. allgem. Chem.* 165, 55-8 (1927). Expts. on Ag and S were carried out as a verification of the theory just given (cf. preceding abstract). Purified Ag and S were mixed in powder form, the particle diameters averaging about 0.001 mm. and were compressed in a tablet machine under a pressure of about 1000 kg./sq. cm. The tablets were then heated in the air in a steam-heated chamber and analyzed after different lapses of time by extg. the S with CS_2 . At 110° and 98° the action was rapid and led to audible explosions in 1 or 2 min. Expts. were made at 110°, 98°, 78°, 65°, 55°, 45°, 38° and 22°. At the lower temps. the data were quite consistent, so that the % conversion plotted against the square root of the elapsed time gave straight lines from which the av. value of k was taken and another graph made plotting $\log k$ against $1/T$, the points falling approx. on a straight line up to 98°. From this graph the value of Q was calcd.; and allowing for

the vapor pressure of S, the energy required to open the Ag₂S lattice amounts to 6600 cal. per mol. This is in fair agreement with calcn. made from Köster's data (cf. *C. A.* 17, 14) which gave 6400 cal. as the value. The reaction velocity of the whole reaction increased 5.47 times for 10° rise in temp. whereas the diffusion const. increased about 1.65 times.

A. W. KENNEY

Reaction in the solid state at high temperature. I. Rate of reaction for an endothermic change. WILHELM JANDER. *Z. anorg. allgem. Chem.* 163, 1-30 (1927).—An endothermic and an exothermic reaction can be differentiated by plotting a rate of reaction curve and noting its shape. The theory for the reaction between 2 kinds of crystals is presented. The rate of reaction is dependent on temp. and size of crystals. A description of the app. used for expts is given. The rate of reaction is measured for BaCO₃ and CaCO₃ with SiO₂ and for CaCO₃ with Mo oxide. The effects of temp. and of grain size were studied. Excellent agreement is found between exptl. data and theoretical calcs.

R. H. LAMBERT

A very general time law of chemical kinetics and its significance. The velocity of hydrolysis of the organo-oxides. ANTON SKRABAL. *Z. Elektrochem. angew. physik. Chem.* 33, 322-48 (1927).—It is set up as a general expression for the velocity of the many reactions taking place with H₂O in aq. soln. that $dx/dt = (k_w + k_a h + k_b i) \times (a - x)$ (1), where $(a - x)$ is the instantaneous concn. of the substance reacting with H₂O, h = H-ion concn. and i = OH-ion concn. $hi = w$, the ionization product of water. A mathematical treatment of this expression enables generalizations to be drawn as to the conditions of min. reactivity or max. stability. If $a - x$ in the above expression = 1, the velocity const. k , becomes $k = k_w + k_a h + k_b i$. If then a curve is plotted whose abscissas are log h and ordinates are log k , the curve will, in general, consist of 3 parts, a descending portion, a horizontal portion and an ascending portion, all practically rectilinear. The abscissa of max. stability lies at the center of the horizontal portion. It is possible for this generalized curve to take different forms in which one or more of the sections of the curve are absent: e. g., the curve may be a straight horizontal line in case the velocity is independent of the H-ion concn.; or it may be a straight descending line. The abs. values of the 3 const. given in equation (1) differ greatly for different reactions and in many cases cannot all 3 be directly detd. Euler's theory of the mechanism of hydrolytic reactions is criticized at length. It is shown mathematically that according to his assumptions the general curve in the log k -log h plane would have a different shape from that described above and S. observes that there has been no evidence to show in any single case the existence of certain parts of these curves. Further, Euler's conditions of max. stability are shown to be incorrect. They do not necessarily correspond with the isoelec. point. The Euler hypothesis cannot, in many cases, be verified experimentally; and in other cases it is ambiguous. It rested, however, on the basis that in the numerous cases of acid and basic hydrolysis where it had been used, any deductions based on it had not proved to be in error. S. specifically denies this; and states that it is contrary to experience, that in all cases the ions react more rapidly than the undissoc. esters and cites examples. The hydrolysis of Et acetate by acids is 10,000 times more rapid than that of the Et₂O and the hydrolysis of Ac₂O proceeds not more slowly but 50 times more rapidly than that of Et acetate, contrary to the deductions which would be drawn from Euler's work. The real nature of the catalytic reactions in which water plays the part of a reactant is not known and none of the numerous theories of the mechanism which have been advanced is satisfactory. S. sets himself the problem of detg. from constitutional formulas the numerical values of the 3 velocity const. in equation (1) and considers the general reaction, $XOY + HOH = XO + YO$, in which X or Y may be either alkyl or acyl. This then includes in the term organo-oxides the anhydrides, ethers, esters, acids and alcs. The data on the alk. and acid hydrolysis of these different classes of compds. are discussed and it is pointed out that the organo-oxides whose hydrolysis leads to bases are catalyzed by H ion, whereas those which yield acids are catalyzed by OH ion; k_a and k_b can be calcd. for a esters. Whereas k_a for different esters is relatively const., k_b varies over extremely wide limits, from about 1 to 880,000. S. considers at some length the alk. sapon. of

reacting material, so that there may be not only steric hindrance but steric assistance of sapon. Certain relationships between the const. such as $V = k_b/k_a$ and $W = k_w/2\sqrt{k_a k_b w}$ characterize the hydrolysis curve. The abs. value of k_w may vary between the largest value so far detd., 1.6 for maleic anhydride, and the smallest so far measured, 9.2×10^{-9} for Et acetate; k_w for Et₂O is presumably of the order of 6×10^{-14} . It is possible to est. by analogies the values of the individual const. for a no. of

simpler compds., but the no. of factors¹⁰ which influence the velocity, such as conformation, etc., makes the calcn. extremely complicated. The acetals form a class closely related to the organo-oxides and the fact that the rate of their hydrolysis can be approx. predicted forms a test of the S. theory. A. W. KENNEY

Decomposition of glycylglycine by alkali. I. S. YAICHNIKOV. *J. Russ. Phys.-chem. Soc.* 58, 1373 (1926).—The splitting of glycylglycine with 0.2 N HCl is a typical bimol reaction (*C. A.* 17, 1573). 0.05 N glycylglycine in 0.2 N NaOH at 100° is decomposed in 7 hrs. Five-cc samples were taken in certain intervals; they were neutralized with 0.2 N HCl (phenolphthalein as indicator) and further titrated by Sørensen's method. The results were: (time (hrs) t , $\frac{1}{t}$ broken up x , $K = 1/t \cdot \log(a - x)$). 0, 44.0, 0.25181; 1, 60.0, 0.19897; 2, 76.0, 0.20660; 3, 100.00, —. Changing the concn. of glycylglycine to 0.1 N, other conditions the same, the splitting was slower for the same period of time but faster than with acid. A. A. B.

The rate of racemization of pinene, a first-order homogeneous gas reaction. D. I. SMITH. *J. Am. Chem. Soc.* 49, 4350 (1927).—The rate of racemization of (*d*) pinene was measured in soln. in the gas phase and as the pure liquid over the range 184–237°. The rate of racemization is only 50% larger in the pure liquid than the dil. gas, is independent of surface, and pressure. The heat of activation is 43710 cal., in approx. agreement with the Dushman equation. F. R. B.

Mechanical models of the kinetics of chemical processes. G. PROKOPOVICH. *Ukrainskii Khim. Zhurnal* 2, 81–104; *Chem. Zentr.* 1926, II, 2373.—Balls are drawn from an urn. The white ones are put back, the black ones are replaced by white ones. If the no. of black balls in the urn was A and if α balls were withdrawn per unit of time, then the velocity const. of the monomol. reaction is proportional to α/A . Similar model for reactions of a higher order are described. C. C. DAVIS

The reaction of the formation of barium sulfate. V. GUREVICH. *Ukrainskii Khim. Zhurnal* 1, 585–94 (1925); *Chem. Zentr.* 1926, II, 1556.—When dil. solns. contg. Ba^{++} and SO_4^{--} , resp., are allowed to flow together, turbidity as manifest by the Tyndall effect does not appear immediately, but only after a latent period t , which is measurable (Winkler, *Z. anorg. Chem.* 33, 311). Addn. of HCl, NH_4Cl , KCl, MgCl_2 or FeCl_3 increases t , for equimol. concns. Fe^{+++} having a greater retardant effect than Mg^{++} . The latter has the same effect as H^+ , which has a greater effect than K^+ or NH_4^+ , which are similar in effect. With 0.000187 mol. K_2SO_4 and 0.102 mol. BaCl_2 per l. t , 0. With the addn. of 0.652 mol. of HCl t becomes 23 sec., with 2.00 mol. HCl 5 min., with 1.304 mol. KCl, 12 sec.; with 1.304 mol. NH_4Cl , 17 sec.; with 0.75 mol. FeCl_3 , 25 sec.; with 2.055 mol. MgCl_2 , 4.5 min.; and with 0.172 mol. FeCl_3 , 23 sec. The concn. of glycerol does not alter t . Crystn. from a supersatd. soln. or coagulation of a colloidal sol should be accelerated by electrolytes, so that the increase in t must be due to other phenomenon. It is regarded by G. as an example of the Brønsted law (*Chem. Zentr.* 102, 169) according to which reactions between ions of opposite charge are retarded by neutral salts. A quant. comparison with the theory is impossible because the activities of the concd. solns. used are not known. C. C. DAVIS

Equilibria in the reduction, oxidation and carburization of iron. II. Methane-hydrogen equilibria in the presence of cobalt. RUDOLF SCHENCK, F. KRÄGELOH AND FRIEDRICH STÜCKEN. *Z. anorg. allgem. Chem.* 164, 313–25 (1927).—The authors wish to know whether the equil. conditions resulting from the action of Co upon CO are solely those due to the reaction: (I) $2\text{CO} \rightleftharpoons \text{C} + \text{CO}_2$, or whether other equilibria involving a Co carbide must also be considered. The results of an incomplete series of experiments performed in 1914, are given. At that time Co was considered to act solely as a catalyst in the reaction mentioned above and no carbide equilibria were thought to be involved. Doubt in the matter has led the authors to det. the equil. conditions in the closely related system: $\text{CH}_4 \rightleftharpoons \text{C} + 2\text{H}_2$, catalyzed by Co. The procedure is the same as that used in the system $\text{Fe}-\text{CH}_4$ (cf. *C. A.* 21, 3334). The primary reaction is a catalytic decompn. of the CO according to (I). Co is a better catalyst for this reaction than Fe. Superimposed upon this equil. is another involving Co carbide. This equil. is reached more slowly than the former. Both equilibria are studied quantitatively over the range 310–740°. Above 680° the reaction involving the carbide is no longer encountered. Although Co carbide was not isolated, its properties are predicted. The parallelism between the effects of Fe_3C and Co carbide on the decompn. of CH_4 leads the authors to believe that, as with Fe, it is likely that Co carbide forms mixed crystals with Co. The heat of formation of Co carbide is found by calcn. to be –11,300 cal. The authors draw the following conclusions with regard to the influence of Co upon equil. (I): above 668° the influence is purely catalytic;

below this temp. it is difficult to explain the equil. relations unless the existence of dil. mixed crystals of Co carbide in Co is postulated.

The problem of clean platinum electrodes in the determination of the electric conductivity of electrolytes. A. GERASIMOV. *J. Russ. Phys.-Chem. Soc.* **58**, 196-200; *Chem. Zentr.* 1926, II, 2326.—To test the applicability of clean electrodes for cond. measurements, the resistance capacity C of a cond. cell having clean electrodes was detd. as a function of the concn. of the soln. (KCl or $MgSO_4$) and of the apparent resistance. The results show that C increases with decrease in the resistance of the soln., even within the range where the min. was sharp and where the electrode surfaces satisfied the Kohlrausch conditions. The relative change in C from 0.001 N to 0.01 N KCl was 1.9%, and that from 0.001 N to 0.02 N $MgSO_4$ was 2%. If R is the apparent resistance of the cell, formulas such as, $C = a + b/R$, or $C = a - bR$, where a and b are consts., conform to the exptl. data.

C. C. DAVIS

Reversal of chemical reactions by electrolysis. ROBERT SAXON. *Chem. News* **133**, 342(1926).—The reversal of electrolysis of common reactions of pptn. such as that of $CaCl_2$ and Na_2SO_4 is discussed. Conclusion: The elec. current does reverse chem. reactions of this type. The yields in percent in a few common reactions are given.

WILLIAM J. SWEENEY

The oxidation of cacodyl oxide. AMAND VALEUR AND PAUL GAILLIOT. *Compt. rend.* **185**, 70-1(1927).—A slow current of air is passed into cacodyl oxide (I) under a layer of water at room temp. The O_2 absorbed is equiv. to only 50% transformation of I into cacodylic acid. The remainder of I is converted, without the intervention of O_2 , into $(CH_3)_3As$, CH_3AsO and As_2O_3 . The decompn. of I into the last 3 compds. is caused by the catalytic action of a peroxide. The foregoing transformations constitute a new kind of catalyst due to peroxide—one in which synthesis and retrogradation occur simultaneously.

FREDERICK C. HAHN

Dissociation pressure of sodium sulfate decahydrate. II. MOTOTARO MATSUI, SHINOSUKE FUKUSHIMA AND SUKEO NAKADA. *J. Soc. Chem. Ind. (Japan)* **30**, 330 41(1927); cf. *C. A.* **20**, 3261.—The vapor pressure of $Na_2SO_4 \cdot 10H_2O$ was measured with an improved form of the static isotenoscope. Sixteen values were obtained at so many different temps., kept within ± 0.01 - 0.05° , in the range of 20-50°. These values were fairly concordant with those obtained by Wuite (*C. A.* **8**, 1224) statically, but lower than those obtained by other authors dynamically. From the above data, the following vapor pressure equations were derived: $\log p = -2837.83/T + 10.7866$ below 32.4°; and $\log p = -2360.58/T + 9.2254$ above 32.4°. The transition point was computed from the equation to be at 32.6°.

SHUMPEI OKA

The dissociation of some organic and inorganic substances at high temperatures. GLADYS M. WOOD AND T. C. POULTER. *Proc. Iowa Acad. Sci.* **33**, 172-3(1926).—The investigation was undertaken to ascertain whether the well-known cond. in many gaseous reactions at high temps. is due entirely to the reaction or partially to the disassocn. of one or the other or both of the constituents into charged particles. For the exptl. work, a tube 150 mm. long and 15 mm. in diam. contg. one Pt and one W electrode was used. The electrodes were of wire; they overlapped about 22 mm. and were about 3 mm. apart. This tube was heated to approx. 500°. A gentle stream of vapor of the following substances was passed through the tube at atm. pressure. A potential of from 1 to 15 v. was applied to the electrodes and the current was read by means of a galvanometer. The following substances showed a deflection ranging from 1 to 15 scale divisions: glacial $AcOH$, Et acetoacetate, HCl , $AmOH$, I , $C_6H_5NO_2$. Those showing a deflection of less than one scale division are 75% $AcOH$, amylene, CCl_4 , C_6H_5Cl , HCO_2H , Br , $PhBr$, $AcOMe$. Those showing no deflection are C_6H_6 , $MeOH$, NH_3 , toluene, $CHCl_3$, H_2O , Et alc., C_6H_5CHO , $EtBr$, air.

W. G. GAESSLER

Studies in metallic nitrides and hydrides. I. I. ZHUKOV. *Ann. inst. anal. phys. chim.* **3**, 14-41(1926).—A no. of metals were heated to 1250° in the presence of N_2 . The absorption of gas by Mg begins at 780-800°, a product of the compn. Mg_3N_2 being formed; Ca filings react at the same temps. to form Ca_3N_2 (solid at 1250°) while Li_3N results with Li. The above 3 compds. show no measurable dissocn. pressure below 1250°. Pressures of varying amts. of N_2 in contact with Mn and Cr were recorded. The isotherms (910 and 1175 for Mn, 1100 and 1200 for Cr) represented equilibria with a solid phase of continuously varying compn. Al begins to form AlN between 850° and 875°. Pure Ti was not available; the specimen studied behaved in general like Mn or Cr. At 1000° Mo absorbed only 20 cc. N_2 per 5 g. of the metal. No reaction below 1250° was observed with V, W, Zn, Cu and Fe; 4 g. of U absorbed 27 cc. of the gas at 1000° (the sample used contained carbide as an impurity). In cond. measurements of the nitrides the powd. sample was compressed in an ivory cyl.

under between a steel piston and brass plate serving as the electrodes. The conductivities of the azotized Cr, Mn and Ti were of the order of that of the pure metals, while with AlN , Ca_3N_2 and Mg_3N_2 it was below 5×10^{-7} . Azotized Mn and Cr affect the magnetic needle; this property does not increase parallel with the N content.

BASIL C. SOYENKOFF

The metallic nitrides. I. I. ZHUKOV. *Ann. inst. anal. phys. chim.* 3, 461-2(1926); cf. preceding abstr.—Dissoen. pressures of NaH are 75 mm. at 360° and 261 mm. at 390° . CeH_2 has a pressure of 1 mm. at 450° and 490° and forms solid solus. with the excess of H_2 . Rh shows compd. formation with H_2 at 0° , 25° and 100° ; Ir forms only solid solus.

BASIL C. SOYENKOFF

The solubility curve of copper in aluminum. P. YA. SAL'DAU AND N. N. ANISIMOV. *Ann. inst. anal. phys. chim.* 3, 485(1926).—A satd. soln. of Cu in Al contains 2.7% between 150° and 300° , the concn. increasing rapidly with the temp. to 5.6% at 500° . The hardness of alloys tempered at 500° reaches a max. at 6% Cu; the max. of aging also lies at 6%.

BASIL C. SOYENKOFF

The chemical structure of the natural hydrates of ferric oxide. N. S. KURNAKOV AND R. YA. RODE. *Ann. inst. anal. phys. chim.* 3, 305-32(1926).—The only possible hydrate of definite compn. is $\text{Fe}_2\text{O}_3 \cdot \text{H}_2\text{O}$ (hetite and lepidocrocite). (1) Hydrohematites are solid solus. of H_2O in hematite; their heating and dehydration curves are continuous. The max. H_2O content was 7.98%. (2) Hetites, lepidocrocites, limonites and brown ores contain 9.9 to 13.2% H_2O , 10.1% combined to form the monohydrate and the rest dissolved in the latter. The heating curves, besides the hetite break, show an inflection at $125-35^\circ$ where the solid soln. begins to decompose. The dehydration curves show a break at $200-50^\circ$ where hetite passes into solid soln. of H_2O in hematite. (3) Xanthosiderites, lake ores, pea ores, limonites contg. 13.8% and more of H_2O have heating curves discontinuous at $120-50^\circ$ besides the usual hetite break. A transition from xanthosiderite to hetite solid soln. probably occurs at this point. Lake ores exhibit recalcence at $325-400^\circ$, probably due to their finely dispersed state; specimens belonging to older formations do not show this effect.

B. C. S.

Heating of formate solutions under pressure. HANS TROPSCH AND A. V. PHILIPPOVICH. *Abhandl. Kenntnis Kohle* 7, 103-6(1925); *Chem. Zentr.* 1926, II, 1401.—Though at 175° formates of the alkalis and alk. earths are resistant to heating under pressure, expts. show that when heated to $340-400^\circ$ aq. HCO_2Na decomps. to Na_2CO_3 and H_2 , and that the reaction is reversible. $(\text{HCO}_2)_2\text{Ca}$ decomps. otherwise, possibly on account of first forming CaCO_3 and HCHO and the HCHO then decompg. into CO and H_2 . This would explain the formation of a large proportion of CO in the pressure heating.

C. C. DAVIS

The action of dilute acid and soda solution on mica. A. FIOLETOVA. *Ann. inst. anal. phys. chim.* 3, 426-33(1926).—Specimens of biotite were wholly decomd. by 1% HCl within 10 hrs. while 2% HCl attacked less than half of the total wt. Ignition to $500-550^\circ$ hinders the subsequent action of acid. The av. compn. is 36.72% SiO_2 , 1.05% TiO_2 , 13.84% Al_2O_3 , 7.32% Fe_2O_3 , 15.53% FeO , 0.48% CaO , 3.18% MgO , 10.56% K_2O , 4.45% Na_2O and 5.57% H_2O . The high H_2O content of mica and the products of its hydrolysis agree best with Vernadskii's formula for the mica nucleus:

ed with 5 addnl. groups $\text{HO}(\text{Fe})\text{MgO}(\text{OH})\text{Si}(\text{O})_2$.

BASIL C. SOYENKOFF

The equilibrium between hydrates of calcium sulfate. D. BALAREFF. *Z. anorg. Chem.* 163, 137-40(1927).—Dehydration of $\text{CaSO}_4 \cdot 0.5\text{H}_2\text{O}$ is reversible above

80° . The system is univariant. Below 80° the vapor pressure falls below 2 mm. A transformation takes place at 82° from one anhydride to another.

R. H. L.

The fusibility of the mixtures of lithium and magnesium fluorides. V. P. IL'INSKIY AND P. F. ANTIPIN. *Ann. inst. anal. phys. chim.* 3, 464(1926).—The eutectic lies at 718° , solid solus. being formed on the LiF side.

BASIL C. SOYENKOFF

Melting points of the ternary system sulfuric acid-acetic acid-water. ALEXANDER LEFFMAN. *Trans. Am. Inst. Chem. Eng.* 18, 187-94(1926).—M. ps. of a no. of H_2SO_4 - AcOH - H_2O mixts. were obtained by starting with a given mixt. of the concd. acids and detg. the m. ps. after the addn. of known successive amts. of H_2O , the final dil. soln. being analyzed to det. the amts. of the resp. acids. With these data the ternary diagram was mapped. Mixts. of H_2SO_4 and AcOH do not form a binary system but are part of the ternary system SO_3 - $(\text{CH}_3\text{CO})_2\text{O}$ - H_2O . H_2SO_4 dehydrates AcOH even in the presence of enough H_2O to form $\text{H}_2\text{SO}_4 \cdot \text{H}_2\text{O}$. No compd. of H_2SO_4 and AcOH with or without H_2O was found, although Kendall describes one with a m. p. of -2.5° .

The possibility of the existence of such a compd. was not disproved, for the viscosity of the soln. is so high as to make crystal. processes very slow. A. W. KENNEY

The ternary system silver-tin-copper. W. GUERTLER AND W. BONSAK. *Z. anorg. allgem. Chem.* **162**, 22-30 (1927).—In the binary system Ag-Sn, Ag_3Sn crystallizes out at 480° . The compd. $\text{Ag}_{15}\text{Sn}_3$ has also been identified. In the system Cu-Sn the most marked crystal type is Cu_5Sn , while in the system Ag-Cu no intermediate crystal type exists. In the ternary system a wide range of compn. is studied, from 90% Ag, 3% Sn and 7% Cu to 10% Ag, 39% Sn and 51% Cu, and the equil. diagram is discussed. The Ag mixed crystal zone is the most important part of the system technically, as an alloy which lies in this zone greatly resembles Ag in color and resistance to attack, while the mech. properties are improved by addition of the other metals. No. 1 alloy, contg. 86% Ag, 6% Sn, 8% Cu shows a Brinell hardness of 63.5, No. 4 contg. 84% Ag, 8% Sn and 8% Cu shows for Brinell hardness 70.8 and No. 8 contg. 75% Ag, 17% Sn, 8% Cu gives Brinell hardness 65.3. Nos. 1 and 4 are in the heterogeneous zone of Ag and Cu_5Sn mixed crystals; No. 8 is in the heterogeneous zone of Ag-Cu-Sn. Hardness increases as Ag_3Sn_2 is approached. H. STOERTZ

The transformations of the system tin-cadmium in the crystalline state. A. FEDOROV. *Ukrainski Khim Zhurnal* **2**, 69-71; *Chem. Zentr.* **1926**, 11, 2405.—The thermal diagram of state of the system Sn-Cd was investigated and is shown. It gives no evidence of the formation of a compd. The eutectic point is at 177° and corresponds to 70% Sn by wt. The eutectic can be followed from 0 to about 90% Sn. At lower temps. the solv. of Cd in Sn reaches 24%. On cooling below 120° , the solid soln. decomp. into β -Sn and Cd. The thermal effect of the transformation shows a max. for various compns. of the fusion mixt. which depends upon the cooling conditions. C. C. DAVIS

Equilibria in the system gold-zinc. P. YA. SAL'DAU. *Ann. inst. anal. phys. chim.* **3**, 211 (1926).—Cond. of Au-Zn alloys was measured over a wide range of temps. and compn. with the aid of a special app. (cf. C. A. **11**, 1626). Cooling curves of the alloys were detd. as well as the microstructure. Au-Zn seps below 420° from the solid phase α (contg. 25% Zn) as α_1 , which undergoes a transformation at about 270° into α_2 stable at low temps. All cond. isotherms show a max. at 1:1 (Au:Zn). Cond. data and microstructure do not confirm the existence of compd. AuZn_3 found by Vogel. A solid phase contg. 75% Zn forms AuZn_3 at about 500° ; another modification of this compd. appears on cooling to 250° . Conductometric analysis, in general, serves to distinguish 3 types of solid phases of variable compn., phases formed by the free components of the system whose cond. isotherms do not exhibit maxima, phases, characterized by maxima located at all temps. at the same ordinates, contain undissoc. compds. plus their components, phases, whose cond. maxima shift with temp. and on cooling approach ordinates corresponding to the rational compn. of compds., contain partly dissoc. compds. BASIL C. SOYENKOFF

The methods of determining the composition of the solid phase in systems at equilibrium. B. P. SHISHOKIN. *Ann. inst. anal. phys. chim.* **3**, 421-5 (1926).—Schreiner's method (*Z. physik. chem.* **11**, 81 (1893)) is more exact when the compn. of the liquid phase and residue is expressed in g. per 100 g. of the solvent. Then for the angle of intersection $\lg \alpha = (a_2 - a_1)/(b_2 - b_1)$, where a and b are the concns. of A and B in the liquid and a_2 and b_2 in the residue, resp., provided the solid phase contains no water of hydration. When applied to the system AgNO_3 -guanidine nitrate $\cdot \text{H}_2\text{O}$ the method proves the existence of $2\text{AgNO}_3 \cdot \text{CH}_3\text{N}_3 \cdot \text{HNO}_3$. Rivett and Clendinning's data (C. A. **17**, 3292) show the formation of solid solns. on either side of $2\text{NH}_4\text{Cl} \cdot \text{CuCl}_2 \cdot 2\text{H}_2\text{O}$. BASIL C. SOYENKOFF

The analytical and graphical methods of study of the equilibria of complex systems. V. P. SHISHOKIN. *Ann. inst. anal. phys. chim.* **3**, 333-69 (1926).—Matzestinsk and Agursk springs are formed by the mixt. of metamorphosed Black Sea water and a component poorer in mineral salts. The main mineral springs of Pyatigorsk are also a mixt.; the waters of southern Mashuk and radioactive waters are derived from the main springs. Penfield-Foote formula for tourmalines satisfies their characteristic equation. BASIL C. SOYENKOFF

The equilibria of tetranitromethylaniline in certain binary systems. N. N. EFREMOV AND A. M. TIKHOMIROVA. *Ann. inst. anal. phys. chim.* **3**, 289-301 (1926).—Tetryl m. 126.8° ; crystals reappear at the m. p. only upon inoculation and stirring. With $o\text{-NO}_2(\text{OH})\text{C}_6\text{H}_4$, m. 44.9° , a eutectic was found at 40.2° and 12.2% of tetryl; solid solns. are formed contg. up to 5.5% of the phenol. The liquid mixts. are mobile, bright yellow and do not tar on superheating. $p\text{-NO}_2(\text{OH})\text{C}_6\text{H}_4$, m. 113.8° , forms viscous mixts. which darken on heating. The eutectic lies at 80.6° and 50.6% of the

phenol. Solid $p\text{-NO}_2(\text{OH})\text{C}_6\text{H}_4$ dissolves up to 10.5 mols. of tetryl. $p\text{-NO}_2(\text{Me})\text{C}_6\text{H}_4$, m. 52.4, exhibited a eutectic at 46.6° and 23.4% of tetryl; the mixts. were stable, colorless and crystd. rapidly. No solid solns. were formed. With $o\text{-NO}_2(\text{NH}_2)\text{C}_6\text{H}_4$, m. 69.4°, a eutectic results at 49.7° and 73.2% of the amine; the liquid mixts. decomposed at 115–50°; no solid solns. were formed. Tetryl and $m\text{-NO}_2(\text{NH}_2)\text{C}_6\text{H}_4$, m. 114.0°, gave a eutectic at 78.3° and 55.3% of the aniline; the mixts. are unstable, solid solns. are not formed. $p\text{-NO}_2(\text{NH}_2)\text{C}_6\text{H}_4$, m. 147.3°, has a eutectic at 87.2° and 40.6%; the mixts. are unstable. $m\text{-(NO}_2)_2\text{C}_6\text{H}_4$, m. 69.5°, showed a eutectic at 65.5° and 66.5%; the components do not form solid solns. 2,4-(NO_2)₂ C_6H_3 forms a eutectic mixt. with tetryl which m. 59.1° and contains 20.5% of the latter. Liquid solns. are fairly stable, solid solns. do not exist. With 2,4-dinitrophenol m. 111.4° a eutectic was obtained at 83.1° and 57.7%. Solid solns. begin at 16% of tetryl and 18.5% of the phenol. Picric acid m. 122.4°, forms vitreous mixts.; the eutectic lies at about 75–7° and 43% of the phenol. The liquid mixts. can be heated above their m. p. without decompn. The eutectic with strychnic acid, m. 175.5°, is located at roughly 25.5% of the acid and 81.1°. The mixts. give off oxides of N on heating to the m. p. and gelate on cooling. 2,4,6-Trinitrophenol m. 78.8°, forms a eutectic at 58.8° and 63.4%. Crystn. proceeds with great difficulty. No evidence was found for the existence of the 3:2 compd. discovered by Gmra. The eutectic mixt. of 2,4,6-trinitrocresol (m. 101.2°) contains 36–7% of tetryl and m. about 78°. The ratios of the components in the above-mentioned eutectic mixts. approach those of small whole nos. Solns. of tetryl in picric acid and TNT are in most suitable for military purposes.

BASIL C. SOYENKOFF

A thermoanalytical study of the formation of naphthylamines from naphthols. B. N. MENSHUTKIN AND N. A. BUTKOV. *Ann. inst. anal. phys. chim.* 3, 405–20 (1926). Solv. curves of the system $\text{ZnBr}_2\text{PhNH}_2$ show a max. at 270° and about 55% of ZnBr_2 , corresponding to $\text{ZnBr}_2\cdot 2\text{PhNH}_2$; a eutectic of the compd. and ZnBr_2 lies at 17° and 81.6°, while with PhNH_2 it is too close to the m. p. of the latter to be detd. $\text{ZnBr}_2\cdot 2\text{MeHNPh}$ is insol. in the free amine, easily sol. in EtOH and Et_2O , decomps. without m. 285°. $\text{ZnBr}_2\cdot 2\text{Me}_2\text{NPh}$ is similarly insol. in Me_2NPh , hardly sol. in EtOH and decomposes without melting at 280°. ZnBr_2 and α -naphthylamine form $\text{ZnBr}_2\cdot 10\alpha\text{NH}$, m. 241°; the eutectics lie at about 225° and 47°, and 35 and 0.5% of ZnBr_2 , m. p. The mixts. are viscous and crystallize very slowly. $\text{ZnBr}_2\cdot 2\beta\text{-C}_{10}\text{H}_7\text{NH}_2$, m. 261°; its eutectic with ZnBr_2 is at about 200° and 60% ZnBr_2 while the eutectic of the amine lies close to its m. p. $\text{ZnCl}_2\cdot 4\alpha\text{-C}_{10}\text{H}_7\text{NH}_2$, m. 253° and forms a eutectic with ZnCl_2 at 65° of the latter and 220°, with the amine at 47° and about 0.1% ZnCl_2 . $\text{ZnCl}_2\cdot 2\beta\text{-C}_{10}\text{H}_7\text{NH}_2$, m. 270°; the first eutectic is at 205° and 62% ZnCl_2 , the second close to the m. p. of the amine. The data on β -naphthol- β -naphthylamine agree with those of Kremann and Strohschneider, a slight difference being due to the higher m. ps. of the amine used by the above authors (*C. A.* 13, 2475). ZnCl_2 and ZnBr_2 are insol. in naphthols and phenols. CaCl_2 forms no compds. with naphthols nor with naphthylamines. CaCl_2 is a better catalyst for the reaction between naphthols and NH_3 since it does not form mol. compds. with the resulting amines like ZnCl_2 and ZnBr_2 . The reaction $\beta\text{-C}_{10}\text{H}_7\text{OH} \rightarrow \beta\text{-C}_{10}\text{H}_7\text{NH}_2$ is not complete on account of the formation of $2\beta\text{-C}_{10}\text{H}_7\text{OH} \cdot \beta\text{-C}_{10}\text{H}_7\text{NH}_2$, which must be decompd by alkali.

BASIL C. SOYENKOFF

The singular isotherms of solubility of naphthalene in mixtures of aniline and allyl mustard oil. N. I. STEPANOV AND S. V. LIPIN. *Ann. inst. anal. phys. chim.* 3, 409–26 (1926). On a triangular diagram the isotherms appear as nearly straight lines meeting at a sharp angle; the point of intersection lies on the bisector 50% PhNH_2 –50% $\text{H}_2\text{NCH}_2\text{CH}_2\text{NCS}$. The substituted thiourea forms a dimer in the liquid state.

BASIL C. SOYENKOFF

Electrical conductivity of binary liquid systems. S. I. CHERBOV. *Ann. inst. phys. chim.* 3, 459–60 (1926).—A study of the mixts. of PhNH_2 and AcOH confirms the results obtained by Konovalev (*J. Russ. Phys.-Chem. Soc.* 24, 440). The isotherm (at 17°) for $\text{Ac}_2\text{O}\text{--H}_2\text{O}$ resembles the viscosity isotherm except that the point is located at 96% mol. H_2O .

BASIL C. SOYENKOFF

Equilibria in systems with phases separated by a semi-permeable membrane. XXII. P. A. H. SCHREINEMAKERS. *Verslag Akad. Wetenschappen Amsterdam* 36, 139–40 (1927); cf. *C. A.* 21, 3010.—A mathematical derivation, showing that the permeability of a double membrane is affected by temp.

C. CALINGAERT

Theory of acid and basic catalysis. The mutarotation of glucose. J. N. BRÖN-DELAND AND E. A. GUUGENHEIM. *J. Am. Chem. Soc.* 49, 2554–84 (1927).—In correspondence with an extended conception of acids and bases, a new theory of acid and basic catalysis is presented, in which the catalytic effect is ascribed, not particularly to the H^+ and HO^- ions, but to the action of acid and basic mols. in general. Previous work

in the field is discussed and criticized. The mutarotation reaction of glucose has been studied by a dilatometric method under the influence of a no. of acids and bases of various electric charge types. The results of the expts. have given strong support to the theory presented. The catalytic effect of acid and basic mols. on the mutarotation of glucose increases with their strength as acids and bases. There seems to be a simple relationship between catalytic efficiency and strength, shown by the fact that a log. plot of the basic catalytic const. against the basis strength constant, covering the range of 10^{18} in the latter, is approx. a straight line with slope of about 0.4. The laws of mutarotation are in marked conformity with the laws previously found for the decompn. of nitramide.

C. J. WEST

Methanol catalysts. I. H. S. TAYLOR AND G. B. KISTIAKOWSKY. *J. Am. Chem. Soc.* **49**, 2468-76(1927).—Adsorptions of H, CO and CO₂ on 2 methanol catalysts, ZnO and ZnO-Cr₂O₃, were measured at 0° and 100°. In order to obtain reproducible results it was necessary to clean the surface of H₂O and CO₂ by preliminary evacuation at 400°. Both these catalysts had adsorptive capacities considerably greater than those of most metal catalysts. The adsorption of both H and CO is large at very low pressures and rapidly reaches satn. capacity independently of further pressure increase. The expts. indicate that the heat of adsorption is of the same order as that on metal catalysts. The mixed oxide catalyst shows greater adsorptive capacity than the ZnO. The results are consistent with the known facts concerning methanol synthesis on these catalysts.

R. L. DODGE

The catalytic synthesis of water vapor in contact with metallic gold. A. F. BENTON AND J. C. ELGIN. *J. Am. Chem. Soc.* **49**, 2426-38(1927); cf. *C. A.* **21**, 691.—The catalytic formation of H₂O from H and O in the presence of a reduced Au catalyst was studied in the temp. range 130-150°. The dynamic method was used. Adsorption of the 2 gases by Au was also measured by a static method. The rate of reaction varies as the square of the H pressure and the first power of the O pressure. It is approx. inversely proportional to the pressure of H₂O vapor. Preliminary treatment of the catalyst with O produced a large but transitory increase in yield. At 130-150° H is not adsorbed by Au in measurable quantities. O is strongly adsorbed; the amt. adsorbed increases with increasing temp., but is independent of the pressure. The adsorption rate is very low, is independent of the gas pressure, and increases with increasing temp. The kinetics of H-O combination over Ag and Au show little in common. No simple mechanism for the reaction in contact with Au is adequate to account for the observed results.

R. L. DODGE

Activity and temperature relationships for nickel catalysts. I. FRITZ THOREN. *Z. anorg. allgem. Chem.* **163**, 367-95(1927).—The activities of Ni catalysts prepd. in various ways were measured by a static method. The reactions used were: C₂H₄ + H₂ → C₂H₆; C₂H₄ + 3H₂ → C₂H₁₂; O₂ + 2H₂ → 2H₂O. The activity of the catalysts increased stepwise with increase in temp. The mean values for the temps. at which marked increase in activity was evidenced were 9.7°, 40.1°, 60.2°, 80.7°, 100.3°, 119.4°, 134.7°, 170.0°. The actual percentage increase in activity at the various activation temps. was not reproducible. The activation temps. were closely the same for all reactions, and for different Ni catalysts. The activation of the H is considered to be the cause of the phenomenon. II. *Ibid* **165**, 171-91(1927).—Previously reported expts. on the hydration of C₂H₄, C₂H₆ and O, using the static method, indicated a stepwise increase in activity of Ni catalysts with increase in temp. Further expts. on the hydration of C₂H₄, using the dynamic method and a single catalyst, confirmed the earlier results. The average temps. at which the irregular increases in activity occurred, appeared to be -18°, 10°, 41°, 61°, 81°, 100°, 120°, 139° and 163°. The results were not reproducible with different samples of the same catalyst.

R. L. DODGE

Ternary systems. VI. Sodium carbonate, sodium bicarbonate and water. A. E. HILL AND L. R. BACON. *J. Am. Chem. Soc.* **49**, 2487-95(1927); cf. *C. A.* **21**, 1915.—Isotherms of the system: Na₂CO₃-NaHCO₃-H₂O at 25°, 30° and 50° were studied. The double salt trona, NaHCO₃·Na₂CO₃·2H₂O, is stable in contact with satd. solns. from 21.26°, the temp. of its formation, up to at least 50°. The range of concns. within which it may be prepd. increases gradually with increase in temp. The salt is a stable phase from solns. contg. as little as 0.16% of NaHCO₃ at 31.98° and at no point requires for its formation more than 3.74% of NaHCO₃ in the soln. Four invariant temps. for the ternary system were found between the temp. of the ternary eutectic at -3.32° and 35.27°.

LOUISE KELLY

Diagrams of state of the systems silver nitrate-lithium nitrate and silver nitrate-rubidium nitrate. A. P. PALKIN. *J. Russ. Phys.-Chem. Soc.* **58**, 1334-8(1926).—Temps. were measured with the registering app. of N. S. Kurnakov. A Au-Pt thermo-

couple 0.15 mm. in diam. was inserted into a narrow capillary and the contents of the app. were stirred until the substance began to solidify. The melting-point curves were plotted based on the cooling curves of the melts. The melting was carried out in a test tube inserted in another tube of larger size. This app. was immersed in an oil bath at 170–180°. Other data were plotted based mainly on heating curves in the oil bath. In the system AgNO_3 - LiNO_3 , AgNO_3 , mp. 208°, undergoes polymorphous conversion at 159°; LiNO_3 , m. 245°. There is a eutectic pt. in this system at 75% AgNO_3 and 171.5°. Polymorphous conversion of AgNO_3 (159°) was observed from 100 to 33.5% of AgNO_3 . All fusions are colorless and very hygroscopic. Polymorphous conversion of AgNO_3 increases the vol., breaking the test tubes. RbNO_3 , m. 306°, colorless crystals of hexagonal system. In the system AgNO_3 - RbNO_3 2 eutectic pts. were observed, at 67.5% AgNO_3 and 128° and at 40% AgNO_3 and 136°. The "liquid" curve has a max. at 50%, 139.5°; at 37.5% AgNO_3 , 141° the curve shows a distinct bend, going up further up to the m. p. of RbNO_3 = 306°. The max. at 50%, 139.5° leads to the conclusion that the compd. $\text{AgNO}_3 \cdot \text{RbNO}_3$ is present. As the bend on the "liquid" curve corresponding to 141° is also seen on the other fusions up to 5% AgNO_3 and the eutectic pt. corresponds to 40% AgNO_3 , 136°, is traced to 25% AgNO_3 a second compd. of the compn. $\text{AgNO}_3 \cdot 3\text{RbNO}_3$ is thought to exist, corresponding to the ordinate at 25% AgNO_3 . All fusions are colorless and not hygroscopic. $\text{AgNO}_3 \cdot \text{RbNO}_3$, m. 139.5°, forms with AgNO_3 an ordinary type of binary fusion with 1 eutectic pt. at 128°. No solid solns. are formed. Polymorphous conversion of AgNO_3 - RbNO_3 was not observed in the heating curve. In the system AgNO_3 - RbNO_3 - RbNO_3 the ordinate shows an unstable compd. contg. 25% AgNO_3 ; it is decompd. above 141°. Polymorphous conversion of RbNO_3 occurs at 162°. The eutectic point corresponding to 141° is traced down to 5% AgNO_3 . The character of the system of metal nitrates of the first group, even series in Mendelyev's Periodic System is complicated with increase in at. wt.

A. A. BOEHLINGK

Electrolytic crystallization processes. I. V. KOHLSCHÜTTER. *Z. Electrochem. angew. physik. Chem.* **33**, 272-7 (1927).—A theoretical discussion of the mechanism of electrolytic crystn. of metals. Nearly every metal has its peculiar form of cathode deposit, which depends upon the electrochem. conditions and properties of the soln. from which sepn. takes place. As shown by the Röntgen spectroscope, the formation of the deposit may be regarded as a process of crystal formation, the discharge of the ions and the forming of the crystals being regarded by Blum and Rawdon as occurring simultaneously. This view is analyzed. Electrolytic crystn. is a case of topochem. reaction, in the field of force of cryst. matter. The combined cryst. growth, nucleus formation, direction of growth and the depositing of new individuals are chem. phenomena. A relation between the cathode potential and the form of deposit exists, but this is only one of the factors in the mechanism of deposition. **II. The aggregation forms of loose metallic deposits.** V. KOHLSCHÜTTER AND A. GOOD. *Ibid.* 277-89.—Metals which deposit on the cathode as loosely adhering needles or plates are studied. The method and app. used are, essentially, those of Kohlschütter and Uebersax (*C. A.* **18**, 1911). Pb is deposited from $\text{Pb}(\text{NO}_3)_2$ solns., Cd from CdSO_4 (neutral and ammoniacal), Zn from ZnSO_4 (neutral, ammoniacal and acid), Sn from SnCl_2 and SnSO_4 (acid, neutral and ammoniacal), Ag from AgNO_3 (neutral and ammoniacal) and Tl from Tl_2SO_4 and TlNO_3 (neutral and acid). The effect on the cryst. formation of varying temps. and concns. and c. d.s., using point and concn. electrodes, is studied. A comparison of the deposits shows that each metal has its own peculiar cryst. growth, depending upon the conditions under which the deposit is formed. Irregular aggregation forms are not infrequently observed, but to the forces on the crystal and in the electrolyte. Thus, Cd crystallizes with less ease than does Pb, while Zn behaves very similarly to Cd. Sn and Tl show great facility in crystallizing, the velocity of growth of the crystals being very rapid. Complex formation, in ammoniacal soln., furthers crystal development. Orientated position of nuclei goes hand in hand with crystg. ability. **III. The formation and properties of adherent metallic layers.** V. KOHLSCHÜTTER AND F. JAKOBER. *Ibid.* 290-308.—The method used for studying adherent metallic cathode deposits is similar to Kohlschütter and Vuilleumier's (*C. A.* **13**, 1050). The contractometer has the flexible cathode dipping horizontally, rather than vertically, into the electrolyte. Solns. of NiCl_2 -boric acid, NiCl_2 - NH_4Cl , CoCl_2 -boric acid, CoCl_2 - NH_4Cl , CoCl_2 , CoSO_4 , FeSO_4 , PdCl_2 , AgCN contg. excess KCN, chrome alum (CrCl_3 and $\text{Cr}_2(\text{SO}_4)_3$ could not be used), ZnSO_4 and ZnCl_2 (acid and neutral), ZnSiF_6 , ZnSO_4 (ammoniacal), Zn dissolved in excess NaOH, and PbSiF_6 are used for depositing the resp. metals. The effect on the nature of the deposit and on the contraction of deposition on Ag and Cu (Ni, Co, Fe, Cr) and Pt(Pd), of varying c. d. (Ni, Co, Fe, Cr, Pd, Ag), thickness of

deposit (Ni, Co, Fe), superimposing a c on d e. (Co, Fe), compn. of electrolyte and acid concn. (Co, Fe, Cr), varying temp. (Co, Fe, Pd), depolarizers and H content on Pd deposits and varying KCN concn. on the Ag deposit is studied. For Ni, comparison of curves from the new type of contractometer with the old, shows the contraction to be more nearly proportional to the deposition. The contraction caused by Co deposits is less than that by Ni in all cases, that caused by Fe lying between the 2, under similar conditions. When the metal appears highly divided during deposition and the electrode is evenly covered, then contraction appears, as in the cases of Ni, Cr, Co, Fe and Pd. With Zn and Pb no contraction on deposition could be obtained in any of the solns., an expansion always taking place. J. BALOZIAN

Researches on the electrolysis of copper in the presence of gelatin. C. MARIN AND A. BUEFFAT. *J. chim. phys.* **24**, 170-81 (1927). Cu, deposited from soln. contg. gelatin, is fine-grained and has a luster. A heavier deposit is obtained from such a soln. than from a soln. of pure CuSO_4 of the same concn. The surcharge consists of 33% CuSO_4 and 66% gelatin and its compn. is independent of c d. A study of the amt. of surcharge S , compared to the gelatin concn. (of the soln.) C , shows the phenomena to be one of adsorption following the formula: $S = KC^{1/2}$. E. G. VANDENBOSCH

The persistence of potential at a mercury cathode on open circuit. F. P. BOWDEN, JR. *Trans. Faraday Soc.* **23**, 511-83 (1927). After prolonged electrolysis of dil. H_2SO_4 , the overpotential at a Hg cathode on opening the circuit persists for several hrs. This persistence must be due either to active H or to negative metal impurities. Exptl. evidence is advanced to show the latter is the case and the impurities are identified as Na, Mg, Al, Zn, Pb and As. The amt. of impurity necessary is very small, being less than 10^{-6} g. equivs. It is shown that the H-ion concn. in the vicinity of the cathode may be very different from that obtained in the bulk of the electrolyte and that this has an important influence on the rate of fall of the potential. So that even in apparently pure soln. the potential of a cathode on open circuit is controlled by traces of negative metal impurities on its surface. It is apparent that the measurement of these potentials can throw little light on the true H overpotential. Moreover, since the decay curves are not smooth, measurements of the back e. m. f. at set intervals after the circuit is opened and extrapolation to zero time may give a quite erroneous value for the potential at this instant. The presence of these impurities offers a satisfactory explanation of the "hydrides" observed at a Hg cathode. In general, in order that cathodic back e. m. fs. may be interpreted with confidence as H overpotential phenomena it is necessary to ensure that metallic impurities of the order of $< 10^{-6}$ g. equiv. have not been deposited on the cathode surface. Under most exptl. conditions impurities are present in amts. greater than this. This also offers a method complementary to that of Heyrovski (*C. A.* **18**, 2997) for the detection and identification of traces of impurities in soln. In a note added to the paper, A. L. MCAULAY describes 2 different sorts of expts. which made him reach the same conclusions totally independently of B. The first expt. consisted in passing the gases from a Hg cathode which showed a high and lasting overpotential over or through a Hg drop arranged by various devices in different pieces of app. to be as near as possible to the overpotential cathode. In no case did the Hg drop show any sign of acquiring an overpotential by activation by the gases. The second expt. had for its object an attempt to produce overpotential by bombarding Hg with monoatomic H. A discharge tube of Pyrex had as cathode about 1 cc of Hg. H at a few cm. pressure was passed through the tube, and on or through the Hg. In every case a heavy condensed discharge from an induction coil was passed through the tube, the red glow of the Balmer series coming well down on the Hg cathode. Great care was taken to keep the cathode cool. The app. was so arranged that immediately on stopping the discharge the tube was flooded with N H_2SO_4 and the Hg became automatically a half cell completed by a calomel electrode. Although the Hg had been bombarded by monoatomic H in large quantities for about 1 hr. it never became more negative than the calomel electrode. A. L. HENNE

The electrode potentials of beryllium, magnesium, calcium, strontium and barium from thermal data. W. M. LATIMER. *J. Phys. Chem.* **31**, 1267-9 (1927).—By using the expression, $E^\circ nF = \Delta F = \Delta H - T\Delta S$, where nF is the no. of faradays, ΔF the free energy, ΔH the heat of soln. of the metal in acids and ΔS the entropy change, values for the electrode potential, E° , of the following metals were calcd.: Be = -1.69 v.; Mg = -2.40 v.; Ca = -2.87 v.; Sr = -2.92 v.; Ba = -2.90 v. E. G. V. B.

The effect of hydrochloric acid on the electrode potential between mercury and mercurous chloride. S. R. CARTER, F. M. LEA AND R. A. ROBINSON. *J. Chem. Soc.* **1927**, 1906-11; cf. *C. A.* **21**, 1400.—Cells of the type: Hg | Hg_2Cl_2 , x N HCl | N HCl | N -KCl | N KCl, Hg_2Cl_2 | Hg were measured at 18° with solns. of HCl vary-

mg from 10.09 N ($E = 0.4102$ v.) to 0.0027 N ($E = 0.7035$ v.). The presence of HgCl_2 tends to decrease the Cl^- -ion concn., resulting in an increase in e. m. f., but this has only a small effect on the above values.

Oxidation-reduction potentials of mercurous and mercuric chlorides in hydrochloric acid solutions. S. R. CARTER AND R. A. ROBINSON. *J. Chem. Soc.* 1927, 1912-23; cf. *ibid.* 21, 1400—Cells of the type:

were studied at 18° with HCl varying from 0.01 to 10 N and HgCl_2 from 0.00013 to 0.5 N . The logarithm law holds with the more dil. solns. of HgCl_2 but breaks down when the concns. of HgCl_2 and HCl are of the same order, on account of the formation of complex ions such as HgCl_4^{--} . SO_2 causes the oxidation of Hg_2Cl_2 to HgCl_2 when in 8 N to 2 N acid; with 2 N to 0.16 N acid there is decompn. according to the equations: $\text{Hg}_2\text{Cl}_2 \rightarrow \text{Hg} + \text{HgCl}_2$; with 0.16 N to 0.07 N acid it is unaffected, with more dil. acid it is reduced to Hg . The oxidation potential of SO_2 in 0.18 N HCl is less than the oxidation potential of the Hg system when the concn. of the HgCl_2 is greater than 0.0094 M and greater when the concn. is less than 0.0094 M .

Removal of a common source of trouble in hydrogen-ion measurements. STEPHEN POLKOFF AND A. H. KUNZ. *Proc. Iowa Acad. Sci.* 33, 169 (1926).—The best conditions for platinum Pt black deposits are given. If these conditions are followed, it is rather difficult to "poison" the H electrodes in the ordinary neutralization reactions. Poisoned electrodes can be restored to give normal values if treated with concd. HNO_3 .

W. G. GAESSLER

Some electrochemical studies of titanium. E. D. BORTS AND F. C. KRAUSKOPF. *J. Phys. Chem.* 31, 1401-19 (1927).—A study of the electrode potential of Ti in solns. of titanous salts with and without the addn. of acids and neutral salts. Methods of prep. pure Ti were investigated and the purest Ti was obtained by reduction of pure TiCl_4 with Na in a steel bomb. The electrode potentials of Ti in $M/4$ solns. of TiCl_4 and $\text{Ti}(\text{SO}_4)_2$ were 0.23 and 0.18 v., resp. (H standard). Addn. of a trace of H_2 increases the potential 0.22 v. HCl and H_2SO_4 cause a decrease in potential while alk. salts give the usual slight increase. Replacement expts. do not agree with the e. m. f. measurements except in the solns. contg. HF . These phenomena are discussed and the similarity to Si is emphasized.

* R. E. GIBSON

Electromotive force of flame. A. SYSOYEV. *Ukrainskii Khim. Zhurnal* 2, 185-6 (*Chem. Zentr.* 1926, II, 2393).—A Pt wire was stretched 5-10 mm. from a Pt foil anode, a fragment of salt was heated before the wire, with a fine pointed flame so that the salt vapor reached the wire first and then the foil. The wire was positive and the foil negative. The p. d. increased as follows: $\text{LiCl} < \text{Li}_2\text{CO}_3 < \text{CaCl}_2 < \text{TiCl}_4 < \text{SiCl}_4 < \text{NaNH}_4\text{SO}_4 < \text{NaCl} < \text{BaCl}_2 < \text{AcONa} < \text{Na}_2\text{CO}_3 < \text{NaNO}_3 < \text{KCl} < \text{RbCl} < \text{CsCl} < \text{K}_2\text{SO}_4 < \text{KNO}_3 < \text{K}_2\text{CO}_3$, that of LiCl being 0.003 v. and of K_2CO_3 0.67 v. The elec. dissocn. const. increases with rise of temp. and distance between the electrodes. When the foil is in a salt soln., the dissocn. const. is smaller and of the opposite sign. With a H flame, higher values of the dissocn. const. were obtained. The phenomenon is analogous to the opposite dissocn. const. of the luminous anode, where the more strongly heated anode is positive.

C. C. DAVIS

Anode oxidation of formic acid. FRANZ FISCHER AND WALTER KRÖNIG. *Abhandl. Königl. Preuss. Akad. Wiss. Berlin* 7, 244-8 (1925); *Chem. Zentr.* 1926, II, 1621.—When concd. HCO_2H containing HCO_2Na was electrolyzed, there was no evidence of evolution of gas (CO_2) at the anode. It was assumed therefore that a solid intermediate product was formed. Actually very small quantities of a product, probably cryst., were isolated, but this could not be identified as a per-compd., as oxalic acid or an mesoxalic acid. It was possibly methanetetra-carboxylic acid.

C. C. DAVIS

Experiments on the construction of isothermal gas concentration cells. FRANZ FISCHER AND WALTER KRÖNIG. *Abhandl. Königl. Preuss. Akad. Wiss. Berlin* 7, 231-43 (1925); *Chem. Zentr.* 1926, II, 1621.—It was attempted to construct isothermal H and O concn. cells such a way that 1 electrode, adjusted to the potential of the gas, drives the ions of this gas into soln., while the other electrode utilizes the heat of the surroundings to prevent condensation or alloy formation of the electrolytically sepd. gases which reach this second electrode. In this way the latter maintains its potential. The

cells investigated included Ni|NaOH|Ag, Cu|NaOH|Ag, Ni|NaOH|C, Ag|NaOH|C, Ag|H₂O|C, Pt|NaOH|Ag, Pt|NaOH|Cu, Pt|NaOH|C, Pt|H₂SO₄|C, Pt|NaH|Au, Pt|NaOH|Cu₃Sb, Pt|Na₂S|C and Ni|Na₂S|C under all practicable pressures. All cells studied were subject to polarization. C. C. DAVIS

The formation of formic acid by the electrolysis of aqueous salt solutions above the critical temperature. ALBERT JAEGER. *Abhandl. Kenntnis Kohle* 7, 201-8(1925); *Chem. Zentr.* 1926, II, 1401.—The object of the expts. was to det. whether it is possible to electrolyze aq. salt soln. above the crit. point, and if so whether the H evolved would reduce at the cathode the CO or CO₂ to HCO₂H, MeOH or similar products. Na₂CO₃ and NaHCO₃ solns. were electrolyzed at 400°, and in each case HCO₂H was identified. Attempts to reduce CO and CO₂ to HCO₂H by bringing in contact in an autoclave alk. electrolytes and these gases yielded neither HCO₂H nor any other product of an extensive reduction. When the C anode was surrounded with a diaphragm and Na borate used as an electrolyte so little HCO₂H was formed compared with the yields in the other expts. that it may be assumed that the HCO₂H originates both by anode oxidation of C and by cathode reduction of CO and CO₂. C. C. DAVIS

Demonstration of the Schönherr-Hessberger nitrogen-fixation arc. G. I. FINCH. *Proc. Phys. Soc. London* 34, 464-5(1927).—The Schönherr-Hessberger arc differs fundamentally from the Birkeland-Eyde and Pauling arcs, in that it has in fact a hot cathode and therefore produces a low-tension arc. A small-scale demonstration arc is described. GEORGE CALINGAERT

Experimental proof of electric dipole moments in dissolved molecules of the type Ca₄. L. EBERT AND H. V. HARTEL. *Naturwissenschaften* 15, 669-70(1927).—The authors investigated the presence of a measurable dielec. orientational polarization P_0 of a no. of substances of the Ca₄ type in benzene soln. From P_0 can be calcd. μ , the elec. dipole moment. For concns. of 6.71 and 29.11×10^{-3} of C(OCH₃)₄ was found $P_0 = 14$ and 10 , i. e., $\mu = 0.8 \times 10^{-18}$; for C(OC₂H₅)₄ at $c = 4.07$ and 16.7×10^{-3} followed $P_0 = 29$ and 16 , $\mu = 1.1 \times 10^{-18}$; for C(CH₃)₃OC₂H₅ at $c = 1.35$ and 5.78×10^{-3} was found $P_0 = 154$ and 94 , $\mu = 2.6 \times 10^{-18}$; for C(CH₂Cl)₄ at 9.58×10^{-3} concn. $P_0 = 2$, $\mu = 0.2$ if any, for CCl₄ at $c = 3.69 \times 10^{-3}$, $P_0 = 1$, $\mu = 0.1$ if any. P_0 was found from $P_0 = P - P_{\text{solid}}$, and P_{solid} from $\frac{E_{\text{sol}} - 1 M}{E_{\text{sol}} + 2 d_{\text{sol}}}$. The accuracy in P was 2 units.

The decrease of P_0 with increasing concn. is due to association; μ was therefore calcd. from the lowest P_0 value. The results prove for the mols. with positive μ the presence of a C atom with pyramidal valences. B. J. C. v. D. H.

The decomposition of some organic substances by the electric spark. N. R. FOWLER AND E. W. J. MARDLES. *Trans. Faraday Soc.* 23, 301-6(1927).—The primary of an induction coil is connected to a Wehnelt electrolytic interrupter, 8 amp. being passed. The secondary is connected to 2 adjustable C electrodes, set in the sides of a flask, contg. 200 cc. of the liquid to be tested, the spark being a hissing flame, 0.5-1 cm. long, and passing below the surface of the liquid. Expts. are made with paraffin oil (d. 0.82, b. 182-300°) (I), C₆H₆ (pure crystallizable) (II), aniline (III), 2-methylaniline (IV), 1-methylaniline (V) and EtOH (VI). On passing the spark for an hr., they gave from a trace to 0.11 g./min. C; 50-450 g./min. of evolved gas, consisting of 35-70% H₂, 20-60% methane and 1.5-5% acetylene and other unsatd. hydrocarbons. Further, VI gave 38% CO, III, IV and V small amts. of HCN. A high-b. p. liquid was left as a residue by I, a thick yellow liquid by II and tars by the anilines. VI was used in the vapor phase as attempts to pass sparks through the liquid were unsuccessful. After sparking the anilines for a short time, the discharge stops, the liquid heating rapidly, but on redistn. and removal of HCN this may be repeated. In exptg. with acetylene the gas was contained in a bulb having Cu electrodes and using a current of 2 amp. On turning the current, the gap is bridged with C threads which prevent further discharge. By shaking, this may be repeated a no. of times. Small amts. of air, added to the acetylene, give no different results, while large amts. produce an explosion. The greater the voltage used, the higher is the yield of free element. J. BALOZIAN

The potential of a proposed standard form of copper and the activity of copper sulfate. R. F. NIELSEN AND D. J. BROWN. *J. Am. Chem. Soc.* 49, 2423-8(1927).—Since the potential at Cu electrodes depends on the method of prepn. of the electrodes an easily reproducible form of Cu giving const. results has been sought. Such an electrode is a 2-phase amalgam prepd. by electrolysis of a half-molal soln. of CuSO₄ slightly acidified, using about 5 amps. per sq. dm. of Hg surface, and a Cu anode. After prepn. the amalgam was kept under this soln. The e. m. f. of cells of the type: Cu (amalgam) | CuSO₄ (x M) | HgSO₄ | Hg were detd. when the value of x was 0.05, 0.1, 0.2, 0.5 and 1.38 (satd.) and from these values the activity coeffs. of CuSO₄ were

found to be 0.216, 0.153, 0.107, 0.064 and 0.0378, resp., the first value being taken from the results of Lewis and Randall.

The use of amalgam electrodes for determining activities in methanol. J. H. WOLFENDEN, C. P. WRIGHT, N. L. R. KANE AND R. S. BUCKLEY. *Trans. Faraday Soc.* 23, 491-8(1927).—The cell $\text{Na}(\text{Hg})_x \mid \text{NaCl in MeOH} \mid \text{AgCl:Ag}$ was studied over a range of 0.1 *M* to 0.0005 *M*. A description of the cell is given. E. m. f. measurements depend on rate of flow and below 0.005 a second factor, not known, causes results too low to give ionic activities calcd. from the Debye and Hückel equation.

R. H. LAMBERT

Electromotive force of the cell with transference and theory of interdiffusion of electrolytes. P. B. TAYLOR. *J. Phys. Chem.* 31, 1478-1500(1927).—A general expression for the e. m. f. of the cell with transference has been derived in terms of the corresponding cell without transference. Correction has been made for transference of the solvent and for diffusion of the electrolyte. The latter is dependent on mol. free energies only and not on ionic free energies. A cell with transference should be set up to form a junction with initially a sharp boundary between electrolytes and thereafter to let these diffuse undisturbed. The formula for liquid junction potential differences is extended to provide for variable mobilities and activity coeffs. A critical use of $p_{\text{H}_2\text{O}}$ with regard to the electrolyte used is urged.

R. H. LAMBERT

The electrochemical behavior of silver and copper amalgams. KURT ARNDT AND GEORG FLORITZ. *Chem.-Ztg.* 51, 461(1927).—To det. the actual potential that might arise in the human mouth when two teeth are filled with different metals the authors studied the amalgams most frequently used. The standard alloy, 50 Sn, 45 Ag, 5 Zn, Cu and Ni, was obtained and introduced into Hg, slightly heated. The excess of Hg was removed by pressing through a linen cloth. An electrode with 1.2 sq. cm. surface was prep'd of this amalgam and its potential measured against a standard 0.1 *N* HgCl electrode. Solus. of 1% NaCl, 1% lactic acid and mixts. of the two were used. The potential found corresponds to that of Sn. Similar expts. with Cu amalgam gave a potential corresponding to Cu. Only very slight potentials were obtained when the amalgams were measured against pure gold.

C. G. F.

Critical résumé of recent electron theories of electrical and thermal conduction in metals. ERICH KRETSCHMANN. *Physik. Z.* 28, 565-92(1927).—A thorough résumé of exptl. results and theories, too extensive and detailed to be abstracted.

A. E. RUARK

Electrolytic conduction in molten alloys. XVII. Electrolysis of alloys of zinc with lead, bismuth and cadmium, of antimony with lead and bismuth, and of cadmium with lead and bismuth. R. KREMANN AND ANDREAS TRÜSTER. *Monatsh.* 47, 285-93 (1926).—The exptl. procedure was the same as that in previous investigations. Difficulties were encountered rendering the results uncertain except with Bi-Cd alloys for which data are given for 25, 50 and 75 at. % Bi. Electrolysis was maintained for 20 hrs. in each expt. Bi accumulates at the anode, the electrolytic effect increasing with c. d. up to 5.6 amp / sq. mm. The max. effect is found with the 50% alloy resulting in a 65% change in the concn. of Bi. **XVIII. Summary of the results of this series of papers.** R. KREMANN. *Ibid* 295-306.—The process of accumulation of the constituents of an alloy at the electrodes is the result of a balancing of the motion of the constituents under the applied e. m. f. by the process of diffusion. For a given alloy the stationary state, produced by electrolyzing the molten alloy during 3 to 24 hrs., appears to be only slightly dependent on temp. The phenomenon is likened to the process of diffusion in a gas mixt. With some alloys the resultant effect is very small at elevated temps., but this is to be ascribed to the sp. properties of the metals in question (e. g., Bi Pb) rather than to any general effect of high temp. The max. effect is always encountered in the neighborhood of 50 at. % alloy. Constituents of decidedly metallic character migrate to the cathode, resulting in a concn. of the more metalloidal constituent at the anode (e. g., Bi). The series Hg, Ne, A, Bi, Sb, Hg, Pb, Sn, Zn, Cd, Cu, Ag, Al, Na, K is in the order of the increasing tendency to migrate away from the anode, and is roughly in the order of decreasing ionization potentials, except for the positions occupied by Pb and Al. The electrolytic effect is not directly proportional to the difference of the ionization potentials of the constituent metals, indicating that the current is carried partly by electrons, and partly by material transport. The presence of inter metallic compds. further affects the electrolytic effect.

F. C. KRACEK

Continuous transition between ionic and electronic conduction. C. TUBANDT, E. RINDORFF AND W. JOST. *Z. anorg. allgem. Chem.* 165, 195-220(1927).—The nature of the elec. cond. of solid CuI was detd. The α - and β -modifications are purely electrolytic conductors, the Cu^+ alone being mobile. The γ -modification is a mixed

conductor, showing purely electronic cond. up to 240° and purely ionic cond. above 390° , the transition being gradual between 240° and 390° . The temp.-cond. curve was detd. between 10° and 700° . The m. p. (602°) and transition point $\beta \rightleftharpoons \gamma$ (402°) are marked by sharp breaks in the curve. There is no indication of a transition $\alpha \rightleftharpoons \beta$, which is reported to be at 440° . A min. occurs at approx. 325° , where there is 50% electronic and 50% ionic cond. •Addn. of I_2 to CuI causes an increased cond. which is of a metallic nature. Similarly for $CuBr$ and $CuCl$ there is a transition from electronic cond. at low temps. to ionic cond. at high temps.

J. E. SNYDER

Electrical conductivity of mixtures of sulfuric and phosphoric acids. J. MEYER AND A. PAWLETTA. *Ber* 60B, 551-3(1927).—A perfectly normal, mutual influence of the dissociation relationships is observed in mixts. of H_2SO_4 and H_3PO_4 . Contrary to Pessel (*C. A.* 17, 2403), there is no evidence of chem. reaction between the acids.

B. C. A.

The electrical conductivity of vapors and liquid drops during incipient combustion. J. A. J. BENNETT. *Trans. Faraday Soc.* 23, 295-301(1927).—Studies are made of the phys. aspects of slow combustion by Mardles' method. Air is bubbled through (for a rich mixt.) or over (lean mixt.) the liquid in a vaporizer. The mixt. is then passed through a glass (quartz is used for higher temps.) combustion tube in an electric furnace having temp. control. In the tube are set, about a cm. apart, 2 thick $Pt(Au)$ foil electrodes $1/8$ cm. sq., a Pt and $Pt-Rh$ couple being welded to the anode. The p. d. across the electrodes is 30 v., the current being read by a Kelvin galvanometer. The cond. of lean mixts. of air and vapors of various org. compds. is due to deposits on the electrodes. Rich mixts. of the less volatile compds. are ionized above 400° , but not until a thick fog had appeared. In order to prevent fouling of electrodes or tube, the time of an expt. should be as short as possible. The chem. activity of Pt is due to surface combustion as shown by a curve of furnace temps. against electrode temps. for a 50% mixt. of H_2 -air. Liquid drops, similar to vapors, have no measurable cond. before fog formation. As is shown by curves of undecane mixed with antiknockers, N compds., aromatic bases, phenols, and alcs., cond. increases exponentially with temp. from 300° to 500° . Although it lowered the initial temp. of combustion, ultra-violet light does not cause an appreciable increase in ionization, or cond., that noted being due to fouling of the electrodes. Thus in the slow combustion of liquid drops of org. compds. in air electrons are present in large nos., while in vapor-air mixts. there are relatively few, which conclusions are used to explain ignition in internal-combustion engines.

J. BALOZIAN

Electrical conductivity at low temperatures. J. C. McLENNAN AND C. D. NIVEN. *Phil. Mag.* [7], 4, 386-404(1927).—The resistance-temp. curves of Pb , Cd and In were investigated and the results found confirmed the work of other experimenters. Resistance-temp. curves of samples of Be , Cr , Ru and Th were investigated. The results showed that the temp. gradient was small for all pure metals at very low temps. except for those that were superconducting; and even in the case of the latter the temp. gradient rapidly diminished just before the sudden disappearance of the resistance. The results obtained for Cr showed it to be a fairly poor conductor with a steep temp. gradient at room temp. The effect of aging electrolytic Cr was to reduce its sp. resistance at room temp. from 44 to 17 microhms; the very high value for the electrolytic Cr was due to occluded gas, and when this was driven off the resistance-temp. curve was moved down towards the temp. axis with very little alteration in its shape. The resistance of Ru was measured at $2.63^{\circ} K$, and no sign of superconductivity was apparent. The resistance-temp. curve of an alloy of Na and K was investigated down to the temp. of liquid H_2 . It resembled the curves for the pure metals composing it; the curve for the alloy indicated a much higher resistance at $0^{\circ} K$. than the residual resistance of either Na or K .

GEORGE GLOCKLER

Fortuitous thermoelectric currents in bismuth. G. TODESCO. *Nuovo cimento* [N. S.], 4, 94-103(1927); cf. *C. A.* 21, 2215.—Using a ring of Bi suspended between the poles of a magnet and carrying a small mirror to measure the degree of deflection, T. has systematically measured the current intensity obtained as a function of the angular position of the region subjected to luminous radiation. Rings prepd. by various heat treatments as well as by compression of powd. Bi were studied. The diverse thermoelectric currents noted are ascribable to the orientation of the elementary crystals in the structure of the metal.

L. T. FAIRHALL

The relation between conductivity and thermoelectric power in the magnetic field. V. GIAMBALVO. *Nuovo cimento* [N. S.], 4, 176-80(1927).—Thermoelectric forces were measured in Sb with and without the application of a magnetic field. Measurements of resistance were similarly made. The curves representing the specific varia-

tions in resistance and thermoelectric power show a difference in character for the 2 phenomena. For weak fields $\Delta P/P_0$ varies more rapidly than $\Delta r/r$, while for more intense fields the latter continues to increase rapidly and the former tends to assume a const. value. Notwithstanding the difference in sign of Hall's coeff., Sb and Bi behave the same with respect to the action of the field on their motile corpuscles.

L. T. FAIRHALL

Action of the magnetic field on optically active substances. G. CALCAGNI. *Notiz. chim. ind.* **2**, 429(1927). The solns. were exposed to a magnetic field by winding the polarimetric tube with wire (0.8 mm. diam.) and utilizing a d. c. of 7.5 amp. and 23 v. This app. gave consistent results and did not heat the soln. enough to influence the precision. Water, solns. of glucose, sucrose, tartaric acid and tannic acid, *dl*-lactic acid, *AmOH*, eucalyptus oil and castor oil were tested. The additional rotation which was produced by the magnetic field was manifest immediately and these increments, the sign of which depended upon the direction of the current, were equal whether positive or negative. The additional rotation was independent of the nature of the substance and of its concn., and the values were in all cases 2.0-2.5°. Moreover with optically inactive substances, *i. e.*, water and *dl*-lactic acid, the additional rotation was the same as that with the active substances. The results in general indicate that the effect of the magnetic field is exercised on the light, which is of an electromagnetic nature, and as in the Zeeman effect, the magnetic field acts on the trajectories of the electrons which produce the light.

C. C. DAVIS

Properties of active iron compounds. A. BICKEL AND C. VAN EWEYK. *Biochem. J.* **18**, 178-80(1927); cf. Baudisch, *C. A.* **20**, 438. Three iron preps. (1) active Fe (Baudisch), (2) a non-magnetic "ferro-ferricarbonate," extraordinarily active toward benzidine and (3) a non-magnetic oxide prep'd by heating (2), also strongly active toward benzidine, were covered with cond. H_2O and with distd. H_2O and exposed to one lab. atm. for 5 months. No change in activity took place. Therefore, the active character of the mineral water, which soon loses its activity, must be very different from the (1). The activity is probably due to active mols. or mol. complexes rather than to the same condition of the system.

S. MORGULIS

Paramagnetism and the third law of thermodynamics—interpretation of the low-temperature magnetic behavior of gadolinium sulfate. W. F. GIAUQUE. *J. Am. Chem. Soc.* **49**, 1870-7(1927).—An equation involving only natural const. is derived from thermodynamically and it is shown that the values of the magnetic susceptibility of $Gd_2(SO_4)_3 \cdot 8H_2O$ agree quant. with it. Among the possible applications of this equation which are suggested are paramagnetic thermometry at low temps., and low-temp. calorimetry. Calcn. of the abs. value of the entropy of substances having a positive magnetic susceptibility is discussed.

W. W. STIFLER

Magnetic susceptibility of some binary alloys. J. F. SPENCER AND (MISS) M. E. SPENCER. *Proc. Roy. Soc. (London)* **A116**, 61-72(1927).—The relation between mass susceptibility and compn. was studied for a series of binary alloys. In the $Ag-Pb$ system, the alloy contg. about 29.2% Pb shows a pronounced max. value for the susceptibility, indicating a possible compd. Ag_3Pb_2 . The alloys contg. 55 and 0.9% Pb are non-magnetic. Au-Pb alloys contg. approx. 62 and 56% Pb, resp., are non-magnetic, while the 94% Pb alloy is approx. 10 times as strongly diamagnetic as either pure Au or Pb. All alloys of Au-Sn contg. more than 6% Au are diamagnetic. The magnetic behavior indicates the formation of the compd. $AuSn_3$, but there is no indication of the formation of $AuSn$ or $AuSn_4$, which (in addition to $AuSn_3$) are indicated by freezing pt. curves. The Au-Cd alloys contg. 22, 47, 60 and 94% Cd are non-magnetic and the others have only small pos. or neg. susceptibilities. The magnetic data indicate the diamagnetism of $AuCd_4$ but do not show $AuCd$ or Au_4Cd_3 , though all three are indicated by freezing pt. curves. Although both Al and Sn are paramagnetic, all the Al-Sn alloys are diamagnetic. There is some evidence of the formation of Al_4Sn_3 . All the Fe-Sn alloys are diamagnetic. The compd. Sn_4Bi_3 is indicated. The Cd-Sn alloys contg. less than 67% Sn are diamagnetic. The formation of $SnCd_3$ is indicated. The susceptibility-compn. curve for the Pb-Sn series is practically linear, decreasing steadily from the value for pure Sn to that of pure Pb. The alloy contg. approx. 70% Sn is non-magnetic. There is no evidence of intermetallic compds. Besides the curves, full numerical data for each series are given.

W. W. STIFLER

Magnetic properties of vanadyl chloride and sulfate and the atomic moment of quadrivalent vanadium. NICOLAS PERRAKIS. *Compt. rend.* **184**, 1430-4(1927).—Expts. on $V_2O_4Cl_4 + 5H_2O$ between -79° and $+53^\circ$ indicate that the quadrivalent V ion has a moment corresponding to 8 Weiss magnetons. Similar expts. on $VOSO_4 + 6H_2O$ over the range -79° to 100° indicate a magnetic moment of 9 Weiss mag-

netons. In both cases the requirements of the Curie law are met though the Curie temp. is not always the same.

W. W. STIFLER

Magnetic study of the tetraoxide and the trioxide of vanadium, measurement of the atomic moment of quadrivalent and trivalent vanadium. NICOLAS PERRAKIS. *Compt. rend.* 185, 111-3(1927).—Between -79° and $+52^{\circ}$ the coeff. of magnetization of V_2O_4 corresponds to the equation $X_A(T + 398.4) = 0.322$, indicating a magnetic moment of 7.98 magnetons. From 52° to 60° there is a rapid increase, after which it again decreases up to 163° , according to the equation $X_A(T + 1108) = 0.992$, indicating a moment of 14.00 magnetons. The value 8 agrees with previous results for V^{IV} (see preceding abstract) while 14 agrees with the moment of V^{III} as found by Cabrera. However, P. found no evidence of dissoci. of V^{IV} into V^{III} . Measurements on V_2O_5 showed a similar, though not as abrupt change between 47° and 67° . The lower temps. gave results that satisfy $X_A(T + 483.9) = 0.457$ while for the higher temps. the results give $X_A(T + 577.3) = 0.460$, indicating 9.50 and 9.53 magnetons, resp. This is $1/2$ magneton higher than found previously for V^{IV} .

W. W. STIFLER

Magnetic anisotropy of crystalline nitrates and carbonates. K. S. KRISHNAN AND C. V. RAMAN. *Proc. Roy. Soc. (London)* A115, 549-54(1927).—In crystals of $NaNO_3$ and KNO_3 the susceptibility perpendicular to the plane of the NO_3 ion is greater than for directions in this plane. This difference in the susceptibilities is the same for both crystals. On the assumption that this anisotropy is due to the NO_3 ion, its value is computed from the known value of the magnetic birefringence (Cotton-Mouton effect) of HNO_3 . The computed and exptl. values agree satisfactorily. Similar anisotropy is found for the CO_3 ion. An explanation based on the electronic structure is suggested.

W. W. STIFLER

Thermodynamic treatment of certain magnetic effects—a proposed method of producing temperatures considerably below 1° abs. W. F. GIAUQUE. *J. Am. Chem. Soc.* 49, 1864-70(1927).—By thermodynamic reasoning G. shows that the entropy change accompanying the magnetization of a paramagnetic substance such as $Gd_2(SO_4)_3 \cdot 8H_2O$ at extremely low temps. might furnish a means for reaching a temp. considerably below 1° abs. At such a temp. the direct detn. of the no. of magnetons in paramagnetic substances should be possible.

W. W. STIFLER

The thermodynamic properties of a few concentrated salt solutions. H. S. HARNED. *Trans. Faraday Soc.* 23, 462-70(1927).—Activity coeffs. for strong acids in homoanionic and strong bases in homocationic salt solns. are compared. By making certain assumptions, peculiarities of some unsymmetrical ions can be explained. Cf. C. A. 20, 3632.

R. H. LAMBERT

The entropy change on melting. I. The dependence of the entropy change on the atomic number. E. KORDES. *Z. anorg. allgem. Chem.* 160, 68-76(1927).—The entropy of melting of the elements is a periodic function of the at. no. with maxima at the halogens and minima at the alk. metals. The periodicity is complicated by the different complexity of the various forms of the same element.

F. R. B.

The absolute constant of entropy and its applications. FRANCO RASETTI. *Nuovo cimento* [N. S.], 3, 67-86(1926).—A math. and more or less historical discussion. R. concludes that classical thermodynamics is insufficient for calcg. a chem. equil. completely from measurements of reaction energy. If one calcs. the entropy of a perfect monatomic gas by means of statistical mechanics, a value is obtained contg. an arbitrary const. By introducing a quantum hypothesis one can det. an abs. value of entropy. A consideration of the relation existing between the quantum states of the atom and the const. of entropy of a gas shows that a precise theoretical detn. of the const. of entropy for polyatomic mols. is impossible until more exact knowledge of their quantum states, i. e., their band spectra has been obtained.

L. T. FAIRHALL

Absolute zero of entropy and internal energy. J. E. VERSCHAFFELT. *Phil. Mag.* [7], 4, 335-7(1927).—V. does not accept the conclusion of Kleeman (C. A. 21, 2416) that the conditions $(\partial U/\partial T)_v = 0$ and $(\partial S/\partial T)_v = 0$ at $T = 0$ are necessary mathematical consequences of the fact that U and S are min. for $v = \text{const.}$ at the abs. temp.

GEORGE GLOCKLER

Properties at the absolute zero of temperature of the quantities associated with the reversible mixing of substances. R. D. KLEEMAN. *J. Phys. Chem.* 31, 1559-65(1927).—As in previous papers (C. A. 21, 2416, 2594) total entropy and total internal energy are divided into externally uncontrollable and controllable parts. Thermodynamic equations are derived for the properties of substances and mixts. under their vapor pressures at the abs. zero of temp.

E. R. SMITH

Properties of substances in the condensed state at the absolute zero of temperature. R. D. KLEEMAN. *Phil. Mag.* [7], 4, 257-68(1927); cf. C. A. 21, 2215, 2416, 2594.

On the basis of his division of energy, entropy, etc., into controllable and non-controllable parts, K. derives a number of thermodynamic formulas which are said to hold for condensed systems at the abs. zero.

GEORGE GLOCKLER

The theoretical impossibility of absolute zero and a relation between this postulate and the theorem of Nernst. A. SCHIDLOF. *J. chim. phys.* 23, 814-20(1926).—The assumption of the impossibility of abs. zero may be made explicit by assuming that the ratio of heat absorbed to the temp. in a reversible cycle operated near zero abs. approaches zero as the temp. approaches zero. It may now be deduced that sp. heat and coeff. of expansion approach zero as temp. approaches zero. The axiom of Clausius leads to the same results if the quantity of heat transported is always kept finite.

F. R. BICHOWSKY

The thermal decomposition of hydrogen peroxide vapor. L. W. FIDER, JR. AND E. K. RIDEAL. *Trans. Faraday Soc.* 23, 545-52(1927).—An app. is described for the measurement of the rate of decompn. of H_2O_2 vapor in const. vol. A method is described for prepg. pure concd. H_2O_2 from the urea- H_2O_2 cryst. compd. known as "Hyperol." The vapor under about 85 mm. pressure at 85° is shown to be composed of simple mols., free from any measurable hydrate. The thermal decompn. on quartz at 85° is a zero-order reaction inhibited by O_2 , which stops about 80% short of completion. On Pt wire, H_2O_2 vapor undergoes an apparently unimol. decompn. which is shown to be very probably detd. by the rate of diffusion through an adsorbed or dissolved layer of O_2 . The reaction on a Hg surface consists of a preliminary direct oxidation of Hg to Hg_2O , followed by coupled oxidation of Hg_2O to HgO , in which an amt. of O is liberated proportional to the amt. of HgO formed. It is shown that HgO is not reduced by H_2O vapor.

A. L. HENNE

A study of the thermal decomposition of nitrogen pentoxide. F. O. RICE AND DOROTHY GETZ. *J. Phys. Chem.* 31, 1572-80(1927).—The velocity const. of the decompn. of N_2O_5 was detd. under dust-free conditions but no evidence was obtained to show that the decompn. is a dust reaction. The velocity const. was the same when P_2O_5 was used in the prepn. and drying of the N_2O_5 as when no P_2O_5 was used, thus showing that there is no catalyst connected with the use of P_2O_5 . N_2O_5 is more stable in 100% HNO_3 than in the gas phase or in soln. in org. solvents. The rate of decompn. in CCl_4 soln. was measured by a new method.

E. R. SMITH

The decomposition of hydrogen sulfide. H. AUSTIN TAYLOR AND C. F. PICKETT. *J. Phys. Chem.* 31, 1212-9(1927).— H_2S was passed at a measured rate of flow over an electrically heated Pt filament and the effluent gases were analyzed for H_2S and H_2 to det. the extent of decompn. The expts. were carried out at 948° , 1041° , 1138° and 1269° . The mechanism of the reaction appears to consist primarily of adsorption of H_2S mols. on the Pt surface, their decompn. resulting in a liberation of H_2 and vaporization of S from the surface. The heat of evapn. of S from the Pt is calcd. as 11,750 cal.

E. G. VANDENBORCH

Heat transfer alignment charts. MAURICE ROUILLEUX. *Chem. Met. Eng.* 34, 148-51(1927).—Two charts are given, one of which is for calcg. logarithmic mean temp. difference, the other for calcg. the desired heating surface when mean temp. difference, heat transfer coeff., and total heat transferred are known.

W. L. B.

Heat conduction of solids. GEO. G. BROWN AND C. C. FURNAS. *Trans. Am. Inst. Chem. Eng.* 18, 295-307(1926).—"New differential equations representing the law of heat conduction are derived without making the simplifying assumptions that the thermal cond. and sp. heat are const. These equations are solved by graphical methods and applied to the detn. of thermal conductivities, sp. heats and heats of transition or reaction." A solid cylinder with a center axis consisting of a heating element giving even distribution of heat throughout its length is employed. A bibliography is included.

W. H. BOYNTON

The connection between heat of fusion and specific heat. KARL LICHTENECKER. *Physik. Z.* 28, 473-5(1927).—The fact that the heat of fusion of ice corrected for the work done is close to the heat content of the ice itself, is discussed in relation to the degrees of freedom of the mols. and the rigidity of the ice crystal.

F. O. A.

The metastability of the elements and compounds as a result of enantiotropy or monotropy. X. The true specific heat of chemically and physically pure white and gray tin. ERNST COHEN AND K. DO. DEKKER. *Z. physik. Chem.* 127, 183-217(1927); cf. *C. I.* 18, 1930. —From white Sn whose purity was thoroughly established, chemically pure gray Sn was prepd.; its purity was detd. pycnometrically and by means of x-rays. The d. of chemically and physically pure white Sn at 13° referred to H_2O at 4° is 7.285. Under similar conditions, equally pure gray Sn is 5.765. The true sp. heat of gray Sn

is 0.0493 ± 0.0002 for the temp. interval 8° to 13° , whereas the value for white Sn is 0.0537 ± 0.0003 for the temp. interval of 13° to 18° . J. H. PERRY

Calorimetric study of certain salts. EMMA CANE. *Rend. accad. sci. Napoli* **32**, 83-7(1926).—The sp. heats of the following salts at 13° to 25° , as detd. by a Bunsen calorimeter, are: CaMoO_4 , 0.166; PbMoO_4 , 0.098; BaMoO_4 , 0.113; $\text{Y}_2(\text{MoO}_4)_3$, 0.159; SrMoO_4 , 0.149; $\text{Ce}_2(\text{MoO}_4)_3$, 0.126; $\text{La}_2(\text{MoO}_4)_3$, 0.114; PbWO_4 , 0.077; CaWO_4 , 0.104. The calcd. av. mol. heat of the group, MoO_4 , is 26.5; and its values as calcd. from the above compds. are considered to be sufficiently const. to indicate that the mol. heats of these salts follow an additive law. R. H. LOMBARD

The latent heat of evaporation of sulfur. J. H. AWBERRY. *Proc. Phys. Soc. London* **39**, 417-20(1927).—The latent heat of evapn. of S was detd. by finding the loss of wt. of a vessel full of S when energy was dissipated in it at a known rate. Heat losses were prevented by immersing the vessel in S vapor. A method of correction for heat loss by having a dummy vessel with a smaller heating coil and using the differences in energy and in wt. evapd. for the two vessels, was tried but gave unsatisfactory results. The latent heat of S was found to be 79 cal./g. $\pm 2\%$. GEORGE CALINGAERT

Measurements of heat of combustion of calcium cyanamide and calculation of heat of formation therefrom. NAOTO KAMEYAMA AND SOJIRO OKA. *J. Soc. Chem. Ind. (Japan)* **30**, 317-23(1927).—See C. A. **21**, 2416. SHUMPEI OKA

Heats of adsorption of several gases and vapors on charcoal. F. G. KEYES AND M. J. MARSHALL. *J. Am. Chem. Soc.* **49**, 156-73(1927).—The heat of adsorption of O, Cl, CO_2 , NH_3 , Et_2O , chloropirrin and water on gas-mask charcoal was measured in an ice calorimeter. The heat at large concns. varies almost linearly with $4A/\beta$, where A and β are van der Waals' consts. F. R. B.

The reversible mixing of substances in the condensed state at the absolute zero of temperature. R. D. KLEEMAN. *Science* **66**, 216-7(1927).—The results of mathematical reasoning are stated. The internal heat of mixing or the increase in internal energy on mixing a number of substances is 0 at abs. 0 if the substances and the resultant mixt. are under the pressures of their vapors. By approximation, at temps. near the abs. 0, the internal heat is proportional to the cube of the temp. If, then, the sp. heats are known, the proposition can be tested exptly. Under the same conditions of mixing, there would be no change in internal energy or entropy. A. W. K.

The partial heat capacity of the constituents and the specific heat of aqueous solutions of sodium and hydrogen chlorides. MERLE RANDALL AND W. D. RAMAGE. *J. Am. Chem. Soc.* **49**, 93-100(1927).—By using twin calorimeters and the direct method of measuring partial quantities the heat capacity of solns. of NaCl was measured at various temps., and that of HCl solns. at 25° . The partial molal heat capacity of the solute varied approx. as the sq. root of the molality in dil. solns., and that of the solvent as the 1.5 power of the molality. F. R. B.

The surface energy and the heat of solution of solid sodium chloride. I. S. G. LIPSETT, F. M. G. JOHNSON AND O. MAASS. *J. Am. Chem. Soc.* **49**, 925-43(1927).—The heat of soln. of cryst. NaCl and of NaCl prepd. by chilling the vapor were measured in a rotating adiabatic calorimeter. The connection between thermal and calorimeter was by radiation only. The accuracy claimed was 0.1%. The difference of heat of soln. of the 2 forms of NaCl was 3.5 ± 1.0 cal. i. e., the surface energy of the powder is about 400 ergs per sq. cm. NaCl shows a max. heat of soln. at a concn. of 1%. F. R. B.

Remarks on the correction of thermochemical data. W. SWIENTOSLAWSKI AND H. STARCZEWSKA. *J. chim. phys.* **23**, 821-2(1926).—A systematic method is given for correcting old thermochem. values for errors in the at. wt. assumed. This is illustrated by further correction of the results of Valeur (cf. C. A. **20**, 326). F. R. B.

A contribution to the thermochemistry of organic compounds. ENDRE BERNER. *Arch. Math. Naturvidenskab* **39**, No. 6, 5-134; *Chem. Zentr.* **1926**, II, 2537-8. The older formulas for the analysis of heats of combustion into individual factors, including those of Thomsen, Swientoslawski, von Weinberg, Fajans and Hückel, are assembled and in part critically examd. Within the exptl. errors, these investigations indicate that the energy of the C-H bond is the same as that of the C-C bond in *said.* and in *unsaid.* hydrocarbons. Nevertheless further and more precise measurements of the heats of combustion are to be desired. Only the data on gases are strictly comparable. Data on isomeric compds. are compared from a crit. point of view. New investigations were made of esters of different tartaric acids, symmetrical dimethylsuccinic acids, symmetrical diphenylsuccinic acids and hydrobenzoinis, whose configuration and other properties are itemized. To render comparable data on heats of combustion, heats of soln. can be utilized instead of heats of fusion, which are difficult to det. The follow-

ing data give the mol. heat of combustion at const. vol. (cals.) and the same corrected for the heat of fusion or heat of soln., resp.: dimethyl *d*-tartrate 618.56, 621.3; dimethyl racemate 617.60, 621.0; dimethyl mesotartrate 618.06, 621.7; diethyl *d*-tartrate 930.32, 930.3; diethyl mesotartrate 930.96, 931.6; diethyl rac. sym. dimethylsuccinate 1321.49, 1321.5; diethyl mesodimethylsuccinate 1322.6, 1322.6; diethyl rac. sym. diphenylsuccinate 2448.76, 2453.8; diethyl mesodiphenylsuccinate 2447.36, 2455.1; isohydrobenzoin 1718.57, 1723.2; hydrobenzoin 1719.07, 1724.1; stilbene 1759.0, 1760.8; isostilbene 1769.2, 1770.9. These values are more reliable than the previous ones published by B. (C. A. 13, 2516). The measurements were made with a Pt resistance thermometer, which was reliable to 0.0001°. The sources of error in the usual methods for detg. heats of combustion are discussed in detail. Compressed O may contain small quantities of CH₄. In calibrating with BzOH, the water equiv. decreased at first as the pressure of O in the bomb calorimeter increased, but after purification of the O with Pd-asbestos the equiv. became higher and const. Introduction of a layer which conducts heat poorly between the calorimeter and its jacket is undesirable. The influence of the vaporization of water and of errors due to the thermometer is detailed. The latter source of error is negligible when a Pt-resistance thermometer is used. Errors in weighing in the expts. described reached only a few hundred thousandths, and weighings were reduced to a vacuum. The heat of ignition (fusion of a constant Pt wire) was 0.8 cal. The cross-section of the calorimeter was not circular, but the screw stirrer rotating 260 times per min. moved in a small attached cylinder. The water jacket was also stirred. A Peters bomb plated with Au was used. The resistance thermometer had 25.5Ω at 0°, and $R_{100} - R_0 = 9.9180\Omega$. The measurements were made in a manner similar to those of E. Fischer and F. Wrede. The calorimeter was charged with 3700 g. of water, and on the latter floated a metal cover, so that hardly any water evapd. The heat exchange with the surroundings is shown graphically. The temp. was 18°. The O, CO₂, and H₂O contents were taken into account at all times. The following data were obtained. Me *d*-tartrate, m. 61.5°. Me racemate, m. 60°. Me mesotartrate, m. 114°. Et *d*-tartrate, d_4^{20} (vac.) 1.2047, n_D^{20} 1.4467. Mesotartaric acid, m. 58.0°. Sym. mesodimethylsuccinic acid, m. 193°. Rac. sym. dimethylsuccinic acid, m. 129°. Et mesodimethylsuccinate, n_D^{20} 1.4213. Et rac. dimethylsuccinate, n_D^{20} 1.4227. Sym. mesodiphenylsuccinic acid, m. 229–30°. Ethyl mesodiphenylsuccinate, m. 140°. Rac. sym. diphenylsuccinic acid, m. 222° (with CHCl₃ in 183°). Ethyl rac. diphenylsuccinate, m. 84.5°. Hydrobenzoin, m. 136°. Isohydrobenzoin, m. 119.5°. Stilbene, m. 124°. The uncertainty of the water equiv. was calcd. as 0.04 per thousand, and that of the heat of combustion as about 0.1 per thousand. The heats of soln. were detd. with a Beckmann thermometer, and the calorimeter was calibrated by measuring the heat of soln. of KBr in water.

C. C. DAVIS

Standardization of Professor T. W. Richards' thermochemical data. W. SWENSON, J. W. GLAND, and J. BOBINSKA. *J. Am. Chem. Soc.* 49, 2476–8 (1927).—The authors have recalcd. the heats of combustion of the org. compds. previously reported by Richards (C. A. 4, 1465; 9, 1422; 14, 2881) to make them conform to the new thermochemical standard unit, 1 g BzOH weighed in vacuum yields 6319 cal.₁₈°. The coeff. of standardization for the data of 1910, expressed in kilojoules, is 238.27; for that of 1911 and 1920, expressed in cal.₁₈°, is 0.99942. Tables or recalcd. values are given.

E. R. SCHIERZ

The relation between the heat of formation of salts and the volume of their components. OSCAR SCHUTZ and FRITZ EPHRAIM. *Helv. Chim. Acta* 9, 920–3 (1926).—Heat of formation of the halides of some metals varies linearly with the at. vol. of the halogen. Similarly the heat of formation of salts of the same halogen with different metals varies linearly with the at. vol. of the metal.

F. R. BICHOWSKY

Note on the rule of three temperatures. EDM. VAN AUBEL. *J. chim. phys.* 23, 261–2. A reply to criticism of Prud'homme (C. A. 19, 913.)

F. R. B.

The specific heat of a sufficiently chilled uncondensed phase. NICOLAS KOLODOZ. *Compt. rend.* 184, 322–3 (1927).—A criticism of the paper of Perrakis (C. A. 21, 3534).—Pointing out that he develops needless hypotheses.

D. H. POWERS

Specific heat of a phase condensed by sufficiently cooling. J. E. VERSCHAFFELT. *Compt. rend.* 184, 603–4 (1927).—A criticism of Perrakis (C. A. 21, 3534). Trouton's law states that L/T is the same for all normal substances at the normal b. p. but not that the quotient is independent of temp. The asymptotic approach of the saturation curve in the pv diagram to the axis $p = 0$, does not mean that p tends to remain const. but only that it tends toward zero.

H. M. McLAUGHLIN

A new base point on the thermometric scale and the $\alpha \rightleftharpoons \beta$ inversion of quartz. **FREDERICK BATES AND F. P. PHELPS.** *Bur. of Standards, Sci. Paper No. 557, Vol. 22, 315-27(1927).*—The temp. of inversion of α to β quartz was detd. by thermocouples inserted in holes in cryst. quartz plates. The start of the inversion occurs sharply at 573.3° and the temp. then drops quickly to 572.7°. Heating and cooling curves are given. The temp. at which inversion starts may be used as a new fixed thermometric point. A thermocouple may be inserted in a hole drilled in a small piece of clear crystal quartz or even simply placed in contact with it. If the furnace heating is sufficiently slow a marked change in the rate of temp. rise will be noted at 573.3°.

R. W. RYAN

Accuracy of measurement in determining the temperature of solid bodies with thermo-elements. **H. HAUSEN.** *Arch. Warmewirt. 8, 87-9(1927).*—Expts. showed that the error arising from the conduction of heat along the couple depends on the cond. of the solid tested, on the depth of immersion, and on the temp. difference between air and object. Thus with cork and a temp. difference of 115° an immersion of 17 cm. is required to reduce the error to 0.1° with silk-insulated Cu-constantan wires 0.06 cm. thick.

ERNEST W. THIELE

The refractive index of alkali boron fluorides. A lecture demonstration. **J. H. DE BOER.** *Physica 7, 99-101(1927).*—Because the refractive index of alkali boron fluorides is near to that of water and their dispersion curves are different, color effects appear in mixts. of these salts with their satd. solns. Ten g KBF₄ boiled in 100 cc. water is transparent blue at 100°, green at 90°, yellow at 60°. In a concd. HBF₄ soln. of KBF₄ these phenomena appear at room temp.

B. J. C. VAN DER HOEVEN

A photographic method of investigating the color of light sources, and the reflecting power of colored fabric and other surfaces. **P. W. CUNLIFFE AND F. D. FARROW.** *J. Textile Inst. 18, T291-302(1927).*

E. J. C.

The transparency of turbid media. **LUDWIG SILBERSTEIN.** *J. Opt. Soc. Am. 15, 125-30(1927).*—Mathematical.

E. J. C.

Ignition of natural gas-air mixtures by heated metal bars. **H. F. COWARD AND P. G. GUEST.** *J. Am. Chem. Soc. 49, 2479-86(1927).*—Measurements of the temps. at which metal bars ignite mixts. of natural gas and air show that the metals of greater catalytic effect must be hotter to cause ignition than metals or other substances of smaller catalytic effect. The temp. necessary to ignite the natural gas-air mixts. by bars of Ni, W and several special steels was found to increase regularly with increase in natural-gas content of the inflammable mixts. With two of the 3 Pt bars tested, a much higher temp. was required to ignite the most violently explosive mixts. than to ignite less explosive mixts.

LOUISE KELLEY

Arsine from fused glass. **H. M. ELSEY.** *Science 66, 300(1927).*—When borosilicate glasses were heated and stretched an odor of arsine was detected. The odor might be due to gaseous As. The odor was noticeable only when fresh free surface was being formed in glasses which contained 0.5% and 0.8% As. The source of the odor is most likely the reaction represented by $4As + 3H_2O \rightarrow As_2O_3 + 2AsH_3$. This reaction is similar to the reaction between P and H₂O at high temps. $4P_2 + 12H_2O \rightarrow 3H_3PO_4 + 5PH_3$.

An aspect of the history of atomism. **J. C. GREGORY.** *Science Progress 22, 293-*

304(1927).—A concise history of the at. theory of matter from ancient times to the present.

JOSEPH S. HEPBURN

Comparison between the dispersion formulas of the atomic theory and the theory of continuity. FR. HLÚČKA. *Sitzb. Akad. Wiss. Wien* 135, IIa, 9-28(1926).

S. C. LIND

A theory of matter and electricity. G. D. BIRKHOFF. *Proc. Natl. Acad. Sci.* 13, 160-5(1927).—Matter is supposed to be a charged fluid held together by an "atomic potential". For this fluid the pressure equals $\frac{1}{2}$ the d. By using the method of tensors and the principle of relativity and the assumption that two bits of the matter fluid of the same charge may not penetrate, while matter of the opposite sign may penetrate, B. derives the principle of conservation of energy and the possibility of a stable and determinate at. system.

F. R. BICHOWSKY

The hydrogen atom and the Balmer formula. GEORGE D. BIRKHOFF. *Proc. Natl. Acad. Sci.* 13, 165-9(1927); cf. preceding abstr.—The H atom is assumed to be a uniform and spherically symmetrical equiv. mixt. of positively and negatively charged fluids; the negative part has but little mass density. For such a system the elec. force will vanish at the boundary. The oscillations of such a system are of a general form which reduces to Schrödinger's in a special case.

F. R. BICHOWSKY

Transition probabilities for principal series of sodium from Schrödinger's wave functions. V. SUGIURA. *Phil. Mag.* [7], 4, 495-504(1927); cf. C. A. 18, 3533; 19, 2780, 2781; 20, 2618.

GEORGE GLOCKLER

Some considerations of the properties of element number 87, dicesium (Dc 224), and of the possible cause of the radioactivity of potassium and rubidium. D. DOBROSERDOV. *Ukrainskii Khim. Zhurnal* 1, 491-7(1925); *Chem. Zentr.* 1926, II, 162.—Dc should have an atomic vol. of 93-98, greater than that of any other element, and therefore should show the highest ionization capacity. The sensitivity of its detection by spectral means can accordingly be only slight. On the other hand its radioactivity should be high, and the radioactivity of K and Rb is probably explainable by their admixt. with Dc. Both α - and β -rays are probably emitted by Dc, the α -rays being, however, for the most part absorbed by the surrounding mass of K or Rb (whence the He content of K minerals), while the more penetrating β -rays give the appearance of a β activity of K. In searching for Dc, highly radioactive K prepns. should be utilized and efforts directed towards increasing this radioactivity by fractionation.

C. C. DAVIS

Coördinative binding and atomic structure. H. LESSHEIM, J. MEYER AND R. SAMUEL. *Z. anorg. allgem. Chem.* 165, 253-83(1927).—A comprehensive discussion of the nature of coördination linkage, which is regarded as essentially similar to homopolar linkage. It is distinguished from the latter in that instead of involving the electrons in the outermost incomplete groups it depends on those of the completed sub-groups next below, which become exposed after the removal of the valence electrons in the formation of an ion. The electrons of these completed sub-groups may then be shared with atoms, ions, and satd. or unsatd. atom groups to form coördination bonds. For the elements of at. nos. 23 to 30 the probable arrangement of electrons in various stages of ionization according to the quantum nos. n , k and j shows that the max. coördination no. is usually equal to the no. of electrons in the outermost completed sub-group. Certain rules are noted concerning the influence on the coördination no. of the no. of electrons in the incomplete sub-groups. These rules hold in similar transition elements of the other long periods wherever they can be applied. The theory is also extended to complex compds. of the lighter atoms. The magnetic properties of coördination compds. also agree with the theory.

F. A. JENKINS

The constitution of ordinary lead. F. W. ASTON. *Nature* 120, 224(1927).—The mass spectrum of ordinary lead (tetraethyl-lead used) consists of 3 principal lines, corresponding to at. wts. of 206 (relative intensity 4), 207(3) and 208(7). Indications of another isotope at 209 and possibly 203, 204 and 205 were found; the lines of the last three were, however, badly overlapped by the Hg spectrum. A seventh Hg isotope at 196 was found, occurring to an extent of 0.04%.

J. B. C. VAN DER HOEVEN

The electron affinity of hydrogen. G. JOOS AND G. F. HÜTTIG. *Z. Physik* 40, 331-2(1926); cf. C. A. 21, 2599.—The electron affinity of H atom is calcd. from grating energies based on the structure of NaH obtained from x-ray photographs. H is energetically stable and the electron affinity is between 15 and 35 Cal.

M. F.

Helium compound. D. H. MORRISON. *Nature* 120, 224(1927).—He and other gases at pressures from 0.5 to 1 mm. passed over a strong radioactive source of Ra B and Ra C, simultaneously excited by a silent elec. discharge, then through a U-tube with glasswool and into a bulb with ZnS screen, appeared to become radioactive (scintillation

count). The elec. excitation was essential for H_2 ; negative results were obtained for O_2 and N_2 . For He a positive result, less intensive than for H_2 , was obtained; it suggests the formation of a gaseous helide of Pb or Bi and is explained from the H_2 character of orthohelium.

B. J. C. VANDERHOEFEN

Structure of radioactive atom and origin of α -rays. E. RUTHERFORD. *Phil. Mag.* [7], 4, 580-605 (1927).—R. puts forward the view that the nucleus of a heavy atom has certain well-defined regions in its structure. At the center is the controlling charged nucleus of very small dimensions (not greater than 1×10^{-12} cm.) surrounded at a distance (about $1.5 - 6.0 \times 10^{-12}$ cm.) by a number of neutral satellites describing quantum orbits held in equil. by the polarizing action of the elec. field arising from the central nucleus. In the case of radioactive atoms these neutral satellites must consist in part of neutral He nuclei which lose their closely bound electrons when the elec. field falls below a certain crit. value. No definite information is so far available as to the number of these satellites or whether the satellites are all of the same kind. It seems not unlikely that neutral satellites of mass 2 or 3 and possibly 1 (neutrons) may exist in the strong elec. field of the nucleus. The central nucleus is thought to be a closely ordered and almost cryst. arrangement of its component electrons and protons and it may be that the number of such stable arrangements in nature is limited. If such be the case then several elements may have the same inner nucleus. For a radioactive series R assumes that this is the case. The energy of motion of a neutral particle having escaped its inner nucleus, is derived as also for a charged He nucleus. It is especially assumed that the corresponding electrons fall towards the inner nucleus (to satisfy the radioactive displacement law). The known velocities of alpha particles from radioactive elements are then used to derive a system of energy-levels within the nucleus in which levels these neutral satellites are supposed to move. The quantumnos. assigned to these levels vary from element to element and their numerical values extend from 14.5 to 30. Half quantum nos. are used. A relation between the radioactive decay const. λ and the above quantum no. n is found of the form $\log \lambda = c + \alpha n^{2.6}$, where c and α are factors for a particular radioactive series. This relation is similar to the well-known Geiger-Nuttall relation connecting range of α -particle and decay const. Emission of γ -rays: It has been thought so far that γ -ray emission is due to the falling of electrons from one energy level to another within the nucleus (C. A. 20, 867; 21, 3017; and W. Kuhn, *Z. Physik* 44, 32 (1927)). However, it is possible that γ -rays may also be caused by the dropping of satellites in various energy levels within the nucleus.

GEORGE GLOCKLER

A precise measurement of e/m_0 by Busch's method. FRITZ WOLF. *Ann. Physik* 83, 849-83 (1927).—A detailed account of B.'s original method as well as W.'s improvements thereon is given. A mean of 70 measurements of e/m_0 gives the value $(1.767 \pm 0.0018) \times 10^7$ e m u.

J. H. PERRY

The electron as a vector wave. C. G. DARWIN. *Proc. Roy. Soc. (London)* A116, 227-53 (1927).—An expansion of the conception already enunciated (C. A. 21, 1752) that difficulties in the interpretation of the spinning electron in terms of the wave theory may be met by considering the wave of an electron, like a wave of light, in terms of 2 components. The wave equations are fitted to the H spectrum, and thus conform to quantum mechanics. They are unsymmetrical, and therefore best interpreted in terms of a vector. Formulas are developed in vector form for the intensities of spectral lines, and for the magnetic moment of the atom, the theory being sketched for 2 or more electrons.

W. T. RICHARDS

Theory of paramagnetism. B. CARRERA. *J. phys. radium* 8, 257-75 (1927).—The Curie-Weiss law, $\chi(T + \Delta) = C$, is a definitely established empirical relation. The const. Δ may have either pos. or neg. values between wide and, as yet, undetd. limits. Its value for a given paramagnetic atom may be altered by changes in the structure and chem. nature of the compd. and these seem to be the predominant factors in detg. its value. This suggests that an alteration in the susceptibility of a dissolved cation, produced by a change in concn., may be due to imperceptible changes in the value of Δ caused by the formation of complex cations, rather than to the existence of two or more different states for the cation of which the relative proportion is altered by change in concn. The const. C is characteristic of the paramagnetic atom itself. Empirically $\sqrt{C} = nk$, where n is an integer and k is a universal const. This leads at once to the conception of the Weiss magneton. To obtain Langevin's formula by the application of quantum ideas, C. assumes that: (a) the electron configurations of the outer layers of the atom become "disorganized" whenever the atoms approach within a certain distance of each other; (b) the rearrangement of the electrons is effected in such a way as to conserve the magnetic moment; (c) in case an external magnetic

field exists, the probability of any particular orientation of the magnetic axis depends both upon the field and the influence of the neighboring atoms. The development of these ideas (worked out in collaboration with J. Palacios) leads to the Curie-Weiss law with the addition of a small factor $(1 - l^2)$, which is negligible in most cases, and which does not change the magnetic moments appreciably. The value of Δ computed from this theory fulfils all the conditions required by expt. As outlined, the theory implies that any deformation produced by the external field is a second-order effect, thus making paramagnetism independent of temp. W. W. STIFLER

Theory of paramagnetism. B. CABRERA. *Compt. rend.* **185**, 346-8(1927); cf. preceding abstract.—Empirically it is found that paramagnetic properties are associated with atoms having unsatd. electron shells, particularly the sub-levels M_{IV} and M_V in the Fe group, N_{IV} and N_V in the Pd group, O_{IV} and O_V in the Pt group, and N_{VI} and N_{VII} in the rare earths. The magnitude of the deformation produced in the electron configuration of an atom depends upon (a) the stability of the original configuration, (b) the distance between the atom and those that surround it, and (c) the nature of those atoms. Thermal agitation accounts for the variation of χ with temp. For monatomic gases, only the effects of the impacts need be considered, while for polyatomic gases, liquids and solids, the vibration of the atom about its equil. position must also be considered. W. W. STIFLER

The magnetic dispersion of electrons. W. BOTHE. *Z. Physik* **44**, 543-8(1927).—A mathematical paper in which it is shown that the magnetic moment of the electron should have a characteristic influence on the dispersion of cathode rays. W. W. S.

Molecular structure. H. LUDLOFF. *Naturwissenschaften* **15**, 409(1927).—Term analysis of the partial spectral bands has yielded considerable knowledge on the electronic structure of molecules. In agreement with Lewis it was found that electron impulses in mols. are so distributed that they neutralize each other in pairs. All "even" mols. are diamagnetic. This is further discussed in detail. A result of this rule is the red shading of the band spectrum of even mols., and violet shading for odd ones (cf. *C. A.* **21**, 2608). The explanation of this structural peculiarity lies in the symmetry of the proper electron function in the two-center problem for unequal nuclei.

B. J. C. VAN DER HORVEN

The probability law in radioactive radiation (measurements on polonium). WALTHER KUTZNER. *Z. Physik* **44**, 655-83(1927).—K. had previously observed (*C. A.* **18**, 1236) a systematic deviation from the theoretical probability distribution of α particles from a Po prepn. as the surface of the prepn. was made larger. This effect is confirmed in a more complete study, and possible alternative explanations given by others (recoil effects; insufficient resolving power of the counting app.) are shown to be incorrect. The origin of the effect is still obscure. F. A. JENKINS

Mode of disintegration of radium D, E and F. SEISHI KIKUCHI. *Japan. J. Physics* **4**, 143-58(1927).—A silk fiber, activated with a prepn. of Ra D, E and F in equil., was stretched across the cloud chamber of a Wilson condensation app. and the track of rays emerging from this line source were photographed. In some expts., a strong prepn. of these elements was brought near to the chamber, and the tracks of photoelectrons excited in the gas filling the chamber by a radiation of the γ -ray type were also obtained. On these photographs of Ra F α -rays, Ra E β -rays, Ra D β -rays and the photoelectrons could be unmistakably distinguished each from the others. No tracks were found in the form of pairs. A suggestion was given that Ra F probably undergoes a double disintegration. The heterogeneity shown by Ra E β -rays could not be ascribed to the effect of encounter with planetary electrons. Each atom of Ra E emits 1 and only 1 β -particle at disintegration. There was found a group of Ra D rays excited in the L levels by γ -rays other than those which have hitherto been known. The γ -rays here found were shown to consist of either a homogeneous radiation of wave length 4 A. U. or a more or less heterogeneous radiation having a max. of intensity distribution at that wave length. The coeff. of internal conversion of Ra D was found to be 0.95. The formula, $\tau = \beta Z^4 \lambda^3$, of the ordinary absorption was found to hold good also for internal conversion. C. J. WEST

Special effect of polonium, of solar radiation, and of high tension on lead. SR. MAKACINEANU. *Compt. rend.* **185**, 122-4(1927); cf. *C. A.* **20**, 3638.—Po deposited on Pb and subjected to solar radiation has been discussed in a previous note. At the suggestion of Deslandres the author has made use of 120,000 v. The Po was in a very weak HCl soln. The current of ionization given by the face opposed to the cell which carries the Po was measured. The expts. are classified in 4 series. Leaflets not exposed; leaflets exposed resp., to a high positive or negative voltage; leaflets exposed at the same time to the sun and the high voltage; leaflets exposed to solar radiation only.

Curves are given showing the ionization currents! All four cases show currents. The curves are divided into two distinct groups. Leaflets not exposed or exposed only to high voltage; leaflets exposed to solar action only or complemented by high voltage. The nature of the radiation developed on the face opposite the cell which carries the Po is α , which cannot come from the Po for it would be stopped by the 0.1 mm. Pb. A new radioactive substance developed in the Pb is suggested. L. D. R.

Remarks on the preceding communication. DESLANDRES. *Compt. rend.* **185**, 124-5(1927) -- Besides the α radiation the Po may give a little γ radiation. The α -rays are stopped by the lead; but they may give rise to a radiation of protons. The exact interpretation will require more research. L. D. R.

Pleochroic haloes in cordierite. G. MAHADEVAN. *Indian J. Physics* **1**, 445-56 (1927). -- Pleochroic haloes occurring in cordierite from South India are studied under the polarizing microscope. Embryonic rings, normal, "emanation," "over-exposed," "bleached" and "dwarf" haloes are met with in the sections examined. The radii of these haloes show close agreement with the calculated values for the α -range of the members of the U and Th series in the mineral. In many cases, the successive rings are well preserved. There is no more discrepancy between the expected and observed results in the haloes of cordierite than in those of biotite. MARIE FARNSWORTH

The radioactivity of water and mud of the lake of Tékir Ghoil. G. SIADBEL. *Ann. sci. univ. Jassy* **14**, 20-2; *Chem. Zentr.* **1926**, I, 2787. -- The lake contains dissolved H_2S , $NaCl$ and $MgSO_4$, and probably sepd. from the Black Sea, near which it is located. The radioactivity of the water is very slight, viz., about 7×10^{-16} g. of radioactive substances (Rn) per g. of water. The radioactivity of the mud is greater, and by the method of H. W. Schmidt showed about 0.163 millimicrocuries per l. of water. The opinion is held that the therapeutic action of the curative water cannot be attributed solely to its radioactive properties, but also depends upon its content of sol. salts and colloidal substances. C. C. DAVIS

The variation of radioactivity of hot springs. KATSUYOSHI SHIRATORI. *Science Repts. Tôhoku Imp. Univ.* **16**, 613-20(1927). -- S. studies the radioactivity of hot springs in the west of Honsyu to det. whether the earthquake of May, 1925 had any effect on their activity. His results show that the radioactivity of the hot springs is generally higher with a few exceptional cases. The temp. of the springs was generally lower. No causes for the changes in temp. and radioactivity were detd. D. H. POWERS

Uranium minerals from Lotsmanskaja Kamenka near Jekaterinoslaw and from Khutor Golowin near Shitomit and their radioactivity. N. LIESCHENKO. *Nachr. Berginstituts Jekaterinoslaw* **19**, 171-5; *Chem. Zentr.* **1926**, I, 2560. -- Both U minerals, of which the first could not be more closely defined, originate from pegmatites. The first one is attacked by mineral acids with evolution of gas. It is of lemon-yellow color and is highly radioactive, having 50% of the radioactivity of pitchblende. The second one, *wijkite*, varies from olive-brown to a dark brown, has a hardness of 5, gives a bright yellow streak and by microchem. examn. contains U, Th, Si, Fe and perhaps Cb. Its radioactivity is 60% that of U pitchblende. C. C. DAVIS

A method to measure minimal quantities of radon and its use to determine the radium content of some meteorites. GRETE HALLEDAUER. *Sitzb. Akad. Wiss. Wien* **134**, IIa, 39-44(1925). -- The essential differences from the method of Joly consist in the use of the radon chamber to measure the time of charging rather than discharging an electrometer. By having an identical chamber, the rate of natural discharge can be measured simultaneously with the principal detn. Five samples of meteoric iron gave the following results in 10^{-13} g. Ra per g. of material: Hex River Mts. 0.86; Mt. Joy 0.47; Nelson Co. 0.18; Cocks Co. 0.40; Roebourne (Hammersley Range) 0.84. Five samples of meteoric stone gave: Waconda 7.1; Tabory (Ochansk) 3.34-7.84; Moes 3.31; Dhurmsala 12.6; Beaver Creek, 4.7. Previous measurements agreed well with the new ones, though uniformly somewhat lower. S. C. LIND

The separation of pure radium salts from isomorphous mixtures with barium. A. G. ELISEEV. *Ann. inst. anal. phys. chem.* **3**, 443-54(1926). -- Soly. isotherm (at 25°) of $BaCl_2$ in water + HCl shows no complex formation, the soly. being 30.7 g. per 100 g. of H_2O and approaching 0 in 28% HCl . A study of the system $RaCl_2$ - $BaCl_2$ - HCl - H_2O shows that the soly. of $RaCl_2$ at first decreases more rapidly than that of $BaCl_2$; $RaCl_2$ does not influence the soly. of the Ba salt. The soln. was at no point satd. with respect to $RaCl_2$; the latter seps. by forming isomorphous crystals with $BaCl_2$. The enrichment factor is 2.8 at the beginning of pptn. with HCl and approaches 1 asymptotically. The Tyuyamuyun ore contains 1.49% U_3O_8 , 4.63% Ba and traces of rare earths. BASIL C. SOYENKOFF

Pyrex as a container for radium solution. L. F. CURTISS. *Nature* **120**, 406

(1927).—A Pyrex bulb contg. a large amt. of dissolved Ra salts was badly cracked after 2 yrs., the cracks occurred only above the level of the soln. A. E. RUARK

Actinium series and the order of stability of radioactive isotopes. A. S. RUSSELL. *Nature* 120, 402-3(1927).—R. assumes that (a) the Act series starts with an isotope of U, ends at an isotope of Pb, and includes uranium Y; (b) if an element of even at. no. has isotopes of odd at. mass, these are likely to be 1 and 3 units less than the mass of its most stable isotope; (c) the most stable mass* of an element of odd atomic no. is likely to be one unit greater than that of the most stable mass (of even no.) of the element next below it. The consequences of these postulates for the Act series are discussed, leading in some cases to the prediction of new at. wts. A. E. RUARK

The scattering of alpha particles by helium. E. RUTHERFORD AND J. CHADWICK. *Phil. Mag.* [7], 4, 605-20(1927); cf. *C. A.* 16, 678.—The collisions of α particles with He nuclei have been investigated. The results show that, in general, the collision relations for these particles are similar to those holding for the collisions between an α particle and a H nucleus. At large distances the forces between the particles are given by Coulomb's law, but at closer distances very strong additional forces come into action. Possible explanations of the origin of these additional forces are discussed, and it is suggested tentatively that they may be due to magnetic fields in the nuclei. GEORGE GLOCKLER

Effect of radon on solubility of lead uranate. K. C. BAILEY. *Phil. Mag.* [7], 4, 404-7(1927).—A. Holmes (*C. A.* 20, 2450) suggests that the difference existing between the estimates of geological time based on the Pb/Th ratio in Th minerals and those based on the Pb/U ratio in U minerals is due to the fact that, in the latter case, most of the Pb produced would probably form $PbUO_4$, which is practically insol. while in the former the relatively sol. $PbThO_3$ would be formed and partially removed by leaching. The fact that a compd. is insol. "in vitro" does not prove that the same compd. will be insol. when subjected to a radioactive field; and, although the field produced in the case of a U mineral is feeble as compared with that available in the laboratory, its action has probably continued over many millions of years—a fact which may well compensate for its lack of intensity. Moreover, such minerals usually contain traces of other compds. such as chlorides, which might interact with $PbUO_4$ under the influence of radiation to form sol. substances. $PbUO_4$, whether boiled for some hours with distilled H_2O or left in contact with distilled H_2O for several weeks, remained quite insoluble. The supernatant liquid gave no color with sodium sulfide, even when evaporated to one-tenth its volume with a few drops of nitric acid, to prevent the deposition of any lead which had gone into solution, and made alkaline before testing. Further, no Pb passed into soln. when $PbUO_4$ was boiled for some hours with a soln. of NaCl. However, when $PbUO_4$ is acted upon by Rn it becomes sol. as B. shows exptly. It is possible then as a result of these expts., that the Pb/U ratio in a U mineral is likely to be considerably affected by the entering into soln. of both Pb and U under the influence of the radioactive field due to the mineral itself. If it is assumed that a $PbUO_4$ is formed and under the influence of strong ionization is brought into soln. and removed, then equal numbers of atoms of U and Pb will disappear; and, as this involves a larger percentage reduction of the Pb than of the U present, it follows that estimates of geological time based upon the Pb/U ratio will err on the side of insufficiency. GEORGE GLOCKLER

Ionization produced by radon in spherical vessels. G. GLOCKLER. *J. Phys. Chem.* 31, 1322-31(1927). A comparison is made of the ionization produced by Rn and its decomposition products as calcd. by the av.-path law of Lind (*C. A.* 7, 1671) and by the method of Mund (*C. A.* 20, 3380). The two methods give similar results for small spherical vessels up to a diam. of 10 cm. as has been found previously by Lind by an exptl. method (*C. A.* 13, 1182). A new derivation of Mund's equation is given and the assumption made by Mund that all of the Ra A and Ra C decompose on the wall is modified. On the basis of the exptl. detn. of the av. path law by Lind and Bardwell (*C. A.* 18, 14) which gives the av. path equal to 0.61 times the radius of the reaction vessel, G. calcs. that 30% of the Ra A and 7% of Ra C decompose in the gas phase. Mund's efficiency factor has been recalcd. on this basis. GEORGE GLOCKLER

Tracks of α -particles in a thick silver bromide gelatin layer on a photograph plate. L. MYSSOVSKII AND P. TSCHISHOV. *Z. Physik* 44, 408-20(1927).—The tracks of α -rays were studied with the aid of photographic emulsions thicker than 50μ . While almost all of the tracks were straight, a very few showed deflection as great as 90° and some showed forks. These were taken stereoscopically and a continuous registration of α -rays was secured. F. O. A.

The β -rays of great velocity from radioactive substances. D.-K. YOVANOVITCH AND J. D'ESPINE. *J. phys. radium* 8, 276-83(1927).—The authors have studied the rapid

β -rays of several radioactive substances by the method of the magnetic spectrum. They have shown why direct deviation app., provided with numerous improvements, is found particularly favorable for this study. Rapid β rays have been detected for Ms Th 2, Th B, Ra B + C and Ra E. For each of these substances, the results obtained with the direct deviation app. have been compared with those found by other experimenters employing different methods. The elevated energy attained by certain of these rays (for example 8,000,000 volts for MsTh2) is of the same order as that for certain α -rays (those of Th C, which attain 8,825,000 v.) L. D. R.

The absorption of β -rays by matter. GEORGES FOURNIER. *Ann. phys.* **8**, 205-77(1927); cf. *C. A.* **20**, 3127.—This work correlates the researches that have been undertaken on the subject of absorption of β rays by matter. These researches, applied to β -rays of Ra E and to simple absorbing substances with at no below 50, give evidence of a simple relation: $\mu/\rho = 15 + 0.142 N$ between the mass coeff. of absorption and the at. no. N of the absorbing element. In trying to extend this law to the heavy elements, there appears a parasitic phenomenon imputable to secondary radiation. The results of the absorption of the β -rays of Ra E in compds. have been classified with relation to an additive law. Disturbance due to certain grouping of atoms has been noted. The linear law relative to simple substances holds for all groups of β -rays: $\mu/\rho = a + bN$. A general expression is given to the mass coeff. of absorption: $\mu/\rho = b(105 + N)$ in which the quality of β -rays is characterized by the coeff. b and the quality of the absorbing agent by its at. no. N . L. D. R.

The effect of the bombardment of lithium chloride by slow positive ions in a high vacuum. EUGEN BADAREU. *Physik. Z.* **28**, 634-7(1927).—In a very high vacuum the current flowing from a positive ion receiving plate to the ground is slightly less for a receptor consisting of an Fe plate covered with LiCl than for a bare Cu plate. Furthermore, the current comes to a max. value and remains stationary with increasing energy of the bombarding ions, with the LiCl receptor, while there seems to be no limiting current value when the receptor is a bare metal. In air at pressures of a few tenths of a mm. of Hg, the current flowing from the salt-covered plate is a very small fraction of that flowing from a bare Cu plate, B's expts. being in agreement with those of Völker (*C. A.* **13**, 3072). The cause of the difference in behavior in the 2 cases is supposed to be the difference of c. d. of the bombarding ions. At the higher pressure, the more intense stream of bombarding positive ions causes the salt to emit positive ions, the results being a decrease of current flowing from the receiving plate to the ground. Emission of positive ions from salts is smaller, the smaller the ion-current density which causes the emission. R. J. HAVIGHURST.

Physical and biological effects of high-frequency sound waves. R. W. WOOD AND A. L. LOOMIS. *Phil. Mag* [7], **4**, 417-36(1927).—Sound waves of high frequency were generated in an oil bath by a piezo-electric oscillator of quartz operated at 50,000 v. and vibrating 300,000 times a second. The oscillations were produced by vacuum tubes and the quartz plate controlled the frequency in the usual way. If the waves are passed across the boundaries sepg. two liquids such as oil and H₂O or Hg and H₂O more or less stable emulsions are formed. Chem. reactions are accelerated and crystns. are started. The most striking of the chem. effects is in the so-called "clock-reaction" in which the termination of the reaction is marked by the sudden change from a clear transparent soln. to a deep blue one. A layer of translucent paraffin formed small opaque spots (centers of crystn.) when acted on by the vibrations. Colloids of a "very difficult" soil sample were completely dispersed in a few minutes, while the usual methods of shaking violently and centrifuging would have to be repeated 20 or 30 times before the colloid is completely dispersed. Many physical and biol. effects are described. GEORGE GLOCKLER.

Influence of weak magnetic fields on the state of polarization of the light given out by hydrogen canal rays. H. RAUSCH V. TRAUBENBERG AND S. LEVY. *Z. Physik* **44**, 549-64(1927).—The state of polarization of the light emitted by H canal rays was studied for the H α and H β lines in fields from 1 to 80 gauss for various combinations of field and observation directions with the direction of the canal rays. (1) With direction of field coincident with line of observation, and both perpendicular to direction of rays, a rotation of the plane of polarization was observed. This increased with the field but at the same time a depolarization was observed. (2) With line of observation, field, and ray-direction mutually perpendicular, the depolarizing effect was observed without rotation of the plane of polarization. (3) When observed in the direction of the rays, there is no polarization without the field, but a transverse magnetic field produces polarization. (4) When field and rays are in the same direction, observations at right angles to this show no polarization effects. (5) The rotation and depolarizing

effects mentioned under (1) and (2) vanish when the canal rays have traveled a certain distance outside the field, and the original state of polarization gradually reappears. A mathematical discussion of these effects is included. W. W. STIFLER

The critical potentials of iodine. V. KONDRATIEV AND A. LEIPUNSKY. *Z. Physik* **44**, 708-12(1927).—An exptl. technic is developed for detg. the crit. potentials of an easily dissociated polyatomic gas. It permits the distinction between the crit. potentials of the mol. and those of the atoms. A bundle of mols. is collimated so that it passes between the gauzes of the ionization app. without coming in contact with the hot cathode, thus avoiding thermal dissocn. A subsequent expt. is made in which the mol. stream is partially dissociated by pre-heating. Additional crit. potentials in this measurement are then ascribed to the atom. By this method, I_2 gives crit. potentials at 2.5 and 3.8 v. The former is interpreted as due to the dissocn. of the mol. into one normal and one excited atom, the latter into two excited atoms. Prominent crit. potentials of the atom are found at 1 and 6.5 v. F. A. JENKINS

Ionization by collision and a photo-electric theory of the sparking potential. T. TAYLOR. *Phil. Mag.* [7], **4**, 505-11(1927).—Reply to Huxley, *C. A.* **21**, 2603. T. refutes Huxley's contention that photoelec. action at the cathode of discharge tubes cannot be a reasonable mechanism of production of electrons (cf. *C. A.* **21**, 1221, 1405). GEORGE GLOCKER

The emission of light from hydrogen atoms. R. D'E. ATKINSON. *Proc. Roy. Soc. (London)* **A116**, 81-103(1927).—Expts. are described in which a non-luminous beam of canal rays was made to emit the Balmer lines by excitation at one point only. The distribution of excitation round this point was determinable, and the position of its max. could be fixed within 0.02 mm. The distribution of intensity was detd. photographically and compared, near the max., with that to be expected on the assumption that the intensity due to a strict point-excitation would begin at the point and fall off exponentially. An agreement supporting this view was obtained. The nature of the excitation process, and further expts. made possible by the success of the method, are discussed. W. T. RICHARDS

The ionization process in hydrogen, nitrogen and argon. KARL E. DORSCH AND HARTMUT KALLMANN. *Z. Physik* **44**, 565-74(1927).—Expts. are described which give the following ionization processes in H_2 : Electrons of about 16 v. velocity form primary H_2^+ . Additional primary processes do not take place in appreciable amount (less than 0.5%) at least up to 40-50 v. There are 2 secondary processes: H_2^+ forms H_3^+ through reacting with neutral H_2 mols. and H_2^+ decomposes into H^+ and H atoms. The latter only takes place with the further addn. of a detd. amount of energy. The ionization potentials of H_2 , N_2 and A are compared with one another. Their order is as follows: A, N_2 , H_2 . If one gives to A an ionization potential of 15.6 v. (inferred from optical measurements) the value for N_2 is between 16 and 16.5 v. for H_2 about 16.5 v. MARIE FARNSWORTH

The ionization potential of terbium. L. ROLLA AND G. PICCARDI. *Atti accad. Lincei* [6], **5**, 818-9(1927).—With the flame method already used for other elements (cf. *C. A.* **20**, 2945) $\log K$ was found to 10.212 for Tb, compared with 13.403 for Na and 11.498 for Ca which were used as controls. The ionization potential of Tb was, therefore, 6.74 v., a value which falls exactly on the curve of ionization potentials of the rare earths (cf. *C. A.* **21**, 699). C. C. DAVIS

The critical potentials of nitrogen and the nature of active nitrogen. A. S. LEVSELEY. *Trans. Faraday Soc.* **23**, 552-60(1927).—The nature of the collisions between N mols. and electrons has been examd. over a range of electronic energy values extending from 2.0 v. to 15.0 v. It is shown that these collisions become inelastic at the point when the electrons attain 6.30 v. energy; further, starting from this point the collision would appear to be inelastic over a range of about 3 v. The effect of the addn. of H has been studied. This causes no modification in the results obtained, and it is concluded that the effect observed is due solely to N and not to any NO present in the gas as impurity. The inelastic collisions observed may be assocd. with the excitation of a band system of N, situated in the ultra-violet region of the spectrum and having for its final state the stable state of the mols. A. L. HENNE

The ionization potential of helium according to the Schrödinger theory. G. W. KELLNER. *Z. Physik* **44**, 91-109(1927); cf. *C. A.* **21**, 3309.—The sum of the 2 ionization potentials of He is detd. on Schrödinger's theory. As the result of 4 approximations the value 77.840 v. was obtained, giving 23.750 v. for the first ionization potential. A. E. RUARK

The lowest term of once-ionized lithium on the Schrödinger theory. G. W. KELL-

NER. *Z. Physik* **44**, 110-2(1927).—By the methods used in calcg. the ionization potentials of He (cf. preceding abstract), lower limits for other ionization potentials are obtained as follows: Li^+ , 73.88 v.; Be^{++} 151.29; B^{+++} 255.86; C^{++++} 387.73.

A. E. RUARK

Ionization in flames of various organic substances. J. A. J. BENNETT. *Trans. Faraday Soc.* **23**, 307-11(1927); cf. *C. A.* **21**, 1058.—An attempt to find a relation between the degree of ionization of org. compds. in flames and the amt. of detonation in engines burning fuels contg. them. To measure the ionization, 2 small Pt electrodes, kept a cm. apart, are placed in the flame, const. temp. being maintained at the anode by a Pt, Pt-Rh thermocouple. A p. d. of 30 v. is used between electrodes, the current through the flame being measured with a galvanometer. In introducing the compds. into the Bunsen flame the more volatile are mixed with the air used and the less are burned at the mouth of the burner. Org. N and halogen compds., carbonyls, org. oxides, halogens, aldehydes and other miscellaneous org. compds. are tried in this way; some increasing and others decreasing the cond. of the flame. Differences are caused by variations in the concn. of electrons, there being no catalytic action. Substances with low ionization potential increase the no. of electrons in the flame and, therefore, the current, while those with a high potential produce the opposite effect. The influence of these compds. on ionization in a hexane flame, produced by passing dried air through a bottle contg. cotton satd. with it and burned in 4 quartz tubes, so sealed in a rubber stopper as to produce a long flame, is found to be the same as in the Bunsen flame. Ionization in the substances themselves is detd., the less volatile liquids being vaporized by heating and then passing air over or through them. As they increase or decrease ionization in the Bunsen flame, so do their flames show greater or less elec. cond., resp. A mixt. of 2 substances produces a flame the cond. of which lies between the sep. conductivities of the 2. There is no simple relation between ionization and detonation, although both occur simultaneously in the flame; the former being neither a cause nor an effect of detonation, but a temp. effect.

J. BALOZIAN

Magnetic susceptibilities of the positive ions of vanadium. SIMON FREED. *J. Am. Chem. Soc.* **49**, 2456-68(1927).—The susceptibilities of V^{++++} , V^{+++} and V^{++} were measured by a new null method of which a description is given. The V^{++++} ion had 1 integral Bohr magneton, the V^{+++} ion 2 magnetons and the V^{++} ion 3 magnetons. A possible explanation is offered for the fact that these results do not agree with any current theory based on the anomalous Zeeman effect and quantum considerations. Measurements on some diamagnetic substances are included.

W. W. S.

Some tests on the electrodeless discharge in stationary waves. R. MOENS. *Bull. sci. acad. roy. Belg.* [5], **13**, 72-6(1927).—Ionization and luminosity phenomena produced by stationary elec. oscillations of high frequency in tubes contg. rarefied Ne, air, H_2 , O_2 , N_2 and Hg are described. The spectrum of the Hg discharge differs from that of the Hg arc in distribution of intensity of the lines. A Ne tube introduced through the axis of 2 coils placed end to end increases an induced e. m. f.

J. E. SNYDER

The transition of ordinary dispersion to Compton effect. IVAR WALLER. *Nature* **120**, 155-6(1927).—A preliminary account of work on a generalized dispersion formula which includes light waves with λ both large and small as compared with the dimensions of the dispersing or scattering body. The gradual transition from dispersion (λ large) following Kramers and Heisenberg's laws to Compton scattering following Breit and Dirac's laws for intensity is described qualitatively for an atom with one electron.

B. J. C. VAN DER HOEVEN

Deflection of molecular rays of electric dipolar molecules in the inhomogeneous electric field. ERWIN WREDE. *Z. Physik* **44**, 261-8(1927).—Mol. rays of KI, TlI, NaI, CsCl and RbBr were deflected in an inhomogeneous elec. field. From the magnitude of the deflection, the elec. moment for KI is of the order of 10^{-17} e.g.s. units, which agrees with theoretical values (*C. A.* **18**, 2837).

J. E. SNYDER

The work of thermionic emission. G. MICHEL. *Z. Physik* **44**, 403-7(1927).—A formula is set up and tested exptly. for the work of emission of electrons from a group of elements (or their oxides) as a function of the metallic atoms in the surface.

F. O. A.

Electronic theory of the voltaic cell. O. M. CORBINO. *Phil. Mag.* [7], **4**, 436-46(1927).—Discussion of contact potential of metals in relation to the seat of e. m. f. in voltaic cells (cf. *C. A.* **19**, 611; **21**, 2104, 3018).

GEORGE GLOCKLER

The dependence of the dielectric loss and the dielectric constant of paraffin, hexane, xylene, quartz, glass, porcelain, hard papers, pressboard and an ionized air condenser upon the frequency. ERNST MÖLLER. *Arch. Elektrotechn.* **15**, 16-40(1925); *Physik. Ber.* **6**, 1374.—A study of the dependence of the dielectric loss as detd. by the power

factor or phase-difference δ and the dielec. const. of the insulating materials on the frequency through the range 500,000–12,100,000 ω showed that they fell roughly into 3 groups which can be expressed mathematically as follows: (I) $tg\delta = a/\omega + b$ porcelain and moist pressboard; (II) $tg\delta = b + c\omega$; $tg\delta = b + c\omega^n$ hydrocarbons, SiO_2 , glass contg. heavy metals, some papers; (III) $tg\delta = \frac{1}{2}a/\omega + b + c\omega$ papers, "Fredener" glass, rich in alk., moist C_7H_8 and porcelain. The effect of moisture was evident only in hygroscopic pressboard and the liquid hydrocarbons hexane and C_7H_8 . a , b and n are consts. usually equal to 1. Since a power-loss in a condenser can be considered equiv. to a resistance, the expts. amount to a resistance measurement. E. R. SCHIERZ

Rotating-crystal x-ray photographs. GILBERT GREENWOOD. *Mineralog. Mag.* 21, 258–71 (1927).—The crystal is rotated in a beam of x-rays and the reflected rays are recorded photographically on a cylindrical film the axis of which coincides with the axis about which the crystal is rotated. This method is well adapted for the study of crystallographic problems such as the detn. of the true cell dimension in the direction of the axis of rotation and the space group in which the substance crystallizes. Rotation photographs were made of $N(CH_3)_4I$ and $N(C_2H_5)_4I$. W. F. HUNT

The direction of ejection of x-ray electrons. E. C. WATSON AND J. A. VAN DEN AKKER. *Proc. Natl. Acad. Sci.* 13, 659–62 (1927).—The method of obtaining magnetic spectra of the electrons ejected by x-rays has been used to study the velocity and number of electrons as a function of the angle of ejection. The most probable direction of ejection is at approx. 80° from the forward direction of the x-ray beam, and is the same for electrons from all energy levels. The momentum of the electron in its orbit does not affect the direction of ejection in the way demanded by the theory of Auger and Perrin (*C. A.* 21, 1754). This work presents a serious difficulty for the conception of the reality of electronic orbits. R. J. HAVIGHURST

Values of energy characteristic of the x-levels. A. CARRELLI. *Nuovo cimento* [N. S.], 3, 144–51 (1926).—An examn. of the exptl. material pertaining to the energy of the orbit of x-rays shows the admissibility of a quantum n coinciding with the theoretical value. The particular characteristic of the x-orbits depends upon the presence in them of all the electrons that can be accommodated. The lack of disturbing action on the part of other electrons is a further confirmation of the symmetrical distribution of all the orbits constituting a given stratum. L. T. FAIRHALL

Installation for the study of spectrography, crystallography, and metallography with the use of x-rays. L. ROLLA AND L. MAZZA. *Met. italiana* 18, 247–80 (1926).—Monograph describing the installation set up for these studies at the Univ. of Florence, and making use of the methods of Laue, Bragg, Siegbahn, Debye-Hull, etc. Numerous photographs and sketches are given, and also the mathematics and details of the methods. ROBERT S. POSMONTIER

The rotating-crystal method. E. SCHIEBOLD. *Fortschritte Mineral. Krist. Petr.* 11, 113–280 (1927).—A very complete and detailed account is given of the x-ray rotating- and oscillating-crystal methods of studying crystal structure, with descriptions of the app. and mode of interpreting photographs. A long bibliography is included. J. F. SCHAIERER

Researches on quartz. A. MEISSNER. *Physik. Z.* 28, 621–5 (1927); cf. *C. A.* 21, 361. —If a quartz plate cut perpendicular to one of the 3 elec. axes is excited by high-frequency vibrations of variable frequency, 2 longitudinal vibrations of the plate occur. One mode of vibration appears when the exciting frequency corresponds to a wave length of 1665 m., the other at 1160 m. These longitudinal vibrations are inclined at angles of 71° and 48° to the optical axis. X-ray crystal analysis indicates that planes of Si atoms are inclined to the optical axis at approx. these same angles. The p. d. induced between faces of a quartz plate by pressure was measured with a string electrometer and with a double-grid vacuum tube. Elastic properties may be calcd. approx. from the data of the elec. acoustic excitation. R. J. HAVIGHURST

The atomic structure of the antimony oxides. U. DEHLINGER AND R. GLOCKER. *Z. anorg. allgem. Chem.* 165, 41–5 (1927).—An x-ray study has been made of the 4 oxides, Sb_2O_3 , Sb_2O_4 , Sb_6O_{13} and Sb_2O_5 , by the Debye method, from which the following conclusions are drawn. All 4 oxides have cubic lattices—pseudo cubic in the case of Sb_6O_{13} . The lattice of Sb_2O_3 corresponds to the structure of senarmontite described in the literature. All the lines in the Debye photograph of Sb_2O_4 are derived from those of Sb_2O_3 , if the sine of the angular refraction is multiplied by 1.082. Moreover, the intensity of the corresponding lines of the two films is the same except for slight differences in three lines. The photograph of Sb_6O_{13} shows all the lines of Sb_2O_4 in the same position and intensity and, in addition, a few very weak new lines. There is no difference in position and intensity in the lines for Sb_2O_4 and Sb_2O_5 . From exposures with a

chamber of specially high resolving power it follows that the lattice constns. of Sb_2O_4 , Sb_2O_5 , and Sb_2O_3 are the same within at least 0.1%. From these facts diagrams of the lattices of the oxides are deduced. They are cubic structures and the cubes of Sb_2O_4 and Sb_2O_3 develop from the simple structure of Sb_2O_5 by the addition of further planes. Sb_2O_5 cannot be represented by a cubic lattice and this is in agreement with the observation that this is the only one of the oxides to show double refraction. The deviation from a cubic structure is, however, very slight. The structure is tetragonal, built up of three cubic cells, the axial ratio being 3.

A. W. KENNEY

Globe and spherical scale utilized for the determination of the orientation of crystals by x-rays. USABURO YOSHIDA. *Japn. J. Phys.* **4**, 133-6(1927).—A method of using a globe and a spherical scale in the researches of crystals by x-rays is described.

C. J. WEST

Higher multiplets in x-ray spectra. J. H. VAN DER TUUK. *Z. Physik* **44**, 737-44 (1927).—A new study of the M x-ray line in the region of the rare earths shows that M_α and M_β lines of these elements exhibit very important structure and intensity anomalies. The complex doublet $M_{\alpha 1\alpha 2\beta}$ degenerates for these elements into an only partially resolved multiplet, whose structure changes from element to element. These deviations from the usual doublet character are brought into relation with the completion of the 4-quantum electron groups in the rare earths.

F. A. JENKINS

The azimuthal intensity distribution in scattered x-rays. W. FRIEDRICH AND G. GOLDBABER. *Z. Physik* **44**, 700-7(1927).—Using an ionization method, measurements are made of the intensity distribution of the scattered radiation produced by hard x-rays (200,000 v, 2 mm Cu filter). The comparison of the exptl distribution with various theories shows a relatively good agreement with that of Compton.

F. A. JENKINS

Intensity measurements of x-ray reflections from fine powders. J. BRENTANO. *Phil. Mag.* [7], **4**, 620-9(1927); cf. *C. A.* **16**, 1182; **20**, 2786.—An investigation is made of the intensity of x-ray reflections of very fine powders of NaCl. The intensities were evaluated by photometric measurements made on the powder photographs of NaCl which had been obtained with the type of camera designed by B. The principal difficulty in the way of obtaining reliable data is due to the existence of extinction both primary and secondary in the crystal. In the present work the conditions of extinction of x-ray reflections from extremely fine powders are discussed, and it is pointed out that the only extinction effect which can occur is const. for all reflections, but is a function of the wave length. The conditions which have to be satisfied in order to make relative intensity measurements from powders independent of the knowledge of the coeff. of absorption and of extinction are indicated. The method adopted for the evaluation of the photographic records of NaCl is described. The results are compared with other detns. employing single crystals and relatively coarse powders. The measurements are in general in good agreement, but for the most powerful reflections the present measurements give somewhat higher values, indicating a small amount of primary extinction in the measurements from larger crystals. Reducing a crystal to the state of a "coarse" powder can in general be considered suitable for eliminating secondary, but not primary extinction.

GEORGE GLOCKLER

Determining the crystal orientation of metallic single crystals. YOSOMATSU SHIMIZU. *Science Repts. Tohoku Imp Univ* **16**, 621-5(1927).—Since the detn. of the crystal orientation of metallic single crystals by means of x-rays is troublesome, S. has devised a method for making the same detns. very simply. The etched surface is brought in front of an elec. lamp and placed in the orientation in which it appears most shining, the position of the eye being fixed. A thin cover glass is fixed on the etched surface at such an angle that the image of the lamp is superimposed on the brightest part in the etched surface. The surface of the cover glass must then be parallel to the microfaces in the metal face, so if the angle is measured between the cover glass and the etched surface the inclination of the microfaces against the plane etched surface is detd.

D. H. POWERS

X-ray diffraction in liquids. C. M. SOGANI. *Indian J. Physics* **1**, 357-92(1927).—Previous exptl. work in this field is summarized and it is shown that the available data are rather meager and not sufficiently precise. A review is made of the theories so far proposed, and in particular, of the theory of Raman and Ramanathan which extends the thermodynamic theory of light-scattering to the x-ray region. Improvements in technic are described: the usual glass or celluloid containers which give liquid-like patterns themselves, have been replaced by a cell with mica windows and the incident pencil used has been made narrower. By thus avoiding the complications due to the container and also getting a better resolution of the phenomenon, the variations in the

diffuseness of the halo and differences in its structure for different liquids are clearly revealed. Twenty-two liquids belonging to the aliphatic and aromatic groups have been studied: pentane, hexane, cyclohexane, heptane, octane, oleic acid, ether, glycerol, water, benzene, phenol, aniline, toluene, ethylbenzene, nitrobenzene, *o*-xylene, *m*-xylene, *p*-xylene, mesitylene, *o*-nitrotoluene, *m*-nitrotoluene and *p*-nitrotoluene. It is shown that the agreement obtained in a few cases by Keesom and Smedt between Ehrenfest's formula and the mean mol. distance as calcd. on the assumption of hexagonal closest packing is purely accidental. That the assumption of close-packing is not justified is shown by the data for the long-chain aliphatic compounds. The ratio k which the distance between the diffracting planes given by Bragg's law for the principal halo bears to the quantity $n^{-1/2}$, where n is the number of mols. per unit vol., has been calcd. for several liquids, and it is found that the value of k departs more and more from that corresponding to close packing as the length of asymmetry of the mol. increases. The influence of compressibility on the sharpness of the halo predicted by the theory of Raman and Ramanathan is confirmed: sharper halos are obtained with compounds of low compressibility. The scattering at small angles is not negligibly small, and is relatively greater in the case of liquids with higher compressibility or having comparatively unsymmetrical mols. than for the others. A study of over a dozen benzene derivs. shows an interesting variety in the structure of the principal halo. In *o*- and *m*-nitrotoluenes, and in mesitylene, the halo appears clearly resolved into 2 components. The progressive way in which the halo is modified as one passes to more and more complex derivs. and the distinct differences found even between the patterns of isomeric mols., reveals the importance in x-ray liquid-diffraction of the form and structure of the mols. M. F.

Some new regularities in atomic spectra. J. C. McLENNAN and A. B. McLAY. *Phil. Mag.* [7], 4, 407-12 (1927).—When the resonance frequencies for B, C, N, O, F and Ne are plotted against at. no. a curve with a break between N and O is found. Similar curves with similar breaks in an analogous position are obtained for the next 3 similar rows of elements in the periodic system. A possible interpretation is that the outer electron orbits in these elements fall into 2 subgroups contg. 3 electrons each, which arrangement differs from Stoner's classification into 2 subgroups containing 2 and 4 electrons, resp. (cf. C. A. 19, 209). GEORGE GLOCKLER

Action of x-rays on colloids. J. A. CROWTHER and J. A. V. FAIRBROTHER. *Phil. Mag.* [7], 4, 325-35 (1927).—It is shown that certain colloidal solns. are affected by exposure to large quantities of x-radiation. Positively charged colloids are coagulated by irradiation, but negatively charged colloids have their stability increased. The effect is studied numerically for a Bredig Cu sol. It is suggested that the coagulation is brought about by the ionization produced in the diffuse double layer surrounding the particles. GEORGE GLOCKLER

Spectral relationships of lines arising from the atoms of the first row of the periodic table. R. A. MILLIKAN and I. S. BOWEN. *Phil. Mag.* [7], 4, 561-89 (1927).—A summary of the various spectra of stripped atoms as obtained by M. and B. by hot-spark-spectroscopy is given together with a discussion of energy levels of these atoms and a complete graph of the Moseley law for these atoms. All the ionization potentials for removal of the first electron are now known: Li = 5.37, Be = 9.50, B = 8.34, C = 11.3, N = 14.49, O = 13.57, F = 16.9, Ne = 21.48 v. Some of the ionization potentials for removal of the second, third and fourth electron are also given. Modern spectroscopic theory as applied in the analysis of these spectra is discussed. G. G.

The ultra-violet absorption of crystals of simple structure. RUDOLF HILSCH. *Z. Physik* 44, 421-30 (1927).—The transparency of single alkali halide crystals to ultra-violet light was studied. The heavy-metal impurities which reduce the light transmission may be removed with $(\text{NH}_4)_2\text{S}$, giving a well-defined material for alk. halide phosphors. F. O. A.

The transition probability in the lithium atom. B. TRUMPY. *Z. Physik* 44, 575-84 (1927).—The results are given of a study of the intensity and breadth of the principal absorption series of Li. The jump probability for the Li atom is detd. through planimetering the absorption curve and the total intensity (a_M) of the lines calcd. M. F.

Theory of the isotope effect in line spectra. GEORGE JOOS. *Ann. Physik* 83, 1054-64 (1927).—The influence of the nuclear mass on the term values for heavier atoms is calcd. by assuming a system consisting of nucleus, electron core, and emitting electron. The mass effect with penetrating orbits may become several times as large as that calcd. for H-like atoms, provided the core dimension is not appreciably influenced. Previous statements that the H value represents an upper limit for the isotope effect in heavier atoms are therefore incorrect. With non-penetrating orbits, the effect can be only slightly larger or smaller than the H value. The equations give the proper order of

magnitude for the doubling found in the Ne lines by Hansen (*C. A.* 21, 1407), indicating that it is due to mass effects only, and does not involve differences in nuclear structure.

F. A. JENKINS

The character of the general, or continuous spectrum radiation. WM. DUANE. *Proc. Natl. Acad. Sci.* 13, 662-70(1927).—Expts. were made upon the general x-radiation produced by single impacts of electrons upon Hg vapor in order to obtain evidence bearing upon the following fundamental questions: First, when an electron hits an atom in such a way as to produce radiation other than that of the atom's line spectrum, does it produce a monochromatic ray? Second, when an electron produces general radiation, does it give up its entire kinetic energy to that radiation? The effective wave length of the radiation produced by electrons bombarding Hg vapor at a potential of 11,890 v. was found by an absorption method to be 1.10 Å. U., 6% larger than the short wave-length limit. In a large number of impacts, at least, the electron transfers almost if not all of its kinetic energy to the quantum of radiation when it produces that quantum, and the radiation thus produced is nearly if not exactly monochromatic.

R. J. HAUGHURST

Band spectra. R. C. JOHNSON. *Science Progress* 22, 231-53(1927).—A comprehensive review of the band theory and its relation to mol. structure.

J. S. H.

The structure of the atmospheric absorption bands of oxygen. G. H. DIEKE AND HAROLD D. BABCOCK. *Proc. Natl. Acad. Sci.* 13, 670 8(1927).

R. J. H.

The influence of the thermal agitation of crystal atoms upon the intensity, position, and sharpness of x-ray spectral lines. IVAR WALLER. *Ann. Physik* 83, 153-83 (1927).—A mathematical treatment of the effects of thermal motion of the crystal atoms upon x-ray spectral lines is given. Reference must be made to the original paper for details.

R. I. HERSHEY

Spectrographic investigations on carbohydrates in the ultra-violet. I. KWIECINSKI AND L. MARCHLEWSKI. *Z. physiol. Chem.* 169, 300(1927).—The absorption band in the ultra-violet observed by Niederhoff (*C. A.* 21, 1932) with galactose and glucose could not be confirmed except with preps. that had not been sufficiently purified. With fructose the purer the prepn. the feebler was the absorption band. Very pure preps. may be spoiled by further crystn. and the intensity of the absorption thus increased.

A. W. DOX

Instantaneous spectrograms of copper, silver and gold. HANTARO NAGAOKA, DAIZO NUKIYAMA AND TETSUGORO FUTAGAMI. *Proc. Imp. Acad. (Japan)* 3, 319-23 (1927). **Instantaneous spectrograms of zinc, cadmium and mercury.** *Ibid* 324-9. **Instantaneous spectrograms of boron, aluminum and thallium.** *Ibid* 330-3. **Instantaneous spectrograms of carbon, silicon, tin, lead and cerium.** *Ibid* 392-7. **Instantaneous spectrograms of antimony, bismuth and manganese.** *Ibid* 398-402. **Instantaneous spectrograms of chromium, molybdenum and tellurium.** *Ibid* 403-8. **Instantaneous spectrograms of iron, cobalt and nickel.** *Ibid* 409-14. **Instantaneous spectrograms of palladium, iridium and platinum.** *Ibid* 415-8.—The lines are given with their intensity, emission interval and phase. Full details will be published in the *Sci. Papers of the Inst. of Phys. and Chem. Res.* and general conclusions drawn.

C. J. WEST

Infra-red absorption spectra of organic sulfur compounds. I. Aliphatic mercaptans and sulfides. F. K. BELL. *Ber.* 60B, 1749-56(1927).—The infra-red absorption spectra between 1.0 μ and 12.0 μ of propyl, butyl and isoamyl mercaptans, as well as the corresponding sulfides, have been investigated. Four sharply defined absorption bands, which were present in the spectra of all these mercaptans, undergo a similar displacement toward the larger wave lengths during the transition of these mercaptans to the corresponding sulfides. The occurrence of a well-defined band at 3.8 μ in the absorption spectra of the 3 mercaptans, which is missing in the corresponding sulfides, offers the possibility of a qual. method of differentiating between the aliphatic mercaptans and sulfides.

J. H. PERRY

Series in the spectrum of trebly-ionized tin (Sn, IV). K. R. RAO. *Proc. Phys. Soc. London* 39, 408-16(1927).—Wave lengths in the spectrum of trebly ionized Sn (Sn IV) have been detd. from spectrograms obtained in the second order of a concave grating. These lines, following clues already given (*C. A.* 21, 1758), have been classified as members of principal (P), sharp (S), diffuse (D), fundamental (F), and super-fundamental (G), series. The details of the analysis including term values are given in the tables.

C. C. KIESS

Regularities in the spectrum of ionized neon. P. K. KICHLU. *Proc. Roy. Soc. (London)* 39, 424-8(1927).—Approx. 100 lines of the quartet system of Ne II have been classified as combinations between S', P, P', D, D' and F' terms (*C. A.* 21, 2226). The

lowest term so far found is $^1P'$ characterized by the seps. 518.0 and 298.8 cm^{-1} .

Infra-red absorption spectra of liquids. E. N. GAPON. *Z. Physik* **44**, 600-2 (1927).—It is shown that the wave nos. of the observed absorption bands of many liquids are represented by the formula $\nu_i = \nu_c \sqrt[n]{n}$, where n is an integer. The least wave no. of the series $\nu_c = 0.34 \times 10^{12} (V^{1/3}/M\beta)^{1/2}$, in which V is the mol. vol., β is the coeff. of compressibility, and M is the product of the mol. mass by Avogadro's no. A table contains a comparison of the observed and calcd. values of ν_c for 9 org. compds.

Rainbow "spectra." ROBERT SAXON. *Chemistry & Industry* **46**, 825-6 (1927).—Convergent light impinging on a vertical test tube filled with H_2O is reflected and dispersed after reaching the convex surface of the H_2O . The spectrum is called a "rainbow spectrum." If the H_2O is colored with various salts the spectra show characteristic absorption bands.

Determination of radiation factors of solid bodies. VIKTOR POLAK. *Z. tech. Physik* **8**, 307-12 (1927).—Data on emission coeffs. of technical materials are scarce and mostly in the range up to 300° . The factor σ_x of total radiation can be measured bolometrically from $\sigma_x = C\alpha_x/(T_{1x}^4 - T_2^4)$ for C an instrument const., σ_x the galvanometer reading, T_{1x} the surface temp. of the solid, T_2 the temp. of the surroundings. A bolometer according to Schmidt was used. The radiant body was a disk 4 to 5 mm. thick and 30 to 40 mm. in diam., bedded in fireproof insulation. It was heated up to 1200° with a $\text{H}_2\text{-O}_2$ jet flame. From expts. on black-body radiation C was evaluated. The following approx. values were detd. for bricks, silica brick from open-hearth gas chamber, rough surface, 1000° , $\sigma_x = 4.0$ Cal. per sq. m. hour and degree⁴, i. e., 80% of black-body radiation; silica brick from open-hearth arch, rough surface, slagged, 1100° , $\sigma_x = 4.28$, 85%; fireclay brick, glazed, 1000° , 3.7, 75%. For metallic surfaces was found: iron plate (4 mm.), smooth surface, 1035° , 2.97, 60%, at 900° , 2.80, 55%; steel plate (5 mm.), ground surface, at 1100° , 3.04, 61%, at 940° , 2.81, 55%; wrought iron, rough surface, at 1118° , 4.85, 95%, at 1045° , 4.58, 92%, at 925° , 4.31, 87%; cast-steel, ground, at 1040° , 2.80, 56%, at 900° , 2.70, 54%, at 770° , 2.60, 52%; cast iron, lathed surface, at 985° , 3.40, 70%, at 880° , 3.10, 60%. The great influence of the surface conditions is apparent. Oxide layers on metals raise the radiation considerably. From the metal values the Maxwell law of proportionality between absorptive power and electric resistance was confirmed.

Intensity of prohibited multiplets. L. S. ORNSTEIN AND H. C. BURGER. *Naturwissenschaften* **15**, 670-1 (1927).—Several p-f lines of the Cd arc spectrum between metal electrodes were measured. The ratio of p₀-f, p₁-f, p₂-f was found to be 1:3:5; the same holds for the second multiplet. An electrodeless discharge in pure Cd vapor of low pressure yielded no p-f lines; it appeared that the ratio p-f:p-d is a pressure function, approximately proportional to $p^{0.4}$. This ratio increases with the c. d., the lines widening for stronger fields. At atm. pressure p-f:p-d = 0.01 for the first multiplet, 0.10 for the second. The ten fold value of the latter is characteristic for Cd.

The zero-zero band of the second positive band spectrum of nitrogen. ($\lambda 371$). GISEBURO NAKAMURA. *Japn. J. Phys.* **4**, 109-17 (1927).—An arc in N emits strongly higher members of band lines of the 2nd positive band spectrum of N. An accurate wave-length detn. of the lines of the 0-0 band was made and it was found that the simple parabolic formulas of the Deslandres type obtained by Zeil and Lewis were not applicable to such high members. The fully recognized triplets of both P- and R-branches at lower quantum states were transformed into apparent doublets as the quantum no. was increased.

Interpretation of the continuous spectrum of hydrogen. YUTAKA TAKAHASHI. *Japn. J. Phys.* **4**, 103-8 (1927).—T. explains the continuous spectrum of H as emitted by a combination of 2 H atoms, of which at least 1 is excited. In the case of a combination of a normal atom and an excited one, it is shown that the spectrum should cover a region between 700 and 1200 A. U., if the final state is a normal mol. and a region extending from about 1800 A. U. to the infra-red, if the final state is an excited mol. If the 2 combining atoms are both excited to the final state of Balmer's series and the final state of the combination is an excited mol., the spectrum is shown to extend from 900 to 2000 A. U., where, according to Lyman and others, an intense continuous spectrum was actually observed when the c. d. in a discharge tube was great.

Spectra of various metals emitted from arcs in chlorine atmosphere. MICHIOKA MIYANISHI. *Japn. J. Phys.* **4**, 119-31 (1927).—Lines of Hg, Cd, Zn, Mg, Ca, Sr and Ba

emitted from 11-amp. arcs burned in a Cl atm. were examd. Many forbidden lines and enhanced lines were detected in these light sources. Besides these, many new lines were detected. Some of them are arc lines and their wave nos. are expressed as differences of known spectral term values. The remaining lines are spark lines; they are classified according to the method given by Kimura and Nakamura. In the expt. the current flowing in the arcs was always kept at 11 amps. But when the current in an ordinary arc in air was raised to about 45 amps., the spectrum became similar to that of 11-amp. arc in Cl. The essential cause of the forbidden lines and notable broadening of series lines, as well as the appearance of the enhanced lines observed in the present expt., may be ascribed to the presence of Cl ions in the arcking medium. C. J. WEST

The detection of hafnium by x-ray spectroscopy. K. KIMURA. *Z. physik. Chem.* **128**, 369-93(1927).—Using the $L\beta_1$ line of Hf and the $L\beta_2$ line of Cp_2O_3 , which are about 4 X-units apart, K. detd. percentages of Hf in mixts. of the oxides of Hf and Zr, and mixts. of their phosphates. The Hf contents of alvite, hagatalite and oyamalite were also detd. A. F. RUARK

The structure and stability of the carbon arc in relation to its ultra-violet output. H. D. GRIFFITH, J. S. TAYLOR and JESSIE M. JACK. *Brit. J. Radiology* (Roentgen Soc. Section) **23**, 203-14(1927).—The flame of the C arc contributes most of the biologically effective radiation. The efficiency of the arc as a source increases with flame length to a limiting value, after which it is independent of it. The ultra-violet emission can be considered as a function of the watts consumed in the flame of the arc. Conditions governing the max. possible flame length for an arc running under given conditions are worked out for one single arc and for a group of several in series.

Intensity relations in doublets of large frequency difference. I. S. ORNSTEIN, M. COELINGH and J. G. EYMERS. *Z. Physik* **44**, 653-4(1927).—The intensity distribution in several ps and pd multiplets of the Ba spark spectrum is measured. The summation rule is found to hold within exptl. error if the observed intensities are divided by the 4th power of the emitted frequency, as would be expected from the correspondence principle. F. A. JENKINS

The molecular diffusion of light in liquids. Experimental control of theoretical formulas. JEAN CABANNES. *J. phys. radium* **8**, 321-35(1927).—The exptl. results are first discussed in order to control afterward the theoretical formulas. The relation between the luminous intensity diffused laterally by 1 cc. and the lighting of the liquid is valued at 9.2×10^{-6} cm.⁻¹ for ether (20° C. and 4358 Å. U.) and $(10.7 \pm 0.55) \times 10^{-6}$ cm.⁻¹ for benzene (25° C. and 5440 Å. U.). The values are concordant. The relation of Ramanathan between polarization of light by vapor and depolarization by liquid (relation which supposes rigid mols.) is not verified in the fatty series. It is thought that the mols. with open chains are deformed in the liquid state and that this deformation diminishes their anisotropic properties. L. D. R.

Arc spectra of elements of oxygen group. J. C. McLENNAN, A. B. McLAY and J. H. McLEOD. *Phil. Mag.* [7], **4**, 486-95(1927).—The spectra of Se I and Te I are similar to O I and S I. All four spectra are shown to conform to the theoretical structures predicted for them by modern spectroscopic theory (Pauli-Heisenberg-Hund). The structure for Po I is not yet known as only a very few wave lengths that belong to its arc spectrum have been observed. GEORGE GLOCKLER

Optical excitation of mercury with controlled radiating states and forbidden lines. R. W. WOOD. *Phil. Mag.* [7], **4**, 466-86(1927); cf. *C. A.* **19**, 776; **20**, 17.—A further study of the various lines excited optically in Hg vapor with and without the presence of inert gases such as N₂, He, CO and A at various pressures. The abnormal increase in intensity of 2655.13 caused by admission of He contg. a trace of N₂ is found to be due to the development of the forbidden line 2655.8 (1S - 2p₂). The intensity ratios of the lines emitted as a result of optical excitation depend upon a number of factors such as: (1) the manner in which electrons on an upper level distribute themselves among lower levels, (2) the relative intensities of the lines in the exciting arc by the absorption of which the electrons are carried to upper levels, (3) transfer of electrons to metastable orbits, as by N₂, causing absorption of lines not normally absorbed, (4) an as yet unexplained action of N₂ in causing the appearance of lines not called for by the energy diagram (collisions of the second kind or sensitized fluorescence), (5) the intensity of the exciting light. GEORGE GLOCKLER

Molecular scattering of light in a binary liquid mixture. C. V. RAMAN. *Phil. Mag.* [7], **4**, 447-8(1927).—R. claims that K. C. Kar's criticism (*C. A.* **21**, 1906) is based on a misconception. GEORGE GLOCKLER

The heat of formation of the K₂ molecule. A. CARRELLI and PETER PRINGSHEIM. *Z. Physik* **44**, 643-52(1927).—The brightness of the red band-fluorescence excited in

K vapor by white light is measured, and is assumed to be proportional to the concn. of K_2 mols. From the latter the vapor pressure curve of K_2 is detd. and, combining this with the known heat of vaporization of at. K, the heat of formation of K_2 is found to be 0.63 v. It may also be calcd. directly from the results of expts. where the temp. is varied at const. pressure. By this method the value 0.53 v. is obtained. The convergence frequency of the band spectrum gives 0.63 v. F. A. JENKINS

Stability of acetone toward light. KARL WIESLER. *Z. angew. Chem.* **40**, 1033-4 (1927).—Chemically pure acetone which is stable toward permanganate soln. (Specification German Pharm. VI), after exposure to ultra-violet light will no longer pass this specification. After rectification of the acetone exposed to ultra-violet light, a pure acetone is obtained of higher permanganate stability, while the forerunnings and the residual fraction contain impurities unstable toward the permanganate. This shows that acetone initially satisfactory may develop unstable impurities due to photochem. changes of the acetone. Acetone should be protected from light, therefore, to maintain its permanganate stability. FREDERICK H. HAHN

The nature of the activating radiation in photochemical action. WILFRID TAYLOR AND ARTHUR ELLIOT. *Trans. Faraday Soc.* **23**, 583-92 (1927).—Actinic extinction curves have been obtained by allowing light filtered through various concns. of Cl to activate a mixt. of I and Cl. The activating radiation is shown to be non-homogeneous, and it is shown that the exptl. results can be accounted for to a high degree of approximation by assuming that the effective photochem. equiv. of monochromatic light is independent of wave length between 3500 and 6000 Å. U., and that for a given frequency the actinic power is directly proportional to the intensity. No evidence is found for assuming that any part of the ordinary optical absorption in this region has special chem. properties, or that 2 different types of absorptions, actinic and non-actinic, are superposed. A. L. HENNE

The photochemical decomposition of hydrogen peroxide solutions. F. O. RICE AND M. L. KILPATRICK. *J. Phys. Chem.* **31**, 1507-10 (1927).—Solns. of H_2O_2 in dust-contg. and in dust-free water decompose at very different rates. The rate of decompn. is roughly proportional to the dust content. By removing portions of the dust, solns. were obtained which decompd. from $1/3$ to some value less than $1/18$ as fast as the control or dust-contg. solus. Therefore it is to be expected that quant. measurements of the rate of decompn. of dust-free solns. of H_2O_2 , absorbing known amts. of light energy, would show that this reaction deviates much less from the law of photochem. equiv. than appears from the work of other investigators (*C. A.* **7**, 2344, 3445; **16**, 385). E. R. SMITH

Studies in photosensitization. I. J. R. BATES AND H. S. TAYLOR. *J. Am. Chem. Soc.* **49**, 2438-56 (1927).—A new type of *cooled mercury arc*, capable of operating at 100° , and a *high-pressure H discharge* giving a continuous ultra-violet spectrum (2500-1900 Å. U.) suitable for the study of absorption spectra by short exposures, are described. The following reactions have been studied: (1) Ethylene condenses under the influence of excited Hg atoms, but not by the action of light alone. (2) Acetylene is polymerized both by excited Hg atoms and by ultra-violet light, but cannot be hydrogenated by H activated by excited Hg vapor. (3) In the Hg photosensitized reaction between H and O, H_2O_2 may, under certain conditions, be the sole product. (4) H_2O , NH_3 , C_2H_6 , EtOH, MeOH, C_6H_6 , C_6H_{14} , HCOOH, acetone and ethylamine are decompd. by excited Hg atoms. (5) The decompn. products of NH_3 show an excess of H over stoichiometric proportions. The absorption spectrum of NH_3 has been studied. (6) Excited Hg atoms can decompose a HCO_2H mol. in 2 ways. The mechanisms of these reactions are discussed. W. T. RICHARDS

The measurement of light absorption. H. VON HALBAN AND J. EISENBRAND. *Proc. Roy. Soc. (London)* **A116**, 153-62 (1927).—A critical survey of the photographic and photoelec. methods for the detn. of light absorption. The conclusion is reached that "by employing a sufficiently large extinction the photographic method permits the extinction coeff. to be detd. to within a small percentage error." It is not suitable for small differences between extinctions, the photoelec. method giving, under favorable conditions, a sensitivity to differences of extinction about 10^3 beyond that of the photographic. W. T. RICHARDS

The luminescence of solid nitrogen under cathode-ray bombardment. J. C. McLENNAN, H. J. C. IRETON AND K. THOMSON. *Proc. Roy. Soc. (London)* **A116**, 1-15 (1927).—The phosphorescent spectrum of the light from solidified N, after irradiation by high-speed electrons from a Coolidge tube, consists of two bands, N_3 and N_4 . N_4 has components from 5240 to 5204 Å. U., 5214 having the strongest intensity. N_3 has components from 5944.47 to 5932.0 Å. U., the strongest being 5944.47. In addn. 3 diffuse bands N_1 having mean wave lengths of 5554, 5617 and 5658 Å. U.

and a number of faint diffuse bands, each shaded off towards the red in the blue and violet spectral region were observed. Highly red-sensitized plates failed to record the N_2 group reported by Vegard. The N_1 group bands faded under prolonged irradiation, but the N_2 and N_4 groups were unaffected, this being accounted for by a change in form of the solid nitrogen. The moment of inertia of the mol. system involved in the phosphorescence is calcd. as approx. 3×10^{-40} m.² cm.² These data, and other work at hand, make a decision concerning the existence of solid nitrogen in the upper atm. unwise, but it is the opinion of the authors that Vegard's hypothesis is untenable, and that "in seeking for the origin of the famous green auroral line we must turn to oxygen."

W. T. RICHARDS

The question of the occurrence of solid nitrogen in the earth's atmosphere. HEINZ PELZER. *Ann. Physik* **83**, 362-84 (1927).—An inquiry into Vegard's Aurora hypothesis. P. seeks conditions whereby the upper atm. layers, in radiation equil. with the sun's and the earth's rays, may attain temps. below 36° K. (m. p. of N). For such a condition to exist on the night side of the earth, the lower atm. layers must absorb the earth's radiation almost completely or at least selectively in the infra-red region to at least 99.5%. Such conditions are most improbable and it hence appears that Vegard's aurora hypothesis must be rejected on thermodynamic grounds. R. E. GIBSON

The luminescence of quinine sulfate. A. PETRIKALN. *Z. Physik* **42**, 435-42 (1927).—Quinine sulfate is luminous while being dehydrated. In an app. with a slowly revolving disk the quinine sulfate placed on the disk was dehydrated and rehydrated during one revolution; by this arrangement it was possible to direct the luminescence to the same spot for 12 hrs. The luminescence spectrum was photographed and analyzed; it consists of two large bands on the underground of which 9 small (20-30 A. U.) bands were measured between 4330 and 3580 A. U. These could be arranged in series. The energy transformation during dehydration is discussed. J. A. SZILARD

Spectral photography of faintly luminous phenomena. WILHELM KRAEMER. *Z. wiss. Phot.* **24**, 220-3; *Chem. Zentr.* **1926**, 11, 1506-7.—Light phenomena which are produced by Tesla oscillations and by the electroscope coated inside with tinfoil in satd. vapors of aniline, dimethylaniline, 1-naphthylamine, *o*-phenetidine, tetralin and naphthalene were studied. The lines and bands which were observed are compiled in tables. The emissions are attributed to definite atoms and atomic groupings. C. C. DAVIS

Absorption and fluorescence of the vapors of silver bromide and silver chloride. J. FRANCK AND H. KUHN. *Z. Physik* **44**, 607-14 (1927).—An investigation similar to that previously reported for AgI (*C. A.* **21**, 3024) is carried out on the absorption and fluorescence of AgBr and AgCl vapors. The absorption bands lie between 3100 and 3400 A. U. for AgBr and between 3100 and 3300 for AgCl. All bands have sharp heads shaded towards the red. The vibration frequency changes only slightly between the initial and final electronic states, the difference decreasing from iodide to chloride. Series of resonance lines were also obtained by suitable illumination of the vapors, of which 12 terms are measured for AgBr and 5 for AgCl. From these the heat of dissociation of AgBr is roughly estd. as 2.5 v., in agreement with the thermochem. value 2.6. This shows conclusively that in the vapor state these mols. are non-polar. The true heats of dissociation are closely related to the consts. of the quasi-elastic binding forces obtained from the vibration frequency in the normal state. It is therefore concluded that the electron linkage is of a similar type in the 3 mols. AgI, AgBr and AgCl. F. A. JENKINS

Phenomena of luminescence in the course of oxidizing reactions in aqueous solutions. LUCIEN MALLET. *Compt. rend.* **185**, 352-4 (1927).—Numerous oxidizing reactions are accompanied by the production, either of visible light, or of light detectable by the photographic plate and fluorescent substances. The type $\text{ClONa} + \text{H}_2\text{O} + \text{HCl} + \text{NaOH} + \text{O}$ is accompanied always by the production of light. In order to detect emission in the ultra-violet, fluorescent solns. capable of absorbing ultra-violet light and emitting in the visible were used. L. D. R.

Nature of activated molecules. L. J. WALDBAUER AND I. J. PATTON. *J. Phys. Chem.* **31**, 1433-4 (1927).—A simple explanation of the existence of active mols. can be obtained without recourse to any hypothesis of radiation. In the Bohr atom the electrons move in elliptical orbits with the nucleus at one focus. Their velocity is greatest near the nucleus and least in the outer portion of the ellipse. The valence electrons are furthest from the nucleus and are therefore, less firmly held throughout their journey; but at the outer limits of their orbits they are at their slowest speed. Collisions between mols. in this state will be almost certain to cause reaction and such mols. can be called activated. This does not exclude absorption of radiation quanta as an

auxiliary influence but its effects will merely move the valence electron further from the nucleus and consequently increase the activation somewhat. Like the radiation hypothesis this explanation of the activated mol. is not yet susceptible to exptl. or mathematical demonstration.

HARRY B. WEISER

The resonating power of some metallic salts in solutions irradiated by filtered light from a mercury arc. A. ANDANT AND E. ROUSSEAU. *Compt. rend.* **185**, 202-3 (1927).—The phenomenon of resonance previously obtained with Mn salt irradiated with filtered light from a Hg arc is not an isolated fact, since the same phenomenon has now been observed with salts of Mg, Na, K and U.

E. P. WIGHTMAN

Photovoltaic cells. C. W. TUCKER. *J. Phys. Chem.* **31**, 1357-80 (1927).—A detailed study of photovoltaic cells of the type (1) Illuminated Pt. MX | Soln. | Pt. MX or (2) Illuminated M-MX | Soln. | M-MX, where M is Ag or Cu, MX, Ag halide or Cu₂O (photosensitive substance) and the solns. are either reducing, neutral or oxidizing. In cells of the first type illumination causes oxidation of the photosensitive substance if the soln. is an oxidizing one and reduction if the soln. is a reducing one. The e. m. f. varies in sign accordingly. In cells of the second type illumination tends to promote reduction of the photosensitive substance. Here, however, local action causes reduction of the observed e. m. f. This is not great if the photosensitive substance is in a uniform layer but is very considerable where the layer is not uniform. A reversal in sign of the e. m. f. is the result unless the local cells formed are reversible. A theoretical discussion is essayed and the field is reviewed at length.

R. E. GIBSON

Optical dissociation of salt molecules. A. TEREIN. *Z. Physik* **44**, 713-36 (1927).—Irradiation of dil. vapors of diatomic halogen salts (e. g., NaI, TlBr, TII) with ultra-violet light of frequency greater than a certain limit causes a strong emission of several lines of the metallic atom. From the study of the dependence of this light on the wave length of the exciting radiation, on the presence of added gases, etc., this phenomenon is explained as a primary disocn. of the salt mol by the absorption of light, the products being an excited metal atom and a normal halogen atom. Irradiation of the dil. vapor of a triatomic halogen salt (e. g., HgCl₂, HgBr₂, HgI₂, CdI₂, ZnI₂, PbI₂) with ultra-violet light whose frequency lies between detd. limits gives an intense emission of an extended band system. Its features are wholly independent of the exciting frequency. The absence of an emission in the region of the exciting wave length, combined with the behavior of the phenomenon at higher pressures and with energy considerations, point to a primary dissociation caused by light in which the triatomic mol. yields an excited diatomic mol. and a normal (or excited) halogen atom.

Increasing radioactivity. A. GASCHLER. U. S. 1,644,370, Oct. 4. In order to increase the radioactivity of substances such as U and Th, they are heated under pressure and subjected to a high-potential elec. current.

4—ELECTROCHEMISTRY

COLIN G. FINK

Recent developments in electric steel furnaces. The new S. & H. high-efficiency arc furnace. R. GROSS. *Z. Ver. deut. Ing.* **71**, 1098-1100 (1927).—3 illus. In the new Siemens and Halske furnaces graphite electrodes are used in preference to carbon on account of the five-fold elec. conductivity and the consequent smaller cross section necessary to carry the current. A water-cooled circular sand trough is loosely fitted to each of the 3 electrodes directly outside of the roof to which it is luted. Above this trough a water-cooled Cu collar [to which the power cables are connected] is tightly fitted to each of the 3 electrodes. The collars are 35 cm. high, the lower outer edge being flanged and buried into the sand of the trough. Thus an almost gas-tight seal is obtained, resulting in a saving of about 20% in electrodes. At Remscheid the new furnace is of 8-ton capacity; it is used on special automobile steels; operates at 1700 k.v. a. 101 v. and at 3000 k.v.a. 175 v. Operating data: four charges per 24 hr. day at 580-

630-kw. hrs. per ton of finished steel, starting with cold charges; 8-10 charges per day at 180-220 kw. hrs. per ton of finished steel, starting with molten charge. An improved regulator automatically controls the feed of the electrodes. C. G. F.

High-frequency induction melting. D. F. CAMPBELL. *J. Iron Steel Inst.* (advance copy), No. 1, 9 pp. (Sept. 15, 1927).—A detailed review covering the Rodenhauer, Ajax-Northrup and other furnaces. C. G. F.

The automatic electric furnace. Its uses and possibilities. H. F. WOOD. *Trans. Am. Soc. Steel Treating* 11, 975-85(1927).—A description of two rotary-hearth elec. heat-treating furnaces for crank shaft production at the Ingalls-Shepard Company, Harvey, Ill. W. A. MUDGE

Electric annealing furnace is controlled automatically. EDWIN BREMER. *Foundry* 55, 674-7(1927).—The furnace is of 350-kw. capacity. Steel castings are heated to 1650° F. and this temp. is maintained for 10 hrs. Temp. is automatically controlled. Sand is used as a seal for the doors and the scaling is thus reduced to a min. [No details are given as to heating units, etc.] C. G. F.

Electric annealing solves machining problems at Timken plant. ANON. *Elec. World* 90, 729-30(1927).—A recent installation is Ni-Cr alloy resistor furnace of 850-kw. capacity, annealing 80 tons of steel bars at one charge. The furnace is of the pit type with an inside width of 9 ft., length 21 ft., depth from bottom piers to parting line of 6½ ft. C. G. F.

Behavior of molybdenum as resistor in the electric furnace. H. J. MILLER AND M. LINDERMAN. *Ann. Inst. Min. Met. Eng., Tech. Publ.* 16, 13 pp (1927).—The destruction of Mo ribbons used as resistors in elec. furnaces is due chiefly to chem. reaction with materials present in heating tubing, insulation, or gases in the furnace. Of these materials most likely to be there, SiO₂ and C are the most destructive. For the best working conditions of such furnaces it is recommended that both heating tubing and insulation should be of calcined pure alumina, mixed with Al(OH)₃ as binder and fired at 1500°. The first heating of a new furnace should be carried out under high H pressure which may be later reduced. If the material used for heating tubing or insulation contains C oxides of a high degree of oxidation should be added, so that they may react with it, the products of the reaction to be removed by evacuation. The molybdenum ribbon may be coated with molybdenum oxides having a low degree of oxidation to protect it from forming oxides or carbides. C. G. F.

Industrial heating control. P. H. CLARK. *Gen. Elec. Rev.* 30, 446-52(1927).—C. describes the mechanical type nonindicating temp. control instrument for elec. furnaces and ovens for use in low temp. work, and also the expansion type, which function according to the pressure exerted against a Bourdon spring through the medium of either a liquid, vapor, gas or mercury. These are, resp., limited to temps. of 150°, 400° and 1000° F. The gas-filled instrument is mostly used because it is more sensitive and has a greater temp. range. For temp. above 800° F. an elec. pyrometer or potentiometer is used. Various features of control panels, overload relays and temp. limit fuses are presented and the importance of accurate temp. control in various heating zones is emphasized with specific examples. A. D. S.

The formation of formaldehyde from water gas in the electric glow discharge. ADOLF KOENIG AND R. WEINIG. *Festschrift 100-jahr Bestehen Techn. Hochschule zu Karlsruhe* 1925, 525-30; *Chem. Zentr.* 1926, II, 2131. The treatment of mixts. of CO and H by the glow current leads to gaseous, liquid and solid products of varying compn., among which H₂O, CO₂, HCO₂H, HCHO and glycolaldehyde were identified (cf. Loeb, *Z. Elektrochem.* 12, 282(1906)). In attempts to det. the optimum conditions for HCHO formation, it was proved that with a current of gas, the products are adsorbed and adhere to the walls, as a result of electrophoresis. To avoid their enrichment with undesirable reaction products, the walls of the Siemens tube were continuously or periodically rinsed with water. In this way it became possible to obtain HCHO as the chief product of the action of the glow discharge on water gas, so that up to 77% of the gas treated was recovered as HCHO. The max. yield of HCHO was obtained when the incoming gas contained 46% CO by vol. Calcd. on a basis of the elec. energy consumed, the yield was 2 g. of HCHO per kw. hr. C. C. DAVIS

The commercial production of fluorine. P. LEBEAU. *Bull. soc. encour.* 139, 15-35(1927); cf. C. A. 20, 873—A general discussion and review. C. G. F.

The alkali-chlorine industry. JEAN BILLITER. *Z. Elektrochem. angew. physik. Chem.* 33, 353-60(1927).—This industry consumes 0.1% to 0.15% of total German industrial power. B. reviews construction of different electrolytic cells, electrodes, diaphragms, methods of operation, etc. The most widely used cells are the Siemens-Billiter, the Griesheim, the Hargreaves-Bird (in the Townsend, Nelson and Allen-

Moore modifications) and the Solvay. Newer uses for Cl are found in substitution and addn. products of acetylene to give solvents (e. g., trichloroethylene); org. compds. (e. g., phosgene, chlorobenzene, benzyl chloride and chloropiricin); metallic chlorides (e. g., ZnCl_2 , CuCl_2 , CuCl , etc.); and cellulose production (Italian process). D. G.

Pure caustic potash from technical potash by electrolysis using the mercury cathode. L. A. VERNITZ. *Trans. Russian Inst. for Appl. Chem.* No. 4, 10-16(1925).—V. describes (1) an app. for the electrolysis of a potash soln. (from wood and plant ashes) and the production of a Hg amalgam and (2) an electrolyzer for the decompn. of the amalgam into KOH and Hg. Drawings of the app. are given. J. S. JOFFE

Electrolytic preparation of sodium perborate at Larderello. UMBERTO SBORGI AND DAVID LENZI. *Giorn. chim. ind. applicata* 8, 423-7(1926).—Sketches and photographs of the app. used, and description of the process, are given. R. S. P.

The treatment of complex raw-speiss. W. F. KAISER. *Continental Met. Chem. Eng.* 2, 195-8, 238-42(1927).—K. reviews the constitution of speiss and wet and dry processes of treatment and then describes some electrolytic expts. The use of alk. sulfide soln. as electrolyte results in removal of As and Sb, and small quantities of FeS when present. H_2SO_4 was the acid electrolyte employed. Attention is called to the influences of certain metals during electrolysis, amperage, voltage, temps., lyes, regulation of liquor concn. and distance of the electrodes. The behavior of the single metals in the speiss is discussed. The expts. were made with similar materials in the anodes as used with basic electrolytes. The electrolyte was a 10% soln. of $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ with 7% free H_2SO_4 . The expts. show the operation with raw speiss by direct hydrolysis is not economical, but when such raw speiss is concd. to a higher degree direct electrolysis is permissible, if Cu, Ni, Co and some As are the main metal constituents. Further experimentation is planned. W. H. BOYNTON

Progress in chromium plating. W. PFANHAUSER. *Chem.-Ztg.* 51, 605-6(1927).—In order to eliminate the occluded or codeposited H from Cr plate the von Bosse process submits the plated ware to high-tension a. c. *in vacuo*. A luminous discharge takes place from the surface of the plate and practically all H is removed after 15 min. at ordinary temp. C. G. F.

Electroplating. W. BLUM. *Ind. Eng. Chem.* 19, 1111-3(1927).—An address. Emphasis is laid upon the contributions of chemistry to electroplating. C. G. F.

The conductivity of plating solutions. II. A. E. NICOL. *Metal Ind.* (London) 30, 68-9(1927); cf. C. A. 21, 2437.—The influences of carbonate content in cyanide plating solns. are discussed and the necessity of a CO_3 content in excess of the total of the other constituents is an abs. necessity. An explanation of and method of testing for "layering" are given. W. H. BOYNTON

Formation of powdered copper in anode mud. M. DEK. THOMPSON. *Chem. Met. Eng.* 33, 298(1926).—T. explains why the reaction $2\text{Cu}^+ = \text{Cu} + \text{Cu}^{++}$ with finely divided Cu in the anode mud goes from left to right. Cu ions must be produced and not used up by diln. There is a slightly higher temp. in the immediate vicinity of the anode than in the main body of the soln. The reaction takes place as a result of cooling from the temp. of the junction of the anode and the soln. to the temp. of the body of the electrolyte. The effect of temp. fall must overpower the opposite effect due to diln. The same explanation as regards direction of reaction holds for the reaction $3\text{Au}^+ = 2\text{Au} + \text{Au}^{+++}$. W. H. BOYNTON

The formation of copper powder at the anode, and the passivity of the anodes. ERNESTO DENINA. *Ann. chim. applicata* 17, 284-96(1927).—Though Thompson is correct in showing that deposition of Cu at the anode is not solely a result of diln. (cf. preceding abstr.), his method of explaining the phenomenon by a temp. differential does not cover adequately the complicated phenomena involved. It is even possible that diln. accounts in part for the formation of Cu. A detailed discussion, based on phys.-chem. principles and mathematical reasoning, in which the mechanism of the process is explained, leads to the conclusion that the ratio of the no. of Cu^+ ions to Cu^{++} ions formed diminishes with increase in the c. d. This explains the favorable influence of a high c. d. in minimizing the loss of Cu in the anode sludge. C. C. D.

Electromotive utilization of the oxidation of solid and of liquid fuels. FRANZ FISCHER AND WALTER KRÖNIG. *Abhandl. Kenntnis Kohle* 7, 213-24(1925); *Chem. Zentr.* 1926, II, 1620.—The p. d. which appears during the oxidation of solid and of liquid fuels under pressure was investigated, the fuels being used for the cathode, Fe netting for the anode and aq. Na_2CO_3 for the electrolyte. The tension increased with increase of temp. The best results were obtained with solid fuels, while with brown coal and crude petroleum, reducing substances (humic acids) entered the soln. and greatly reduced the effect. The chief difficulty lies in the construction of a suitable

app. In conclusion, the electromotive utilization of the auto-oxidation of solid fuels was investigated. C. C. DAVIS

Automotive storage battery. W. L. REINHARDT. *Ind. Eng. Chem.* **19**, 1124-6 (1927).—A non-technical discussion from the standpoint of construction and standardization of materials. C. J. BROCKMAN

The mercurous sulfate electrode for testing storage batteries. SAKABE MAKIO. *Trans. Am. Electrochem. Soc.* **53** (preprint), 6 pp. (1927).—See *C. A.* **20**, 3648. C. G. F.

Electrolysis of mains by stray currents from tramway system. (Corrosion.) M. H. SARRADE. *Gas J.* **179**, 449-51 (1927).—Given in a well installed street railway system as much as 12 to 20% and in old systems as much as 60% of the return current may find its way to neighboring pipes and cause much damage. Photographs of typical cases are given, and remedies are suggested. R. W. RYAN

A study of the phenomena of electrolytic corrosion of mains. A. BOLZINGER. *Gas J.* **179**, 499-501, 551-3, 628-9, 754-6 (1927).—The theory of electrolytic corrosion is discussed and distinguished from ordinary soil corrosion, and equations are developed for potential at any given point. The direct protection of underground mains by coatings, etc., is extremely costly and uncertain in effectiveness. All return feeders on trolley lines should be maintained at equal potentials. Methods of measuring p. d. and intensity of current are given, especially the methods using tri-electrode vacuum tubes as described by Chappuis. The production of graphic charts is discussed. R. W. RYAN

The corrosion of lead cable sheaths due to stray currents. O. HAEHNEL. *Elek. Nachr. Tech.* **4**, 106-15 (1927); cf. *C. A.* **20**, 2649.—An address. The voltmeter test alone is not sufficient to establish the presence or absence of corrosion. The chem. compn. of the corrosion products is much more reliable. PbSO_4 , PbCl_2 , $\text{Pb}(\text{NO}_3)_2$ and PbO_2 have all been found when corrosion was due to stray currents. The first 3 are present in but small quantity when corrosion is not due to stray currents. If the railway track from which the stray elec. current emanates is more than 100 m. distant, the effect is practically nil. Clean Fe electrode *versus* clean Pb electrode buried in the soil and in the absence of air gave a potential of -0.1 v., Pb being the anode. With the introduction of air the polarity is reversed, rising to almost $+0.3$ v., Pb now being the cathode. C. G. F.

Recording overvoltages with the Clydonograph. MÜLLER-HILLEBRAND. *Siemens-Z.* **7**, 605-12 (1927).—Nineteen illustrations. C. G. F.

Mercury-arc-rectifier characteristics. E. B. SHAND. *Elec. J.* **24**, 486-93 (1927). C. G. F.

Dielectric* puncture under oil. J. T. LITTLETON AND W. W. SHAVER. *Elec. World* **90**, 503-5 (1927).—Expts. on Pyrex glass and porcelain show that the breakdown is not instantaneous. No evidence was obtained of the breakdown being caused by heating. Further work is being done. C. G. F.

Gas films in high-tension cables. L. EMANUELI. *Elec. World* **90**, 601-5 (1927).—Tests show that bombardment of insulating compd. by gaseous ions causes air emulsions and forces a path through impregnated paper fiber which leads eventually to dielec. breakdown. C. G. F.

Hot-cathode rectifier using a thoriated molybdenum cathode. A. GEHRTS. *Siemens-Z.* **7**, 559-64 (1927). C. G. F.

The effect of series resistance on the current from a photoactive cell containing a fluorescent electrolyte. C. C. MURDOCK AND DOROTHY WAUGH MURDOCK. *Trans. Faraday Soc.* **23**, 593-600 (1927); cf. *C. A.* **20**, 3644.—Current is generated by illumination of a Goldman cell. The reciprocal of the current in 10^{-10} amps. is plotted against the external resistance in megohms. The result can be expressed by the equation: $1/i = S(r + R)$, in which i is the current, r the resistance of the circuit, S the slope of the exptl. curves and R its negative x -intercept diminished by the resistance of the shunt galvanometer and that of the cell. This correction is in most cases much less than the uncertainty of the value of R . From the above equation, one obtains for the total e. m. f. of the circuit: $ri = (1/S) - Ri$. Consequently, the e. m. f. of the circuit comprises a part measured by $1/S$ which is independent of the current and a negative part, $-Ri$, proportional to the current. A. L. HENNE

Storage battery. W. B. STONE. Brit. 263,024, May 19, 1926. Structural features.

Storage battery. W. E. HOLLAND and W. H. GRIMDITCH. U. S. 1,644,590, Oct. 4. Batteries are formed with dry, reversible, positive and negative plates (having a substantial proportion of their active materials in the charged state), and with separators of hard rubber or other non-absorbent insulating material.

Storage-battery plate. C. H. O. LÜBECK. Swed. 62,208, Jan. 4, 1927. Structural features.

Storage-battery plate. SVENSKA ACKUMULATOR AKTIEBOLAGET JUNGNER. Swed. 62,235, Jan. 11, 1927. Structural features.

Treating lead storage battery plates. ACKUMULATOR-FABRIKSAKTIEBOLAGET TUDOR. Swed. 63,357, July 19, 1927. Air-resistant negative lead sponge plates are produced by washing out the forming electrolyte and removing the adhering water by drying in absence of oxygen. Before the washing the fully charged plates are given a slight discharge with a high current density.

Storage battery separator. P. E. NORRIS. U. S. 1,644,853, Oct. 11. Separators are formed of a fabric which may be composed of coarsely woven cotton, the strands of which are coated with rubber which partially fills the interstices of the fabric.

Protecting the lead lining in wooden tanks for electric storage batteries. ACKUMULATOR-FABRIKSAKTIEBOLAGET TUDOR. Swed. 63,309, July 12, 1927. Between the wooden tank and the lead lining there is laid in a chem. resistant and elec. insulating lining of rubber or ebonite, in order to protect the lead lining against corrosion.

Arrangement of ventilation on electric storage battery cells. SVENSKA ACKUMULATOR AKTIEBOLAGET JUNGNER. Swed. 62,981, May 17, 1927. Mech. features.

Electrolyzer electrode of the filter press type. R. PECHKRANZ. U. S. 1,643,900, Sept. 27.

Photoelectric cell. T. R. GOLDSBOROUGH. U. S. 1,645,280, Oct. 11.

Electrolytic rectifier. LERUE P. BENSING. U. S. 1,645,085, Oct. 11. A Pb anode is used with a cathode which may be formed of Mg and with an aq. fluoride electrolyte contg. at least 5% of a suitable fluoride such as KF and a smaller proportion of an alk. hydroxide or other alkali.

Material for commutator brushes of electrical apparatus. F. C. ATKINSON. U. S. 1,644,703, Oct. 11. An oxide of Cu is mixed with pitch or other suitable fusible material of organic origin, the mixt. is subjected to destructive distn., the product is cooled, powdered and mixed with a binder contg. Cu and this mixt. is molded and baked.

Electrodeposition of molybdenum. C. G. FINK and C. H. ELDRIDGE. Can. 274,429, Oct. 4, 1927. Mo is electrodeposited upon the article to be plated while serving as a cathode in an electrolyte whose Mo content is composed of an excess of H_2MoO_4 .

Electric furnace. AKT-GES. BROWN, BOVERI, ET CIE. Brit. 263,118, Dec. 15, 1925. A modification is specified of the furnace described in Brit. 261,785 (C. A. 21, 3567).

Electric resistance furnace. F. A. J. FITZGERALD. U. S. 1,643,808, Sept. 27.

Electric resistance furnace. T. A. REID. U. S. 1,645,293, Oct. 11.

Electric furnace. J. CHAPMAN. U. S. 1,645,091, Oct. 11.

Electric resistance furnace. INTERNATIONAL GENERAL ELECTRIC CO. Brit. 262,796, Dec. 9, 1925.

Electric resistance furnace for sherardizing, etc. N. E. NORTH. Brit. 262,859, Sept. 16, 1925.

Electric resistance muffle furnace. A. D. KEENE. U. S. 1,643,774, Sept. 27.

Electric resistance furnace adapted for annealing sheets of iron or steel. CHRISTIAN STEINSTRUP. U. S. 1,645,119, Oct. 11.

Electric induction furnace. J. A. SEEDE. U. S. 1,645,074, Oct. 11.

Muffle furnace (electrically heated). W. G. BRIDGE and W. A. PERVIER. U. S. 1,644,107, Oct. 4.

Electric annealing furnace. T. STASSINET. Brit. 262,800, Dec. 12, 1925. Fire-clay walls of the furnace have a thickness of 90 mm. or less and the total thickness of the fireclay and insulating walls is 150 mm. or less.

Electrode for rotary resistance furnaces. FINSPONGS METALLVERKS A.-B. Swed. 61,947, Nov. 16, 1926. In an electrode for rotary, oscillatory and rocking furnaces for the treatment of zinc powder, that part which is to produce the heat is made from coal powder high in ash; this gives it a higher elec. resistance than the other parts of the electrode, which are made from a graphite mass of higher cond.

Electrically heated hood for annealing metal sheets in packs, etc. T. F. BAILY. U. S. 1,643,600, Sept. 27.

System for ionizing gases by electric treatment. F. DESSAUER and UNIVERSITÄTS-INSTITUT FÜR PHYSIKALISCHE GRUNDLAGEN DER MEDIZIN. Brit. 262,829, Dec. 14, 1925.

Electric fuse. R. H. D. BARKLIE. U. S. 1,644,626, Oct. 4. Metal such as Au is deposited electrolytically on an electrode of Ag or other suitable sol. material so that the thickness of the metal is not substantially greater than that of com. beaten Au, the electrode material is dissolved, and the metal film is floated onto an insulating backing and the solvent is removed from the product.

Incandescent electric lamp. D. S. GUSTIN. U. S. 1,643,810, Sept. 27. An O-free, org. "getter" such as benzidine, diphenyl, crystal violet or carbazole is used with lamps of the gas filled type. Cf. C. A. 21, 1598.

Incandescent electric lamps. A. DE GRAAFF. U. S. 1,644,712, Oct. 11. An O-getter for filament lamps comprises H together with a drying agent such as P_2O_5 . The H is dild. by another gas such as A or N and constitutes 0.5-4.0% of the gaseous filling.

5—PHOTOGRAPHY

C. E. K. MEES

Photochemistry of silver iodide. LÜPPO-CRAMER. *Phot. Ind.* 25, 806-7(1927).—AgI emulsions, with grains so fine that the coated emulsion is transparent, have an increased light sensitivity when treated with free Br. With longer treatment, sensitivity decreases. A similar effect is given by treatment with Cl. A. P. H. T.

An arithmetical method of determining the exposure time in photography. B. SCHULTZE-NAUMBURG. *Z. wiss. Phot.* 24, 385-90(1927).—The time of exposure necessary is given by the proportionality factor C divided by the product of the albedo and the illumination. C depends only on the plate speed and the relative aperture of the objective. The albedo is the ratio of the reflected to the incident light. E. R. B.

Production of photographic images on cellulose acetate film. A. J. HALL AND R. A. HILL. *J. Soc. Dyers Colorists* 43, 291-2(1927).—Satisfactory images with S R A colors could not be produced on yarn but were obtained on cellulose acetate (Celastoid) film. These prints were not permanent since on exposure to light they become uniformly blue in color. A method for making the prints permanent has not yet been found. L. W. RIGGS

Mechanism of formation of the latent photographic image. F. C. TOY. *Nature* 120, 441(1927).—Recent explanations of the formation of the latent image ascribe it (1) to a complete loss of electrons and photoelec. effect, or (2) to a redistribution of electrons in the system and photo-conductivity effect. The chief obstacle to the latter is the decrease of the photo-conductivity effect found by Choblenz for wave lengths shorter than $420\text{ m}\mu$. Toy now finds that the photo-conductivity of Ag halides varies with the thickness of the halide layer and that for layers of 0.07 nm. , the photo-conductivity effect is greater at $365\text{ m}\mu$ than at $430\text{ m}\mu$. The wave-length effects in thin layers are, therefore, in accord with the known properties of the photographic emulsion. C. F. K. MEES

The laws governing the densities produced in photographic emulsions. M. C. NEUBURGER. *Phot. Kor.* 62, 175-83(1926).—A summary of published work in which the characteristic curve of a photographic emulsion is described and an explanation given for its shape in terms of relations between distribution of size and sensitivity of AgBr grains. Proof of cryst. structure of AgBr grains by Debye-Scherrer x-ray spectrograph is outlined. Reciprocity law, dependence of gamma on wave length, the formation of latent image, and characteristic curves for x-rays and α -rays are discussed. A self-registering microphotometer using thermopile and galvanometer is described. Bibliography is appended. M. W. SEYMOUR

The handling of old print-out papers. F. FORMSTECHE. *Camera (Lucerna)* 5, 180-3(1927).—Print-out papers tend to dry out with age. Papers relatively high in AgCl and low in AgNO₃ tend to become more contrasty. Other papers tend to become softer, because of conversion of AgNO₃ to Ag citrate, which is insol. Gelatin papers still give good prints if they have not yellowed unevenly. Collodion papers tend to dry out and become hard and impermeable to toning solns. This can be remedied by pre-bath in alc. Albumin papers, silvered by the user, tend to give up AgNO₃ to the paper and become impermeable. They are preserved at proper humidity by soda paper. Cf. *C. A.* 20, 3654. M. W. SEYMOUR

Ripening germs and the failure of the reciprocity law. LÜPPG-CRAMER. **Phot. Ind.* 25, 835 6(1927).—Investigations are described of the failure of the reciprocity law on several positive emulsions in different colored light. Decrease in density with decreased light intensity during exposure is called the normal effect. Increase in density under the same circumstances is called the reversed Schwarzschild effect and is regarded as an exposure anomaly. Conclusion: The failure of the reciprocity law is very complicated and to a high degree depends on the ripening condition of the Ag halide. A. P. H. TRIVELLI

Comparison of the developers, metol-hydroquinone and metoquinone. EUGÈNE MULLER. *Rev. franç. phot.* 7, 193 4; *Chem. Zentr.* 1926, II, 1230.---*Meloquinone* is an addn. compd. of hydroquinone and methyl-*p*-aminophenol sulfate. This developer was compared with a series of developers prepd. from different proportions of metol and hydroquinone. The results are compiled in tables. C. C. DAVIS

Method for the instantaneous photography of the combustion process of flashlights. H. BECK AND J. EGGERT. *Z. wiss. Phot.* 24, 367-79(1927).—An app. was constructed for following up with instantaneous photographs the combustion of flashlights. It consists of an enclosed roller (shut off from light), fed with a photographically light-sensitive material, which moves past a slit during the flash. From the record photograph there can be derived, within the exptl. limits: the intensity of the flash at any point of time, including that of the highest intensity; the entire energy of the emitted light; the total and the practical duration of the flash (total burning time = time from the first glow to the final extinction of the flash; practical burning time = duration of the practically utilizable portion of the flash). The flashlight was compared with other light sources as to its actinic value and its brightness. For 1 g. Agfa flash powder at 1 m. distance the following values were obtained: max. intensity, 1.2×10^6 Hefner c.;

entire energy, 6.9×10^4 meter candle seconds; total duration of burning, 0.183 sec.; practical burning, 0.106 sec.

E. P. WIGHTMAN

Photomicrography with low magnification of opaque objects. F. KAHLER. *Z. wiss. Phot.* **24**, 361-6(1927).—A description is given of an optical system, with which good results are obtainable.

A. P. H. TRIVELLI

Determination of iodide in mixtures of halides [in the examination of photographic paper] (BAINES) **7**.

Photographic emulsion. W. DIETERLE, O. MATTHIES and J. REITSSTOTTER. *Can.* **273**, 683, Sept. 6, 1927. Photographic Ag halide emulsions are comprised of substances which are extd. from proteins by electro dialysis.

Photographic desensitizers. I. G. FARBENIND. A.-G. *Brit.* **262**, 816, Dec. 11, 1925. *p*-Ethoxyquinaldimethyl sulfate or other alkyl sulfate of a *p*-alkyloxyquinaldine is condensed with *m*-nitrobenzaldehyde, *e. g.*, by boiling with glacial HOAc and copellidine, to form a product having a desensitizing action upon AgBr emulsions or photographic plates formed with such emulsions.

Projection-printing system for color photography. SOC. DU FILM EN COULEURS KELLER-DORIAN AND P. A. RICHARD. *Brit.* **263**, 115, Dec. 19, 1925.

Photographic copying by the reflecting method. ALFRED MILLER. *U. S.* **1,645**, 112, Oct. 11. Treatment of the sensitized colloid layer after exposure is restricted to the surface of the layer.

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

Double sulfates of bismuth and alkali metals. I. Sulfates of bismuth and potassium. V. CAGLIOTI AND A. STOLFI. *Atti accad. Lincei* [6], **5**, 896-901(1927).—The system $\text{Bi}_2(\text{SO}_4)_3 \cdot \text{K}_2\text{SO}_4 \cdot \text{H}_2\text{O}$ at 25° was studied. The results, which are given in tabular and graphical form, indicate only 1 double salt, the *compd.* $\text{Bi}_2(\text{SO}_4)_3 \cdot 3\text{K}_2\text{SO}_4$, hexagonal crystals. It is stable in solns. contg. 5.32 to 12.8% of K_2SO_4 . It is also formed by adding, in the theoretical proportions, aq. K_2SO_4 to concd. aq. $\text{Bi}(\text{NO}_3)_3$ acidified with HNO_3 . The *compd.* $\text{KBi}(\text{SO}_4)_2$ described in the literature could not be found, perhaps because the conditions of the present work differed from those under which it was supposedly prepd. (cf. *Am. Chem. J.* **14**, 170(1892)). Because of hydrolysis of $\text{Bi}_2(\text{SO}_4)_3$, the method used by Zambonini and his collaborators in their numerous researches on double salts of the rare earths was not applicable, and solid $\text{Bi}_2(\text{SO}_4)_3$ in different proportions was added to satd. aq. K_2SO_4 , contg. in some cases excess K_2SO_4 .

C. C. DAVIS

Observations on soluble metatungstates. F. F. SMITH. *Chem. News* **135**, 113-5(1927); cf. *C. A.* **21**, 3171.—The literature on Pb metatungstates is contradictory and therefore confusing. Both W. Lotz and V. Forcher claimed to have prepd. the salt while Rosenheim maintained that it did not exist. S. repeated the method of F., obtained the crystals, but on attempting to dissolve them in order to purify them a white residue was formed. He then undertook to prep. the salt by dissolving 50 g. of Na metatungstate and an equiv. amt. of $\text{Pb}(\text{NO}_3)_2$ in 2.5 l. of H_2O at 80° . After repeated filtering and evapn. at 70° a crop of silky, white needles was obtained which did not prove to be the $\text{PbO} \cdot 4\text{WO}_3$, aq. desired. The insol. white powder that is obtained in the process was found to contain PbO , WO_3 and H_2O , in the same proportions as a ditungstate, and is most probably a product of hydrolysis. The Na metatungstate used was found to be impure. *Ibid* 129-31.—Ba metatungstate is prepd. by treating a hot concd. soln. of the Na salt with an equiv. amt. of BaCl_2 and a few drops of HCl, filtering, cooling and recrystg. the crop of crystals obtained. These may be reconverted into the Na salt with Na_2CO_3 . When treated with $\text{Pb}(\text{NO}_3)_2$ at 70° , the insol. white powder is formed, as before. If the filtrate from the original Pb salt is allowed to evap. at room temp., instead of heating, then in a week or two crystals of $\text{PbO} \cdot 4\text{WO}_3 \cdot 7\text{H}_2\text{O}$ sep. out. The salt may be analyzed by 1 of 3 methods: (1) by converting the Pb into sol. PbCl_2 with hot concd. HCl; (2) by dissolving in NaOH or KOH, pptg. Pb on Pt gauze electrolytically, redissolving it in warm dil. HNO_3 , igniting the $\text{Pb}(\text{NO}_3)_2$ and weighing as PbO ; pptg. the W from acid soln. with quinine, filtering the pptd. quinine tungstate, washing, igniting and weighing as WO_3 ; (3) by volatilizing the W by passing CCl_4 over the salt in a porcelain boat, weighing the Pb as PbCl_2 and igniting the W *compd.* collected, and weighing as WO_3 . $\text{Na}_2\text{O} \cdot 4\text{WO}_3 \cdot 10\text{H}_2\text{O}$ is prepd. from 5:12 Na tungstate

soln. with H_2WO_4 at 70° . NH_4 metatungstate is prepd. from 5:12 NH_4 tungstate and H_2WO_4 solns. at 70° . J. BALOZIAN

Double sulfates of the rare earth metals and the alkali metals. VIII. Double sulfates of cerium (cerous) and sodium. F. ZAMBONINI AND S. RESTAINO *Atti accad. Lincei* [6], 5, 828-32(1927); cf. C. A. 21, 711, 2855.—The system $\text{Ce}_2(\text{SO}_4)_3$ - Na_2SO_4 - H_2O at 25° was studied by the same method as before, the results of which are given in tabular and graphical form. The data indicate the existence of 2 double salts, the compd. $\text{Ce}_2(\text{SO}_4)_3 \cdot \text{Na}_2\text{SO}_4 \cdot 2\text{H}_2\text{O}$ and the compd. $4\text{Ce}_2(\text{SO}_4)_3 \cdot 5\text{Na}_2\text{SO}_4 \cdot 8\text{H}_2\text{O}$, the first of which has long been known (cf. *Ann. Pharm.* 42, 134; *J. prakt. Chem.* 80, 16(1860); *Bull. soc. chim.* 31, 533(1874)), whereas the other is new. Both are microcryst. powders. $\text{Ce}_2(\text{SO}_4)_3 \cdot \text{Na}_2\text{SO}_4 \cdot 2\text{H}_2\text{O}$ is stable in contact with solns. contg. from 0.14% Na_2SO_4 and 0.35% $\text{Ce}_2(\text{SO}_4)_3$ to approx. 7% Na_2SO_4 . $4\text{Ce}_2(\text{SO}_4)_3 \cdot 5\text{Na}_2\text{SO}_4 \cdot 8\text{H}_2\text{O}$ is stable in contact with solns. practically free of $\text{Ce}_2(\text{SO}_4)_3$, but which contain from approx. 7.5 to 15% Na_2SO_4 . The soly. data of aq. $\text{Ce}_2(\text{SO}_4)_3$ in Na_2SO_4 differ from those of Barre (C. A. 5, 435). Both compds. lose water only at high temps., and dehydration is not complete until 400° is reached. X. Sulfates of neodymium and ammonium. F. ZAMBONINI AND A. STOLFI. *Ibid* 832-7.—At 25° the system $\text{Nd}_2(\text{SO}_4)_3$ -(NH_4) $_2\text{SO}_4$ - H_2O furnished only the compd. $\text{Nd}_2(\text{SO}_4)_3 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 8\text{H}_2\text{O}$, stable in contact with solns. contg. from 2.5% $\text{Nd}_2(\text{SO}_4)_3$ and 1% (NH_4) $_2\text{SO}_4$ to 0.58% $\text{Nd}_2(\text{SO}_4)_3$ and 44% (NH_4) $_2\text{SO}_4$. It had a d. of 2.590, from which the calcd. mol. vol. is 329.4. Complete crystallographic data of the macroscopic crystals are given. They are monoclinic and correspond perfectly to those of the La-NH_4 , Ce-NH_4 , Di-NH_4 and Nd-Tl double salts already described. C. C. DAVIS

A new group of azido mixed salts. A. C. VOURNAZOS. *Z. anorg. allgem. Chem.* 164, 263-73(1927).—V. prepd. the compd. $\text{Na}_3[\text{AsBr}_3(\text{N}_3)_3]$ from NaN_3 and AsBr_3 in CH_3OH soln. It crystd. in white needles and gave no reaction with a CH_3OH soln. of AgNO_3 . He obtained mixed zinc halogen azides of the type $[\text{ZnNi}_2\text{N}_3\text{N}:\text{N}]\text{M}$. In this prepn. the Zn halides and NaN_3 were very thoroughly dried and the reaction was brought about in dry acetone soln. except in the case of the chlorides, fluorides and cyanides. With the latter CH_3OH was used as the reaction medium. The Zn halides and monobasic org. Zn salts gave the same coordinate mixed type of compd. The members of this group are white or colorless cryst. substances, sol. in CH_3OH , $(\text{CH}_3)_2\text{CO}$, and C_6H_6 , and insol. in ether. They are crystd. out by means of the latter. They give a deep red coloration with FeCl_3 (1:100) and a dark brown with the same concn. of CuSO_4 . Pb and Ag compds. of the type $\text{AgI} \cdot [\text{ZnI}_2 \cdot \text{NaN}_3]_2$ and $\text{PbI}_2 \cdot [\text{ZnI}_2 \cdot \text{NaN}_3]_4$ were prepd. The cyanide was assigned the formula $[\text{Zn}(\text{CN})_2(\text{N}_3)_3]\text{Na}_4$. C. E. P. JEFFREYS

Preparation and properties of aluminum perchlorate with fifteen molecules of water of crystallization. D. DOBROSERDOV AND A. PSHENICHNI. *Ukrainskii Khem. Zhurnal* 2, 109-18; *Chem. Zentr.* 1926, II, 2404.—Freshly pptd. $\text{Al}(\text{OH})_3$ is dissolved in const.-boiling $\text{HClO}_4 \cdot 2\text{H}_2\text{O}$ on the water bath. On cooling, crystals of $\text{Al}(\text{ClO}_4)_3 \cdot 15\text{H}_2\text{O}$ sep., which are stable at room temp., but which lose $3\text{H}_2\text{O}$ in the desiccator and lose $9\text{H}_2\text{O}$ at 100° . The satd. aq. soln. at 18.5° contains 6.86% $\text{Al}(\text{ClO}_4)_3 \cdot 15\text{H}_2\text{O}$, that at 90° contains 42.3%. From the mother liquor of $\text{Al}(\text{ClO}_4)_3 \cdot 15\text{H}_2\text{O}$ and from the soln. prepd. by dissolving $\text{Al}(\text{OH})_3$ in $\text{HClO}_4 \cdot 2\text{H}_2\text{O}$ at room temp., small needles were obtained, the compn. of which corresponded approx. to the formula: $\text{Al}(\text{ClO}_4)_3 \cdot 15\text{H}_2\text{O} + 23.66 [\text{HClO}_4 \cdot 1.98\text{H}_2\text{O}]$. The analyses of the salts were carried out by the new method of D. (cf. C. A. 21, 2447). C. C. DAVIS

Preparation of aluminum perchlorate with nine and with six molecules of water of crystallization, and a study of the former with respect to its solubility, dehydration and behavior when heated. D. DOBROSERDOV AND VL. ERDMANN. *Ukrainskii Khem. Zhurnal* 2, 119-35; *Chem. Zentr.* 1926, II, 2404; cf. preceding abstr.—The hydrate $\text{HClO}_4 \cdot 2\text{H}_2\text{O}$ dissolves on the water bath about $\frac{1}{3}$ mol. of $\text{Al}(\text{OH})_3$, giving a colloidal soln. which on cooling solidifies to a gel. If 1 more mol. of $\text{HClO}_4 \cdot 2\text{H}_2\text{O}$ is added to the soln. and the latter is evapd., long 6-sided prisms of the compn. $\text{Al}(\text{ClO}_4)_3 \cdot 9\text{H}_2\text{O}$ are deposited. These deliquesce in the air, the resulting soln. having the approx. compn. $\text{Al}(\text{ClO}_4)_3 \cdot 15\text{H}_2\text{O}$. Over H_2SO_4 or P_2O_5 it loses $3\text{H}_2\text{O}$, and at 100° it fuses without loss of water. When heated in a Pt crucible the salt is converted to Al_2O_3 , obviously not through the intermediate stage of AlCl_3 , because there is no loss of Al. The existence of enneahydrate and of hexahydrate agrees with the theory of Flawitzkis, according to which the hydrates of halogen salt derivs. are hydrated acids. According to this the enneahydrate is a salt of the ortho-form of perchloric acid $\text{Cl}(\text{OH})_7$, because $(\text{HClO}_4)_3 \cdot 9\text{H}_2\text{O}$ is equiv. to $3\text{Cl}(\text{OH})_7$. The hexahydrate is similarly a deriv. of the "first anhydride of the ortho-form," $\text{OCl}(\text{OH})_6$. At 0° , 100 g. of water

dissolves 463 g. of $(\text{HClO}_4)_3 \cdot 9\text{H}_2\text{O}$, at 14.3° , 564 g. and at 91.5° , 3065 g. The method of Willard (*C. A.* 7, 311) for the prepn. of HClO_4 from NH_4ClO_4 , HNO_3 , and HCl can also be used for the prepn. of N_2O . C. C. DAVIS

The salts of iron and boron. N. S. KURNAKOV AND F. A. KOTOMIN-BUDARIN. *Ann. inst. anal. phys. chem.* 3, 488-9 (1926).—When 1-1.5 mol. $\text{FeC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ and 1 mol. B_2O_3 are heated to 1000° in an Fe crucible, $(\text{FeO})_2\text{B}_2\text{O}_3$ is obtained. $(\text{FeO})_2\text{B}_2\text{O}_3$ results with 2.5 mols. of the oxalate, and $\text{Fe}_3\text{B}_2\text{O}_7$ appears at 1400° with 3 mols. Below 700° $(\text{FeO})_2\text{B}_2\text{O}_3$ and $\text{FeO}(\text{B}_2\text{O}_3)_2$ are produced as sep. phases. BASIL C. SOYENKOFF

Organic compounds of quinquivalent bismuth. G. CHARRIER. *Atti accad. Lincei* [6], 5, 889-92 (1927).—In a similar way to their reactions with SbCl_3 (cf. May, *C. A.* 7, 70), aryldiazonium chlorides react with BiCl_3 , forming aryldiazonium chlorobismuthates, thus: $\text{ArN} \cdot \text{NCl} + \text{BiCl}_3 \rightarrow \text{ArN} \cdot \text{NBiCl}_4$. These new compds. also have their analogs in compds. such as $\text{ArN}_2 \cdot \text{AuCl}_4$, $(\text{ArN}_2)_2\text{HgCl}_4$, $(\text{ArN}_2)_2\text{SnCl}_4$ and $\text{ArN}_2 \cdot \text{BF}_4$, all of which have been described. They were prepd. by adding BiCl_3 in aq. HCl to the aryldiazonium chloride soln. There were prepd. in this way the following diazonium chlorobismuthates: phenyl, lustrous, m. $85-7^\circ$ (decompn.); o-tolyl, lustrous, m. $115-20^\circ$ (decompn.); m-tolyl, lustrous, slightly yellow, m. around 120° (decompn.); p-tolyl, lustrous, m. around 120° (decompn.); p-anisyl, lustrous straw color, m. around $145-7^\circ$ (decompn.); p-chlorophenyl, brilliant, silky, m. $105-7^\circ$ (decompn.); p-bromophenyl, lustrous, m. $135-40^\circ$ (decompn.). All these compds. are very stable in air and decomp. only very slowly. With dil. caustic alkalies they evolve N and form basic Bi salts, and with hot dil. acids they evolve N, forming the Bi salt and the phenol. With 1:1 HCl and Cu powder they give the Sandmeyer reaction. With concd. H_2SO_4 they evolve HCl and probably form the corresponding sulfates $\text{ArN} \cdot \text{NBi}(\text{SO}_4)_2$, which are very stable and can be heated in concd. H_2SO_4 at 100° for some time without much decompn., though ultimately decompn. ensues, with formation of N, $\text{Bi}_2(\text{SO}_4)_3$ and the phenolsulfonic acids. The compds. $(\text{ArN} \cdot \text{N})_2\text{BiCl}_6$ and $(\text{ArN} \cdot \text{N})_2\text{BiCl}_6$ could not be prepd. C. C. DAVIS

The reduction of alumina and other oxides by tungsten at high temperatures. H. v. WARTENBERG AND H. MOEHL. *Z. physik. Chem.* 128, 439-44 (1927).—A small rod of Al_2O_3 heated in a W-wire furnace failed to melt at 2100° (m. p. 2050°) but reacted to form a crust of fine black crystals on the rod, the heating filament decreasing in diam. and WO_2 depositing on the sides of the furnace. It was shown that this reaction could not be explained by the presence of O_2 in the N_2 atm. The phenomenon is explained by the vaporization of Al_2O_3 , a reaction between the gaseous Al_2O_3 and the W-filament to form Al and WO_2 and the migration of the WO_2 and the gaseous Al to the Al_2O_3 rod, where on account of a lower temp. the reaction at the filament reversed and W and Al_2O_3 formed. Similar results were obtained with MgO , ZrO_2 and ThO_2 , at somewhat different temps. These reactions are correlated with the Nernst approximation formula and found to be in agreement. The results are interpreted to be in confirmation of the former conclusion (*C. A.* 17, 2835) that ThO_2 in W lamps must be effective as Th, though within the W filaments ThO_2 can be found because of the retention of the WO_2 vapor. ROBERT F. MEHL

Notes on the composition and behavior of precipitated copper and iron sulfides. F. FEIGL. *Z. anal. Chem.* 72, 32-43 (1927).—A careful study of Cu sulfide ppts. formed in acid solns. shows that it is not yet positively known whether the ppt. is CuS or Cu_2S and S. When formed from alk. solns. the ppt. appears to be a mixt. of Cu_2S and CuS . In the case of the Fe salts it is fairly certain that $(\text{NH}_4)_2\text{S}$ ppts. Fe_2S_3 from ferric solns. but it is not so generally known that Fe_2S_3 is also formed when yellow $(\text{NH}_4)_2\text{S}_2$ is added to a ferrous soln. It is a curious fact that the ppt. now recognized as Fe_2S_3 behaves toward Zn soln. as if it were of this compn. but toward HgCl_2 it reacts as if it were FeS . Apparently the Fe_2S_3 can exist as $\text{FeS} \cdot \text{FeS}_2$ and this may be called, not tautomerism, but valence isomerism. W. T. H.

Germanium. XXII. The dihalides of germanium. F. M. BREWER AND L. M. DENNIS. *J. Phys. Chem.* 31, 1526-38 (1927).—An attempt to prepare GeCl_2 failed. GeBr_2 and GeI_2 as well as the bromoform were made as proven by analysis. Some properties of these compds. were detd. The dihalides possess strong reducing powers similar to those of tin. R. H. LAMBERT

Hydrates of aluminum nitrate. G. MALQUORI. *Atti accad. Lincei* [6], 5, 892-6 (1927).—The system $\text{Al}(\text{NO}_3)_3 \cdot \text{H}_2\text{O}$ was investigated between -27° (the cryohydric point) and the temp. at which $\text{Al}(\text{NO}_3)_3$ decompn. with liberation of HNO_3 . From -27° to 73.5° , the m. p. of $\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$ is in equil. with satd. solns. Above 73.5° , the soly. curve exhibits a sharp discontinuity, corresponding to the existence of 2 hydrates with less H_2O of crystn., viz., $\text{Al}(\text{NO}_3)_3 \cdot 8\text{H}_2\text{O}$ and $\text{Al}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$. The point

where the 2 curves meet has an abscissa corresponding to a ratio $\text{Al}(\text{NO}_3)_3/\text{H}_2\text{O}$ which is lower than that conforming to $\text{Al}(\text{NO}_3)_3 \cdot 8\text{H}_2\text{O}$. This indicates that $\text{Al}(\text{NO}_3)_3 \cdot 8\text{H}_2\text{O}$ undergoes partial fusion, decomp. into $\text{Al}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$ and its soln. All 3 hydrates have already been prepd. in other ways (cf. Seligman and Williams, *C. A.* 10, 2672; Inamura, *Mem. Coll. Sci. Kyoto* 4, 105(1919); cf. *C. A.* 14, 2451). C. C. DAVIS

The application to iron and neodymium oxides of a general method for the synthesis of silicates. A. DUBOIN. *Compt. rend.* 185, 116 7(1927).— SiO_2 and Nd_2O_3 are added to KF or KHF_2 , previously melted in a Pt crucible. After cooling the mass is fused with KCl and then extd. with H_2O . By fractional crystn. a fine, cryst. product is obtained corresponding to the formula: $\text{Nd}_2\text{O}_3 \cdot 3\text{K} \cdot 0.9\text{SiO}_2$. The method is applicable to Fe but it is more difficult to fractionate the product. E. G. V. B.

The *cis-trans* isomerism of metallic salts of the type $\text{R} \cdot \text{M}^n\text{X}_2$. F. KRAUSS AND F. BRODKORB. *Z. anorg. allgem. Chem.* 165, 73-8(1927).—Compds. of Pd of the type Py_2PdCl_2 and $(\text{C}_2\text{H}_5\text{NH}_2)_2\text{PdCl}_2$, where Py represents the pyridine mol., are produced in the two isomeric forms. They are mono-molecularly sol. in phenol. The yellow *trans*-diammine-dichloropalladium compd., $(\text{NH}_3)_2\text{PdCl}_2$, is similarly sol. in water. E. O. ELLINGSON

The nature of the luteo cobalt complex. WILHELM BILTZ. *Z. anorg. allgem. Chem.* 164, 245-55(1927).—A summary of the properties of the $\text{Co}(\text{NH}_3)_6^{3+}$ ion based on the x-ray spectroscopic (Meisel and Tiedge, *C. A.* 21, 3500), mol. vol. (Biltz and Birk, *C. A.* 17, 2683; 18, 1930; 20, 2924; Birk, *C. A.* 21, 677) and magneto-chemical (Rosenblum, *C. A.* 14, 1922) measurements. DAVID DAVIDSON

Ruthenium. X. The "isomeric" chlorides. J. I. HOWE. *J. Am. Chem. Soc.* 49, 2381-93(1927); cf. *C. A.* 20, 560.—There is no isomerism among the known complex chlorides of Ru. Salts of the series which has been considered to be $\text{M}_2\text{Ru}^{\text{III}}\text{Cl}_6$, contg. tervalent Ru, really contain quadrivalent Ru and have the formula $\text{M}_2\text{Ru}^{\text{IV}}\text{Cl}_6\text{OH}$. The so-called "aquo" series is actually the ordinary series of tervalent Ru; the salts of this series crystallize as monohydrates of the formula $\text{M} \cdot \text{Ru}^{\text{III}}\text{Cl}_5 \cdot \text{H}_2\text{O}$. In all of these salts the coordination no. of Ru is six. Claus' view that the blue soln. of reduced Ru contains Ru in bivalent form is again confirmed. LOUISE KELLEY

A separation of hafnium and zirconium by precipitation of the phosphates from sulfuric acid solution. J. H. DE BOER. *Z. anorg. allgem. Chem.* 165, 16-20(1927); cf. *C. A.* 20, 1153.—This method depends on the facts that Hf complexes are more easily decomposed than the corresponding ones of Zr and that $\text{Hf}_2(\text{PO}_4)_4$ is less sol. than $\text{Zr}_2(\text{PO}_4)_4$. The pptd. phosphates are divided into 2 equal parts. The first is dissolved in HF, repptd. as the hydroxides with either KOH or NaOH, filtered and washed free from F and phosphates and redissolved in concd. H_2SO_4 . The remainder of the ppt. is dissolved, directly, in concd. H_2SO_4 . The 2 solns., thus obtained, are united. Dilg. with H_2O ppts. the phosphates, the ppt. being richer in Hf than Zr. The process is repeated with the first fractions until pure Hf is obtained, while the metals in the mother liquors are pptd. with H_3PO_4 and may be used for a new fractionation. Pb-lined dishes were first used for the concd. H_2SO_4 solns. and as the quantities grew less, porcelain ones. In an actual expt. 860 g. of ignited phosphate, contg. 20% Hf, required 3 l. of concd. H_2SO_4 to dissolve the pptd. hydroxides and 9 l. for the remaining phosphates. Pure Hf can be obtained by 12-15 fractionations, while 26 are required to obtain pure Hf from a $\text{Zr}_2(\text{PO}_4)_4$ soln. contg. 2% Hf, by the pptn. of the phosphates from an oxalic acid soln. A fractionation essentially similar to this, described by Bardet and Toussaint (*C. A.* 19, 2779), is difficult because of the necessity for using large quantities of concd. H_2SO_4 . J. BALOZIAN

The separation of hafnium and zirconium by fractional decomposition of the complex phosphato fluorohafnates and zirconate. J. H. DE BOER AND P. KOETS. *Z. anorg. allgem. Chem.* 165, 21-30(1927); cf. *C. A.* 20, 1153.—Hf and Zr complexes of F and H_2PO_4 are fractionally decomposed with borax, F combining with B and the 2 phosphates being pptd. The phosphates were extd. from the mineral malacon by treating with concd. H_2SO_4 , H_2O , H_3PO_4 and HCl in a cast-Fe vessel. In an actual fractionation, carried on in wooden app., 4.5 kg. of phosphates, from other sec. fractions and contg. 20% Hf, is dissolved in 10 l. concd. HCl, 3.5 kg. moist NH_4HF_2 (2 kg. dry) and 30 l. H_2O . After adding 1.5 l. H_3PO_4 (1:4), the temp. is lowered to 30° and the first fraction of phosphate (3.3 kg. pyrophosphates, contg. 25% Hf) is pptd. with 1.75 kg. borax and filtered. The second (1 kg., contg. 7% Hf) is pptd. with 0.75 kg. more borax, Hf and Zr being exhausted in the mother-liquor. These combined with others, totaling 7 kg., were dissolved and repptd., the first fraction giving 5 kg., contg. 30% Hf. This repeated 7 times with first fractions, gives 85% Hf (apparent) and 60% Hf (actual). Further purification is impossible, as small glass app. cannot be used. The Hf content

of samples is detd. with a vacuum Röntgen spectrograph. The influence of the hydrolysis of the complex, resulting in the removal of H_3PO_4 , the formation, in part, of the double fluorides of Hf and Zr, and the hydrolysis of the pptd. phosphates are discussed. The presence of Ta influences the $L_{\alpha 1}$ -lines of Hf so that the results seem lower than they actually are.

J. BALOZIAN

The different stabilities of similarly formed complexes of hafnium and zirconium. J. H. DE BOER. *Z. anorg. allgem. Chem.* 165, 1-15 (1927); cf. *C. A.* 20, 1153.—Although the ability of Zr and Hf to form complexes of the same type is about the same, the slight difference in their ionic vol. indicates that the stabilities of these, when similarly formed, are different. Zr combines somewhat more easily with other ions than does Hf, while complexes of Hf are somewhat more readily decomposed than those of Zr. In acid solns. this is found to be true with oxalic, concd. H_2SO_4 , concd. H_3PO_4 (the phosphates being pptd. on dilg. with H_2O), phosphofluorozirconic (hafnic) acid, concd. HNO_3 , concd. HCl, the complex fluorides (e. g., $(\text{NH}_4)_2\text{HfF}_6$) and lakes. $\text{Hf}_2(\text{PO}_4)_4$ and $\text{Zr}_2(\text{PO}_4)_4$ ppt. on adding H_2O , but are redissolved by HF. Complexes formed in concd. HNO_3 are less stable than those in concd. H_2SO_4 ; their phosphates are no longer sol. in it, but the arsenates are sol. Complex formation in concd. HCl is even less than in concd. HNO_3 , but in very concd. HCl compds. of the type $\text{H}_2(\text{HfOCl}_4)$ are formed. Alkali carbonates ppt. from Hf and Zr oxychloride solns. a complex which is sol. in excess carbonate. Here again, the Zr complex is more easily formed and the Hf more easily decompd. This is also found to be true of many org. hydroxyl compds. (the poly alcs. and hydroxy acids). Perzirconate and perhafnate solns. (from the metal, H_2O_2 and NaOH) are gradually decompd. on heating, $\text{Hf}(\text{OH})_4$ and $\text{Zr}(\text{OH})_4$ being pptd. The soln. is richer in Zr, the ppt. in Hf and the Zr compd. is more stable than the Hf. Alc. partially crystallizes these salts, also richer in Hf. Hf compds. are more easily decompd. by heat than the Zr. The ionic vol. of Hf is greater, while the at. vol. of Zr is greater. Arsenates are more sol. than phosphates, but other chem. properties of both are similar, the soly. of the Hf salts being less than that of the Zr salts.

J. BALOZIAN

Tin salts of organic acids. E. ELÖD AND F. KOLBACH. *Z. anorg. allgem. Chem.* 164, 297-312 (1927).—Alkali stannous and stannic salts of formic acid were obtained by reaction of the alkali salts of the acid with Sn halides in 25% formic acid soln. They were sepd. by means of fractional crystn. and with a polarization microscope. The substances are strongly birefringent, six-sided crystals. They have a noticeable formic acid tension at room temp. The formula assigned was of the type $\text{Na}_2[\text{Sn}(\text{HCO}_2)_4] \cdot 5\text{H}_2\text{O}$. The Sn acetate salts were prepd. in AcOH soln.: $\text{Sn}_2\text{O}(\text{CH}_3\text{CO}_2)_2$ and $\text{Na}_2/\text{Sn}(\text{CH}_3\text{CO}_2)_6$. The reaction of 1 mol. SnCl_4 with 2 mols. $(\text{NH}_4)_2\text{C}_2\text{O}_4$ in CH_3OH or glacial AcOH yielded $[(\text{NH}_4)_2\text{C}_2\text{O}_4]_2\text{SnCl}_2 \cdot \text{H}_2\text{O}$. The Na, K and NH_4 formates, acetates and oxalates were obtained without difficulty, but the K salt analogous to Na dichlorostannoöxalate was not obtained. Instead, $(\text{KO}_2\text{C}\cdot\text{CO}_2)_2\text{SnO}_2\text{C}\cdot\text{CO}_2\text{Sn}(\text{O}_2\text{C}\cdot\text{CO}_2\text{K})_2$ was found. A possible structure assigned to the stanñoöxalate is $\text{Na}_2\text{—}\left[\text{Sn}\cdot\left(\text{O}_2\text{C}\cdot\text{CO}_2\text{N}\right)_2\right]_2$, giving to tin the coördination number 6. C. E. P. JEFFREYS

The inter-relationships of the sulfur acids. HENRY BASSETT AND R. G. DURRANT. *J. Chem. Soc.* 1927, 1401-68.—A study of the behavior of many of the S acids and an attempt to explain the genesis of polythionates in the Wackenroder reaction and in the decompn. of thiosulfates by acid. The first products of the hydrolysis of S are probably equiv. quantities of H_2S and the very unstable sulfoxylic acid, $(\text{HO})_2\text{S}$, which is immediately transformed into H_2S and H_2SO_3 . The reaction probably takes place between $(\text{HO})_2\text{S}$ acting as an oxidizing agent and its anhydroacid, $\text{HO}\cdot\text{S}\cdot\text{O}\cdot\text{H}$, as a reducing agent to form H_2S and pyrosulfurous acid, $\text{H}_2\text{S}_2\text{O}_5$. The reversal of this reaction would be the first step in the Wackenroder reaction. Evidence for the above conclusions is based on the behavior of Na formaldehydesulfoxylate, a deriv. of $(\text{HO})_2\text{S}$. The term "hydrosulfite" to designate the salt $\text{Na}_2\text{S}_2\text{O}_4$ is suggested as preferable to "hyposulfite." The factors which det. color in simple S compds. are considered. The yellow color of certain simple S compds. is ascribed to the presence of a S atom with a 10-electron sheath. The decompn. of $\text{H}_2\text{S}_2\text{O}_4$ is discussed and representative equations are suggested. The autooxidation of H_2SO_3 is considered. The equation $\text{H}_2\text{SO}_3 + \text{H}_2\text{S}_2\text{O}_5 \rightleftharpoons \text{H}_2\text{SO}_4 + \text{H}_2\text{S}_2\text{O}_4$ is recommended as probably most expressive of the reaction. The decompn. of thiosulfuric acid is discussed at great length. In all probability the reaction $\text{H}_2\text{S}_2\text{O}_3 + \text{H}_2\text{O} \rightleftharpoons \text{H}_2\text{SO}_4 + \text{H}_2\text{S}$ does not proceed in either direction, although the sulfate may result from the trithionate formed. $\text{H}_2\text{S}_2\text{O}_3$ decomps. according to the 3 following reactions: (a) $\text{H}_2\text{S}_2\text{O}_3 \rightleftharpoons \text{H}_2\text{SO}_4 + \text{S}$; (b) $\text{H}_2\text{S}_2\text{O}_3 \rightleftharpoons \text{H}_2\text{S} + \text{H}_2\text{S}_4\text{O}_6$; (c) $2 \text{H}_2\text{S}_2\text{O}_3 \rightleftharpoons \text{H}_2\text{O} + \text{H}_2\text{S}_4\text{O}_6$. Reaction (a) takes place to the

greatest extent when acids act on thiosulfates. It is probably a bimol. reaction involving a sulfur unit S_2 . Reaction (b) is considered an essential step in the Wackenroder reaction. Contrary to the usual view in favor of $H_2S_6O_6$, $H_2S_3O_6$ is considered the primary thionic acid both in the Wackenroder reaction and in the thiosulfate decompn. The hydrolysis of $H_2S_3O_6$ is discussed. Reaction (c) takes place in very acid solns. The anhydro-acid thus formed bleaches methylene blue, by which it is converted into tetrathionic acid. Evidence of the actual existence of this acid, which might be called dithiopyrosulfuric acid, is presented. The structural formulas of the polythionates and their behavior on hydrolysis in acid and in alk. soln. are considered. A comprehensive summary is impossible in a short space. The literature is referred to and discussed throughout the article, and expts. are described to support the views of the authors.

RUBY K. WORNER

The reaction between manganese salts and sodium hypochlorite in the presence of certain other salts. B. E. DIXON AND J. L. WHITE. *J. Chem. Soc.* 1927, 1469-76.—A study of the effect of variations in the conditions of the expt. on the conversion of Mn salt into permanganate. In the presence of Cu salt, the max. amt. of $KMnO_4$ was formed at the end of 3 min. boiling and when $1/3$ of the total O_2 had evolved. The blue-violet color described by Heslinga (cf. *C. A.* 16, 2817) and attributed to the presence of Fe is due to the action of alkali on permanganates to form manganates. Cu and Co salts have very different effects: the alk. concn. is relatively unimportant with Co, although large concns. hinder permanganate formation; with Cu, it is a critical factor. With Co, the proportion of Mn salt converted decreases regularly with increase of amt. of Mn salt used; with Cu, the results are erratic, but under favorable conditions, the conversion can be quant. irrespective of the amt. of Mn salts present. In the presence of Co, the reaction is appreciably reversible, whereas with Cu it is negligibly so. The Cu ppt. soon forms an easily sepd. dense black residue which has little effect on $NaOCl$ decompn. after the permanganate has formed; the ppt. of Co is flocculent, finely divided, and difficult to filter, and throughout the reaction promotes the evolution of O_2 from $NaOCl$. Increase in the ratio of Co to Mn causes a decrease in the amt. of permanganate formed; for moderate amts. of Mn, an equiv. amt. of Cu gives the best results, although the most effective ratio is not well defined. The limit of delicacy for detection of Mn depends apparently on the amt. of permanganate capable of producing a visible tint. A large quantity of $NaOCl$ masks the color. Mn equiv. to 0.002 mg. MnO was detected. The probable mechanism of the reaction is outlined.

RUBY K. WORNER

The action of hydrogen on tin salts at high temperatures and pressures. V. IPAT'EV AND V. NIKOLAI'EV. *Compt. rend.* 185, 462-3(1927); cf. *C. A.* 20, 1572.—Compds. of tin are reduced to a variety of products in the presence of H at high temps. and pressures varying from 270° to 380° and 38 to 260 atm., resp. $Sn(OH)_4$ is reduced to metallic tin; $Sn(SO_4)_2$ to $SnSO_4$ or SnS_2 and SnS ; $SnCl_4$ to $SnCl_2$ and SnO . When a mixt. of $SnCl_4$ and $AgCl$ is heated (380° , 260 atm. 4 hrs.) small amts. of Sn and Ag are obtained, but most of the tin is eliminated in the form of $Sn(OH)Cl$. E. O. E.

The reduction of arsenic compounds in acid and in alkaline solution by sodium hyposulfite. Production of sodium arseno-hyposulfite. WALTER FARMER AND J. B. FIRTH. *J. Chem. Soc.* 1927, 2019-21; cf. *C. A.* 20, 1186.— As_2S_3 is prepd. by the reduction of certain As compds. by Na hyposulfite, 2 intermediate complex compds. are apparently formed, one of which is a decompn. product of the other. The primary intermediate complex, Na arseno-hyposulfite, $Na_3As(S_2O_4)_3$, is obtained by the action of $Na_2S_2O_4$ on Na_3AsO_3 or on Na_3AsO_4 under proper conditions. Decompn. of $Na_3As(S_2O_4)_3$ in alk. soln. in the presence of Na_2SO_3 by neutralizing the alkali is thought to lead to the formation of a secondary intermediate complex, Na arseno-thiosulfate, $Na_3As(S_2O_3)_3$, which rapidly decompn. into As_2S_3 .

RUBY K. WORNER

Contribution to the knowledge of Nessler's reagent. S. M. NAUDE. *Z. physik. Chem.* 125, 98-110(1927).—The ternary system $KI-HgI_2-H_2O$ was investigated. In order to analyze the solid phase Hg was pptd. electrolytically on a Pt dish, the complex salts were decomposed by boiling with a strongly alk. alc., the I was pptd. with 0.1 N $AgNO_3$ and the excess was back-titrated. The pptd. solid phase consists of $KHgI_3 \cdot 1/2 H_2O$.

J. A. SZILARD

Titanium sesquioxide. GULBRAND LUNDE. *Z. anorg. allgem. Chem.* 164, 341-4 (1927).— TiO_2 heated in a stream of H_2 for 20 min. at 1000° lost 4.64% in wt., whereas the transition $TiO_2 \rightarrow Ti_2O_3$ requires 10%. According to the method of Friedel and Guerin, a mixt. of H_2 and $TiCl_4$ is passed over TiO_2 at about 650° . An amorphous blue-black product and, in very small quantities, a red-violet sublimate were obtained. The temp. was then raised to 1000° and the product heated in the $TiCl_4$ stream for 30

min. X-ray investigation indicates that the product obtained is identical with that of Friedel and Guerin. Axial ratio = 1.320. $d = 4.605$ (Friedel and Guerin: $c/a = 1.316$; $d = 4.601$). RUBY K. WORNER

Besson's supposed phosphorus suboxide, P_2O . I. J. CHALK AND J. R. PARTINGTON. *J. Chem. Soc.* 1927, 1930 6.—Attempts to prep. the supposed suboxide by the action of PCl_3 on H_3PO_3 according to Besson's directions yielded apparent mixts. of variable compn. and with properties different from those ascribed to the supposed P_2O . They appear to consist of finely divided amorphous P and adsorbed H_3PO_3 . If prepd. at moderately low temps., solid H phosphides may also be present. The amt. of O_2 is insufficient to account for the formula P_2O and H_2 is always present. The mechanism of the reaction is probably a decompn. of H_3PO_3 to form phosphine which then reacts with PCl_3 to form P and, if the temp. is low, solid II phosphide. RUBY K. WORNER

An investigation of the complex chemical behavior of beryllium salts. V. R. FRICKE AND O. RODE. *Z. anorg. allgem. Chem.* 163, 31-9 (1927); cf. *C. A.* 21, 1601.—The complex chem. behavior of Be salts has been studied by a thermal analysis. The app. used is described. Cooling curves detd. the m. p. of mixts. $BeCl_2$ was studied with various nitriles such as isocaprotrile, propionitrile and toluonitrile. Naphtho- and acetonitriles could not be used because of their ease of charring. Aniline and nitrobenzene also carbonize readily. R. H. LAMBERT

The law of the non-polar atom linking and the coordination compounds of the platinum metals. H. REMY. *J. prakt. Chem.* 114, 337-47 (1926).—The law of the non-polar atom linking, which was shown previously (cf. *C. A.* 15, 300) to be valid for O acids, is extended for the coordination compds. of the Pt metals. The existence of the recently discovered chloroferrates with coordination nos. of 5 and 7 was anticipated by the law of the non-polar atom linking. J. A. SZILARR

A study of the cyanides of the platinum metals. The cyanides of ruthenium. F. KRAUSS AND G. SCHRADER. *Z. anorg. allgem. Chem.* 165, 59-72 (1927).—The salts $K_2Ru(CN)_6$ and $K_4Ru(CN)_6 \cdot 3H_2O$ were examd. and the following compds. prepd. and described: $Cu_2Ru(CN)_6 \cdot xH_2O$, $Cu_2Ru(CN)_6 \cdot 4NH_3$, $Ag_3Ru(CN)_6 \cdot xH_2O$, $Ag_4Ru(CN)_6 \cdot 3NH_3$. The brucine and strychnine salts formed by the action of these alkaloids on the acid $H_4Ru(CN)_6$ are discussed. It is concluded that the earlier assumption of the bivalence of Ru in the double cyanides is corroborated. R. O. ELLINGSON

Platinum compounds of hydrazine and isonitriles. I. A. CHUGAEV, M. S. SKANAVI-GRIGORÉVA AND A. POSNYAK. *Ann. inst. platine* 1926, No. 4, 299-305.—The authors

describe compds. of the type

$$\begin{array}{c} \text{CH}_3\text{NC} \qquad \qquad \text{CH}_3\text{NC} \\ \diagdown \qquad \diagup \qquad \diagdown \qquad \diagup \\ \text{CH}_3\text{NC} \cdots \text{Pt} \cdots \text{NH} \cdot \text{NH}_2 \cdots \text{Pt} \cdots \text{CNCH}_3 \\ \diagup \qquad \diagdown \qquad \diagup \qquad \diagdown \\ \text{CH}_3\text{NC} \qquad \qquad \text{CH}_3\text{NC} \end{array} \quad \text{X}_2 \cdot n\text{H}_2\text{O}.$$

K_2PtCl_6 with CH_3NC and $N_2H_4 \cdot H_2O$ gives $8CNCH_3 \cdot Pt_2 \cdot 2N_2H_3 \cdot Cl_2 \cdot 8H_2O$, red prisms, very sol. in H_2O , less sol. in alc., emerald-green when heated. The Cl is ionic. The iodide $[4CH_3NC \cdot Pt_2 \cdot 2N_2H_3]I_2 \cdot 4H_2O$ is a cryst., emerald-green compd., very sol. in H_2O . The perchlorate forms strawberry-red needles with 2 mols. of water of crystn. The azide forms dark blue needles. With concd. HCl the chloride forms $4CH_3CN \cdot Pt_2 \cdot 2N_2H_3 \cdot 2HCl \cdot Cl_2$, almost colorless needles, little sol. in H_2O , sol. in alkalis. Red compds. are formed with isonitriles and caustic. K_2PtCl_6 treated with C_2H_5NC , $N_2H_4 \cdot H_2O$ and $NaNO_3$ forms $[8C_2H_5NC \cdot Pt_2 \cdot 2N_2H_3](NO_3)_2 \cdot 2H_2O$, red prisms, sol. in H_2O ; perchlorate, red needles little sol. in H_2O ; iodide, yellow needles, chloroplatinate, red crystals; chloride, orange-yellow needles. With concd. HCl is formed $4C_2H_5NC \cdot Pt_2 \cdot 2N_2H_3 \cdot Cl_2 \cdot 2HCl$, a white ppt. WILLIAM M. MALISOFF

A new series of acido-amido-tetrammine derivatives of quadrivalent platinum. I. A. CHUGAEV. *Ann. inst. platine* 1926, No. 4, 37-43.—C. preps. $[Pt_4(NH_3)(NH_2) \cdot Cl]Cl_2$ by the action of alkali on $[Pt_5(NH_3)Cl]Cl_4$. This compd. requires 1 g. equiv. of acid for neutralization and turns phenolphthalein red. Similar characteristics are shown by $[Pt_4(NH_3)(NH_2) \cdot Cl]Br_2$ and $[Pt_4(NH_3)(NH_2) \cdot Cl](NO_3)_2$. Analogously another series $[Pt_4(NH_3) \cdot NH_2 \cdot Br]Br_2$ is prepd. by the action of NH_4OH on the pentammine bromide. Analyses substantiate the above formulas. W. M. M.

The chemistry of solid substances. Polymorphic transitions in HgI_2 and S (KOHLSCHÜTTER) 2. Valence and addition compounds (PERRIN) 2. Ternary systems: $Na_2CO_3-NaHCO_3-H_2O$ (HILL, BACON) 2.

7—ANALYTICAL CHEMISTRY

WILLIAM T. HALL

Electrometric analysis. WILLI CLAUD. *Metall. u. Erz* 22, 7-12(1925); *J. Inst. Metals* 33, 415.—The theory, principles, app. and review of the subject are given.

E. J. C.

Studies on the precision of volumetric analysis. III. Standards for alkali hydroxide solutions. K. O. SCHMITT. *Z. anal. Chem.* 71, 273-90(1927); cf. *C. A.* 21, 1775.—Oxalic acid and its acid salts have been recommended as standards for bases with phenolphthalein as indicator. If, however, as Bruhns has recommended, the oxalate ion is pptd. by the addn. of Ca^{++} , an equiv. amt. of mineral acid is formed in the soln. and an indicator like dimethyl yellow can be used in place of the phenolphthalein and thereby the carbonic acid error is avoided. Rigorous tests of such a procedure show that with pure oxalic acid or with K tetroxalate, it is, in fact, possible to carry out such titrations with great accuracy but it is necessary to have the soln. almost exactly neutral when pptn. with CaCl_2 is accomplished. A preliminary titration is, therefore, necessary. Directions are given for recrystg. and prepg. pure oxalic acid and K tetroxalate.

W. T. H.

The influence of impurities from the containing glass on the titer of caustic soda solutions (fixanal solutions). K. SEILER. *Schweiz. Apoth. Ztg.* 65, 229-33(1927); cf. *C. A.* 19, 1389; 20, 1188, 1771.—Results of renewed expts. tend to show that deviations between the values obtained with Me orange and phenolphthalein are caused by impurities originating from the glass.

S. WALDBOTT

Methods of expressing strengths of commercial caustic soda and soda ash. ANON. *Analyst* 52, 529-60(1927).—"Newcastle" and "Liverpool" or "New York and Liverpool" degrees and percent Na_2O are often used indiscriminately in the trade. It would be best to drop such terms and report the % Na_2O equiv. to "English test" as per Lunge's tables.

W. T. H.

A simple method for the potentiometric, differential titration. W. A. ROTH. *Z. Elektrochem. angew. physik. Chem.* 33, 127-9(1927).—The method of MacInnis and Jones (*C. A.* 21, 367) is simplified by using a glass-filtering crucible to keep the soln. around the comparison electrode isolated from the bulk of the soln. that is being titrated. Satisfactory elec. connection is made through the sintered glass bottom of the crucible. The method is illustrated by some typical titrations of AgNO_3 with NaCl and of acid with base.

W. T. H.

The use of borax as a standard in acidimetry. T. MILOBEDZKI AND MLEF. H. KAMINSKA. *Bull. soc. chim.* 41, 957-60(1927).—Borax has not been used as much as it deserves for the standardization of acids. To obtain $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$ it is necessary to have the first crystals appear at above 60° from the satd. soln. The use of methyl red as an indicator is recommended and some interesting observations are made with respect to the difficulty of prepg. NaOH solns. absolutely free from carbonate.

W. T. H.

Potassium permanganate as an acidimetric standard. THEODOR HECKZO. *Z. anal. Chem.* 71, 332-8(1927).—To a measured vol. of standard KMnO_4 soln. in an Erlenmeyer flask, add a slight excess of 0.2 N H_2SO_4 and then 2 or 3 times as much H_2O_2 as is theoretically necessary to accomplish the complete reduction of the MnO_4^- to Mn^{++} . After the reduction is complete titrate the excess acid with the base, using a slight excess and finishing the titration by the addition of H_2SO_4 , using methyl red as indicator.

W. T. H.

The use of yellow mercuric oxide and of metallic mercury as standards in volumetric analysis. I. M. KOLTHOFF AND L. H. VAN BERK. *Z. anal. Chem.* 71, 339-49(1927).— HgO can be dissolved in KI or KBr and water and the soln. titrated with HCl . After proper corrections have been applied, the results are within 0.1% of the truth but the method is certainly not as accurate as standardization of an acid against borax. To carry out the standardization, dissolve 1 g. of HgO and 20 g. of neutral KBr in 25 cc. of hot water, add phenolphthalein and titrate with acid until the soln. is colorless. Then add methyl red and finish the titration at the boiling temp. $\text{Hg}(\text{SCN})_2$ is so slightly ionized that a soln. of a mercuric salt can be titrated with KCNS with ferric alum as indicator. At high room temps., however, there is a slight error due to a slight ionization of the $\text{Hg}(\text{SCN})_2$. No correction is needed at 15° but at higher temps. a correction can be made by making use of a satd. soln. of $\text{Hg}(\text{SCN})_2$ having the same vol. and the same content of HNO_3 and ferric salt as the soln. to be titrated. Deduct from the vol. of KCNS used in the analysis, the vol. required to give an end

point with the $\text{Hg}(\text{SCN})_2$ soln. HgO can be used as standard for this titration but it is somewhat better to use redistd. Hg . W. T. H.

The use of indicators: Gillespie's method. F. J. WATSON. *Chem. Eng. Mining Rev.* 19, 381-3(1927).—The theory of the method of G. is outlined and its practical advantages are shown (cf. C. A. 14, 1499, 1797). W. T. H.

New indicators in argentometry. O. TOMIČEK. *Časopis Československého Lékařnictva* 5, 1-3, 15-6; *Chem. Zentr.* 1926, II, 269-70. Argentometric detns. of chlorides, bromides and iodides according to Mohr and Volhard and in the presence of fluorescein and eosin according to Fajans and Wolf are compared. The Volhard and Fajans methods give practically the same results. In titrations of bromides and particularly of iodides, the Fajans method gives a more distinct end point and is more precise than the Mohr method. For important pharmaceutical detns. of alkali chlorides, bromides and iodides, the method of Fajans is recommended. C. C. DAVIS

Note on cobalt thiocyanate as a microchemical reagent. JUSTIN GREGER. *Biochem. Z.* 185, 438-41(1927).—A 20-40% soln. of $\text{Co}(\text{SCN})_2 \cdot 2\text{H}_2\text{O}$ is recommended. The $\text{Co}(\text{SCN})_2 \cdot 2\text{H}_2\text{O}$ is prepd. by mixing a concd. soln. of CoSO_4 with an alc. soln. of KSCN and evapg. carefully when the substance seps. as blue crystals. The soln. is a very valuable reagent in the examn. of flours and foodstuffs. It dissolves the water-sol. portions of starch while the tissues become clarified and variously colored. S. M.

The effect of gelatin on titration curves of various acids. ERNEST LITTLE. *J. Am. Pharm. Assocn.* 16, 414-7(1927).—Various acids were titrated in the presence of and in the absence of gelatin. Curves were constructed for each class. The curves show surprisingly little effect due to the gelatin. L. E. WARREN

The use of chromate solutions for comparison in colorimetric determinations. HOLGER JØRGENSEN. *Biochem. Z.* 186, 485-9(1927).—Dil. aq. solns. of chromate and dichromate do not have a definite color tone and cannot therefore be used either as H-ion indicators or as colorimetric standards. However, if a buffer of definite p_H is used as the solvent in place of H_2O , the chromate and dichromate solns. assume definite color tones, and these may find varied use in colorimetric work. S. M.

Investigation of the green solutions of potassium chrome alum with respect to the specific gravity. M. A. RAKUZIN AND ADELHEID ROSENFELD. *Chem.-Ztg.* 51, 638(1927).—The d. of the green soln. of chrome alum was detd. at different intervals from a content of 5% to that of the satd. soln. contg. 114.2% of the wt. of solvent. At 5% the d. is 1.0378 at 20° and of the satd. soln. it is 1.6683. Because of the effect of hydrolysis the increase in d. is not perfectly regular. W. T. H.

Spectrum analysis in metallurgy; some further notes. J. R. GREEN. *Chemistry and Industry* 46, 745-6(1927).—For the detn. of small quantities of certain elements, spectral analysis is invaluable and when properly carried out the results agree with those obtained by the ordinary methods of wet analysis. W. T. H.

Experimental researches on quantitative spectral analysis of metallic alloys. TRAJAN NEGRESCO. *Séparate*, Les Presses Universitaires de France, Paris 1927, 120 pp.—This most exhaustive study of the various factors concerned in the production of suitable spectra shows to what extent the analytical chemist can make use of spectral analysis in detg. the constitution of alloys. The sources of error are pointed out and the theoretical aspects discussed. W. T. H.

Analytical commission of the platinum institute. I. Instructions for the reception of platinum ore. S. F. ZHEMCHUZHNI, O. E. ZVYAGINTZEV, B. G. KARPOV, V. V. LEBEDINSKII AND N. I. PODKOPAEV. *Ann. inst. platine* 1926, No. 4, 339.—(1) Two g. of ore are melted with 7-10 g. pure Ag and flux to remove V, W, Fe, etc. (2) At the same time Ag and Pb are dissolved by HNO_3 and estd. (3) A mixt. of HF and HNO_3 is used to dissolve W which is separately detd. The operations require 1 hr. II. **Method of rapid analysis of platinum ore.** S. F. ZHEMCHUZHNI, O. E. ZVYAGINTZEV, B. G. KARPOV, V. V. LEBEDINSKII AND N. I. PODKOPAEV. *Ann. inst. platine* 1926, No. 4, 340-3.—Details are given for the above procedure. III. **Method of analysis of platinum ores.** IV. **Method of analysis of platinum ores for copper and iron.** V. **Method of complete analysis of platinum ore.** A. T. GRIGORIEV, S. F. ZHEMCHUZHNI, O. E. ZVYAGINTZEV, B. G. KARPOV, N. S. KURNAKOV, V. V. LEBEDINSKII AND N. I. PODKOPAEV. *Ann. inst. platine* 1926, No. 4, 343-55.—Dissolve in aqua regia, filter, evapg. the filtrate with HCl , dil. with H_2O , introduce Cl_2 at 40° (to form IrCl_4 and prevent reduction of Au), evapg. at 38-42°, dil. and ppt. at 30° with NH_4Cl (Pt and Ir in ppt.). To a portion of the filtrate add dimethylglyoxime in boiling water (Au and Pd in ppt.). Reduce the new filtrate with Zn and HCl (Cu, Rh, rest of Ir in ppt.). The last filtrate contains Fe, which may be pptd. as the hydroxide. To the filtrate from the pptn. of Pt and Ir by NH_4Cl add concd. HNO_3 (to decompose NH_4Cl), dissolve

the residue in water and digest at 80–100° with alkaline NaNO_2 . The ppt. consists of gold and non-noble metals. Evap. the filtrate, contg. Rh, Ir, Ru, Pt and Pd with HCl to remove HNO_3 , ppt. the Pd by $\text{Hg}(\text{CN})_2$ and the rest of the Pt and Ir by NH_4Cl , then all the metals with Zn. Remove the Zn and redissolve in aqua regia, pptg. the Ir with NH_4Cl and again reducing the filtrate with Zn to get Rh. All Ir ppts. are reduced to metal which is melted with soda and dissolved in dil. HCl. Ir oxide remains as ppt., while Ru goes into soln. and may be sepd. by Zn. VI. Method of analysis of first insoluble residue obtained on dissolving platinum ore with aqua regia. S. F. ZHEMCHUZHNI, O. E. ZVYAGINTZEV, B. G. KARPOV, V. V. LEBEDINSKII AND N. I. PODKOPAEV. *Ann. inst. platine* 1926, No. 4, 355–9.—Treat the ppt. with boiling NH_4OAc and NI_3 soln. to remove PbSO_4 and AgCl , then melt with pptd. Ag and borax. Dissolve the Ag from the Ag residue with H_2SO_4 and melt the Os-Ir residue with Zn in a H atm. or under a mixt. of KCl and NaCl. Dissolve the melt in water, add HNO_3 and HCl and distil OsO_4 . Neutralize the residue with NaOH in excess and distil Ru in a stream of Cl with further additions of NaOH. The Ru is worked up by pptn. with Mg. After the distn. of the Ru acidify the residue, filter, oxidize the filtrate with Cl and ppt. with NH_4Cl , continuing as in the general method for small amts. of Ir, Pd and in the final filtrate for Rh, pptd. by Zn, melted and cooled in a stream of CO_2 . WILLIAM M. MALISOFF

Determination of carbon in iron and steel by the barium hydroxide method. GUSTAV THANHEISER and PRYTER DICKENS. *Mitt. Kaiser-Wilhelm Inst. Eisenforsch. Düsseldorf* 9, 239–45 (1927).—An app. is shown which is especially suited for the analysis of low-C materials but is suitable for other materials contg. more C. The app. can be used for the gravimetric detn. of C as BaCO_3 or for the titration of the BaCO_3 ppt. The results shown agree well even when as little as 0.005% of C is present.

W. T. H.

New method of quantitative analysis applicable to a mixture of rare earths. EUGENE DELAUNEY. *Compt. rend.* 185, 354–7 (1927).—The variation of the breadth of the absorption bands in the visible spectra can be used to det. certain elements. Thus with solns. contg. Nd or Pr curves can be constructed showing how broad the bands should be for a given content of the element.

W. T. H.

The evolution of mineral substances and the analytical applications. A. JOUNIAUX. *Bull. soc. chim.* 41, 905–19 (1927).—A discussion of the various stages which a substance undergoes in nature before stable crystals are formed, with the idea that an exact knowledge of the principles underlying such transformations ought to be helpful to the analytical chemist.

W. T. H.

The analysis of silicate slags. T. P. COLCLOUGH. *J. Soc. Glass Tech.* 11, 177–84 (1927).—The high content of bases in slags increases the danger of dehydrating SiO_2 at temps. above 105°. The sample of slag is moistened with H_2O and heated to boiling before adding HCl and a little HNO_3 . Fe_2O_3 , Al_2O_3 and P_2O_5 are pptd. by NH_4OAc , the Mn being detd. as Mn_3O_4 in the filtrate after the addn. of Br $_2$. The estn. of CaC_2O_4 by titration with KMnO_4 is considered better than ignition and weighing as CaO. P_2O_5 is detd. on a fresh 0.5 g. sample. After the removal of SiO_2 , NH_4OH is added to the filtrate until the $\text{Fe}(\text{OH})_3$, etc., just begins to ppt. and then 2–3 cc. excess. The soln. is boiled. HNO_3 is added until the ppt. is almost dissolved and then 12 cc. in excess. The soln. is cooled to 75° and 40 cc. of a 10% soln. of neutral NH_4 molybdate are added. After settling the yellow ppt. is weighed and calcd. to P_2O_5 by the factor 0.377. S may be present both as sulfide and SO_4 . The sulfide S can be expelled by boiling the sample with HCl. It is recommended that the BaSO_4 ppt. be allowed to stand 24 hrs. before filtering. For rapid control method for blast-furnace slag the CaO is detd. in the filtrate from the SiO_2 , $\text{Al}(\text{OH})_3$, $\text{Fe}(\text{OH})_3$, etc., ppt. together. For open-hearth slags the detn. of the FeO by titration in the sample dissolved in 1:3 H_2SO_4 and some HF serves as an index of the slag condition. For elec. furnace slags the KSCN colorimetric method is suggested for total Fe.

H. F. K.

The analysis of fluorspar. BRAUER and RUTHSATZ. *Chem.-Ztg.* 51, 618–9 (1927).—Drawe (C. A. 19, 2613) recommended a method which is essentially that used by B. and R. for some years and depends upon the indirect detn. of the F combined with Ca. The method is good but if BaSO_4 is present, as frequently happens, boiling with Na_2CO_3 will lead to the erroneous conception that all of the SO_4 comes from CaSO_4 . Also in the residue, the Ca cannot be detd. in such a case without prior removal of Ba. The direct detn. of F by treatment with SiO_2 and H_2SO_4 with volatilization as H_2SiF_6 , although not altogether accurate, is better than not to det. F at all.

W. T. H.

New methods for the determination and separation of metals with the aid of 8-hydroxyquinoline. IV. Determination and separation of cadmium. R. BERG. *Z.*

anal. Chem. **71**, 321-31(1927); cf. *C. A.* **21**, 2630.—The difficult soly. of the compds. of Cu, Zn and Cd with 8-hydroxyquinoline in dil. AcOH solns. permits the sepn. of these cations from Mg^{++} . The same principle permits the sepn. of Cu and Cd since the latter is not pptd. if the AcOH content is increased. In caustic alkali solns., Cd can be sepd. from cations other than those mentioned above, by pptn. with 2-hydroxyquinoline. **V. Determination and separation of aluminum.** *Ibid.* 369-80.—The presence of org. material often makes the detn. of Al difficult by the usual methods and the same is true of the presence of other cations whose salts are easily hydrolyzable. By the reagent, 8-hydroxyquinoline, however, Al can be pptd. even in tartrate solns. The resulting Al ppt. differs from the quinoline salts of Cu, Mg, Zn and Cd by being readily sol in NaOH solns. and unlike Mg, a ppt. is obtained in the presence of dil. AcOH. The Al ppt. can be weighed after drying at 110° or it can be ignited together with oxalic acid and weighed as Al_2O_3 . It is also accurate to det. the hydroxyquinoline in the ppt. by bromometric titration as in the case of the corresponding Zn and Cd ppts. The ppt. has the formula $Al(C_8H_6ON)_3$. W. T. H.

Micro-determination of metals in salts. H. I. COOMBS. *Biochem. J.* **21**, 404-6(1927).—A Pt cylinder surrounds the boat in which the combustion is made. The cylinder and boat are boiled in HNO_3 (1:5), ignited, cooled and weighed. Four to five mg. of the substance to be analyzed is weighed into the boat and moistened with 2-3 drops of H_2SO_4 (1:5). For the combustion, a transparent silica tube is supported on a combustion stand. An aspirator with a bubbler supplies the air. The cylinder, with the tube in it, is first dried and then put into position. Air is turned on and the flame slowly advanced to the center of the cylinder, wire gauze being used to conduct the heat. After a time the gauze is removed and the full flame of the burner is allowed to play on the silica tube. The air is gradually replaced by O and at the end of 3 min. strong heating in the gas, the cylinder is removed, cooled and weighed. B. H.

The determination and separation of rare metals from other metals. VIII. Determination of thallium as thallous (I) chromate and its separation from other metals. LUDWIG MOSER AND ALFRED BRUKL. *Monatsh.* **47**, 709-25(1927); cf. *C. A.* **21**, 716.—Usually Tl has been detd. as TlI but evidence is now produced which shows that the detn. as Tl_2CrO_4 is more satisfactory. Heat the ammoniacal soln. of thallous salt to boiling and add, while stirring, enough K_2CrO_4 to make the soln. contain 2% of this salt. Allow to stand overnight and wash by decantation with 1% K_2CrO_4 soln. and finally with 50% alc. Dry the ppt. at 120° and weigh as Tl_2CrO_4 . For many of the sepns. described the use of pure sulfosalicylic acid, to form sol. complex salts with Tl, is advised. To purify the com. acid, prepare a satd. soln. in 96% alc. and filter through asbestos after standing several days. *To sep. Pb from Tl*, first add a few drops of H_2SO_4 and boil off excess SO_2 , to make sure that all Tl is univalent. Add 20 cc. of 33% sulfosalicylic acid and an excess of $(NH_4)_2HPO_4$ soln. Make slightly ammoniacal and after some hrs. filter off the cryst. $Pb_3(PO_4)_2$. Wash with very dil. NH_4OH contg. some NH_4NO_3 and ignite the ppt. to dull redness before weighing. Conc. the filtrate by evapn., make slightly ammoniacal and det. the Tl as above. *To sep. Mn from Tl*, proceed similarly but ppt. the Mn as $MnNH_4PO_4$ and weigh as $Mn_2P_2O_7$. *To sep. Tl from Al*, prepare a soln. with sulfosalicylic acid as above but in this case det. the Tl first as chromate. In the filtrate destroy the org. acid and then det. the Al as usual. *To sep. Tl from Fe*, proceed similarly but add 10 cc. of sulfosalicylic acid for each 0.1 g. of Fe_2O_3 present. On boiling the dark violet color of the Fe soln. turns red but the Tl can be pptd. as chromate without contamination. *To sep. Tl from Cr*, proceed as with Al. *To sep. Tl from Zn*, heat the soln. to 60° and add NH_4OH until the basic Zn ppt. dissolves completely. Then ppt. the Tl as chromate. *To sep. Tl from Cd*, proceed as with Zn but in the filtrate from the Tl_2CrO_4 pptn. det. the Cd as CdS rather than as $CdNH_4PO_4$. *To sep. Tl from Ni*, add concd. NH_4OH to the soln. dropwise until all the Ni ppt. has dissolved, heat to 60° and det. the Tl as chromate. If much Ni is present use an aliquot part of the filtrate for the dimethylglyoxime pptn. *To sep. Tl from Co*, proceed similarly but carry out the work in an atm. free from H_2S . Drive off the NH_3 from the filtrate from Tl_2CrO_4 and ppt. the Co with KOH and Br_2 . *To sep. Tl from Ag*, treat the slightly ammoniacal soln. either with KCN or $Na_2S_2O_3$ and ppt. the Tl as chromate. To the filtrate, add $Na_2S_2O_3$, if not already present, make strongly acid and ppt. the Ag as Ag_2S by boiling. *To sep. Tl from Hg*, proceed similarly but avoid an excess of KCN. *To sep. Tl from Cu*, proceed as with Ag but first add sufficient NH_4OH to give a clear blue soln. *To sep. Tl from Bi*, dil. the soln. until about 0.1 g. Bi is present in 100 cc., heat to boiling and add $(NH_4)_2HPO_4$ to ppt. $BiPO_4$. Filter and det. Tl in the filtrate as Tl_2CrO_4 . *To sep. Tl from As*, it is best to add KBr to the HCl soln. and distill off the As. *To sep. Tl from Sb*, oxidize the Sb in ammoniacal

soln. with H_2O_2 which does not affect Ti(I) even at 100° and ppt. the Ti as chromate. *To sep. Ti from Sn* , neutralize the acid soln. with NH_4OH , first reducing with KCN if any thallic salt is present, make acid with a little AcOH , add some NH_4NO_3 , dil. to 500 cc. and boil. Filter off the Sn ppt. and weigh as SnO_2 after igniting. Conc. the filtrate and det. Ti as chromate. *To sep. Ti from Se* , ppt. Ti_2CrO_4 from an ammoniacal soln. and det. Se in the filtrate after pptn. with $\text{NH}_4\text{OH.HCl}$. W. T. H.

Rapid method for the separation of silver and lead by the potentiometric method. ERICH MÜLLER AND HERBERT HENTSCHEL. *Z. anal. Chem.* 72, 1-5(1927).—It takes but a few min. to det. both Ag and Pb potentiometrically. First, using a Ag indicator electrode, titrate the Ag with NaCl soln. and then, using a Pt indicator electrode, titrate the Pb with ferrocyanide soln. W. T. H.

The titrimetric determination of bismuth. WILHELM STRECKER AND ALFRED HERRMANN. *Z. anal. Chem.* 72, 5-14(1927).—Two methods by which Bi can be detd. accurately are given. In the first method, the dil. Bi soln. in the presence of a very little HNO_3 is treated with an excess of standard Na_2HPO_4 to ppt. BiPO_4 . The soln. is neutralized and the excess PO_4^{---} pptd. with a known vol. of standard AgNO_3 and the excess of Ag is titrated with KCNS ; ferric alum is used as indicator. In the second method, Bi is pptd. as metal by means of Mg and the metal is dissolved out of contact with air by an acid soln. contg. ferric salt. The amt. of ferrous Fe formed is finally titrated with KMnO_4 . W. T. H.

A new sensitive test for bismuth. H. KUBINA AND J. PLICHTA. *Z. anal. Chem.* 72, 11-4(1927).—Dimethylglyoxime, so widely used as a precipitant of Ni , also gives a sensitive reaction with Bi solns. Thus if a chloride or nitrate soln. contg. Bi is treated with 1% dimethylglyoxime and then NH_3 is added to strongly alk. reaction, all of the Bi is pptd. as yellow, very voluminous Bi oxime. Attempts to det. Bi by this method were unsuccessful because of the tendency for Bi to form basic salts on diln. W. T. H.

The spectral determination of lead in bismuth. EUGEN SCHWEITZER. *Z. anorg. Chem.* 165, 364-70(1927).—By the spectrographic study of homologous lines in emission spectra it is easy to det. with considerable accuracy the quantity of Pb in Sn or in Bi . A table given shows the results with 0.6-10% of Pb in these 2 metals. W. T. HALL.

Detection of chromium by oxidation with bromine or with chlorine in the presence of silver nitrate. R. POSNER. *Z. anorg. allgem. Chem.* 164, 407-8(1927); cf. C. A. 21, 1605.—The test given succeeds in the presence of considerable Fe or Mn and Cl_2 aq. better than with Br_2 . To 5 cc. of 2 N AgNO_3 add 1 cc. of Cl_2 aq. and 0.5 cc. of the soln. to be tested. Boil 1 min. and then make slightly ammoniacal with 2 N NH_4OH . Filter and very carefully neutralize with 2 N HNO_3 . If more than 0.5 mg. of Cr is present per cc., a ppt. of Ag_2CrO_4 is formed at once. If 0.5-0.1 mg. of Cr is present per cc., a ppt. of Ag halide is formed and gradually the soln. becomes orange in color; the color disappears on adding more HNO_3 . W. T. H.

New cobalt reaction. PIETRO FALCIOLA. *Giorn. chim. ind. applicata* 8, 612 (1926).— $\text{Na}_2\text{S}_2\text{O}_4$ is a sensitive specific reagent for Co when added in the cold (solid or dissolved) to the soln. under examn., previously rendered strongly ammoniacal; there develops, according to the concn. in Co ion, a color that goes from yellow to orange, to ruby-red or to a dark red; finally a brown-black ppt. may form. The blue color of ammoniacal Ni solns. is not changed by the reagent. The color develops little by little in the neighborhood of the reagent and extends from it; in this way Co may be detected in the HCl soln. of the sulfides of the 4th group metals. If much Co is present with the Ni , the ammoniacal liquid gives a violet instead of a pure blue color. Decolorization may be brought about, preferably in the hot, by HCHO , which brings back the green color of the nickelous ion. H_2O_2 destroys the characteristic reddish yellow tint. Tartaric, citric and formic acids, if they do not hinder the test, attenuate it considerably. $\text{Na}_2\text{S}_2\text{O}_4$, added in the solid form to a Co soln. in an ammoniacal medium in presence of the common metals and also Mo , U , V , W and Ti , gives after some time a transition in tint to a brownish red; the filtrate shows a reddish yellow color which may be deepened by addn. of more hyposulfite. ROBERT S. POSMONTIER.

Contribution to the study of ruthenium. XI. A volumetric estimation of ruthenium. J. L. HOWE. *J. Am. Chem. Soc.* 49, 2393-5(1927); cf. C. A. 21, 3843.—Finely divided Ru can be dissolved in alk. NaClO soln. and from such soln., after treatment with Cl_2 , RuO_4 can be distd. If the distillate contg. RuO_4 is condensed in cold, concd. HCl , H_2RuCl_6 is formed. After boiling off excess Cl , the soln. can be titrated with 0.05 N SnCl_2 soln. W. T. H.

A rapid method for the determination of nickel. G. SPACU AND J. DICK. *Z. anal. Chem.* 71, 442-6(1927).—If a neutral soln. of Ni is treated with pyridine and an

alkali thiocyanate, the Ni is pptd. completely as $\text{Ni(Py)}_4(\text{SCN})_2$. This ppt. can be filtered, washed, dried in a vacuum and weighed, within about 30 min. As wash liquids the following 4 solns. are recommended: (1) Four g. of NH_4CNS and 6 cc. of pyridine in 1 l. of water, (2) 370 cc. of 95% alc., 615 cc. of alc., 15 cc. of pyridine and 1 g. NH_4CNS , (3) 5% pyridine soln. in abs. alc., (4) ether contg. 2 drops of pyridine in each 20 cc. To 100 cc. of Ni soln. add 0.5-1.0 g. of NH_4CNS , heat to boiling and ppt. with 1-2 cc. of pyridine. Filter, wash, dry in a vacuum at room temp. and weigh. The ppt. contains 11.95% of Ni.

W. T. H.

Substitution of sodium compounds for potassium compounds. A. R. SMITH AND F. C. VILBRANDT. *J. Elisha Mitchell Sci. Soc.* **42**, 118-21 (1926).—Comparative detns. using Na and K compds. side by side were made in about 200 different technical methods of analysis. NaMnO_4 , $\text{Ba}(\text{MnO}_4)_2$ and $\text{Ca}(\text{MnO}_4)_2$ may be used interchangeably instead of KMnO_4 in all detns. for which the latter is commonly used with identical results. NaI , NaOH , Na_2CrO_4 , $\text{Na}_2\text{Cr}_2\text{O}_7$, NaCN , Na_2S , Na_2SO_4 , NaNO_3 , NaClO_3 and $\text{NaFe}(\text{CN})_6$ may also be substituted for the corresponding K compds. in such analytical methods as commonly use the latter. Alc. NaOH gave the same results as alc. KOH for detg. Me esters in menthol and for the sapon. nos. of animal and vegetable fats and oils and lubricating oils but not for the sapon. nos. of beeswax or rosin. In the last two detns. similar but not identical results were obtained.

A. L. M.

A titrimetric determination of potassium. G. JANDER AND O. PFUNDT. *Z. anal. Chem.* **71**, 417-34 (1927).—The method depends upon the detn. of the satn. point by the conductometric method using a cold, concd. soln. of K salt and titrating with a concd. soln. of NaClO_4 . Instead of a telephone the use of a thermo-cross is recommended which is connected to a galvanometer.

W. T. H.

The transformation of alkali chlorides to carbonates by the action of oxalic acid. L. N. MURAVLEV. *Z. anal. Chem.* **72**, 15-9; *Z. anorg. allgem. Chem.* **165**, 137-41 (1927).—An attempt was made to det. Na and K by heating the chlorides with oxalic acid and weighing the resulting carbonates. It was found, however, that the conversion to carbonates was incomplete unless the heating was continued until every vestige of C was consumed and the method is not to be recommended.

W. T. H.

Color test for magnesium. W. J. PETRASCHENJ. *Z. anal. Chem.* **71**, 291-7 (1927).—If dil. NaOH is added to I_2 soln., the color of the latter fades and when the soln. is decolorized it is probable that NaIO is formed. When such a soln. is added to an aq. soln. contg. Mg^{++} a colored ppt. is obtained which may be $\text{Mg}(\text{OH})_2$ and adsorbed I_2 or else it is $\text{Mg}(\text{IO})_2$. If considerable NaOH is present, the ppt. is colorless. The presence of NH_4^+ tends to prevent pptn.

W. T. H.

Determination of manganese and magnesium in aluminum alloys. FRANZ MUGRAUER. *Chem.-Ztg.* **51**, 658 (1927).—Det. the Mn in the usual way by the permanganate method of Volhard and in the filtrate det. Mg by pptn. as MgNH_4PO_4 in the presence of considerable NH_3 which will keep Zn in soln.

W. T. H.

Criticism of some methods for determining magnesium and calcium. A. TERESHCHENKO AND M. NEKRICH. *Ukrainskii Khim. Zhurnal* **2**, 163-72; *Chem. Zentr* **1926**, II, 2464-5. A study of the citrate method showed that the pptn. of Mg in the presence of citric acid is never quant. In the absence of other cations the result is low and in the presence of Ca and other metals it is too high. Diln. of the soln. reduces the co-pptn. of Ca. NH_4Cl accelerates and citric acid retards the settling of the ppt. Likewise the volumetric detn. of Mg as $\text{MgNH}_4\text{AsO}_4$ followed by iodometric titration is unsatisfactory. In the absence of other metals, however, the iodometric method can be used with success if it is modified by dissolving the $\text{MgNH}_4\text{AsO}_4$ in dil. H_2SO_4 , reducing the soln. with SO_2 , expelling the excess SO_2 on the water bath, neutralizing and titrating with I.

C. C. DAVIS

Substitution of centrifugation for filtration and calcination in the gravimetric estimation of tin and lead in their alloys. MICHELE FOA. *Giorn. chim. ind. applicata* **9**, 69-70 (1926).—For alloys low in Sn: Treat 5 g. of the finely divided sample with 30 cc. 1.4 HNO_3 in a covered beaker on the sand bath. After the attack has begun, add drop by drop along the walls, 15 cc. H_2O and allow the attack to finish (about 15 min.). Transfer liquid and ppt. to a previously tared centrifuge tube, washing the soln. beaker carefully with 50 cc. boiling H_2O . Stir the liquid in the tube to dissolve the sepd. $\text{Pb}(\text{NO}_3)_2$. Centrifuge for 3 min. at 3000 r.p.m. Stop the centrifuge slowly and avoid jarring. Decant the supernatant soln. carefully, add 70 cc. boiling H_2O and stir well to pulverize completely the deposit adhering to the glass. Repeat centrifugation and decantation until a drop of the centrifuged liquid on KI paper ceases to indicate Pb. Dry at 110° to const. wt. Collect all the decantations, bring to 500 cc., take 50 cc., ppt. the Pb with 2-3 cc. 1.84 H_2SO_4 and sep. the PbSO_4 by the centrifuge as

above described for Sn. For alloys high in Sn, treat 0.5 g. sample with 12 cc. hot 1.2 HNO_3 ; after 10 min. transfer to the centrifuge tube, and proceed as above described. The results are satisfactory, with great economy in time. R. S. P.

New method for determining copper in chemically treated cloth. BONNARD AND LEBLANC. *Ann. chim. anal. chim. appl.* 9, 233-5(1927).—The Artillery Service of France frequently has to test cloth that has been impregnated with Cu salt to prevent formation of mildew. Cut the cloth into small pieces, ignite and fuse the ash with $\text{Na}_2\text{S}_2\text{O}_7$. Take up in 200 cc. of hot water, add a few drops of HCl and ppt. the Cu with H_2S . Filter, ignite to CuO, dissolve in HNO_3 and det. by electrolysis or by KCN titration. W. T. H.

Determination of lithium in "scleron" metal and in similar aluminum alloys. E. SCHÜRMANN AND W. BÖHM. *Chem.-Ztg.* 61, 677-8, 698-9(1927).—Next to duralumin, scleron metal is one of the best known Al alloys in Germany and contains, besides the usual constituents, a little Li. The Al content varies from 85 to 95% and there is usually about 0.1% Li. Two methods are described for the detn. of Li. The first depends upon the removal of most of the Al as chloride, pptn. of the Cu and Zn as oxalates, pptn. of the Cu by electrolysis before a second oxalate pptn., removal of the last traces of Zn by H_2S , removal of the last traces of Al, etc., with NH_4OH and H_2O_2 , examn. of this ppt. for Li after making a basic acetate pptn. by converting the sulfate soln. to chloride by successive treatments with $\text{Pb}(\text{OAc})_2$, H_2S and HCl and finally detg. as LiCl by the method of Gooch using amyl alc. For the analysis, 20 g. should be taken. The second method depends upon the pptn. of all interfering cations by treating the HCl soln. of the alloy with an excess of freshly pptd. Ag_2O or Ag_2CO_3 . The first ppt. may contain a little Li which can be removed easily by repeating the pptn. Good results can also be obtained by finally sepg. the Na from Li by Carnot's fluoride method, making an allowance for the soly. of LiF in dil. NH_4OH . W. T. H.

A nephelometric method for determining small quantities of arsenic. I. A new turbidity reagent and the behavior of the turbidities produced with arsenic acid. HANS KLEINMANN AND FRITZ PANGRITZ. *Biochem. Z.* 185, 14-43(1927).—The reagent recommended consists of equal parts of 1% K_2MoO_4 soln. and 2% cocaine soln. and 2 parts of N HCl. It gives a turbidity with small quantities of As_2O_3 and the turbidity is quite stable after the max. d. has been reached. The presence of NaCl or of Sb does no harm but H_3PO_4 must be absent. By the nephelometric procedure as little as 1×10^{-6} mg. of As can be detd. II. The determination of arsenic in any material. *Ibid.* 44 62.—Org. matter must first be destroyed by incineration or treatment with concd. HNO_3 . Directions are given in detail for the treatment of an organ of the body, eventually distg. off the As as AsCl_3 , collecting the distillate in N NaOH, oxidizing the As with perhydrol and using an aliquot part of the entire distillate for the nephelometric test. S. MORGULIS

Analysis of antimony alloys. H. VIGNAL. *Ann. chim. anal. chim. appl.* 9, 193-6 (1927).—For the analysis, use about 1 g. of alloy for the detn. of all metals except Sn and use 1.2-3 g. for the detn. of Sn alone. Dissolve the first sample in a mixt. of 40 cc. of 50% tartaric acid soln. and 15 cc. of HNO_3 . Heat gently and shake from time to time. If a clear soln. is not obtained in about 10 mins., this indicates the presence of considerable Sn and a fresh sample should be taken and more tartaric acid used. To the soln. add 10 cc. of 18 N H_2SO_4 and about 15 cc. of water. Let stand 12 hrs., filter off the PbSO_4 and weigh in the usual manner. A few mg. of Pb will remain in soln. Add an excess of NaOH to the filtrate from the PbSO_4 pptn. until the soln. is blue and then add 20 cc. of NaOH soln., d. 1.3, in excess. Boil and add about 0.5 g. of lactose. Boil a little longer, filter and calcine the Cu ppt. To the filtrate from the Cu_2O pptn., add H_2S to ppt. traces of Pb and Cu that remained dissolved. Calcine this ppt. together with the above Cu_2O ppt. Dissolve the ignited ppt. in 15 cc. of HNO_3 and det. Cu and the residual Pb electrolytically. Fe and Zn can be detd. in the filtrate from the H_2S pptn. in the usual way. The alk. soln. from which the last traces of Cu and Pb were removed with H_2S contains all the Sn and Sb. Add H_2SO_4 until the Sb and Sn ppt. that forms where the soln. is acid dissolves with difficulty on mixing. Then add 30 g. of oxalic acid, boil about 2 hrs. and ppt. the Sb with H_2S . Dissolve the ppt. in HCl and KClO_3 , boil off the excess Cl_2 , cool, add 2-3 g. of KI and titrate the liberated I_2 (equiv. to the Sb) with $\text{Na}_2\text{S}_2\text{O}_3$. For the Sn detn. treat with HNO_3 and filter off the resulting metastannic acid after the usual dehydration. Fuse the ignited oxide with NaOH, take up the melt in dil. HCl, heat in a flask, which is connected with a reflux condenser, with about 1 g. of piano wire until the Sb is deposited as metal and the Sn is all in the bivalent state. If necessary add a little SbCl_3 and more Fe. After the Fe has all dissolved, filter, wash rapidly and titrate with KMnO_4 . Each drop of

KMnO₄ forms yellow FeCl₃ which disappears with the formation of SnCl₄ as long as there is any SnCl₂ remaining unoxidized. The end point is, therefore, the formation of a permanent yellow coloration. W. T. H.

Detection of traces of iron in volatile and combustible substances. ERNEST KAHANE. *Ann. chim. anal. chim. appl.* 9, 196-8(1927).—Ignite the substance, or evap. the soln. to dryness. Treat the residue on white porcelain enamel with 1 drop of 50% NH₄CNS soln. and 1 drop of 10% H₂SO₄. A red color is produced when only a trace of Fe is present. W. T. H.

The analysis of irons and steel. Determination of silicon, phosphorus and silicon. M. MARQUEYROL AND L. TOQUET. *Ann. chim. anal. chim. appl.* 9, 225-33(1927).—Treat 10 g. of the metal with 0.5 g. of KClO₃ and 80 cc. of concd. HNO₃ added in 15-cc. portions. If the metal is not attacked well, add all of the HNO₃ at once and introduce the chlorate in small portions. If the reaction is violent, wait before adding a second portion of HNO₃ and add 0.1-0.2 g. of KClO₃ with each 10 cc. of HNO₃. Evap. to dryness and take up the residue in 100 cc. of concd. HCl. Evap. to dryness again, moisten the residue with 30 cc. of concd. HCl, heat till dissolved and dil. with 150 cc. of water. Filter off the SiO₂, which is reasonably pure in the case of steels but with cast Fe, it should be digested with 40-50 cc. of concd. HCl and eventually tested with HF and H₂SO₄. Dil. the filtrate from the silica to exactly 500 cc. and use a 100-cc. aliquot part for the detn. of P, 250 cc. for the detn. of S and 150 cc. for the detn. of Mn. For the P detn. it is recommended to ppt. with molybdate in the usual manner and then, after a purification treatment with different wash liquors, weigh the ammonium phosphomolybdate after drying at 100° for at least 2 hrs. The S detn. as BaSO₄ follows conventional lines but numerous notes are added to the already voluminous literature on this subject. For the Mn detn. evap. the soln. repeatedly with HNO₃, ppt. with KClO₃ as in the Ford-Williams method, dissolve the MnO₂ in a known vol. of H₂O₂ standard soln. and titrate the excess with KMnO₄. W. T. H.

The separation of vanadium from tungsten. S. G. CLARKE. *Analyst* 52, 466-9 (1927).—V can be sepd. from W by cupferron pptn. if 10 cc. of HF is added, the soln. is neutralized with NH₄OH, made acid with 20 cc. of HCl and dild. to 300 cc. before adding the cupferron. In the analysis of steel the ignited WO₃ ppt. commonly contains a little V, which can be recovered as follows: Dissolve the WO₃ in NaOH soln., filter off the undissolved Fe₂O₃, dissolve it in HCl and add this to the main soln. To the filtered NaOH soln. contg. the W, add HF, NH₄OH and HCl and ppt. the V in it by adding cupferron. W. T. H.

Investigations into the analytical chemistry of tantalum, columbium and their mineral associates. VII. The precipitation of tungstic acid by tannin. VIII. The separation of tungsten from tantalum and columbium. W. R. SCHOLLER AND C. JAHN. *Analyst* 52, 504-14(1927); cf. *C. A.* 21, 1073.—Up to now, cinchonine-HCl has been the reagent most used for effecting the complete pptn. of tungstic acid from acid solns. but it is here shown that tannin can be used to ppt. the WO₃ that escapes pptn. by boiling the acid soln. and adding alkaloid. In the following directions, the cinchonine and tannin pptns. are carried out practically at the same time, so that all the W is pptd. in one operation. Neutralize the alkali tungstate soln. (contg. alkali chloride which usually interferes with the pptn. of H₂WO₄ but is beneficial with the new procedure) with dil. HCl until the bicarbonate stage is reached (neutral to phenolphthalein but basic to methyl orange) and add a freshly prepd. soln. of 0.5 g. tannin in water. A part of this flocculates as a white ppt. if the Cl⁻ content of the soln. is high. Add more dil. HCl until the soln. is acid to litmus paper, when the insol. W complex will be seen. Boil a few min. and then add 5 cc. of 5% cinchonine-HCl soln. dild. somewhat. Boil 5 min. longer and let stand at least 6 hrs. before filtering, igniting and weighing in the usual manner, making use of filter paper pulp in filtering and washing with 5% NH₄Cl soln. contg. a little tannin. For the sepn. of W from Ta and Nb, the following methods are shown to be unreliable: (1) extn. of the ppt., obtained by hydrolysis after K₂S₂O₇ fusion, with NH₄OH or (NH₄)₂S (Berzelius); (2) pptn. of the soln. of K salts by boiling with NH₄NO₃; (3) fusion of the oxides with Na₂CO₃ and S (Rose). A new method of sepn. is proposed which depends on the fusion of the mixed oxides with K₂CO₃, pptn. of the resulting aq. soln. with NaCl, recovery of the small quantity of non-pptd. earth acid by hydrolysis in bicarbonate soln. and pptn. of the W in the filtrate by tannin and cinchonine. W. T. H.

An investigation of the reaction of aluminum with the ammonium salt of aurintricarboxylic acid under different experimental conditions and its application to the determination of aluminum in water. J. H. YOE AND W. L. HILL. *J. Am. Chem. Soc.* 49, 2395-2407(1927).—Five factors affect the test for Al with aluminon—time, temp.,

vol., concn. and presence of other ions. To det. Al in water, add 2 cc. of 4 *N* HCl, evap. to dryness and ignite. Cool, add 4 drops of 4 *N* HCl and 5 cc. of hot water. Filter, wash 3 times with hot water, make neutral with 4 *N* HCl, transfer to a Nessler tube and treat with 5 cc. of *N* HCl, 5 cc. of 3 *N* NH_4OAc , water to make 30 cc. and 5 cc. of 0.1% aluminon. After 5 min. slowly add, while stirring, 5 cc. of 5 *N* NH_4OH and 10 cc. of 5 *N* $(\text{NH}_4)_2\text{CO}_3$. Dil. to 50 cc., mix and after aging for 20 min. compare the resulting color with that similarly produced and aged with solns. contg. known amts. of Al.

W. T. H.

Further notes on the separation of vanadium from tungsten. S. G. CLARKE. *Analyst* 52, 527(1927).—Additional references are given and the following suggestions for detg. small quantities of V such as are likely to be retained by the WO_3 obtained in steel analysis. Before adding the cupferron, add 50 g. of NH_4Cl . Ignite the ppt., heat with fusion mixt. and det. the V colorimetrically with H_2O_2 according to Meyer and Pawletta (*C. A.* 21, 32).

W. T. H.

Measurement of hydrogen-ion concentration by means of colloid films containing indicators. PETER WULFF. *Kolloid-Z.* 40, 341-2(1926).—"Indicator foils" are made by incorporating the indicators in thin films of a colorless and transparent colloid that forms a jelly swelling to a limited extent in H_2O and that is chem. non-reactive. Cellulose jellies are the only suitable ones found so far. With such indicator foils the p_{H} of turbid and colored solns. can be detd. quickly by dipping the foil in the soln. for 1 or 2 min. and comparing the color with a color scale. The indicator does not leach easily and the suspended or colloiddally dispersed materials usually responsible for the turbidity and color of commercially important solns. is not absorbed by the foil and does not obscure the indicator's color.

F. L. BROWNE

A new method for determining p_{H} values. KURT WOLF. *Collegium* 1927, 370-97.—In colloidal solns., lime liquors or tannin exts., in which the H electrode fails, 3 other methods may be used. Glass electrodes or bright metal electrodes (cf. Cox, *C. I.* 19, 2610) are suitable for measurements or titration curves. An electron tube arrangement is most satisfactory for measuring the potential, but the tube must allow no flow through the grid circuit and the anode current must change only when the grid potential changes. Soft soda glass is best for the glass electrodes. A Pt wire covered with a thin coating of glass can be used instead of a glass bulb. The 2-metal system Pt-Au was useless, probably because the metals adsorb H to about the same extent.

I. D. C.

Determination of the sulfate ion by the palmitate method. JULIUS ZINK AND FRIEDR. HOLLANDT. *Z. anal. Chem.* 71, 386-7(1927).—Bahrdt (*C. A.* 21, 1506) has published a method very similar to that proposed by Z. and H. (*C. A.* 8, 2436, 3335). The method has given good results even under conditions where B. has doubted its accuracy.

W. T. H.

Volumetric estimation of sulfates. MARIO TALENTI. *Giorn. chim. ind. applicata* 8, 611 2(1926).—T. chooses the Wolf-Müller method, but with modifications, as follows: Suspend pure benzidine in H_2O in an amt. equal to about 2% of the H_2O , warm gently, stirring slightly, and acidify with concd. HCl to give an acidity of about 0.25 *N*. Filter the dark-colored soln., titrate exactly with a soln. of NaOH or KOH (0.5 *N* will do), using phenolphthalein as indicator and disregarding the benzidine set free. The SO_4 ions to be estd. may occur in 3 forms: (1) As free H_2SO_4 . Approx. of simple acidimetry is the best here. (2) As alkali sulfate. Dil. to about 0.5% and measure its acidity. Take an aliquot part and add it with stirring to a known amt. of cold titrated benzidine-HCl in excess. Allow the cryst. ppt. to stand for a few min., filter, wash with a little cold H_2O and retitrate the acidity in the filtrate. The diminution of acidity measures the amount of H_2SO_4 present and pptd. as benzidine sulfate. (3) As a heavy-metal sulfate. Ppt. the metal with its characteristic analytical reagent (e. g., $\text{Fe}_2(\text{SO}_4)_3$ with NH_4OH), filter, wash and proceed with the filtrate as under (2) above. Results are very satisfactory, and the time required, at the most, is not over 40 min.

ROBERT S. POSMONTIER

Determination of sulfide, thiosulfate and sulfur in the presence of carbonate insoluble in water, especially barium carbonate. H. BRINTZINGER AND F. RODIS. *Z. anal. Chem.* 71, 434-41(1927).— BaCO_3 is usually made from barite by reduction with C and the last traces of S compds. are very hard to remove. It is desirable, therefore, to have a method for the detn. of sulfide, thiosulfate and S in com. BaCO_3 . The samples analyzed contained 99.24-99.59% BaCO_3 , 0.07-0.17% BaS, 0.02-0.10% $\text{Ba}_2\text{S}_2\text{O}_3$ and 0.004-0.013% S. The procedure recommended is as follows: First, det. Ba by a method similar to that used for the detn. of S in steel, using 10 g. of sample, decomp. with 100 cc. of 2 *N* H_2SO_4 , absorbing the evolved H_2S in $\text{Cd}(\text{OAc})_2$ and titrating the

CdS ppt. iodometrically. The $\text{Cd}(\text{OAc})_2$ soln. will also contain some dissolved SO_2 , which must be removed by boiling in a vacuum for about 20 min. before titrating. Next det. $\text{BaS} + \text{Ba}_2\text{S}_2\text{O}_3$ by treating another 10 g. of sample with 50 cc. of 0.01 N KI , soln. and adding 2 N HCl until the BaCO_3 is all dissolved. Remove the CO_2 by gently boiling and pass the vapors through KI soln. to absorb any volatilized I_2 . Finally titrate the excess of KI with thiosulfate. The residue in the decompn. flask now contains a suspension of BaSO_4 together with the original S and any S that may have been formed from the $\text{Ba}_2\text{S}_2\text{O}_3$. Heat this in a large Erlenmeyer flask with 50 cc. of 0.01 N KMnO_4 and after about 20 min. titrate the excess permanganate with oxalic acid. Finally det. $\text{BaCO}_3 + \text{BaS} + \text{Ba}_2\text{S}_2\text{O}_3$ by treating with a measured vol. of 0.5 N HCl , heating to remove SO_2 and CO_2 and titrating the excess HCl with 0.5 N NaOH in the cold using methyl orange as indicator. W. T. H.

The detection of chlorides in mercuric oxide. G. J. W. FERREY. *Pharm. J.* 118, 767-9, 794; *Chemist & Druggist* 107, 36(1927).—The presence of halogen affects the Brit. Pharm. detn. of HgO by the NH_4CNS method. Several published tests for chlorides in HgO proved very insensitive and useless for the detection of less than about 0.7% calcd. as HCl . The delicacy of these tests increases with concn. of AgNO_3 , but is independent of the concn. of HNO_3 . By using AcOH as a solvent, the test may become delicate to about 0.4%. The most satisfactory method is to remove the Hg from H_2SO_4 soln. by metallic Zn ; this detects less than 0.02% of HCl ; removal of Hg as basic carbonate is somewhat less sensitive. Dissolve 1 g. HgO in 10 cc. of 25% H_2SO_4 and 10 cc. H_2O , adding 1-2 drops of HNO_3 ; add 1 g. Zn turnings, after 5 min. filter. The soln. should not give more than the faintest opalescence on the addn. of a little HNO_3 and 2 cc. of 0.1 N AgNO_3 for each 10 cc. of soln. S. WALDBOTT

Determination of soluble fluorides. F. L. HAHN. *Z. anal. Chem.* 69, 385-6 (1926).—To the concd. soln. add NaOH till alk. and neutralize with AcOH . Add Na_2SO_4 to provide at least 0.2 g. of this salt for the same quantity of F in 100 cc. Add an excess of CaCl_2 soln., weigh the resulting ppt. of CaF_2 and check by converting to CaSO_4 in the usual way. W. T. H.

Official method for the analysis of sodium sulfide. ATKIN AND HUGONIN. *Boll. industria pelli* 3, 298-9(1925); *Chem. Zentr.* 1926, II, 469-70.—Dissolve the sample (contg. about 2 g. of Na_2S) in 500 cc. of cold water, clarify 200 cc. with 3-4 g. of $\text{Ca}(\text{OH})_2$, filter rapidly, add to 25 cc. of the filtrate 25 cc. of 0.5 N NH_4OH (contg. 12.5 g. of NH_4Cl per l.), and titrate with 0.05 M ZnSO_4 detg. the end point by a spot test with $\text{Pb}(\text{OAc})_2$ paper. C. C. DAVIS

Determination of iodide in mixtures of halides. HARRY BAINES. *J. Soc. Chem. Ind.* 46, 381-2T(1927).—A method practically the same as that published by Chick (*C. A.* 21, 3174) was worked out independently. H_2SO_4 was used for acidulating and the AgNO_3 used was 0.01 N and standardized against KI by the same method as that used in the analysis. After the detn. of iodide, the soln. was neutralized with CaCO_3 and Mohr's method used for detg. Br^- (and Cl^-). The method was used for the examn. of photographic paper. W. T. H.

A volumetric method for the separation of selenium and tellurium. LUDWIG MOSER. *Chem.-Ztg.* 51, 729(1927).—Certain mistakes in the paper of Littmann (*C. A.* 21, 2238) are pointed out. W. T. H.

A simple method for the determination of available chlorine in bleaching liquors. WALTHER HERZOG. *Chem.-Ztg.* 51, 729(1927). JUSTIN HAUSNER. *Idem.*—A polemical discussion (cf. *C. A.* 21, 2236). Also in *Papir-J.* 15, 155(1927). W. T. H.

A note on I. Bang's micro-method for nitrogen determination. KENZO SURO. *Biochem. Z.* 187, 78 83(1927).—The use of a Ag condenser in the distn. of NH_3 is undesirable because it always gives rise to alkali because of the formation of Ag_2S with the H_2S from the rubber connections. A good glass condenser (Jena or hard glass) can be safely used instead of one made from quartz or Pt. S. MORGULIS

Accurate colorimetric determination of small quantities of phosphorus dissolved in oil. C. STICH. *Z. angew. Chem.* 40, 1014(1927).—As reagent a satd. soln. of AgNO_3 in acetone is used and as solvent a mixt. of 40 cc. of ether, 20 cc. of alc. and 5 cc. of acetone. Dil. the oil with 10 times its vol. of the solvent and add the reagent. Gradually a brown coloration is produced which can be used for the colorimetric detn. if the P content is not too high. To prep. the standards dissolve about 0.05 g. of colorless P in benzaldehyde to make a 0.1% soln., adding 2% of ether and 1% of terpene as anti-catalyzers. Mix 10 g. of the soln. obtained in this way with 90 g. of a fatty oil. One g. of this last soln. will then contain about 1 mg. of P . Prep. standards with 0.1, 0.2, 0.4, 0.6, 0.8 and 1.0 g. of P . W. T. H.

A forgotten, very useful process for the determination of boric acid in silicates.

RUDOLF SCHMIDT. *Sprechsaal* 59, 541-3(1926); *Chem. Zentr.* 1926, II, 2010.—A discussion of well-known methods and their defects. According to Fromme (cf. *C. A.* 4, 1586) B_2O_3 does not affect the indicator if, after complete removal of SiO_2 , HCl is added in the presence of methyl orange to an alk. borate soln. until red. Therefore after addn. of glycerol, B_2O_3 can be detd. in the well-known way with CO_2 -free NaOH, phenolphthalein being used. C. C. DAVIS

General method for the estimation of carbon dioxide and of carbonates in solution. Application to the determination of carbon dioxide in body fluids, mineral waters, etc. MAURICE NICLOUX. *Bull. soc. chim. biol.* 9, 758-71(1927); cf. *C. A.* 8, 3666; 21, 1945.—N.'s work on this problem is summarized. The liquid to be tested, which may contain from 0.2 to 200 cc. of CO_2 per 100 cc., is distd. with a mixt. of HCl and octylic alc. and the evolved CO_2 is absorbed by KOH soln. Detailed directions are given for the detn. of CO_2 in various body fluids. L. W. RIGGS

The determination of moisture by the volatile solvent method. J. M. JONES AND T. MCILACHLAN. *Analyst* 52, 383-7(1927).—The method consists in placing the sample together with a little sand in a flask with some light liquid which is immiscible with water, boiling and condensing the distillate so that it falls into a graduated tube. The water falls to the bottom of the tube and its vol. is detd. The most satisfactory liquid to use appears to be toluene. Boiling should be continued until it is certain that all water has been removed. The method is satisfactory for emulsions, including butter, and is more rapid than oven drying. The results with jam, honey and malt ext. are more consistent but it is not certain that they are more accurate. For powders and substances which do not cake together, oven-drying is better and quicker. W. T. H.

Determination of water by distillation. F. GISIGER. *Mitt. Lebensm. Hyg.* 18, 249-53(1927).—Water is detd. by distn. from the sample by means of such distg. agents as benzene, toluene, xylene and acetylene tetrachloride. The media of distn. together with the H_2O in the sample is distd. into a measuring tube, the water layer measured and the detn. calcd. RUSSELL C. ERB

The identification of seminal stains. S. MALLANAH. *Analyst* 52, 399(1927).—The contention is made that the chief cause for failure to detect spermatozoa is that the proper stain is not used. Positive results have been obtained almost invariably by the following method. Cut off a piece of suspected cloth and place it in a sterile Petri dish contg. sufficient soln. to soak the cloth. After a few min., gently scrape off the cloth, spread out the scrapings on a microscopic slide, allow to dry in the air and fix with the flame of a spirit lamp. Cover with a few drops of carbol thionine and after a few min. wash off with water and place in an inclined position so that the slide will dry. When dry, exam. with a $1/12$ oil-immersion lens after adding a little oil of cedar. W. T. H.

Analysis of lithopone. T. S. REMINGTON. *Ind. Chemist* 3, 353-4(1927).—Several schemes for the analysis of lithopone are described and criticized. A somewhat different scheme of proximate analysis is given in detail and the results of the analysis of 12 English samples of this pigment are shown. W. T. H.

The determination of water in organic substances with the aid of calcium carbide. A. CANTZLER AND S. ROTHSCILD. *Z. Untersuch. Lebensmittel.* 53, 125-35(1927).—Good results were obtained in the detn. of H_2O in org. substances by means of CaC_2 , in a suitable app., even in the presence of other volatile constituents. The results agree with those obtained in a vacuum app. WILLIAM J. HUSA

Determination of water in mixtures of benzene and alcohol. D. PETERS. *Z. angew. Chem.* 40, 1011-13(1927).—First det. the benzene content by shaking with added water and measuring the benzene layer. Then det. the temp. at which the formation of layers takes place and compare the result with a curve corresponding to the same benzene content and showing the sepn. temps. of known mixts. W. T. H.

Estimation of carbon by wet combustion. H. O. ASKEW. *Trans. Proc. New Zealand Inst.* 58, 174-8(1927).—The details of a chromic acid method are given with special reference to the detn. of EtOH in dil. solns. L. W. RIGGS

The colorimetric determination of carbon monoxide with ammoniacal silver solution. H. KAST AND A. SCHMIDT. *Gas u. Wasserfach* 70, 821-2(1927); cf. *C. A.* 21, 2630; *Glückauf* 62, 804(1926).—This test is satisfactory for the detn. of small quantities of (0.1 to 1.0%) CO in technical gases or air when the amt. of C_2H_2 is substantially less than the CO and when no very large amts. (10% or more) of ethylene are present. H_2 and CH_4 do not interfere with the test. R. W. RYAN

General applicability of wet oxidation for the carbon determination in organic substances. II. Determination of chlorine, bromine, iodine and nitrogen besides

carbon in organic matter by the wet combustion method. B. LUSTIG. *Biochem. Z.* **185**, 349-54(1927); cf. *C. A.* **21**, 2634.—Reliable results are obtained in N and halogen detns. made on org. substance oxidized by the wet process with dil. H_2SO_4 and KMnO_4 with or without Pt as catalyst. Azo- and diazo-N combinations are not determinable by this method.

A new and very practical method for distinguishing between phthalic and terephthalic acids. R. RIPAN. *Bul. soc. stiinte (Iuj)* **3**, 308-10(1926).—The pyridine deriv. of Cu terephthalate, $[\text{CuPy}_3(\text{H}_2\text{O})_3](\text{O}_2\text{C})_2\text{C}_6\text{H}_4$, is very difficultly sol., while the pyridine deriv. of Cu phthalate, $[\text{CuPy}_2](\text{O}_2\text{CC}_6\text{H}_4\text{CO}_2\text{H})_2$, ppts. only from very concd. solns. The reagent consists of a 4% CuSO_4 soln. to which pyridine is added (4-5 drops to each 10 cc.) at the time of using. To 10 cc. of reagent, several cc. of unknown at about 2% concn. are added. If as much as 0.002 g. terephthalic acid is present, a blue ppt. forms immediately, whereas with phthalic acid there will be no pptn. for several hrs., if at all. The reaction can also be used to detect small quantities of terephthalic acid in the presence of larger amts. of phthalic acid.

RUBY K. WORNER

Analysis of phenol. SALVADOR DELMUNDO. *Philippine J. Sci.* **33**, 363-73(1927).—A short history of the development of the Koppeschaar method for detg. phenol is given. In working with aq. solns. of nearly pure phenol the volumetric method of K. is fairly accurate. The process, however, should be modified by using sirupy H_3PO_4 instead of concd. HCl to liberate Br from the $\text{KBr} + \text{KBrO}_3$ mixt. The gravimetric method is as rapid as the volumetric but the difficulty lies in pptg. either tribromophenol or tribromophenol bromide to the exclusion of the other. Errors on page 405 of Sutton's *Handbook of Vol. Anal.*, 11th edition (1924) are noted. I. W. R.

Some tests for the identification of sulfonal. CLEMENT GENOT. *J. pharm. Belg.* **8**, 435-9(1926).—The soly. of sulfonal in a large no. of solvents is given. Numerous microchem. and cryst. reactions are described. The article is illustrated with photomicrographs of the cryst. forms obtained from 5 different solvents. A. G. D.

The determination of the amino group in nitroarylamines. I. Determination of nitroaniline and nitroacetaldehyde. N. SEMIGANOWSKI. *Z. anal. Chem.* **72**, 27-30(1927).—The method depends upon the decompn. of the sample by boiling with aq. alkali hydroxide, distg. off the NH_3 formed, collecting the distillate in a known vol. of standard acid and titrating the excess acid. It works well with *o*- and *p*-acetanilide and with *o*- and *p*-nitroaniline but in the case of the meta-substitution products the yield of NH_3 is too low.

W. T. H.

Method for determining phenylacetylene. FR. HEIN AND A. MEYER. *Z. anal. Chem.* **72**, 30-1(1927).—The pptn. of cuprous phenylacetylde can be used for gravimetrically detg. phenylacetylene and the ppt. can also be titrated oxidimetrically. Dissolve the sample in 10 times as much alc. and add an ammoniacal soln. of CuCl prepd. as recommended either by Ilosvay Nagy Ilosva or by F. Straus. Shake well, filtr, wash with alc. and ether, dry in a vacuum over concd. H_2SO_4 and weigh. Or, dissolve the ppt. in an acid soln. of ferric salt and titrate the resulting ferrous soln. with KMnO_4 . One mol. of $\text{C}_8\text{H}_5\text{Cu}$ gives 1 mol. of ferrous salt.

W. T. H.

A direct method for the detection and determination of methyl chloride. K. ROKA AND O. FUCHS. *Z. anal. Chem.* **71**, 381-6(1927).— CH_3Cl heated in alc. soln with NaI is decomposed forming CHI_3 and NaCl . The CHI_3 can be distd. off and the distillate caught in alc. AgNO_3 soln. forming at first $\text{CH}_3\text{I} \cdot \text{AgNO}_3$ and then by decompn. with water AgI which can be weighed. Careful testing of the method shows that the reactions are not absolutely quant. and 94% yield of AgI is the best that can be obtained but if a corresponding correction is made, fairly satisfactory results can be obtained. Take 10-15 cc. of the soln. in abs. alc. contg. 1-2 millimols. of CH_3Cl and add about 1 g. of KI for each 4 cc. of liquid. Heat in a short, sealed tube for 3-4 hrs. at 60° , shaking every 10 min. Then distil off the CH_3I as in the Zeisel method for detg. methoxyl, weigh the AgI and multiply the wt. of CH_3Cl equiv. to the AgI by 1.064.

W. T. H.

The copper number for glucose. CHESTER A. AMICK. *J. Phys. Chem.* **31**, 1441-77(1927).—Glucose was chosen for a study of the Cu no. because it has a known mol wt. which can aid in establishing the course of the oxidation and any conclusion based on a study of glucose is applicable to some extent to cellulose. That the use of alk. Cu solns. in estg. glucose is valueless has been confirmed. The amt. of O used is dependent on alky. of the soln. Formation of gluconic or saccharic acid is not a necessary step in oxidation. Carbonate-treated solns. give higher Cu nos. than those in which free alkali is used. The reducing action of sugars is not due to carboxyl formation from the carbonyl group. Oxidation of the carbonyl group to carboxyl stabilizes to mol. Filter paper, etc., adsorb alkali tartrate, which cannot be removed by washing.

The Bertrand volumetric method is inaccurate since Fe salts catalyze oxidation of adsorbed tartrates by permanganate. Pptd. Cu_2O can be estd. without filtering from the reaction mixts. in several ways. R. H. LAMBERT

Improved methods for determining impurities in crude camphor. I. Determination of water and solid matter. S. YAMADA AND T. KOSHITAKA. *J. Soc. Chem. Ind. (Japan)* 30, 356-9 (1927).—For the detn. of H_2O in crude camphor by distn. with volatile solvents, an improved app. was devised, which is a modified form of Normann's app. (*C. A.* 19, 2277). It is claimed that adhesion of condensed H_2O on the wall of the still-head is completely avoided by the use of a still-head provided with a specially designed built-in reflux condenser having an inverted part at its end, and thus an accurate result is secured. The use of toluene or xylene instead of benzene is recommended. The improved method gave more accurate results than the usual method of centrifugal sepn. Y. TOMODA

A study of the determination of saccharin colorimetrically and by the ammonia process. A. F. LERRIGO AND A. L. WILLIAMS. *Analyst* 52, 377-83 (1927).—The various colorimetric methods of detg. saccharin were tested and found less suitable than the well-known method of forming the NH_4 salt of sulfobenzoic acid, by boiling with dil. acids, and detg. the NH_3 by distn. into acid. W. T. H.

Determination of organic matter by chromic acid oxidation. TH. VON FELLEBERG. *Mitt. Lebensm. Hyg.* 18, 290-6.—The combustion method for org. matter, with a dichromate and H_2SO_4 was tried on a list of compds. This method is the basis of Bang's micro-fat detn. (Mikromethoden zur Blutuntersuchung 4 & 5, 1922.) It is suggested to use this method for food and biochemical analysis. RUSSELL C. ERB

The chemical constitution of the micas (JAKOB) 8. Nessler's reagent (NAUDE) 6.

PLATTNER, CARL FRIEDRICH: Determinations with the Blowpipe. (8th edition, by F. KOLBECK.) Leipzig: J. A. Barth. 500 pp. Reviewed in *Mineralog. Abstracts* 3, 320 (1927).

Rapid analysis of alloys. D. W. BERLIN. Swed. 63,238, June 28, 1927. The elec. cond. and sp. gr. of a test specimen are compared with the same properties measured on standard specimens of known compn.

8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

Nomenclature in mineralogy. N. FEDOROVSKII. *Centr. Mineral. Geol.* 1927A, 76-80.—F. advocates revision of the present mineral names by an international congress. A more systematic and simpler terminology is needed. Guiding principles are suggested. J. E. GILL

Note on a new palladium mineral from Potgietersrust platinum fields. H. R. ADAM. *J. Chem. Met. Mining Soc. S. Africa* 27, 249-50 (1927).—At the farm Tweefontein a new Pd mineral occurs with Pd-free sperrylite (PtAs_2). An analysis on slightly impure material gave: Pd 70.4, Sb 26.0, insol. 1.4, Fe (as Fe_3O_4) 0.9%; this approaches Pd_3Sb ; Pt is absent. It is silvery white, insol. in HCl , only slowly attacked by H_2SO_4 and HNO_3 , easily sol. in dil. $\text{HNO}_3 + \text{HCl}$, and has sp. gr. about 9.5. J. F. SCHAIRER

The crystal structure of berzelianite (Cu_2Se). W. HARTWIG. *Z. Krist.* 64, 503-4 (1927).— Cu_2Se has the fluorite structure with the edge of the unit cube 5.748 ± 0.005 A. U. for synthetic material, and 5.731 for a specimen of the natural mineral. Davey's results (*C. A.* 18, 2092) are confirmed. I. S. RAMSDELL

Ore deposits of the Harz. II. A few selenium ores and their paragenesis. GEORG FREIBOLD. *Centr. Mineral. Geol.* 1927A, 16-32.—Brief descriptions of the selenides and their occurrences are followed by more complete descriptions of their phys. and chem. characteristics. Clausthalite (PbSe), tiemannite (HgSe), naumannite (Ag_2Se) and umangite (Cu_2Se_2) are recognized as definite minerals. Lehrsbachite, zorgite, seebachite and Pb-Co selenide are mixts. of the above. The distribution is discussed. The paragenesis at Lautenthal is hematite and cobaltite, dolomite, clausthalite (youngest) at Clausthal, pyrite, quartz, calcite, chalcopyrite, clausthalite, tiemannite; at Lehrsbach, dolomite, clausthalite, tiemannite, umangite, chalcocite (isometric) also, below 91° , chalcocite, bornite, chalcopyrite; at Zorge, quartz, hematite, calcite, clausthalite, tiemannite, umangite; at Tilkeroode, pyrite, quartz, dolomite, calcite, chalcopyrite, selenides (clausthalite, naumannite, tiemannite). J. E. GILL

The synthesis of ullmannite. N. S. KURNAKOV AND YA. POSTERNAK. *Ann. inst. anal. phys. chim.* 3, 484-5(1926).—BaCl₂ (90%) and 10% NaCl are melted in a graphite crucible, Ni₃Sb is added, the temp. raised to 1200° and Sb₂S₃ introduced in small pieces. Upon very slow cooling cubes and dodecahedrons of NiSSb sep.; the $d_{20} = 6.62$; it m. 758° without decomp.

BASIL C. SOYENKOFF

The crystal structure of linnaeite, polydymite and synchodymite. G. MENZER. *Z. Krist.* 64, 506-7(1927).—These 3 minerals all have nearly identical structures. They are face-centered cubic, with 8 mols. in the unit cell, and with an at. arrangement analogous to that of magnetite. The cube edges are 9.398, 9.405, and 9.434 ± 0.007 A. U., resp. There is no evidence for regarding polydymite and synchodymite as minerals distinct from linnaeite (Co, Ni)₈S₄ with a differing ratio of (Co, Ni) to S. L. S. R.

The mineral villiaumite. TOM. BARTH AND GULBRAND LUNDE. *Centr. Mineral. Geol.* 1927A, 57-66.—Villiaumite, described as tetragonal, gives x-ray interferences that are identical with those of NaF. The lattice const. is almost exactly that of c. p. NaF (NaCl type). Coloring and double refraction must be due to penetration of rays, probably radioactive, combined with the mech. requirements of the crystal. NaF subjected to x-rays acquired the properties of villiaumite.

J. E. G.

Magnetite crystals in sinters. G. M. SCHWARTZ. *Eng. Mining J.* 124, 453-5 (1927).—Examn. of polished surfaces of iron-ore sinters has permitted the accumulation of data regarding the sequence of crystn. The significance of and the following generalizations with regard to euhedral crystals in ores are made: (1) euhedral crystals imbedded in other minerals in an ore may be earlier than, contemporaneous with, or later than, surrounding minerals; (2) earlier crystals will as a rule show corrosion or replacement; lacking this, there may be no doubt as to relative age; (3) evidences of contemporaneity are not abundant; and (4) euhedral minerals where a persisting mineral is obviously replaced. Six photomicrographs show the stages of cryst. growth.

W. H. BOYNTON

The crystal structure of hausmannite (MnMn₂O₄). G. AMINOFF. *Z. Krist.* 64, 475-90(1927).—The structure can be interpreted either as body-centered tetragonal, with $a = 5.75$ and $c = 9.42$, or as face-centered, with $a = 8.14$ and $c = 9.42$. There are 8 mols. in the unit cell, which has the symmetry of space group D_{4h}^{19} . An arrangement of the atoms which agrees with the data and at the same time best agrees with the at. radii makes the structure analogous to that of magnetite, except that the axial ratio is 1 : 1.16 instead of 1 : 1.

L. S. RAMSDELL

Ilmenite from the Chibine Mountains. A. N. LABUNTZOV. *Trav. Musée Min. Acad. Sci. U. S. S. R.* 1, 35-42(1926); *Mineralog. Abstracts* 3, 308.—Four analyses of ilmenite are given.

J. F. SCHAIER

Analyses of Hungarian dolomite crystals. ILONA STROBENTZ. *Földtani Közlöny* 55, 49-57(Hung.), 275(German) (1925); *Mineralog. Abstracts* 3, 301.—Fifteen analyses of dolomite and ankerite are given.

J. F. SCHAIER

The optical properties of the andesine of Bodenmais. E. ERNST. *Sitzb. Heidelberg. Akad. Wiss.* 1926, No. 5, 3-21; *Chem. Zentr.* 1926, II, 2047.—Bodenmais andesine contains 28.80% anorthite and 4.56 K-feldspar and has $d. 2.666 \pm 0.003$, $2V = 87.2^\circ \pm 0.6^\circ$, $\alpha_D 1.5445 \pm 0.0002$, $\beta 1.5486 \pm 0.0001$ and $\gamma 1.5520 \pm 0.002$. C. C. D.

Mineralogical notes. R. T. HODGE SMITH. *Rec. Australian Mus.* 15, 69-78 (1926); *Mineralog. Abstracts* 3, 295.—The so-called green rhodonite from Broken Hill is identical with manganhedenbergite. *Analyses of albite and autunite* are given.

J. F. SCHAIER

Lievrite (ilvaite) from the arsenic deposit of Djimara, North Caucasus. I. G. KUZNETZOV. *Bull. Com. Geol. Russie* 44, 721-3(1925); *Mineralog. Abstracts* 3, 307.—Two analyses of ilvaite are given.

J. F. SCHAIER

Zoned nephelite. F. BECKE AND J. E. HIBSCH. *Anz. Akad. Wiss. Wien* 62, 243-4(1925).—According to Bowen's data (C. A. 6, 2221) if mix-crystals of Na₂Al₂Si₂O₈ and CaAl₂Si₂O₈ did not change in compn. and remain in equil. with the liquid melt, zoned nephelite crystals would be possible. Such zoned nephelite crystals in nephelite-phonolite from the Bohemian Mittlegebirges are described briefly.

J. F. S.

The structure of nephelite. C. GOTTFRIED. *Z. Krist.* 65, 100-9(1927).—An x-ray detn. on a natural crystal gave a unit cell with $a = 10.09$ and $c = 8.49$ A. U., contg. 16 mols. and belonging to the space group C_6^2 .

L. S. RAMSDELL

The space group of helvite. C. GOTTFRIED. *Z. Krist.* 65, 425-7(1927).—Helvite, (SiO₄)₂Be₂(Mn, Fe)₂MnS₂, is cubic with the symmetry of T_d^2 . There are 2 mols. in the unit cell, the edge of which is 8.52 A. U.

L. S. RAMSDELL

An unnamed mineral of the olivine group. C. E. TILLEY. *Geol. Mag.* 64, 143-4

(1927).—A Ca orthosilicate described by Paul (cf. C. A. 1, 30) from Shannon Tier, Tasmania is identical with the β - Ca_2SiO_4 described by Day, Shepherd and Wright (C. A. 1, 28). The name *shannonite* is suggested as a mineralogical name for this compd.

J. F. SCHAIRES

X-ray study of silicates. B. GOSSNER. *Centr. Mineral. Geol.* 1927A, 39–44.—The unit cell of *phenacite* is a rhombohedron {100} with $\alpha = 108^\circ 1'$, $a = 7.68 \times 10^{-8}$ cm. and 6 mols. Be_2SiO_4 . The unit cell of *diopside* is a rhombohedron {100} with $\alpha = 111^\circ 42'$, $a = 8.77 \times 10^{-8}$ cm. and 6 mols. $\text{SiO}_2 \cdot \text{CaO} \cdot \text{H}_2$. The at. arrangements are discussed.

J. E. GILL

Some mineral associations from the Norberg district. PER GEIJER. *Sveriges Geol. Undersökning Årsbok* No. 4, 32 pp. (1926); *Mineralog. Abstracts* 3, 273.—The Fe ores of Norberg consist of magnetite in silicate skarn. Analyses of *allanite* (orthite), *Mg-orthite*, *norbergite* and *fluorborite* are given. The compn. of orthite and Mg-orthite is discussed in detail. Minerals contg. the $\text{Mg}(\text{F}, \text{OH})_2$ group occur at Norberg and have been formed by the high-temp. metasomatism of dolomite caused by emanations from a granite.

J. F. SCHAIRES

The chemical composition of the wöhlerite from the Chibine Mountains. G. CHERNIK. *Compt. rend. acad. sci. Russ.* 1923, 37–9; *Chem. Zentr.* 1926, I, 3456.—The wöhlerite forms small, tabular, lemon-yellow crystals, often interspersed with sphene. It is brittle, has hardness 6, d. 3.48, and is optically negative. Its compn. corresponds to the formula: $\{12\text{R}(\text{Si}, \text{Ti}, \text{Zr})\text{O}_3 \cdot \text{R}(\text{Nb}, \text{Ta})_2\text{O}_6\} \cdot 0.05\{[(\text{Ce}), \text{Fe}] \text{Fe}_6\} \cdot 0.5\text{H}_2\text{O}$, where R is Ca, Fe^{++} , Na_2 or K_2Mg .

C. C. DAVIS

The dehydration of apophyllite. A. CAVINATO. *Atti accad. Lincei* [6], 5, 907–10 (1927).—Two samples of very pure apophyllite (from Andreasberg and from New Jersey) on dehydration at different temps. reached a max. loss of 17.20% water at 700°. Evolution of water was extremely slow, e. g., heating for 366 hrs. was required to reach equl. with a partial loss of 13.28%. This 17.20% max. loss and the losses at all the lower temps. are much higher than ever reported before (cf. Z. deut. Geol. Ges. 20, 443 (1868); Hersch, *Dissertation Zürich* 1887; Z. Kryst. 34, 691 (1901); *Proc. verb. soc. Toscana sci. nat.* 15 (1906); Columba, *Rend. accad. Lincei* I, 1907; Zambonini, *Contributo allo studio dei silicati idrati*, Napoli, 1908; di Franco, *Atti accad. sci. nat. Catania* 15, (1926); Henning, *Handbuch der Mineralchemie*, II, iii, 477); this is due to the fact that none of the previous investigators heated their samples long enough. At 280° the apophyllite lost its transparency and the latter was not restored by immersion in oil.

C. C. DAVIS

Notes on the occurrence of zeolites, Ardglen, New South Wales. T. HODGE SMITH. *Rec. Australian Mus.* 14, 213–22 (1924); *Mineralog. Abstracts* 3, 287.—An analysis of fresh columnar basalt is included.

J. F. SCHAIRES

Truscottite. J. A. GRUTLERINK. *Verh. Geol.-Mijnb. Genootschap Nederland, Geol. Series* 8, 197–200 (1925); *Mineralog. Abstracts* 3, 271.—Truscottite, from the Je-hong Donok Au-mine, Benkoelen, Sumatra, forms white spheroidal aggregates with fibrous, platy structure and pearly luster on the cleavage. Fibers show straight extinction and—elongation with $n = 1.560$; sp. gr. 2.47. The formula assigned (H_2O lost below 120° being omitted) is $2(\text{Ca}, \text{Mg})\text{O} \cdot 3\text{SiO}_2 \cdot 1.3\text{H}_2\text{O}$, or if all the H_2O is considered as constitutional the formula is that of gyrolite. Truscottite is considered to be a zeolite of the gyrolite group.

J. F. SCHAIRES

Laumontite from Graf Cziraky, Nadap. R. REICHERT. *Földtani Közlöny* 54, 77–9 (Hungarian), 187–9 (German) (1925); *Mineralog. Abstracts* 3, 287.—An analysis of somewhat altered laumontite is given.

J. F. SCHAIRES

Natrolite from the Chibine Mountains and Lujawrurt in Russian Lapland. A. N. LABUNTZOV. *Trav. Musée Géol. Min. Pierre le Grand, Acad. Sci. Russ.* 5, 17–32 (1925).—An analysis of pink natrolite from Yukspor is given.

J. F. SCHAIRES

The chemical constitution of the micas. III. J. JAKOB. *Z. Krist.* 64, 430–54 (1927).—A complete description of the methods of chem. analysis used in this study of the mica group. (Cf. C. A. 19, 2007; 20, 2301.)

L. S. RAMSDALL

Biotite in tertiary eruptive rocks of Bohemia. GERDA SCHAUBERGER. *Centr. Mineral. Geol.* 1927A, 89–106.—Descriptions of various occurrences, optical data and chem. analyses are given. It is found that Fe-rich biotite occurs in the acid and Mg-rich in the basic members of a rock series. The compn. of the biotite depends on the relative proportions of the Fe and Mg, not on the abs. quantities of these elements in the host rocks.

J. E. GILL

A radioactive mineral from the Santa Clara estate, Pomba, Minas Geraes. D. JALMA GUIMARAES. *Bol. inst. brasileiro sci.* 2, 114–23 (1926).—Six analyses of polycrasegare included with crystallographic and optical data.

J. F. SCHAIRES

Loparite, a new mineral of the rare elements. I. G. KUZNETZOV. *Bull. Com. Geol. Russie* 44, 663-82(1925); *Mineralog. Abstracts* 3, 275.—Loparite from the nephelite-syenite near Imandra is described as isometric, $n = 2.3 - 2.4$, infusible before the blow-pipe, insol. in acids except H_2F_2 . Formula: $11 Ce(TiO_3)_2 \cdot 6(Di, La, Y)_2(TiO_3)_2 \cdot 6CaTiO_3 \cdot 9(Na, K)TiO_3$. Loparite is a member of the perovskite group, with knopite lying between it and perovskite. J. F. SCHAIRER

Mineral veins of Werfen, Salzkammergut. F. HEGEMANN AND H. STEINMETZ. *Centr. Mineral. Geol.* 1927A, 45-56.—Veins cutting slates contain quartz, breunnerite, hematite, lazulite, wagnerite, chlorite, rarely chalcopyrite and through alteration, aragonite. Three distinct groups are recognized and each is described in detail. Measurements of breunnerite, wagnerite and barite crystals and an analysis of wagnerite are given. J. E. GILL

Phosphophyllite and reddingite from Hagendorf. H. STEINMETZ. *Z. Krist.* 64, 405-12(1927).—An analysis of new material gives the following revised formula for phosphophyllite: $P_2O_5 \cdot 3RO \cdot 4H_2O$, where $RO = FeO + MnO$, and ZnO . The ratio of $FeO + MnO$ to ZnO is 1:1.75. Thus phosphophyllite is isomorphous with hopeite ($P_2O_5 \cdot 3ZnO \cdot 4H_2O$) with similar crystal angles, although hopeite is orthorhombic while the former is monoclinic. Phosphoferrite, previously described as a new mineral from this locality, is found to be reddingite ($P_2O_5 \cdot 3MnO \cdot 3H_2O$) with a high Fe content. L. S. RAMSDELL

Chemical and spectrographic study of pyromorphite from Braubach, Nassau. B. CAROBBI AND S. RESTAINO. *Rend. accad. sci. Napoli* 32, 17-27(1926).—This pyromorphite was studied with reference to the identification of the rare elements present in it. By chem. analysis, it contained 0.019% $La_2O_3 + Nd_2O_3 + Sm_2O_3$, 0.002 Ce_2O_3 , and 0.024 Y_2O_3 , etc. The presence of the following elements was established spectrographically: La, Nd, Sm, Y, Eu, Gd, Dy, Er, Yb and Ce. For each of the rare earth groups the elements present in the mineral are of even at. no., and those of odd at. no. are absent. This confirms a similar conclusion of V. M. Goldschmidt and L. Thomassen regarding the occurrence of the rare earth elements in apatite from several sources. The presence of Eu (at. no. 63) is an exception, possibly because of its forming $EuCl_2$ and thereby tending more strongly to form isomorphous mixts. with Pb compds. An earlier analysis is quoted. R. H. LOMBARD

Chemical and spectrographic study of pyromorphite from Leadhills, Scotland, and of mimetite from Santa Eulalia, Mexico. G. CAROBBI. *Rend. accad. sci. Napoli* 32, 54-69(1926).—This is a thorough chem. and spectrographic detn. of the elements which occur in these minerals in small quantities or as traces. In a 28-g. sample of the pyromorphite there was found by chem. methods, 0.1% Cr_2O_3 , 0.001 MnO , 0.16 CaO , a trace of SrO and BaO , and 0.02 rare earth oxides. Spectrographic examn. showed the presence of: Ce, La, Nd, Y, Eu, Gd, Dy, Er, and, in all probability, Yb and Ho. It is suggested that the Cr_2O_3 is present in pyromorphite as $PbCrO_4$, substituted isomorphously for a small quantity of $PbCl_2$. In about 16 g. of mimetite there were found by chem. detn., 0.07% Cr_2O_3 , 0.008 MnO , 1.37 ZnO , 0.29 CaO , and 0.009 $BaO + SrO$. Spectrographic study established the absence of elements of the rare earth group. R. H. LOMBARD

Scharizerite, a new mineral from the Drachenhöhle at Mixnitz, Steiermark. JOSEF SCHADLER. *Anz. Akad. Wiss. Wien.* 62, 180(1925).—A black asphalt-like substance which occurs with the phosphate ore at Mixnitz is described as a new mineral and called *scharizerite*. An analysis gave ash 17, C 35, H 4.5 and N (mean) 8%; P only in traces. The substance is completely sol. in NaOH soln. and is reprecip. by HCl. This so-called new mineral is said to be related to dopplertite and phytokollite. J. F. SCHAIRER

Ore at deep levels in the Cripple Creek district, Colorado. G. F. LOUGHLIN. *Am. Inst. Mining Met. Eng., Tech. Publ.*, No. 13, 32 pp.(1927).—A general discussion of the geology and ore prospects in this Au-district. An analysis of basaltic breccia is included. J. F. SCHAIRER

Scientific expedition to Karabugaz in the years 1921-23. N. I. PODKOPAEV. *Trans. Russ. Institute for Applied Chem.* No. 4, 3-10(1925).—A meteorological study in relation to the pptn. of glauber salt on the shore of the Karabugaz straits on the Caspian Sea. J. S. JOFFE

Observations on the geology of the Santa Elena Peninsula, Ecuador, South America. G. SHEPPARD. *J. Inst. Pet. Tech.* 13, 424-61(1927). GEORGE CALINGAERT

Bentonite. H. S. SPENCE. *Sprechsaal* 59, 183-6; *Chem. Zentr.* 1926, II, 96.—A review of the chem. compn., phys. properties and the applicability of the clay formerly termed "taylorite." (Cf. C. A. 19, 628.) C. C. DAVIS

Dissemination almost universal—accumulation rare. R. A. JONES. *Oil Weekly* 46, No. 12, 32-6(1927).—A general discussion of the migration and concn. of oil deposits.

M. B. HART

The Grozny petroleum field. V. STCHEPINSKY. *Ann. office nat. comb. liquides* 2, 47-67(1927). **The Bakou petroleum field.** *Ibid* 329-53(1927).—Descriptions of the geological formation and of the characteristics of the oil produced are given. A. P.-C.

Jet and jetonized material. E. H. C. CRAIG. *J. Inst. Petr. Tech.* 13, 343-62 (1927).—Microscopic. examn. shows that jet and "jetonized material" are of vegetal origin. Retorting of jet yields light oils, up to 58 gal per ton of jet. There is evidence of the formation of hydrocarbons in carbonaceous deposits in the jetonized stage. The theory of formation of petroleum through bacterial action is not supported by evidence. Jet represents an intermediate stage between wood and coal and also between wood and petroleum.

GEORGE CALINGAERT

Igneous geology of Ardsheal Hill, Argyllshire. FRÉDÉRIC WALKER. *Trans. Roy. Soc. Edinburgh* 55, 147-57(1927).—Geological. Analyses of orthoclase-olivine-basalt, kentalenite, appinite, hornblende-porphyrite, hypersthene-andesite, and hornblende-biotite-granodiorite are included.

J. F. SCHAIRER

Quantitative mineralogical composition of quartz-diorites from Kühlen Grund and Weinheim, Odenwald. PETER CHIRVINSKII. *Centr. Mineral. Geol.* 1926A, 395 9.—Micrometric measurement of the Kühlen Grund diorite gave by calcn.: plagioclase 31.82, quartz 0.84, hornblende 51.74, biotite 9.48, magnetite 5.20, apatite 0.76, pyrite 0.16%. The Weinheim diorite gave: feldspar 67.50, quartz 6.44, hornblende 10.22, biotite 15.56, magnetite 0.02, apatite 0.16, titanite 0.10%. The sp. gr. = 2.791.

J. E. GILL

Accessory rocks from the nephelite-syenite of Ditro. MIKLOS VENDL. *Math. Természettud. Értesítő* 43, 215-42(Hung.), 243 (German), (1926); *Mineralog. Abstracts* 3, 290.—Analyses of nephelite-syenite-aplite and amphibole-camptone are included.

J. F. SCHAIRER

Alkali-rocks in the neighborhood of Anina and Stajerlak. ALADAR VENDL. *Math. Természettud. Értesítő* 43, 244-53(Hung.), 254 (German), (1926); *Mineralog. Abstracts* 3, 290.—Analyses of limburgite and basanitic plagioclase-basalt are included. J. F. S.

Limestone inclusions in the basalt lava of Mayen. ADELE BRAUNS AND R. BRAUNS. *Centr. Mineral. Geol.* 1926A, 237-9.—The inclusions contain calcite, Ca hydroxide, free quartz, wollastonite, green diopside augite, Ca-Na feldspar, garnet, and ettringite. Chem. analysis gave: SiO₂ 18.38, Al₂O₃ 5.87, Fe₂O₃ 3.83, CaO 30.63, SO₃ 2.54, CO₂ 10.67, H₂O 28.02%. It is concluded that these inclusions are not related in origin to the calcite-bearing igneous rocks of Ettringen. They are believed to have come from Tertiary limestones.

J. E. GILL

The formation of dolomite, from the standpoint of the sedimentation of primary magnesium carbonate. M. ROZSA. *Centr. Mineral. Geol.* 1926A, 217-33.—Available data indicate that strata of cryst. magnesite result from recrystn. of primary Mg carbonates pptd. from marine solns. contg. Ca and Mg carbonates. The sep. pptn. of MgCO₃ is due to the great difference in soly. between CaCO₃ and MgCO₃·3H₂O and to horizontal differentiation phenomena. Dolomite is assumed to form by: primary sepn. of mixed salts according to local and temporary equil. conditions, with later change to dolomitic stable products; primary sepn. of dolomite; marine dolomitization, i. e., replacement of original organically or inorganically pptd. CaCO₃ due to change in the equil. conditions in the marine system; dolomitization at depth within the earth's crust i. e., rearrangement of original carbonates or replacement by reaction with foreign solns.

J. E. GILL

Recent geology of the northern Fayum desert. ELINOR W. GARDNER. *Geol. Mag.* 64, 386-410(1927).—An analysis of a clay from Tasr-es-Saglia is included.

J. F. SCHAIRER

The mode of formation of hollow limonite pebbles. H. BORGER. *Centr. Mineral. Geol.* 1927B, 1-8.—The hollow pebbles formed from clay-ironstone fragments and geodes. Oxidizing solns. converted FeCO₃ to limonite, decrease in vol. accompanying this change forming the cavities. Some pebbles formed from the original calcareous geodes, the CO₂ freed from FeCO₃ aiding by causing the soln. of calcite. The uniformity of the cavities is due to the migration of Fe⁺⁺ into the porous outer part, where all the Fe is pptd. The banded structure of the crust is due to variations in the O content of the precipitant.

J. E. GILL

Hydrogen sulfide in the carboniferous limestone of the Donetz basin. YA. V. SAMOILOV AND W. A. SILBERMINZ. *Z. deut. geol. Ges. A*, 1926, 315-36.—See C. A. 20, 3673.

J. E. G.

The lime-magnesia waters from the environs of Streithberg and Müggendorf and their separation products. HANS KLÄHN. *Centr. Mineral. Geol.* 1926B, 390-400.—The $\text{CaCO}_3:\text{MgCO}_3$ ratio in the waters is different from that in the tufas sepd. from them. These are pure calcareous tufas, with only a small Mg content, perhaps due to adsorption. For formation of fresh water dolomite, higher MgCO_3 concn., rougher water and the participation of organisms are necessary. The slight pptn. from modern Streithberg waters as compared with the thick sinters of Diluvial time is believed to be caused by a present lower av. temp.

The origin of the thermal waters of Montegrotto (Euganei). L. DE MARCHI. *Atti accad. Lincei* [6], 5, 841-5(1927).—The mineral components of the water and its temp. indicate a source near the surface, whereas the compn. of the gases (H_2S , CO_2 , O, CH_4 , and N) and their vol. indicate a source at a great depth.

The thermal waters of Ax and of Andorra. J. G. F. DRUCE. *Chemist & Druggist* 106, 323(1927).—More than 60 thermal springs, of temp. 18-77°, emit nearly 1,000,000 gallons every 24 hrs., partly alk., partly milky from colloidal S. The compn. of the gas evolved from "Source Viguerie" examd. by Moureu (cf. *C. A.* 18, 3129) is N, 98.45%; A, with traces of Kr and Xe 1.453; He, with traces of Ne 0.097.

The age of the hydrogen sulfide contamination of the sea basin in the Crimea-Caucasus region and its probable connection with the processes of formation of petroleum. A. ARCHANGELSKII. *Neftyanoe Khozyastvo* 10, 483-6; *Chem. Zentr.* 1926, II, 1006.—The same conditions which governed the transformation of org. remains into petroleum govern the formation of H_2S in the mud at the bottom of the Black Sea.

The rare gases of a few thermal springs of Bulgaria. N. P. PENTCHEFF. *Compt. rend.* 185, 511-3(1927).—The gases of 3 springs have been analyzed by the methods used by Moureu and Lepape. The ratios He/A and A/N confirm the results of Moureu

The constitution of the earth. H. S. WASHINGTON. *Bull. volcanologique* 1925, Nos. 5-6, 1-39.—Previous theories and that of the author regarding the constitution of the earth are summarized in detail. For a similar but more detailed presentation of W.'s theory of the constitution of the earth, cf. *C. A.* 19, 2012.

Geochemistry of iodine. III. The distribution of iodine between the iron and silicate melt. TH. VON FELLEBERG AND GULBRAND LUNDE. *Biochem. Z.* 187, 15-8(1927); cf. *C. A.* 21, 3034.—The slag contains more I_2 than the Fe melt.

9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, R. H. ABORN

Alfred Krupp, 1812-1887. W. BERDROW. *Krupp. Monatsh.* 8, 22-4(1927).—Biographical sketch.

How selective flotation is affecting metallurgical practice. L. O. HOWARD. *Eng. Mining J.* 124, 551-2(1927).

Organic flotation reagents. J. C. WILLIAMS. *Eng. Mining J.* 124, 456-8(1927).—A brief explanation of the chem. compn. of org. flotation reagents. Oils employed have been classed as "frothers" and "collectors." The former includes such compds. as pine oil, while the "collectors," such as coal tar and the heavy mineral oils, have

recently been largely superseded by certain org. chemicals, known as "promoters." Of the 4 reagents discussed, 3 contain a —SH group and the other contains N in an amine group. Compds. contg. both N and S are known that are extremely effective flotation promoters, and most of the org. promoters also effectively vulcanize rubber. W. H. B.

Investigations of the magnetizability of the roasted products obtained by heating magnetite in the air and the relation between this capacity and their chemical composition. E. GREULICH. *Glückauf* 62, 1297-305; *Chem. Zentr.* 1926, II, 2629; cf. C. A. 21, 869.—The magnetizability of the roasted products depends upon the Fe_3O_4 content. The exponential law which applies to the decrease in the Fe_3O_4 content on roasting is also applicable to the decrease in the magnetizability. Even below 550° a decrease in the magnetizability was detected. Above 1400° magnetite is stable. Above 1450° in the presence of Pt it forms free FeO , which was identified by means of magnetic measurements. There is no strict proportionality between the magnetizability and the Fe_3O_4 content. The magnetic method is therefore not suitable for accurate quant. analysis, but does give some information on the possibility of working an ore. For other ores, such as pyrites, it must be considered that certain conditions are indispensable in the roasting of the ore to Fe_3O_4 . C. C. DAVIS

Concentration of the mixed copper-zinc-lead ores at the mines of Orijärvi, Finland. KNUT MÖRTSELL. *Teknisk Tidskrift, Upplaga C (Bergsvetenskap)* 57, 5-7(1927).—A review. C. A. ROBARK

The treatment of Read-Rosebery ore at Zeehan, Tas. E. H. FRASER. *Chem. Eng. Mining Rev.* 19, 361-5(1927).—The ore from the mines at Williamsford and Rosebery consists, in general, of a very finely grained mixt. of sphalerite, galena and pyrite with a gang of quartz and schistose material, and contains about 30 g. of Ag to the unit of Pb. For sepn. it is necessary to grind the ore so that 90% passes a 200-mesh screen. Conc'n. of the ore, conditions for Pb and for Zn flotation, and the need and means of accurate plant control are discussed. Careful control of temp. is necessary to minimize the volatilization of Pb and the formation of Zn ferrate from the blende and pyrite present in the concentrate. The presence of ferrate adversely affects the extn. of Zn in the electrolytic process. It begins to form freely above 750° . Research work is in progress relative to the reduction of ferrate formation. W. H. BOYNTON

Smelting titaniferous ores of iron. ALFRED STANSFIELD. *Iron Steel Can.* 10, 263-7, 271(1927).—The principal Canadian deposits of titaniferous iron ores are briefly described. Magnetic concn. does not sep. the iron from titanium. Much more fuel per ton of iron produced is required for titaniferous ores than for hematites. By making cones contg. TiO_2 , SiO_2 and CaO in varying proportions together with 10% Al_2O_3 in each mix the limiting percentage of each variable to produce a low-melting slag (1185 – 1210°) was detd. In the presence of N_2 , however, the cones when heated to 1400° or over were coated with a difficultly fusible Ti nitride. The dark blue oxide of Ti is not Ti_2O_3 , but probably Ti_4O_7 . When TiO_2 is heated in a C boat at 1600° in a stream of $\text{CO} + \text{N}_2$ a black substance, probably Ti carbide, is formed. Above 1600° the oxide is converted into a copper-colored substance, possibly Ti_3CN_4 . On contact with C the molten slag effervesced and gradually became less fusible. Possibly nitride, as well as TiC , was formed. Titaniferous ores have often been smelted in blast furnaces, but the TiO_2 content of the mixed ores must be kept below 1.5% for foundry iron and below 3% for malleable iron. By the magnetic concn. of titaniferous magnetites the TiO_2 content can be brought down to 5 to 10%. By mixing such a beneficiated ore with siliceous ores, it may be possible to smelt it economically. Mixing magnetite and hematite is not desirable, but the concentrates when sinter-roasted will probably be easily reduced and can therefore be smelted in admixture with siliceous hematites or the production of a superior grade of pig iron. E. G. R. ARDAGH

Treatment of Rouyn copper ores. H. H. CLAUDET. *Can. Mining J.* 48, 751-3(1927).—The different types of ore met with in the Rouyn district are discussed and a method of treating the chalcoppyrite ore is considered. Tables are given showing probable profits with direct smelting compared with smelting preceded by concn. A. B.

Treatment of Horne copper-gold ores. K. WILLIAMS. *Can. Mining J.* 48, 768-70(1927).—The process will consist of roasting in shaft furnaces, smelting to 35% mat in reverberatory furnaces, and converting in Peirce-Smith converters. The smelter stack will be of brick-lined concrete, 422 ft. high. The plant is under construction. A. B.

Flotation test on a copper-nickel ore. A. C. HALFERDAHL. *Can. Mining J.* 48, 608-9(1927).—Attempts were made to float Cu-Ni selectively from pyrrhotite in a Manitoba ore, aided in some cases by magnetic sepn. The association of Ni and Cu with pyrrhotite was broken up only at meshes finer than 200. It was impossible to make a high Ni concentrate without grinding to slime. A. BURRS

An application of froth flotation to oxide ores. A. C. VIVIAN. *Mining Mag.* 37, 153-60(1927).—An account of expts. made in a study of differential flotation of Pb and Zn minerals in oxidized Rhodesia Broken Hill ore. Further discussion is also given of the use of cupferron, KCN, NaCN, taurocholate and other reagents. Cf. C. A. 21, 3177. Results were encouraging but not conclusive. A. BUTTS

Direct production of brass from mixed ores. A. W. GUERTLER. *Metall u. Erz* 23, 325(1926).—PbS and ZnS ores may be roasted with an excess of metallic Cu to produce an upper layer of Cu_2S and two lower layers of Pb-Cu and Zn-Cu. Remelting the Zn-Cu with addition of more Cu produces a machine grade of brass. The Pb-Cu can readily be refined to Pb. Cu_2S can be roasted to reproduce Cu. Fe may be removed as a slag, and small amts. of As, Sb and Bi go with the Pb fraction. C. G. KING

Native smelting in equatorial Africa. J. C. BOWER. *Mining Mag.* 37, 137-47 (1927).—The crude methods used for Fe and Cu are described. A. BUTTS

The dispersoid chemical factor in metallurgy. F. SAUERWALD. *Kolloid-Z.* 42, 242-63(1927).—The high surface tension of metals causes a difficult problem in sepg. them from the slag. The limit of grain size of both boundaries and internal parts of a solid metal is discussed. Change in form of crystals can be noticed by measuring the expansion on heating. The general idea of the relation between boundary and inner portion of a metal is reviewed; its independence of temp., the properties of mixed crystals with respect to the degree of despersity and tempering are big factors in obtaining a desired metal. R. H. LAMBERT

Nickel—past and present. R. C. STANLEY. *Can. Mining Met. Bull.* No. 183, 844-77(1927).—An historical sketch of the use and production of Ni, with details of modern uses and alloys. A. BUTTS

Some characteristics of certain New Guinea gold. R. LAW. *Chem. Eng. Mining Rev.* 19, 370-1(1927).—The types of Au obtained from this field are roughly classed as: (a) melted Au in ingots, buttons, etc.; (b) unmelted Au recently roughly sepd. from quartz and gang; (c) water-worn stones and pebbles carrying precious metals; (d) alluvial dust grains, slugs or small nuggets with a fine Au color. Characteristics of each class are noted. The peculiarities of New Guinea Au are due to an etched or plated external surface. There is a Au in the stone of low fineness (53.6% with Ag as the alloy). There is the metal being sepd. from the gang by weathering and mech. action and simultaneously being superficially acted on by solvents. And there is the coalescence of the fine Au surfaces. The alluvial nuggety Au varying in fineness from the outside inwards is of scientific interest. W. H. BOYNTON

Making sponge iron in Japan. ANON. *Iron Age* 120, 937-8(1927).—A description of a plant built at Kuji and an account of experience with the Anderson-Thornhill process in the reduction of the ferrous sands of the district. E. J. C.

Need for research in foundry pig iron. RICHARD MOLDENKE. *Am. Inst. Mining Met. Eng. Tech. Publication* No. 11, 1-11(1927).—The gradual decrease, in recent years in the quality of pig irons for foundry use, is laid to the ever-increasing demand for pig irons to be used in the production of com. steel. Concn. by furnace men upon steels for the latter purpose has made it increasingly difficult for the foundryman to obtain good casting iron. Since considerable oxidation takes place when the metal is melted for casting, it is absolutely essential in order to get good castings that the pig Fe used be one that has not been subjected to any oxidizing influences at the furnaces. A process for deoxidation of molten foundry Fe would overcome this difficulty, and of course, would be highly desirable. New methods of analysis and more detailed reports of compn. including such constituents as: O_2 of dissolved Fe oxide, occluded O_2 , H_2 and N_2 , Cr, Cu and Ni, would lead to a better knowledge and perhaps an elimination of the troubles arising in foundry practice. A cooperative research program, by furnacemen and foundrymen, is urged. An excellent discussion of the paper is appended. W. F. E.

Pig iron low in total carbon is in demand for use in various industries. ENRIQUE TOUCEDA. *Am. Inst. Mining Met. Eng. Tech. Publication* No. 11, 24-7(1927).—In the production of air-furnace, white-iron castings in which high strength and ductility are desired, the C content should not exceed 2.5% in order that the C in the annealed casting will be sufficiently low. For higher strengths less C should be used. The most satisfactory way of obtaining castings so low in C would be to start with pig Fe having about 3% C. This cannot now be obtained from the blast furnace proper but could be made by an auxiliary installation in the cast house. Addition of steel scrap to lower the C content of pig Fe to be used in the malleable process is not satisfactory because of the impurities which may be introduced thereby. WILLIAM F. EHRET

Carbon in pig iron. R. H. SWEETSER. *Am. Inst. Mining Met. Eng. Tech. Publication* No. 11, 28-37(1927).—Data recorded during several "casts" at the blast fur-

naces of the American Rolling Mills are presented. Basic Fe was being made with by-product coke. The aim in the investigation was to find out how to control the C content of pig Fe and to det. the connection between the analysis of the gas at the tuyères, the analysis of the slag and pig Fe and the temp. of the slag and Fe. For a particular Fe the C and Si tend to increase with increased temp. in the furnace, and the S decreases. The temp. interval was between 2500° and 2700° F. Analysis of samples taken at the tuyères shows that the reactions which det. the character of the slag and of the Fe only are partially complete at the level of the tuyères. Much chem. action takes place between the level of the combustion zones in front of the tuyères and the molten Fe in the bottom of the furnace.

WILLIAM F. EHRET

Proper sulfur-manganese ratio must be maintained. L. E. GILMORE. *Foundry* 55, 734-5 (1927).—A discussion of the importance of the relation between S and Mn to produce good malleable iron. Two charts show the Mn-S relation in the usual air-furnace, open-hearth or elec. malleable, and for cupola malleable, and serve as a practical guide for detg. rational % of Mn for varying S contents in the iron cast. The presence of FeS is responsible for most of the troubles and a correct Mn-S ratio prevents its formation. In the air-furnace, open-hearth or elec. furnace malleable, the recommended ratio is % Mn = $1.7 \times \% S + 0.1$, and for cupola malleable it is % Mn = $1.7 \times \% S + 0.2$. In all cases the min. is % Mn = $1.7 \times \% S$. The chart indicates that Mn should be $2\frac{1}{3}$ times the S to produce good black-heart iron.

W. H. B.

Fundamental research in steel manufacture. C. H. HERRY, JR. *Trans. Am. Soc. Steel Treating* 11, 899-911 (1927).—Particular reference is made to slag-metal reactions resulting in the formation and elimination of non-metallic inclusions formed from Mn, Si and Al.

W. A. MUDGE

The quality of steel as dependent upon the method of production. P. GOERENS. *Krupp. Monatsh.* 8, 25-48; *Z. Ver. deut. Ing.* 70, 1093-9, 1129-36, 1194-8 (1927).—A review.

Centrifugal casting of steel. LEON CAMMEN. *Trans. Am. Soc. Steel Treating* 11, 915-19 (1927).—A discussion of the present and prospective field of application and limitations of centrifugal tube casting is followed by an application to centrifugal bar casting. Steel made by this latter method is both better in quality and cheaper than that made by present methods.

W. A. MUDGE

Direct production of steel from minerals. REMO CATANI. *Met. italiana* 19, 146-59 (1927).—The topics treated are: elec. processes, non-elec. processes, direct and indirect reduction of Fe minerals in the elec. furnace, reduction equations of magnetite, results of direct production of steel from magnetite, reduction of hematite in the elec. furnace.

ROBERT S. POSMONTIER

The theory of the blast-furnace process. FRITZ WÜST. *J. Iron Steel Inst.* (advance copy), Sept., 1927, No. 15, 13 pp.—It is shown that Mn, Si and P cannot be taken up by the iron in any quantity in the blast-furnace bosh. Dissoen. of CO is regarded as essential for economical working, and since dissoen. is considerable only below 500° a low top temp. is desirable in the blast furnace—a condition causing sepn. of C in large quantities, and emphasizing the favorable effect of the hot-blast. The heat evolved in conjunction with the dissoen. of the CO delays the temp. fall within the shaft and permits the indirect reduction to take its course more fully. The theoretical considerations have been fully confirmed by a practical test. In the oxidizing gas phase in front of the tuyères oxidation of the iron takes place, whereby the slag becomes charged with FeO, which inhibits reduction of MnO, SiO₂ and P₂O₅ from the slag. Reduction of these oxides is effected above the level of the tuyère. Si, Mn and P diffuse into the iron before melting in the same way as C, which means that the pig iron is formed before the iron melts. C evolved by dissoen. of CO penetrates the pores of the ore, tending to promote reduction. Also in *Engineering* 124, 436-8 (1927).

W. H. BOYNTON

Alkalies in the blast furnace. WILLIAM MACCONNACHIE. *J. West Scot. Iron Steel Inst.* 39, 79-84 (1927).—A review of the work of others on cyanogen and alkalies in blast-furnace gases is followed by data indicating the considerable accumulation of alkalies at the tuyère level. The alk. cyanides are destroyed by contact with unreduced oxides causing oxidation of both the C and the alk. metals of the cyanide. The alk. oxides so formed may be in the vapor state or in suspension in the gases and combine with SiO₂, MnO, Al₂O₃, etc. to form easily fusible compds. which trickle down, over or through the materials, eventually reaching the bath of slag and metal in the hearth. Here Ca replaces the alkali and the latter rises from the slag and is driven against the C undergoing combustion and is reconverted into cyanide. This reaction may not be complete, as some of the alkali may combine with CO₂. In connection with the reduction of Mn, the interception of alkali shows its greatest distribution effect. As the gases

rise in the furnace the amount of alkali diminishes and the cyanide content diminishes even faster. "The alkalis are not simply condensed but are intercepted and brought back to the hearth by silica and alumina chiefly." In a hot furnace in good order the alkali forms mostly cyanide which will rise the higher in the furnace the more thoroughly the ore has been reduced in the upper part. A brief discussion is given.

W. H. BOYNTON

The use of silica gel as a medium for drying blast. F. H. LEWIS. *J. Iron Steel Inst.* (advance copy), Sept., 1927, No. 9, 10 pp.—At the Wishaw works of the Glasgow Iron & Steel Co., Ltd., a silica-gel plant of 6 adsorber units has been operating since April, 1927. Each unit consists of a large steel box with trays contg. the gel in granular form. The bottoms of the trays are so perforated as to cause the air to flow through them in parallel. Five units are normally used for adsorption and the other is used for activation. The heat for activation is provided by the combustion of blast furnace gas, cleaned in the recovery of by-products from the raw coal used in the furnaces. Between the dehydrating plant and the blower an adjustable inlet for atm. air permits diln. of the dried air to the required moisture figure. Const. moisture in the blast permits the production of a more regular quality of iron, and saves fuel. Historical notes and a bibliography are appended. Also in *Chemistry & Industry* 46, 902-4; *Ind. Chemist* 3, 441-51; *Chem. Age* (London) 17, 281 3(1927).

Basic open-hearth practice. C. H. HERTY, JR. *Trans. Am. Soc. Steel Treating* 11, 569 82(1927).—A comparison covering the melting period, lime boil, working period and the efficiency of the deoxidizers used for 3 types of open hearth charges, consisting, resp., of light scrap, heavy scrap and ore

W. A. MUDGE

The effect of varying ash in the coke on blast-furnace working. C. S. GILL. *J. Iron Steel Inst.* (advance copy), Sept., 1927, No. 5, 7 pp.—G. shows the effect of fluctuating ash and the advantages of consistent ash on quantity and quality of pig iron produced, the saving in blast pressure, and the reduction in coke consumption. Also in *Gas World* 87, No. 2252, Coking and By-products Section, 33-4(1927); *Engineering* 124, 435(1927).

W. H. B.

Manufacture and use of metallurgical coke. R. BULMER. *Bull. Brit. Cast Iron Research Asscn.* No. 17, 19-20(1927).—A brief discussion of the chem. and phys. requirements of blast-furnace and cupola cokes. Many chem. requirements are common to both, but aside from strength, their phys. requirements diverge. While a large, slow-burning coke is desirable in the cupola, the opposite qualities are desired in the blast furnace.

R. H. ANORN

Improved furnace on southern ores. J. P. DOVEL. *Iron Age* 120, 782-4(1927).—More uniform stock distribution and corresponding gains in tonnage and lower ratio coke are effected by having steeper inwalls that are water-cooled. The blast-furnace construction at the Sloss-Sheffield Steel and Iron Co., Birmingham, Ala. is described and illustrated. A heavy cast sectional iron hearth jacket is employed and its size is detd. rather by the size of the cast than by other general dimensions of the furnace. Inwall is protected by several rows of bronze cooling plates connected to and supported by the shell. An independent brick lining is used up to a point where abrasion from the stock would commence. Above this the wall is of metal. Advantages claimed for the furnace are: a larger area for stock; the possibility of using a relatively smaller bell, which results in throwing more coarse material to the walls and causes free work along the wall as well as through the middle; and greatly increased production with a lower coke consumption.

W. H. BOYNTON

Reverberatory furnace burning powdered coal for melting cast iron. O. BECKMANN. *Feuerungstech.* 15, 281-3(1927).—A furnace and mill are described and illustrated.

Equilibria among lead, oxygen and sulfur. R. SCHENCK. *Metall u. Erz* 23, 326 (1926).—The system Pb-O-S is complicated by the vapor pressure of PbS and by the formation of basic sulfates. There are 26 possible reactions in the system and 8 or 9 of the possible curves can be established.

C. G. KING

Platinum and the regions in which it is produced. I-IV. Ural and Siberia platinum fields. N. K. VUISOTSKII. *Separates* (Petrograd) 1923-5.—I. A compendium of the history, uses, av. prices, trade conditions and the resources of Pt. II and III. Minerals and ores of the Pt group and the geology of Pt are described in great detail. IV. The Ural Fields are described.

WILLIAM M. MALISOFF

Cathodic disintegration as a method of etching specimens for metallography. C. S. SMITH. *J. Inst. Metals* (advance copy), No. 438, 3 pp.; *Engineering* 124, 410(1927).—Cathodic sputtering is employed to develop the structure of specimens for microscopic examn. Ag-Cu alloys gave the best results. Its use is limited to alloys of duplex struc-

ture, the constituents of which differ in ease of sputtering. This method should be useful as a confirmation of other methods in cases where the interpretation of etching results is difficult.

R. H. ABORN

Effect of temperature on the properties of metals. G. W. SAATHOFF AND F. M. VAN DEVENTER, *et al.* *Mech. Eng.* **49**, 1111-4 (1927).—A report of progress made by the Joint Research Comm. on the Effect of Temp. on the Properties of Metals. The research work is sponsored by The Am. Soc. of Mech. Engineers and the Am. Soc. for Testing Materials. The results of thermal expansion tests, over the range 0-500°, are given for the following alloys: 0.17 C-steel, stainless steel, Cr-Mo steel and nichrome. Av. and instantaneous coeffs. of expansion are given for each alloy at 100° intervals. Equations for calcg. the coeffs. of expansion are presented. A comparison of the data obtained from high-temp. tension tests by different labs. shows that there is a considerable variation in the results obtained by different labs. when working with the same sample of metal.

WILLIAM F. EHRET

A method of measuring variations of electrical resistance for the determination of the thermal equilibrium diagram of an intermetallic system. F. H. JEFFERY. *Trans. Faraday Soc.* **23**, 563-70 (1927).—A continuous method of measuring the change of elec. resistance of an alloy with change in temp. has been described. The method has been applied to the series of Cu-Sn alloys from 40 at. % Sn to 98 at. % of the same. The results are in almost complete agreement with those obtained by Heycock and Neville but not in accord with those obtained by Ishihara (*J. Inst. Met.* **1**, 315 (1924); cf. *C. A.* **19**, 920) nor with those obtained by Haughton (*C. A.* **15**, 1686). The higher transition point of Sn, as detd. by this method, is 162°.

A. I. HENNE

The application of recrystallization. M. v. SCHWARZ. *Z. Metallkunde* **19**, 321-4 (1927).—Photomicrographic analysis is made of sections where failure had occurred, and by means of *Fry's etching medium*, the presence of recrystn. and grain growth at the defective sections is demonstrated. A sample of cast Fe is heated and the variation in Brinell hardness as the temp. rises is detd. The hardness decreases almost on a straight line up to about 300°; from 300° to 400° the rate of decrease is much lower; and above 400°, as the depth of recrystn. increases, the Brinell no. rises.

H. STOERTZ

Aluminum destruction by mercury and its remedy. H. RÖHRIG. *Korrosion und Metallschutz* **3**, 121-3 (1927). On Al immersed in 92% soln. of HgCl₂ a thin layer of Hg quickly formed. After being washed and dried, the Al was exposed to moist air, which caused the formation of Al(OH)₃ with evolution of much heat. After immersion, test pieces were treated to prevent corrosion in moist air. Washing with water and scraping were unsuccessful; treatment with HNO₃ was partly successful. Annealing was completely successful but is not advisable in practice because of the redeposition of volatilized mercury in cold parts of the app. One or two treatments with a 10% K₂Cr₂O₇ soln. is recommended as the best remedy.

J. K. ROBERTS

Hysteresis in metals under alternating stresses. N. P. INGLIS. *Metallurgist*, Supplement to *Engineer* **144**, Sept., 1927.—A review.

D. B. DILL

Notes on the A₂ stable transformation. A contribution to the subject of graphitization. H. A. SCHWARTZ. *Trans. Am. Soc. Steel Treating* **11**, 767-70 (1927).—A₂ stable is distinctly below A₁ metastable. The theory is offered that A₂ stable approaches A₂ in pure Fe-C alloys as the concn. of the element promoting graphitization decreases.

W. A. MUDGE

Corrosion-fatigue of metal, as affected by chemical composition, heat treatment and cold working. D. J. MCADAM, JR. *Trans. Am. Soc. Steel Treating* **11**, 355-79 (1927).—Corrosion-fatigue depends upon 2 factors—corrosion intensity and a stress range. The corrosion-fatigue limit depends upon a strength factor as well as on corrosion resistance. Data are given for C, Ni, high-Cr and Cr-Ni steels. Transverse cracks passing through non-metallic inclusions usually surrounded by oxide coating are the origins of corrosion-fatigue failures.

W. A. MUDGE

Inter- vs. intra-crystalline fracture in systems of large crystals of aluminum, iron, copper and brass in relation to temperature and time as well as resulting recrystallization. F. SAUERWALD AND G. ELSNER. *Z. Physik* **44**, 36-57 (1927).—Static and impact tensile tests at temps. up to 650° for Al, 800° for Fe, 900° for brass and 1000° for Cu failed to show any general relationship between temp. and type of fracture. Al and Fe gave only intra-cryst. fractures, while Cu and brass exhibited both types. The occurrence of inter-cryst. fracture in these cases is connected with the known small deformability of Cu and brass crystals in certain regions, and need have nothing to do with grain boundary conditions. Spontaneous recrystn. occurring during hot deformation and tending to diminish the brittleness accompanying inter-cryst. fracture complicates the problem at high temp.

R. H. ABORN

Nickel and Monel metal with especial reference to annealing. C. A. CRAWFORD. *Am. Inst. Mining Met. Eng., Tech. Publication No. 35*, 21 pp. (1927).—A paper giving the com. forms of Ni and Monel metal, their chem. compn., phys. and mech. properties, and their working and fabrication. Details in annealing practice are given and the behavior of these metals in forging, casting, pickling, machining, punching, press drawing, hand-hammering, spinning, soldering, brazing, welding and riveting described. An appendix follows the paper, giving details as to the specific uses of the different classes of com. Ni and Monel metal. J. W. SHIPLEY

The hardening of metals by dispersed constituents precipitated from solid solutions. R. S. ARCHER. *Trans. Am. Soc. Steel Treating* 10, 718-47 (1926).—Metals may be hardened by highly dispersed particles within the grains, such as may be formed from super-satd. solid solns. The typical process of hardening by this means consists in a soln. heat treatment at a relatively high temp. followed by rapid cooling into a region of super-satn. then by a pptn. treatment or aging to permit the formation of a very fine ppt. The ppt. tends to grow to a crit. particle size conducive to max. hardness, beyond which the hardness decreases. Various examples of this type of hardening and generalization regarding the theory of the process are offered. W. A. MUDGE

Twinning in ferrite. L. W. MCKEEHAN. *Am. Inst. Mining Met. Eng., Tech. Publications*, No. 29, 7 pp. (1927).—M. describes the prepn. of twins in large ferrite crystals in a $\frac{1}{8}$ in. Armeo Fe welding rod contg. C 0.04, S 0.037, P 0.003, Si 0.008 and Mn 0.02%. No change in the cryst. boundary was produced on heating for 3 hrs. at 700°. Conclusion: Distortion at the twin boundary is therefore not sufficient to cause the growth of new crystals. Twin boundaries in ferrite are more stable than those in Zn. J. W. SHIPLEY

Correlation of magnetic properties with mechanical hardness in cold-worked metals. II. Nickel strip. S. R. WILLIAMS. *Trans. Am. Soc. Steel Treating* 11, 885-98 (1927).—The hardness obtained by cold-rolling Ni strip has been studied in connection with the change of length due to a magnetic field (Joule magnetostriuctive effect), the coercive force, residual magnetism, hysteresis loss per cycle and elec. cond. All magnetic phenomena except the magnetic change in length continued to vary as the Ni increased in hardness on cold rolling. The magnetic change in length did not vary after 30% cold reduction. W. A. MUDGE

Grain growth in compressed metal powder. C. J. SMITHIELLS, W. R. PITKIN AND J. W. AVERY. *J. Inst. Metals* (advance copy), No. 441, 13 pp. (1927).—Tungstic acid was purified and reduced by H so as to give two grades of pure W powder differing in fineness. The powders were pressed into bars and sintered electrically at temps. measured with a disappearing-filament pyrometer. The relation between the temp. of the bar and the wattage required for heating was plotted; a discontinuity appeared on every heating curve, at a higher temp. for the coarser than for the finer powder. The shrinkage in length of bar was greater for the fine than for the coarse metal; with the finest powder it was detected first at 1100° K., and with the coarsest at 1420° K. Metallographic tests showed that the changes at definite temps. were due to grain growth. Greater pressure in forming the bar caused grain growth to occur at a lower temp. It is concluded, contrary to Sauerwald, that grain growth in pressed W powder occurs at temps. depending on the pressure and particle size. GEO. F. COMSTOCK

Chemical and physical properties of non-ferrous castings. S. R. FRANCIS. *Pulp Paper Mag. Can.* 25, 1140-1 (1927).—A brief outline of the most important chem. and metallurgical features affecting the selection and purchase of bronze for various services in the pulp and paper industry. A. PAPINEAU-COUTURE

The scientific conception of some properties important in the casting and hot working of metals. F. SAUERWALD. *Z. Metallkunde* 18, 137-42, 193-5 (1926).—The properties of liquid metals and alloys are considered and their relation to the crystn. of the metal when cast and to the solid castings so formed. Among these properties are the vol. changes in the liquid and the solid metal, the effects of internal friction and of so-called "turbulent friction" and their relation to surface tension and viscosity. App. for measurement of viscosity and internal friction up to 1000° is described. No special dependence of internal friction upon compn. was found and Plüss' conclusion that the concn. corresponding to the eutectic shows a min. value for internal friction was not confirmed. Some alloys contg. Cu₃Sn showed high internal friction, presumably due to the complex compd. present. Surface tension of liquid metals was measured by passing a gas stream through a quartz capillary tube dipped beneath the surface of the melt metal so that the single bubbles of gas escaped very slowly. The pressure required just to allow the gas to pass through the surface and form bubbles was measured; with uniform capillary diameter and depth of immersion this is proportional to the surface tension. The mol.

condition in liquid and solid metals was investigated. Two of the most important alloy series, the iron-carbon and the bronzes, have intermetallic compounds and there is an equil. between these and their dissoen. products which is dependent upon temp. Whether the shifting of this equil. follows the temp. when the temperature is rapidly changing, as during casting of the metal, can sometimes be detd. from the vol. changes during fusion. A graphical method of estg. the degree of dissoen. of a liquid intermetallic compd. by use of its vol. isotherms is described and illustrated. Characteristic results given for copper show a linear relation between temp. and deforming stress with test pieces of various shapes. Recrystn. following hot working was studied and the temp. and duration of working as well as the rate of cooling. The final structure depends primarily on the rapidity of crvstn., the amount of deformation, and the rate of cooling. Development of large crystals after hot working was observed in specimens of Cu, Ni, Fe, Al, Sb, Zn and brass. The temp. at which marked crystal growth followed light cold working and the velocity of the changes were noted, the phenomena being observed immediately after working and (1) quenching in H_2O , (2) after natural cooling and (3) after annealing the forged test pieces, half an hour, at the temperature of working. Results with Cu and Ni are graphically shown, together with photomicrographs of treated Cu and brass. Cu begins to cryst. rapidly at 700° . Ni shows the influence of time, and the end effect of deformation and recrystn. depends on the rapidity of cooling as well as the duration of annealing. A 63% brass worked above the β transformation range and then quenched in water shows a coarse structure at the points of least work.

D. F. McFARLAND

Effect of heat treatment on the combined carbon in gray cast iron. E. L. ROTH. *Trans. Am. Soc. Steel Treating* 12, 27-40(1927).—Max. transformation of combined C in gray cast Fe, into graphitic C, occurs at $1400^\circ F$. when the cast Fe is heated for $1/2$ to 3 hrs. in the case of materials contg. 3.52% C and 1.75% Si as well as those contg. 3.25% C and 2.70% Si. The degree of graphitization does not increase with a rising temp. and is more complete at the center than at the edge. Si does not have a marked effect upon the graphitization.

W. A. MUDGE

A neglected phenomenon in heat treatment. BIRGER EGEBERG. *Trans. Am. Soc. Steel Treating* 12, 46-50(1927).—Quenching Ni-Cr Steels in which there is considerable difference between the Ac and Ar points, at a temp. close to the Ar point rather than the Ac point gives better phys. properties and less dimensional change. W. A. M.

The embrittlement of black-heart malleable iron resulting from heating overstrained material. R. D. ALLEN. *Trans. Am. Soc. Steel Treating* 10, 630-7(1926).—Restructured bars of black-heart malleable Fe, when heated within the range $440-800^\circ F$. and cooled in air, become extremely brittle and fracture with a white steely fracture. This defect may be eliminated by quenching in water from $1200^\circ F$.

W. A. MUDGE

Case-hardening materials, their composition, investigation and valuation. P. W. DOHMER. *Z. angew. Chem.* 51, 725-45(1927).—Proximate, rather than ultimate, analyses of case hardening materials are most desirable. Such materials may contain (1) a C-contg. portion, like charcoal, lignite, coal, coke, sawdust, animal charcoal, etc.; (2) a catalyzer or energy-carrier, such as $CaCO_3$ or $BaCO_3$; (3) CN compds., like KCN, $K_4Fe(CN)_6$, $CaCN_2$, etc.; (4) a binding material, such as glue, dextrin, soap, oil residues, mineral waxes, etc.; and (5) other additions of questionable value like SiO_2 , NaCl, glass, KNO_3 , iron scale, slag, ash, etc. Cyanides, binding materials and other additions are rarely found in hardeners bought and used by the car-load, but are employed in small-scale operations. If the sp. gr. of the material is low (0.360) it indicates high percentages of charcoals; if it is high (near 0.830) it indicates the presence of coke in large amts. The H_2O content is important; it is detd. by the xylene method. Na_2CO_3 is detd. by titration of an aliquot portion of the soln. obtained by leaching a sample with H_2O . Alkaline earth metals are detd. by pptg. HCl solns. of case-hardening materials with alkali carbonates, drying the ppts and then weighing. The residue from these extns. with H_2O and HCl is then "slimed" with H_2O and sepd. into lighter (wood, peat, charcoal, etc.) and heavier (coal, coke, etc.) materials, and then examd. microscopically. H_2O content of 6-8% is normal; sp. gr. must not be too high; charcoal must always be present, 10% being considered optimum; Na_2CO_3 is sometimes a detriment, for it unites with SiO_2 to form silicates (glass). A mixt. of equal parts of $CaCO_3$ and $BaCO_3$ (up to 12-16% of the total wt.) acts better than either carbonate used alone, because of their different temps. of decompn. Wood, peat and many other substances are ineffective, and are added simply as fillers to keep down costs. Dextrin and mineral wax are sometimes used as binders, thus affording a product in pellet form. W. C. E.

Nature of the magnetic transformation of iron. FRANZ WEVER. *Z. anorg. allgem. Chem.* 162, 193-202(1927).—The A_3 and A_4 transformations of Fe are shown

to be both polymorphic and phase transformations as defined by W. In the magnetic A_2 transformation, neither the space group, the crystal structure, nor the space lattice orientation within the individual crystals is changed. Hence the magnetic transformation is not polymorphic. Further, the cooling curve for very pure Fe is interpreted as failing to establish the A_2 as a phase transformation. W. W. STIFLER

Behavior of carbon in a high-chromium rustless iron. M. A. GROSSMANN. *Trans. Am. Soc. Steel Treating* 10, 436-46 (1926) —C in a high-Cr Fe was found to be distributed non-uniformly after heat treatment; this leads to the formation of separate austenitic areas, in equil. with regions of α -Fe. The metal is still soft after rapid quenching from a high temp. because most of it has remained as α -Fe; the ductility has decreased greatly because C has led to the formation of well-distributed austenite areas, which upon quenching become martensitic and therefore hard and consequently interfere with deformation. Photomicrographs show typical structures. W. A. MUDGE

Evidences concerning the location of the carbon atom in boydenite. H. A. SCHWARTZ. *Trans. Am. Soc. Steel Treating* 11, 277-83 (1927). — Boydenite is a soln. of C in γ -Fe, in which one atom of the C replaces one of the Fe in the face-centered cubic arrangement. A solute atom of any kind may occupy either of 2 types of location in the lattice of a given solvent. W. A. MUDGE

Carbon characteristics of copper-bearing pig iron. W. B. COLEMAN. *Am. Inst. Mining Met. Eng., Tech. Publication* No. 11, 12-23 (1927). — The presence of less than 1% of metallic Cu in pig Fe does not seem to alter the phys. properties of castings and test pieces of the Fe. Photomicrographs and tests of the phys. properties show that Cu-bearing pig Fe can be remelted and cast without appreciable change in the structure or properties. Such Fe can be used in small castings and in machines satisfactorily. It has a low Brinell hardness, high total C and shows up well under transverse and deflection tests. Complete data on operation, analyses of casts and slags and control of a furnace producing Cu-bearing pig Fe is given. The presence of ferrite in the final structure minimizes internal shrinkage and facilitates machining. W. F. E.

Solution of cementite in α -iron and its precipitation. J. H. WHITELEY. *J. Iron Steel Inst.* (advance copy), No. 14, 11 pp (1927) — Basic steel of the "Armco" type, acid steel plate heated to 1000° and air-cooled, and acid steel plate heated to about 1400° and cooled very slowly were the specimens examd. The results indicate that above 630°, α -Fe dissolves an appreciable amt. of cementite, which is retained in solid soln. on quenching. On tempering at or below 250°, pptn. of this cementite occurs in the ferrite grains, and on further heating the cementite particles travel to the grain boundaries at high velocity. The soly. of cementite increases above 630°, being about 0.03% at 720°. Decrease in purity of the ferrite slightly raises the initial temp. of soln., the acid steel samples showing no soly. below 750°. Photomicrographic examn. shows that the carbide pptd. at lower temps. was always uniformly distributed in the ferrite grains in parts well away from pearlite areas, indicating a very rapid rate of diffusion. During slow cooling the dissolved carbide is deposited on existing crystals. The presence of dissolved C has a distinct hardening effect. Thus the sample of basic steel untreated showed a Brinell no. of 89, while heated to 680°, quenched and reheated to 550° the Brinell no. was 91 and quenched from 680° it was 105. Also in *Engineering* 124, 472-3 (1927). H. STOERTZ

Thermal expansion of cast iron. E. MORGAN. *Bull. Brit. Cast Iron Research Assn.* No. 17, 6-7 (1927). — A discussion of the observed differences (and their causes) between the theoretical expansion of cast Fe and the actual expansion in typical cases. R. H. ABORN

The graphitic decomposition of cast iron. ROBERT STUMPER. *Feuerungstech.* 15, 241-5, 255-9 (1927) — After a review with 25 references, 4 cases in which cast iron was reduced to a soft mass are illustrated (with photomicrographs) and described in detail with analyses. The conditions of corrosion in the various cases were various, and S. concludes that this type of corrosion product is a normal result of intense corrosive action of the ordinary sort. ERNEST W. THIELE

Properties and heat treatments of cast iron for Diesel engines. F. B. COYLE. *Trans. Am. Soc. Steel Treating* 12, 446-65 (1927) — Data are given in curves to show the effect of variations in compn. and heat treatment on the mechanical properties of cast Fe. Further research should be directed toward compn. of cast Fe with lower C and Si than has been produced in the past. W. A. MUDGE

Mechanical and machining properties of an annealed cast iron. G. C. PRIESTER AND F. J. CURRAN. *Trans. Am. Soc. Steel Treating* 11, 741-58 (1927). — Annealing gray-cast-Fe pistons resulted in an increase in machinability, a 30-40% decrease in strength properties and hardness, an 8-10% decrease in modulus of elasticity, a slight decrease

in max. deflection under transverse loads, a 10% decrease in allowable working stresses for the same deformation and a material change in the microstructure. W. A. M.

Action of pure carbon monoxide upon iron at elevated temperatures. W. P. FISHEL AND JOHN S. WOODRILL. *Trans. Am. Soc. Steel Treating* 11, 730-40 (1927).—The reaction between CO and Fe to produce $F_{\alpha}C$ and CO_2 has been demonstrated to obey the laws of reversible reactions. W. A. MUDGE

Testing machine for repeated impact, and a preliminary investigation on the effects of repeated impact on Lowmoor iron. J. H. SMITH AND F. V. WARNOCK. *J. Iron Steel Inst.* (advance copy), No. 13, 33 pp. (1927).—The machine was designed to apply a direct stress and to avoid the loss of energy involved in deforming hammer, anvil and specimen. The machine developed consists essentially of an anvil attached to the lower end of the specimen, while a mass of known wt. is dropped from variable heights up to 8 ft., thus delivering a tensile shock to the specimen. The driving mechanism permits of the delivery of 40 blows per min. for falls up to 30 in. Lowmoor Fe was used for the specimens because of its uniformity. The batch used contained Si 0.140, P 0.136, S 0.012, Mn 0.010 and C 0.085%, the usual static tests showing 13.95 tons/sq. in. yield stress with 55.85% reduction in area and 29.06% elongation. Brinell no. was 109 along the length of bar and 121 on the cross section. A series of tests was made using 2, 4, 10 and 20 lb. tups, and varying the heights of fall for each tup. The results show a limiting range of impact energy which could be applied repeatedly without producing rupture. For a given amt. of repeatedly applied tensile shock energy, the total energy to produce rupture is const. The single shock energy therefore may be obtained either from a small mass with a large drop or a large mass with a small drop, thus proving that momentum is not an important factor. For a given mass of tup the relation between the height of fall H and the no. of shocks N required to cause rupture is given by the equation $H = AN^2$, A and x being const. After 200 blows, A and x acquire new values. The energy required to produce rupture by a single shock was detd. for various tups and was found to range between 381.5 and 430 in. lbs., the av. being 392 in. lb. Comparing this with the energy required when static means are employed the 2 are found to be approx. equal. When the shocks to produce rupture are below a certain value, the elongation is const. and 4% greater and reduction in area is const. and 3% greater than in static tests. The effect of the shape of the specimen was studied, and the results show that abrupt changes of section, such as sharp V grooves, are a source of weakness in machine parts that have to withstand repeated tensile impact. The endurance increases with the length of the specimen up to a given value, after which it remains const. Surface finish is found to have little effect. H. STOERTZ

Some effects of hydrogen on iron and their bearing on a reported transformation at 370° C. (698° F.). H. S. RAWDON, PETER HEDNERT AND W. A. TUCKER. *Trans. Am. Soc. Steel Treating* 10, 233-56 (1926).—The polymorphic transformation in ferrite at 698° F. was not confirmed; thermal analysis and thermal expansivity measurements indicate an "irregularity." Fe treated with H_2 by heating to a high temp. exhibits a greater tendency for this phenomenon than does similar Fe not subjected to H_2 . X-ray exams. offer an explanation that the heat evolution is due to recrystn. of very fine-grained metal such as might result from the reduction of FeO by H. W. A. M.

Manufacture of malleable iron. A. E. WHITE. *Trans. Am. Soc. Steel Treating* 11, 245-63 (1927).—Equil. in Fe-C alloys of the malleable cast-Fe type is reached in less than 4 hrs. at 1800° with high-Si alloys, in 275 hrs. at 1400° F. with medium-Si alloys, and longer for the low-Si alloys. Combined C for equil. condition varies from 1.20 to 1.25% at 1800° F. to 0.47 to 0.50% at 1400° F. and is only slightly affected by ordinary variations in Si. The max. cooling rate compatible with successful maintenance of equil. is 28° F. per hr. for the lower cooling range (1500-1300° F.) for 0.90% Si alloys and faster for the upper temp. range. The rate varies for a 0.82% Si alloy from 25° to 30° F. at 1700-1600° F. down to 5-8° F. for 1400-1300° F. W. A. MUDGE

Observations on the microstructure of the path of fatigue failure in a specimen of Armco iron. F. F. LUCAS. *Trans. Am. Soc. Steel Treating* 11, 531-40 (1927).—Non-metallic inclusions in Armco iron, some of which are insecurely seated in the metal are a potential source of weakness when the metal is subjected to reversed cycles of stress. The boundary between the non-metallic inclusion and the metal is the path often followed by a fatigue crack. Non-metallic inclusions act as stepping stones for the fatigue crack. Grain boundaries and Fe_3C inclusions are not sources of weakness. Reversed cycles of stress appear to produce disturbances in the structure of the metal in advance of the visible crack. Disturbances in the metal structure adjoining the path of fatigue failure seem to be highly localized to the immediate neighborhood of the crack. Slip planes, strain lines, Neumann bands or other similar markings were not found if the

strained condition of the metal immediately adjoining the crack is disregarded. Many excellent, high-magnification photomicrographs are given. W. A. MUDGE

Normality of steel. J. D. GAT. *Trans. Am. Soc. Steel Treating* 12, 376-413 (1927).—Six types of S. A. F. Steels, one Krupp steel, one contg. 0.5% Ni and one type of Cr-Ni-V steel, in duplicate, were used, and subjected to two different carburizing treatments; viz., carburization for 6 hrs. at 1725° F. followed by cooling in the furnace to 1200° F. for 3 hrs. and carburization for 6 hrs. at 1850° F. followed by furnace cooling to 1200° F. for 4 hrs. A steel will harden satisfactorily if its structure after carburizing is composed of grains of pearlite surrounded by cementitic boundaries. For hardening, the size of the grains of steel is immaterial. Resistance to uniform hardening is caused by high O₂ content forming a eutectoid alloy with the constituents of austenite. W. A. MUDGE

Progress in study of normal and abnormal steel. S. EPSTEIN AND H. S. RAWDON. *Trans. Am. Soc. Steel Treating* 12, 337-75 (1927).—Normal and abnormal steels are defined in terms of the McQuaid-Ehn test. The general condition of abnormality in steel may be considered as "grain-size abnormality" and "structural abnormality;" the first of these often exists independently of the second. Drastic quenching of both normal and abnormal steels, hardened essentially the same, showed no surface soft spots; quenching with less drastic cooling showed a greater tendency toward soft spots with the abnormal steel, regardless of the method of heating prior to quenching. Dissolved gas in any coolant tended to produce soft spots, CO₂ being most detrimental; abnormal steel was more affected by the presence of gas in the coolant than was normal steel. High-C tool steels showed the same differences when carburized as are designated by the terms normal and abnormal for carburizing steel. Abnormal tool steels showed a greater tendency toward the production of surface soft spots upon quenching than normal tool steels. Detn. of the "gas content" of the steel has given no conclusive evidence as to the real nature of abnormality. The causes of abnormality have their origin in the steel-making process and are intimately related to the deoxidation treatment. W. A. MUDGE

Steel qualities and their relation to manufacturing processes. P. GOERENS. *Z. Ver. deut. Ing.* 70, 1093-9, 1129-36, 1194-8 (1926).—To define quality, steels are classified according to chem. compn. and process of manuf. Structure, preliminary casting and heat treatment characterize the "steel condition." Steels identical in the above respects but different in properties are denoted as "steel qualities." These depend on the care taken in the choice of raw materials and in their manuf. The influence of foreign substances on the structure and properties of steel and the forms (solid soln. and compds.) in which they occur are discussed. Many of the inclusions due to these substances have thermal expansion coeffs. half the value of that of the surrounding metal, which may lead to cracks. Pearlitic, martensitic, and austenitic steels are considered from the standpoint of formations and effect of alloying elements. The principles of the removal of foreign substances in pig iron are outlined: (1) dissolving out of S with molten lime-rich slag; (2) oxidation of C, Si, Mn and P with excess of O and removal of these oxides with slag, (3) deoxidation of the FeO formed (by excess O) with Mn, Si, Al or C, and removal of the oxides as in (2); (4) crystn. (puddling process). A diagram showing the solidification processes of steel at various temps. is presented, and an explanation of the differences in weld steel and ingot steel is given. The processes of manuf. of Bessemer, Thomas, Siemens-Martin, crucible, elec. steel, and steel from composite processes are compared. The so-called "trans-crystn." of steel and its causes are briefly described and the technology of casting is discussed. The extent to which the properties of C steels may be changed by small quantities of alloying elements is illustrated by comparative expts. with C-, Si-, Mn- and Cr-steel, manufd. by the basic Siemens-Martin process and cast in ingots of 240 × 240 mm. cross-sectional area and about 600 kg. in wt. Possibilities of improvements in the processes of steel manuf. are treated. D. THURSEN

High-speed steel. F. C. A. H. LANTSBERRY. *Trans. Am. Soc. Steel Treating* 11, 711-25 (1927).—A description of the technic of various methods of producing high-speed steel in England, America and Germany, with particular reference to the process used in Sheffield, England, in the making, compn., working, hardening, tempering and theory of high-speed steel. High-speed steel is adaptable for many uses because of its four independent and different types of hardness, viz. intrinsic hardness, C hardness, red hardness and secondary hardness. W. A. MUDGE

The importance of cementite. R. G. GUTHRIE. *Trans. Am. Soc. Steel Treating* 11, 341-54 (1927).—In low-C steels, which are not to be subjected to hardening, it is desirable to have the cementite in the spheroidal condition to give greater resistance to

corrosion, greater ductility, more stability, greater adaptability to covering by electroplating and enameling, and more ease in welding. In high-C steels, to be subjected to hardening, it is desirable to have the cementite in the lamellar form to give greater ease and homogeneity of heat treatment and resultant phys. properties. W. A. MUDGE

Existence and separation of a double carbide of iron and chromium in the colloidal state, obtained from a chromium steel. M. RAFFO AND O. SAMBUCCY. *Mét. italiana* 19, 207-10(1927).—The substance obtained after treatment of a Cr steel with HNO_3 , then washing with boiling H_2O and dialyzing repeatedly in H_2O contg. 1% HNO_3 , showed the following compn.: Fe = 64.71, Cr = 18.25, C = 13.57%, the probable formula being $\text{Fe}_4\text{C}_8\text{Cr}_3\text{C}_2$. ROBERT S. POSMONTIER

Hardness testing of steel balls by magnetic methods. S. R. WILLIAMS. *Trans. Am. Soc. Steel Treating* 11, 677-90(1927).—A description of improvements in this method of testing. W. A. MUDGE

Smooth finish machining of low-carbon plain and alloy steels. J. S. VANICK AND T. H. WICKENDEN. *Trans. Am. Soc. Steel Treating* 11, 551-68(1927).—Each of 6 S. A. E. steels of the carburizing type was found to have, under incorrect operating conditions, a tendency to machine to a rough finish in final or finishing cuts. This result was due to the existence of a crit. range of "volume removal" rates within which a rough finish was obtained. Smooth finishes were easily obtained by avoiding this crit. range. W. A. MUDGE

The transformation of retained austenite into martensite by stress. KÔTARÔ HONDA AND KEIZÔ IWASÉ. *Trans. Am. Soc. Steel Treating* 11, 399-405(1927).—See C. A. 21, 3336. W. A. MUDGE

Determining the proportional limit of steel. BENGT. KJERRMAN. *Trans. Am. Soc. Steel Treating* 12, 41-5(1927).—In order to avoid error in using the Martens extensometer for detg. the proportional limit the specimen is provided with loosely jointed extensions which reduce this alignment by increasing the distance between the jaws of the machine. Calcn. of the correct proportional limit from load-deflection data is made by detg. the elongation of the specimen corresponding to one load increment of about one to two kg. per sq. mm., assuming for steel a modulus of elasticity of 28,400,000. W. A. MUDGE

Deterioration of structural steels in the synthesis of ammonia. J. S. VANICK. *Trans. Am. Soc. Steel Treating* 12, 169-94(1927).—Ten com. steels were subjected to working conditions of 932° F., 100 atm. pressure and 8.3% NH_3 on a lab. scale. C content should be low; an increase of Cr was helpful; W was useful; V gave no perceptible improvement, while 2.25% Cr stopped selective penetration and intergranular fissuring and limited the depth of penetration to a tolerable extent. NH_3 is the active corrosive; the metal acts as a porous filter and permits an NH_3 enrichment to a destructive concn. W. A. MUDGE

Effect of temperature on the mechanical and microscopic properties of steel. G. C. PRIESTER AND O. E. HARDER. *Trans. Am. Soc. Steel Treating* 12, 436-45(1927).—A comparison of the mech. and microscopic properties of a 0.16 C and a 0.29 C steel at temps. up to 1112° F. W. A. MUDGE

Viscosity of steels at high temperatures below the melting point. NIKOLAUS CZAKÓ. *Auto-Technik* 15, No. 6, 13-15; *Chem. Zentr.* 1926, 14 289-90.—Recent investigations show that the usual methods of testing such as tensile-strength detns. of heated test rods, do not give information satisfactory for judging the behavior of a steel at elevated temperatures. The works of Cournot and Sasagawa (*Rev. métallurgie* 22, 753, 925; cf. C. A. 20, 568, 731) and of Chevenard are discussed. According to their investigations, a metal under stress becomes viscous at high temps. and elongates at a rate which can be expressed by the equation: $V = 1/[10(dI/dt)]$. The expts. were carried out in a current of N. The elongation-time curves were obtained by means of an app. employing the lever principle and recording graphically on a drum driven by clockwork. Five alloys were studied: (1) soft steel (0.04% C); (2) medium soft steel (0.22% C); (3) high-speed steel (0.50% C, 14% Cr, 13.57% W); an Fe-Ni-Cr alloy (approx. 63% Ni, 14% Cr), and (5) Si-Cr steel (2.62% Si, 10.29% Cr). The viscosities and the viscosities as a function of the tensile strengths at given temps. are shown in graphical form. C. C. DAVIS

The hardness of steel as determined by its heat treatment. P. YA. SAL'DAU AND V. N. SEMENOV. *Ann. inst. anal. phys. chim.* 3, 181-210(1926).—Cr-Ni steel of martensite structure and contg. C 0.29, Ni 5.08 and Cr 1.79% has a transition point between 680° and 700°. Specimens heated to 680° and tempered in cold water, irrespective of their previous history, attain the minimum hardness, are most resistant to a

blow and can be worked in the cold. Ferrite structure appears on heating to 680°.

BASIL C. SOVENKOFF

Stresses in quenched and tempered steel. S. L. HOYT. *Trans. Am. Soc. Steel Treating* 11, 509-27 (1927).—Tensile and compressive stresses may not, at times, exactly balance each other; their tendency to equalize results in strains or dimensional changes which are superposed on those due to the vol. changes.

W. A. MUDGE

Mechanism of the tempering of steels. TOKUJIRO MATSUSHITA AND KIYOSHI NAGASAWA. *J. Iron Steel Inst.* (advance copy), No 10, 12 pp. (1927); cf. C. A. 21, 2245.—The change in elec. resistance and intensity of magnetization are detd. for a quenched C steel contg 1.02% C, 0.33% Si, 0.30% Mn, 0.015% P and 0.022% S, and it is found that during the decompn. of *martensite*, the elec. resistance decreases and the intensity of magnetization increases, both in 2 steps below 300°. It is concluded that there are 2 kinds of *martensite*, α and β , of which during heating at a normal rate, the first decomposes at 100° to 170° and the 2nd at 170° to 300°. In decomp., *martensite* yields free C rather than *cementite*, and this combines with Fe in the interval 300° to 400° to form *cementite*. This formation of *cementite* is believed to explain the 2nd contraction in the thermal expansion curve as well as the sharp increase in magnetic hardness between 300° and 400°. This is also illustrated with a W steel contg. the double carbide 4Fe₃C.WC. The authors propose the following classification of the tempered structures of quenched C steels: *martensite* + *troostite*—100° to 300°; *troostite*—300°; *troostite* + *sorbite*—300° to 400°; *sorbite* (*osmondite*)—400°; *sorbite* + granular *pearlite*—400° to 550°; granular *pearlite*—550° to A₁ point. This is only valid for a normal rate of heating.

H. STOERTZ

Fatigue strength of hard steel and their relation to tensile strength. J. M. LESSELLS. *Trans. Am. Soc. Steel Treating* 11, 413-21 (1927).—The relation between tensile strength and Brinell hardness is linear; non homogeneity of the material may give a departure from this law. The superiority of medium-C steel in gear application, when properly heat-treated, is shown over the high-C steel.

W. A. MUDGE

Behavior of mild steel under prolonged stress at 300°. W. ROSENHAIN AND D. HANSON. *J. Iron Steel Inst.* (advance copy), No 12, 6 pp. (1927); *Engineering* 124, 409-10.—The material used was mild-steel strip contg 0.106% C, 0.395% Mn and a trace of Si. Four series of specimens were prepd. with the following heat treatment: (1). Heated to 900° and slowly cooled from 720° to 650°, producing free *cementite* in the boundaries of *ferrite* crystals. (2). Normalized at 900°, giving a microstructure of *ferrite-pearlite*. (3). Cold-worked and annealed for 4 days at 650° producing *cementite* distributed as globules throughout the *ferrite*. (4). Cold-rolled—large distorted *ferrite* grains. The specimens were subjected to loads ranging from $\frac{1}{3}$ to $\frac{2}{3}$ of the normal breaking stress, for a period of 5 years and 3 months at a temp. of 300°, and after this period were examd. for Brinell hardness and microstructure, with a 1-mm ball and a load of 5 kg. In every case a considerable increase in hardness occurred, although the amt. of straining was very slight. Thus in the series of normalized specimens, which showed the greatest strain (approx. 3%) the specimen loaded to $\frac{1}{3}$ of its tensile strength showed a Brinell no. of 71 in the unstrained portion above the shoulders, and a Brinell no. of 85 in the strained portion. No failures occurred, explained probably by the hardening which took place.

H. STOERTZ

Hair cracks in steel rails. J. H. WHITELEY. *Trans. Am. Soc. Steel Treating* 12, 208-15 (1927). A comparison of the magnetization method is followed by treatment with Fe dust in kerosene, and the picric acid etching method for detg. hair cracks in steel rails.

W. A. MUDGE

Case-carburization of production steels by means of salt baths of low cyanide concentration. H. B. NORTHRUP. *Trans. Am. Soc. Steel Treating* 12, 470-8 (1927).—Carburizing tests on 1120, 2315 and 3115 S. A. E. steels at 1650° F. show that the brittleness due to nitride absorption at 1500° F. may be largely eliminated by this higher temp.

W. A. MUDGE

Wear resistance of carburized steel versus cast high-manganese steel. W. J. MERTEN. *Trans. Am. Soc. Steel Treating* 11, 233-43 (1927).—Carefully prepd. and selected, low- and medium-C case-hardened steels are more resistant to wear than 14% Mn steel in service under pressure and sliding motion, but free from shock or pounding.

W. A. MUDGE

Dilatation of iron and steel. F. STÄBLEIN. *Stahl u. Eisen* 46, 101-4; *Engineering* 121, 395 (1926); *Science Abstracts* 29A, 427.—A description of a relatively simple app. for use in steel works for the detn. of the expansion of steel up to 1000°. Curves are given showing the records obtained with the app. for electrolytic Fe where it is seen

that 2 specimens do not give identical values in accordance with previously known information that different specimens of such Fe do not behave alike at the A_3 point, and that the expansion on heating and cooling is different. The latter is ascribed to a distortion of the lattice and difference in the α to γ and γ to α changes. Curves are also shown bringing out clearly the differences in dilatation between steels contg. more or less C than eutectoid alloy. It is seen that the dilatation curve, which is simple in pure Fe, increases in complexity with increased C content. The irregularity is less marked as the C percentage increases from 0.05 to 0.12 and again from 0.22 and 0.86. In the hypereutectoid steels with 0.97, 1.09 and 1.33% of C the slope of the curve is very steep. An attempt is also made to draw the Fe-C diagram in accordance with dilatation curves.

H. G.

The influence of the rate of pull on the observed elastic limit of ingot steels. E. H. SCHULZ AND H. BUCHHOLTZ. *Mitt. Versuchsanst. deut. Luxemburg, Bergwerksg. Hutten. A.-G. Dortmunder Union* 2, 1 9; *Chem. Zentr.* 1926, II, 1181.—Breaking tests were carried out on standard test pieces of basic Siemens-Martin and Thomas steels with different C contents to det. the influence of the rate of pull on the elastic limit. From a practical point of view the observed values of the latter were considerably influenced by the rate of pull. The influence of this rate when 80-100 sec. was required to reach the elastic limit, or a rate not over 0.5 kg. per sq. mm. per sec. was insignificant, and even at a rate of pull of 0.5-1.0 kg. per sq. mm. per sec. it was still not great. Above this, however, the values of the elastic limit increased notably, the increase reaching 11% with soft steels and 9% with hard steels when the rate was 10 kg. per sq. mm. per sec. From a practical point of view the tensile strength, elongation and contraction were not materially influenced by the rate of pull.

C. C. DAVIS

Investigation of bolt steels. V. T. MALCOLM AND JOHN JUPPENLATZ. *Trans. Am. Soc. Steel Treating* 11, 177-216(1927).—A heat-treated alloy steel bolt has been recommended to supplement the C steel bolt in order to meet the higher pressure and temp. demands in power plant and oil refineries. Selection of raw material, method of manuf. and rigid inspection are equally essential with heat treatment, phys. tests and chem. analyses. All advantages claimed for case-hardened nuts may be had without the bad effects by substituting a medium-C, heat-treated steel nut. Detailed tests and their results are given.

W. A. MUDGE

Cutting power of high-speed steel tools and methods of testing. F. RAPATZ. *Stahl u. Eisen* 49, 1109-16(1926).—The cutting power of W steels increases with the hardening temp. slowly between 1000° and 1170° and then rapidly to a max. at about 1300°. The best cutting properties are obtained when the microstructure consists entirely of evenly oriented, fairly large polyhedral grains contg. regularly distributed, small inclusions of the ledeburite eutectic, i. e., when the max. amt. of carbide possible is retained in solid soln. With plain 14-18% W steels this structure is obtained by heating for 10 min. at 1250° or for 1-3 min. at 1300°. The longer period of heating at 1250°, although it gives slightly the more satisfactory structure, has the disadvantage that it is difficult to prevent serious oxidation taking place; on the other hand, care must be taken not to exceed 3 min. at 1300° or to allow the temp. to rise more than 20° above this temp., the metal will be ruined by fusion and redistribution of the eutectic accompanied by abnormal growth of the polyhedral grains. Alloys contg. Co or V in addn. to W may safely be heated to a higher temp. as these elements appear to raise the m. p. of the eutectic. All high-speed tool steels are rendered harder and tougher by subsequent tempering at 580°, whereby the austenite is converted into martensite and internal strains are relieved. As the tensile strength of the alloy increases its life as a cutting tool is reduced very rapidly; an increase in the speed of cutting also reduces the life of the tool but the reduction is not proportional to the cutting speed. The compn. of a steel is no indication of its behavior as a cutting tool; the controlling factors in detg. the life of a tool are hardness combined with toughness and suitable microstructure, as well as homogeneity and freedom from slag inclusions.

B. C. A.

Comparative tests on ball-bearing steels. T. L. ROBINSON. *Trans. Am. Soc. Steel Treating* 11, 607-18(1927).—The size and distribution of the particles of excess cementite are factors in the performance of steel both under reverse stress or fatigue tests and under the static bending test. Steels in which these particles of cementite are comparatively small and uniformly distributed show greater endurance and strength.

W. A. MUDGE

Crystallization and structure of metals and alloys. ALBERT PORTEVIN. *Bull. soc. chim.* [4], 41, 961-87(1927).—An address dealing with structure of solidification which exerts a "hereditary" effect on all subsequent states, effect of mech. deformations

in the cold, effects of reheating or annealing after deformation, and effects of polymorphic transformations as exemplified in Fe and mild steels. A. PAPINEAU-COUTURE

"Tula" alloys. The ternary system cuprous sulfide, silver sulfide, lead sulfide. ROBERT SCHWARZ AND ALFONSO ROMERO. *Z. anorg. allgem. Chem.* **162**, 149-60(1927).—Cu, Ag, Pb and S alloys used for ornamental purposes and known under the name of "tula" or "myello" show on analysis that all the S is combined, a typical alloy contg. 12% Ag_2S , 52% Cu_2S and 36% PbS . The binary systems $\text{Ag}_2\text{S}-\text{Cu}_2\text{S}$, $\text{PbS}-\text{Cu}_2\text{S}$, $\text{Ag}_2\text{S}-\text{PbS}$ were examd. $\text{Cu}_2\text{S}-\text{Ag}_2\text{S}$ shows an unbroken series of mixed crystals with a min. at 665° contg. about 70% Ag_2S . The system $\text{Ag}_2\text{S}-\text{PbS}$ possesses a eutectic with the compn. 77% Ag_2S at 630°. The system $\text{Cu}_2\text{S}-\text{PbS}$ has a eutectic at 540° contg. 51% Cu_2S . The ternary system is studied and the space diagram $\text{Ag}_2\text{S}-\text{PbS}-\text{Cu}_2\text{S}$ is detd. The cooling curve shows the existence of 2 primary crystn. planes, the one characterized by the primary sepn. of mixed crystals and the secondary sepn. of PbS , and the other by the primary sepn. of PbS and the secondary sepn. of mixed crystals. The line connecting the eutectic points $\text{Cu}_2\text{S}-\text{PbS}$ and $\text{PbS}-\text{Ag}_2\text{S}$ is carefully investigated. The space diagram as detd. agrees very well with that theoretically required. H. STOERTZ

The changes of silver-zinc alloys in the crystalline condition. G. I. PUTRENKO. *Z. anorg. allgem. Chem.* **165**, 297-304(1927); cf. *C. A.* **20**, 1023.—Thermal and microscopic analyses of Ag-Zn alloys show the existence of the following compds: Ag_2Zn , Ag_2Zn_3 , Ag_2Zn_6 . Ag_2Zn is found to be dimorphous, with a transition point at 254°

F. A. JENKINS

The iron molybdenum system. W. P. SYKES. *Trans. Am. Soc. Steel Treating* **10**, 839-69(1926).—A description of the C free alloys of Fe and Mo including the equl diagram as detd. from fusion temps., heat treatments and a study of microstructures. Notable features include a eutectic at 36% Mo m. 2625° F., a glass-hard, intermetallic compd., Fe_3Mo_2 , at 53.4% Mo, and appreciable solid soly. increasing with rise in temp. at either end of the system. Secondary hardness may be developed by aging a super satd. soln. at 1112-1292° F.; this hardness is equal to that of high-speed steel and persists at temps. considerably higher. A_r is lowered from 2550° to 2245° F. and A_r is raised to 1795° F. by the addn. of 3% Mo to pure Fe. With a Mo content greater than 3.5-4% the Fe exists in the body-centered crystal lattice at all temps. below the m. p.

W. A. MUDGE

Graphitizing behavior of iron carbide in pure iron-carbon alloys in the critical-range. H. P. EVANS AND ANSON HAYES. *Trans. Am. Soc. Steel Treating* **11**, 691-707(1927).—Fe-C alloys of high purity have been graphitized in the presence of a $\text{CO}-\text{CO}_2$ gas mixt. at a pressure of 5 atm. within the temp. interval 1292-1875° F. Fe₃C in Fe-C alloys of high purity and contg. about 2.3% C is metastable at temps. below 1292° F. and above 1562° F. in the presence of this $\text{CO}-\text{CO}_2$ gas mixt. when it is applied at a pressure of 5 atm.

W. A. MUDGE

Heat of formation of cementite as electrolyzed from a pure iron-carbon alloy of eutectoid structure and composition. G. H. BRODIE, W. H. JENNINGS AND ANSON HAYES. *Trans. Am. Soc. Steel Treating* **10**, 615-29(1926).—A value of -13580 cal per g. mol. was obtained at 86° F. by a calorimetric detn. of the heat of formation of Fe₃C.

W. A. MUDGE

Iron-carbon-vanadium alloy for Brinell balls. G. W. QUICK AND L. JORDAN. *Trans. Am. Soc. Steel Treating* **12**, 3-24(1927).—Work-hardened Fe-C-V steel balls have been produced more resistant to permanent deformation than Hultgren balls. For testing materials of 800 Brinell or over these balls should be superior to the Hultgren ball but offer no advantage over the Hultgren ball for testing materials up to 700 Brinell

W. A. MUDGE

The diagram of state of iron-nickel alloys. S. A. POGODIN. *Ann. inst. anal. phys. chim.* **3**, 477-8(1926).—The diagram of hardness exhibits breaks between 10 and 25% Ni. solid solns. being formed on either side. The sp. resistance and cond. curves are also continuous between 30 and 100% Ni. Meteoric Fe is an equil. mixt., whereas artificial alloys are metastable.

BASIL C. SOYINKOFF

Heterogeneity of iron-manganese alloys. C. R. WOHRMAN. *Am. Inst. Mining Met. Eng., Technical Publication No. 14*, 32 pp (1927).—The photomicrographic structures of Fe-Mn alloys contg. approx. 30% Mn (Mn-1), 8% Mn (Mn-2) and 3% Mn (Mn-3), are interpreted, the Widmanstätten and martensitic patterns being regarded as structures resulting from the breaking up of a solid phase into 2 phases, and proof therefore of the heterogeneity of the alloys. The martensitic structure differs from the Widmanstätten merely in being considerably finer, less well defined and less regular. The examn. included a detn. of the structural changes produced by heat treatment, quenching and annealing, and the value of high magnifications is emphasized. Sys-

tems of definite constituents, stable within definite temp. and concn. regions, are found. Thus on thorough annealing, an aggregate is formed consisting of a ferritic constituent, probably a solid soln. of a small quantity of Mn in α -Fe, and a cementitic constituent which must be a Mn-rich intermetallic compd. It is further suggested that there exists a eutectoid of the 2 contg. about 6% Mn. This appears first in the segregate form of *martensite*, consisting of phases which break down into "*Mn-cementite*" and "*Mn-ferrite*," the aggregate retaining at first the martensitic or Widmanstätten pattern, but changing, on continued annealing, to the lamellar form of *pearlite*. These structures are strikingly similar to those of Fe-C alloys, and W. concludes that the valuable properties of steels are vested in the solid solns. which Fe tends to form, the influence of C being overemphasized in the past. He objects to the term "austenitic" as applied to a group of steels contg. little, if any, *austenite* proper, unless austenite be redefined as a solid soln. of any element in γ -Fe. H. STOERTZ

The miscibility gap in liquid iron-copper alloys. ANTON MÜLLER. *Z. anorg. allgem. Chem.* **162**, 231-6(1927); cf. *C. A.* **21**, 2245.—When Fe-Cu alloy in which sepn. into 2 layers had occurred is heated below the crit. point (1520°), the alloy becomes homogeneous. The miscibility gap is only slightly influenced by C up to about 0.2%, but an alloy contg. 0.31% C could not be homogenized even by heating as low as 1460°. H. STOERTZ

Study of type metals and of lead-tin alloys. A. TRAVERS AND HOUOT. *Rev. metal.* **24**, 541-54(1927).—The Chevenard differential dilatometer was used in the systematic investigation of the hardening of ternary Pb-Sn-Sb alloys and of binary Pb-Sn alloys, particularly for the study of tempering at const. temp. accompanied by contraction. The method allows of detecting traces of hardening, and more particularly of studying the effects of a few 0.1% Pb on Sn or Sn on Pb. The hardening of ternary alloys such as type metals increases with the Sn content, temp. of casting and rate of cooling. Sb does not seem to have any effect. Hardening can also take place, starting from the solid metal at a temp. of 180° or over. These alloys can undergo tempering even at atm. temp.; at the end of 7 months an alloy which had been cast in a chill mold had undergone approx. 67% of the contraction which occurred after complete annealing. Dilatometric study of Pb-Sn alloys showed that, with 0-1% Sn, Pb which had been cast in chill molds showed signs of hardening; but after annealing at about 200° it could not be hardened from the solid state. On the contrary, Sn contg. a few 0.1% Pb can be hardened from the solid state. The degree of hardening of Pb-Sn alloys increases with the Sn content to a max. at 16%. The dilatometric curves obtained on cooling pure Pb showed 1 or 2 breaks indicating allotropic modifications. In studying the transformation rhombohedral Sn \rightleftharpoons quadratic Sn, the calorimetric curves exhibited a discontinuity (break or flattening) at about 171-2° when the molten Sn had been overheated several hrs. at or above 500°. No satisfactory explanation of this anomaly has yet been found, but it may be related in some way to the allotropic transformation of Sn. Methods of analysis of type metals are outlined. A. P.-C.

A comparison of the alloying elements chromium, nickel, molybdenum and vanadium in structural steels. H. J. FRENCH. *Trans. Am. Soc. Steel Treating* **11**, 845-88(1927).—A condensed summary of important characteristics of alloy steels contg. Cr, Ni, Mo and V, illustrated by many practical applications. No one of the four alloying elements has a monopoly on all of the desirable properties of steel for structural purposes. At least three of the elements, viz., Cr, Ni and Mo, and possibly all four, will play an important part in future structural development. W. A. MUDGE

An x-ray study of the β transformation in copper-zinc alloys. ARTHUR PHILLIPS AND L. W. THELIN. *J. Franklin Inst.* **204**, 359-68(1927).—Spectrograms from β brass (51.1% Cu) held at 520° give no indication of a new lattice as compared with the same material at room temp. The 470° transformation is therefore not due to a crystal phase change but may be the result of sub-atomic energy changes. β brass has a body-centered cubic lattice (confirming previous work by Owen and Preston, and Westgren and Phragmen). The parameter increases from 2.956 A. U. to 2.974 A. U. as the % Zn increases from 48.9 to 49.6%. At 520° the parameter is 3.007 A. U. R. H. A.

Useful aluminum alloys. Replacement of silicon by germanium. W. KROLL. *Metall u. Erz* **23**, 684-5(1926).—Ten new Al alloys were prepd. and tested having known quantities of Ge, Si, Mg, Cu and Fe. Addn. of small quantities (1.2-1.6%) of Ge to duralumin, "lantal" and "aludur" alloys increased their strength by 1 kg./sq. mm. and improved the rolling properties of duralumin. Mg germanides are formed. C. G. K.

Useful aluminum alloys. Replacement of silicon with beryllium. W. KROLL. *Metall u. Erz* **23**, 613-6(1926).—Al-Be and Al-Be-Mg alloys have valuable properties which are given for 23 new alloys having a known content of Al, Cu, Mg, Be, Si and Fe.

Each plays an important role in the formation of eutectics at different temps. A Mg beryllide is thought to be formed, whose soly. in Al increases at higher temp. and with addn. of Mg. Addn. of Be causes slight hardening in the "lantal" group, little effect upon duralumin, but has a marked effect upon the "aludur" type. Be replaces Si only insofar as it forms compds. with Mg which are sol. in Al. C. G. KING

The diagram germanium-aluminum. W. KROLL. *Metall u. Erz* 23, 682-4(1926).—Eleven alloys were prepd. having 0.92 to 60.0% Ge in Al with 0.25% Si and 0.45% Fe. The eutectic point is 423°, with an alloy contg. 55% Ge. With low % Ge, sepn. began at 656°. Ge forms a compd. with Mg, and produces a greater hardness (40% Ge gave 82 Brinell) than Si. C. G. KING

The mechanical characteristics of binary aluminum-beryllium alloys. W. KROLL. *Metall u. Erz* 23, 616 8(1926).—Addn. of Be to Al increases its strength giving optimum qualities at about 6%. The effects of Be and Si are similar, but Si produces a greater effect per unit wt. C. G. KING

The under-cooling of some aluminum alloys. MARIE I. V. GAYLER. *J. Inst. Metals* (advance copy), No. 442, 28 pp.(1927).—Some Al-Si alloys contg. up to 20% Si were fused and cooled very rapidly, while time-temp. curves were plotted. The super-soly. curve for the system was plotted from these results. The mechanism of crystn. is discussed, and typical microstructures are shown. The macrostructure was coarser when Al crystd. first. Similar expts. were carried out with alloys modified by Na, in which systematic under-cooling did not occur, and showed that the equil. diagram of the modified alloys agreed closely with the super-soly. curve of the normal alloys. The addn. of Na caused crystn. to take place at temps. on the super-soly. curves. The modifier probably increases the no. of nuclei at the moment of crystn. Alloys contg. about 10.4% Si and up to 0.8% Fe; those with 0.14% Fe and up to 38% Cu; and those with 7.2% Cu and up to 0.7% Fe were also studied, and the effects of undercooling on the structures are illustrated. Casting high-purity Al-Si alloys in chills did not give truly modified structures. Expts. with an Al alloy contg. 7% Cu showed that with higher casting temp. the macrostructure was coarser, but the microstructure finer due to undercooling. GEO. F. COMSTOCK

Copper-magnesium alloys. II. W. T. COOK AND W. R. D. JONES. *J. Inst. Metals* (advance copy), No. 434, 22 pp.; cf. C. A. 20, 3421.—The properties of Cu-Mg alloys contg. 0-11% Cu in the forged and heat-treated conditions were detd. The ductility depends primarily on the forging temp. The latter should not be lower than 350°. Simple heat-treatment causes a decrease in test values. Addn. of Cu to Mg is beneficial up to about 2% Cu. Beyond this quantity the ductility decreases while the sp. gr. increases. For good results control of forging temp. is essential. Care must be taken to avoid cold-shuts by using preheated molds. H. S. v. K.

Magnetism and crystal structure in manganese-aluminum-copper alloys. FR. HEUSLER. *Z. anorg. allgem. Chem.* 161, 159-60(1927).—The alloy consisting of approx. 14% Mn, 10% Al and 76% Cu is non-magnetic when quenched from red heat. If aged at 80° it becomes weakly magnetic with almost no hysteresis. This occurs without any apparent alteration in structure. By appropriate treatment below 260° a third state is produced, characterized by mechanical and magnetic hardness. This is accompanied by a deep-seated alteration in the crystal structure and by a decrease in the elec. resistance. H. suggests the following explanation: At red heat sometimes the Al atoms, at other times the Cu and Mn atoms, are completely dissoed. This state is preserved by quenching. Aging at 80° brings about a chem. binding of the Mn and Cu atoms to the Al atoms, without alteration in crystal structure. This chemical union accounts for the inception of the ferromagnetic properties. W. W. STIFLER

Heat treatment of aluminum-silicon alloys. R. S. ARCHER, L. W. KEMPF AND D. B. HOBBS. *Am. Inst. Mining Met. Eng., Tech. Publications* No. 23, 30 pp.(1927).—Details are given of an extensive research on the effect of heat treatment on Al-Si alloys. Tables, phase diagrams, photomicrographs of structure and graphs showing the effect of the heat treatment on phys. properties accompany the papers. Quenching from 565° as compared with slow cooling produces increased hardening and a decrease in plasticity and elongation. Aging at room temp. has little effect on the phys. properties of these alloys, but aging at elevated temps. increases the hardness up to 20%. Spheroidizing and growth of the Si particles are very marked at temps. above 565° and accompanied by decreased hardness and strength, increased plasticity and usually increased ductility. These effects increase with the temp. and time of heat treatment. In general the strength and hardness of castings are increased by short, and reduced by long heat treatments. J. W. SHIPLEY

Commercial forms and applications of aluminum and aluminum alloys. P. V.

FARAGHER. *Am. Inst. Mining Met. Eng., Tech. Publication No. 33*, 28 pp.(1927); cf. preceding abstr.—F. presents the com. side of the Al industry in the U. S. The use of the various alloys of Al in the manuf. of motors, aircraft, engine bases, railway cars and automobile bodies is described and the com. forms and sizes of each alloy are given, together with the phys. and mech. properties. No metallurgical considerations are included. **J. W. SHIPLEY**

Equilibrium relations in aluminum-silicon and aluminum-iron-silicon alloys of high purity. E. H. DIX, JR., AND A. C. HEATH, JR. *Am. Inst. Mining Met. Eng., Tech. Publication No. 30*, 31 pp.(1927).—The object of the investigation was to det. the solid soly. of Si in Al, to establish the position of the solidus at the Al end and to check the eutectic temp. and concn. Al of 99.951% and Si of 98.64% purity were used. Alloys for soly. work contained a max. of 0.05% Fe. Cooling curves were obtained for the alloys and the position of the eutectic was checked by quenching and microscopical examn. Temps. were detd. by a Pt Pt-Rh couple. A uniform eutectic structure formed over small areas only. Analysis of such areas showed a Si content of 11.82% as compared with 11.6% found by Edwards and 11.7% by Gwyer and Phillips. Soly. detns. were made on specimens homogenized by annealing at temps. 15° to 20° under the eutectic temp. for a week. Solidus detns. were made in a Hoskins furnace controlled by a Leeds and Northrup controller-recorder. All specimens were annealed for 120 hrs. at 560° and then quenched. Temp. readings were taken at 5-min. intervals. Photomicrographs were used for comparing and identifying the cryst. structures. The results are plotted on an equil. diagram. Al-Fe-Si alloys were prepd. contg. as high as 40.78% Fe and 28.87% Si. Annealing periods varied from 1 to 5 weeks. Porosity and cracks were characteristic of alloys high in Fe and low in Si. Examn. of alloys prepd. at the intersection of Al-FeSi₂ and of FeAl₃-Si on the phase diagram indicated that the line Al-FeSi₂ and FeAl₃-Si does not exist. An alloy corresponding to the formula FeAl₃ was prepd. and detd. to be completely homogeneous, thus proving the existence of this compd. The authors suggest that the "X" constituent of com. Al be designated α (Fe-Si) and the second alloy of Al-Fe-Si as β (Fe-Si). The first occurs in "Chinese script" crystals while the latter is found as curved needles. Triangular phase-field diagrams are given. **J. W. SHIPLEY**

Some aspects of the commercial manipulation of aluminum. C. F. NAGEL, JR. *Am. Inst. Mining Met. Eng., Tech. Publication No. 32*, 21 pp.(1927).—The properties of duralumin and other com. alloys of Al are given by N. together with a detailed description of the various heat treatments to which the alloys are subjected in the prepn. of com. metal. The manipulation in hot forming, jointing, soldering and riveting Al and duralumin is described, and the art of welding these metals treated in considerable detail. Tables, drawings and photographs are given. **J. W. SHIPLEY**

Physical characteristics of commercial copper-zinc alloys. W. H. BASSETT AND C. H. DAVIS. *Am. Inst. Mining Met. Eng., Tech. Publication No. 26*, 16 pp.(1927).—Tests on Cu-Zn alloys, including tensile, alternate bending and hardness, are given together with photomicrographs of the effect of annealing on the structure and grain size of Cu-Zn alloys between 100 and 39% Cu. A 65-67% Cu brass draws more deeply when strongly annealed (750°) but, because of the large size of the grains, presents a rough surface. A lighter anneal (600-650°) gave almost as deep a draw and a much smoother surface, while annealing at 425-550° gave much smaller grains and a smooth surface easily polished. Impurities such as Fe lower the size of grains and increase the hardness. The heat treatment previous to rolling very markedly affects the phys. properties of the sheet metal. High annealing temps. produce a lowering of the tensile strength of the rolled metal. Satisfactory specifications for Cu-Zn alloys should be based on the use to which the sheet metal is intended, and each alloy should have its own set of phys.-test data from which a specification may be prepd. **J. W. S.**

Polishing and etching lead, tin, and some of their alloys for microscopic examination. J. R. VILELLA AND D. BRERGEKOFF. *Ind. Eng. Chem.* 19, 1049-52(1927).—In polishing soft metals for microscopic examn. it is more important to avoid distortion of the structure than scratches on the surface. A suitable method is described, involving the use of emery papers coated with paraffin. Alternate etching and repolishing are necessary to show the true structure clearly: Mixts. of HNO₃, acetic acid, and glycerol were used for etching, the methods being described in detail. Excellent photomicrographs are shown. **GEO. F. COMSTOCK**

The effect of boiling orange juice on various alloys and metals. A. L. BLOUNT AND H. S. BAILEY. *Trans. Am. Inst. Chem. Eng.* 18, 139-48(1926).—Corrosion tests, made in boiling orange juice on various metals, classified 2 groups as follows: (1) metals of low corrosion rate (below 0.0001 in. per month). Duraloy brass, Alcumite, Mond

70, Everdur, Monel, listed in order of decreasing resistance; (2) other metals tested including Cu and Al alloys (corrosion rate greater than 0.0006 in. per mo.) The thermal conductivities enter into the selection of materials as well as other factors. A complete discussion of several alloys is given. J. K. ROBERTS

A study of some of the causes of failure in heat-resisting alloys. ROGER SUTTON. *Trans. Am. Soc. Steel Treating* 12, 221-34 (1927).—Ni-Cr carburizing boxes contg. 60% Ni, 18% Cr and 15% Fe were found to give best service life at high temp. when the Fe₃C was evenly distributed and in a thoroughly globular condition, thus denoting a slow cooling rate in the original casting. W. A. MUDGE

Age-hardening tests with electron alloys. K. L. MEISSNER. *J. Inst. Metals* (advance copy), No. 436, 18 pp. (1927).—Six Mg alloys contg. up to 10.6% Al and up to 4% Zn were tested in the form of sheet or extruded rod, for Brinell hardness after heating, quenching, and aging. Some tensile and elongation tests also are reported. Age-hardening is possible with these alloys because Al and Zn form solid solns. with Mg and the soly. decreases with falling temp. The amts. of age-hardening of the 6 alloys at various temps. and for various periods of time are tabulated and plotted. From these results, it is concluded that between 5.5 and 6% Al must be sol. in solid Mg. The age-hardening with Al is greater than that with Zn, but none occurs unless the amt. of the compds. present is greater than is sol. in Mg at room temp. For appreciable hardening, the aging must be carried out above room temp. GEO. P. COMSTOCK

Aluminum bronze. JEROME STRAUSS. *Trans. Am. Soc. Steel Treating* 12, 69-105, 239 73 (1927).—A review of the constitution, mechanical properties and resistance to corrosion of Al-Cu alloys, with and without the addition of other elements. An effort is made to cover the entire useful range of these alloys with particular stress upon the properties and practice common to those compns. of widest commercial use. W. A. MUDGE

Foreword to symposium on corrosion. P. D. MERICA. *Trans. Am. Inst. Chem. Eng.* 18, 1-6 (1926).—A review of problems of corrosion and progress made in the theory and practical preventive methods J. K. ROBERTS

Contribution to the theory of processes of corrosion. ROBERT STUMPER. *Korrosion u. Metallschutz* 3, 169-71 (1927).—The process of corrosion is considered to take place thus: (1) Formation of Fe⁺⁺ ion followed by evolution of H₂ and formation of Fe(OH)₂; (2) the oxidation of Fe(OH)₂ to Fe(OH)₃; and (3) conversion to hydrated ferrous and ferric oxides $x\text{FeO} \cdot y\text{Fe}_2\text{O}_3 \cdot z\text{H}_2\text{O}$ with the liberation of water. This liberation of water causes the formation of a loose and porous rust which film does not prevent the continuance of corrosion. J. K. ROBERTS

Paradox of corrosion and protective film theory. T. FUJIHARA. *Ind. Eng. Chem.* 19, 1008 9 (1927).—From microscopic observations of the progress of corrosion it is concluded that protective films are formed by corrosion products and that the more favorable the conditions are for corrosion the less the corrosion. J. K. ROBERTS

Corrosion of copper pipes. A. F. DUFTON AND F. L. BRADY. *Nature* 120, 367 (1927).—Corrosion in water pipes of Cu lined with Sn is due to tarnishing of the Sn. This can be shown by the potential between Cu-Sn and Cu-tarnished Sn. R. H. L.

Corrosive effect of nitric acid, mixed acid, and sulfuric acid on some of the new alloys with special reference to stainless steels. F. F. CHAPMAN. *Trans. Am. Inst. Chem. Eng.* 18, 7-18 (1926).—A series of tests made on stainless steels and irons in HNO₃, free from Cl₂, HCl and H₂SO₄ indicated that nearly all such steels resisted corrosion in all strengths of acid at all temps. up to the b. p. These results have been well brought out in service. Welded joints cause most of the trouble. Chrome steels made by different manufacturers can safely be joined together in service without electrolytic action. Traces of HCl in HNO₃ have little effect. In practice HCl in HNO₃ causes very rapid corrosion, especially in intermittent deliveries. Cr steels resist mixed acids efficiently. Data on corrosion rates in various acid mixts. are given. J. K. ROBERTS

Corrosive effect of nitric, hydrochloric and sulfuric acids on pure lead and lead containing small amounts of copper and antimony. J. C. OLSEN M. H. QUELL AND WM. G. HOLLEV. *Trans. Am. Inst. Chem. Eng.* 18, 19-36 (1926).—Tests were run on pure Pb and Pb contg. Sb and Cu in various acids in motion and at rest at temps. of 20° to 100°. Corrosion in H₂SO₄ increases with the temp. and concn., and is least on Pb contg. 0.1% Cu. In HCl the greatest corrosion was on Pb contg. Sb and least on pure Pb. Pure Pb is least affected by HNO₃, and corrosion is least in the concd. acid. Conclusion: The presence of Sb increases corrosion especially in HCl, while Cu has a protective action in H₂SO₄, but an accelerating action in other acids. J. K. R.

Heat treating of mists. E. VALD ANDERSON. *Trans. Am. Inst. Chem. Eng.* 18, 9 (1926).—Sepn. of mists causes corrosion difficulties. As long as gases

are above the dew point of acid gases little corrosion is experienced; thus heat insulation is often a good preventive measure. In general the corrosive action of mists and fumes is the same as resultant solns. Materials of construction are discussed. J. K. R.

Protection of aluminum and its alloys against corrosion. H. SUTTON AND A. J. SIDERY. *J. Inst. Metals* (advance copy), No. 439, 17 pp.; *Engineering* 124, 376-7(1927).—Expts. are described in which samples of Al and Al alloys used in airplanes are protected against corrosion (1) by anodic oxidation and (2) by electrodeposited coatings of Zn, Cd and Ni. The corrosion periods were extended to periods of 1 to 2 years. The resistance to corrosion by sea-water is considerably increased by anodic oxidation followed by the application of lanolin, in the form of a 15% soln. in benzene. Electrodeposited Zn coatings 0.0005 in. thick gave better protection to Al than did similar coatings of Cd but the degree of protection was about the same for both on Al alloys. Deposits of Ni of normal thickness were unsatisfactory. A comparison is made between the two methods of treatment. H. S. VAN KLOOSTER

Corrosion at riveted joints. U. R. EVANS. *Engineering* 124, 179-80(1927); cf. C. A. 21, 2114.—A further discussion of how corrosion proceeds in boilers, especially in riveted joints. J. K. ROBERTS

Corrosion in the laundry industry. J. N. VERMILYA. *Trans. Am. Inst. Chem. Eng.* 18, 95-107(1926).—The importance of non-corrodible metals for use in wash wheels, etc., in laundries is stressed, and a discussion of laundry processes and their effect on corrosion are discussed. At present 25% Ni casting alloy has been adopted and appears to resist corrosion. J. K. ROBERTS

Properties of boiler tubing at elevated temperatures determined by expansion tests. A. E. WHITE AND C. L. CLARK. *Mech. Eng.* 49, 1093-7(1927).—A preliminary communication of results obtained from measurements of safe working loads for 0.13% C steel seamless tubing at high temps. Closed tubes were heated in a resistance furnace to 1000°, 1250° and 1500°F. Pressure was applied to the interior of the tubes by N from a tank. At the temps. mentioned the authors find that the proportional limit, as ordinarily detd. by short-time tests, cannot be used as a criterion in judging the stability of the metal. Test pieces, run at loads well below the short-time proportional-limit, showed decided expansion on prolonged heating. It is recommended that an adequate factor of safety be applied whenever short-time proportional-limit values for elevated temps. are employed in engineering design. An excellent discussion of the paper shows how the authors may have made considerable error in their measurements, first, due to the test tubes not being exactly concentric, and second, due to the inadequate means employed to measure the outside diam. of the heated tubes. W. F. E.

Studies on electric welding. L. J. WEBER. *Trans. Am. Soc. Steel Treating* 11, 125-40(1927).—Abnormal carburizing steels are produced in steels deposited by means of the elec. arc in atms. of CO, CO₂, N₂ and air. Normal carburizing steel was obtained if the metal was deposited in a pure inert gas such as He. The elec. arc decomposes CO₂ into CO and O; CO is decompd. with the formation of CO₂. W. A. M.

The application of Röntgen rays in the welding technic. C. KANTNER AND A. HERR. *Z. Ver. deut. Ing.* 71, 571-6(1927).—The detection of defects with the aid of Röntgen rays in welded and unwelded materials is described. It is shown that this may safely be accomplished and offers advantages over the usual phys., chem. and metallographical investigation methods, viz., (1) an extended area of the material may be investigated; (2) testing may be carried out without cutting or destruction of the metal piece and (3) in particular weldings may be investigated rapidly and in an improved manner. The method depends on the permeability of the materials by hard rays of short wave length. An app. for this purpose is illustrated and described. A series of samples of the usual metallic work materials was prepd. and investigated röntgenographically and, to confirm the results, also metallographically. The Röntgen photographs of welds gave important data as to the judgment in their prepn. and use. Leaks, gas bubbles and hollow spaces in the welds were indicated by bright, sharply defined spots. Foreign matter, slag, etc., appeared as agglomerations, bud-like formations, bands or lines. Burned areas in the welds (formation of oxidation products) appeared as irregular bright spots. Poor welds were clearly marked, but showed the same brightness as the material itself, while good welds appeared cloudy in the transition zone. Cracks by contraction, due to unequal cooling stresses, appeared as very bright, sharply defined lines. A series of photographs of the various conditions is given. D. THUSEN

The utilization of cob char as a carburizing agent. H. L. MAXWELL. *Proc. Iowa Acad. Sci.* 33, 174(1926).—It is shown that the char resulting from the distn. of corn cobs in the manuf. of furfural, may be substituted for the more expensive bone char now being used in the carburizing process. The distribution of the tri-ferro car-

bide, Fe_3C , in the carburized zone may be closely governed by time and temp. variations. W. G. GAESSLER

Ore processing. F. DIETZSCH. Can. 273,581, Sept. 6, 1927. Oxidized or roasted Cu ores are treated with a compd. soln. contg. H_2SO_4 , dissolved in a substantially satd. soln. of alkali chloride, alk. earth chloride or other suitable metallic chloride, so as to obtain a soln. charged with a complex cuprous salt. The excess H_2SO_4 is expelled and the Cu pptd. by bringing the soln. into contact with Fe.

Ore processing. P. C. SCHRAPS. Can. 274,713, Oct. 18, 1927. Ores contg. the precious metals are treated with cyanide soln. and metallic Hg for rendering the previous metals readily sol. in the cyanide soln.

Continuous sintering of slimy ores. H. G. THORULF. Swed. 63,400, July 26, 1927. A supplement to Swed. 56,556. Transportable sintering pans are used.

Metallurgical process. H. T. DURANT and P. W. RHODES. Can. 273,749, Sept. 13, 1927. Sulfide ores, concentrates or S-contg. metallurgical products are subjected to oxidation by the employment of a soln. contg. CrO_3 as oxidizing agent, the soln. thus obtained being sepd. from the residual solid material and subjected to a purification treatment. The purified soln. is subjected to electrolysis to recover the metals extd.

Recovering metal from blast-furnace slag. F. ROSENZWEIG. U. S. 1,643,610, Sept. 27. Slag contg. metal oxide after flowing from a blast furnace and while still molten is heated by an elec. current to effect reduction of the metal and the latter is recovered. An app. is described.

Roasting sulfides. J. B. READ and M. F. COOLBAUGH. U. S. 1,644,692, Oct. 11. Sulfide ores are fed through a furnace and air for oxidation is fed into the furnace at a point in advance of that at which the sulfides are introduced; a portion of the hot gases travels countercurrent to carry heat to the sulfides introduced and the remainder of the gases travel concurrently with the ore. A furnace with superposed hearths is described.

Sintering apparatus for treating slimy iron ore. KOPPARBERGS OCH HOFORS SÄGERVERKS A.-B. Swed. 62,170, Dec. 28, 1926.

Reduction of metal oxides. H. G. F. CORNELIUS. Swed. 62,390, Feb. 15, 1927. Oxidic ores requiring for their reduction with coal a higher temp. than does ZnO are mixed with an oxidic Zn compd., oxide or silicate, and the mixt. is heated with a sufficient amt. of coal. The Zn will first be reduced, then the ore metal.

Purifying cadmium. H. HOWARD. U. S. 1,644,431, Oct. 4. Cd sponge is treated with 45° Bé. NaOH soln. at its b. p. in sufficient quantity to dissolve the Zn content of the Cd sponge.

Charging and discharging smelting furnaces. FINSPONGS METALLVERKS A.-B. Swed. 62,849, April 27, 1927. An app. is described for charging and discharging metallurgic furnaces, especially elec. furnaces for the melting of brass and similar alloys.

Hearth furnace for heating or melting iron or other metals while enveloped in a protective gas such as carbon monoxide. A. ZILLIACUS. U. S. 1,643,569, Sept. 27.

Replaceable liner for reverberatory furnaces. B. R. KINNEY. U. S. 1,645,011, Oct. 11.

Pure iron. I. G. FARBERIND. A.-G. Brit. 262,938, Dec. 14, 1925. Vapors of Fe carbonyl which may be dild. with inert or with reducing gases and may be under reduced pressure are passed over heated small metal bodies such as Fe turnings or melts or liquids such as molten Fe or oils or melts of $C_{14}H_{10}$ or phenanthrene. The Fe is obtained as a fine powder. A temp. of 250–300° is suitable with Fe carbonyl, N and Fe turnings.

Tempering eutectoid and hypo-eutectoid steel. B. A. KJERRMAN. Swed. 63,136, June 14, 1927. The steel is heated to a temp. within the interval at the lower point of which the dissolution of the cementite starts and at the higher point of which the dissolution of the cementite is accomplished. The temp. is kept at a point below the upper limit of the said interval until the equil. between dissolved and undissolved cementite has been reached, that is about the time required by the steel mass for getting thoroughly warmed or a little longer. Then the steel is cooled slowly and is not heated again.

Heat-treating steel. F. W. GUIBERT. U. S. 1,644,828, Oct. 11. Steel or other metals susceptible of being hardened by similar treatment are heated and quenched while carrying out the entire process *in vacuo* in order to prevent oxidation or discoloration.

Rail steel. J. K. SMITH. U. S. 1,643,321, Sept. 27. Rails are formed of non-heat treated steel contg. C 0.35–0.75, Mn 0.5–1.1, Cu 0.25–1.25, Mo 0.07–1.0% and Si, S and P in about the usual proportions.

Steel for edge tools. A. E. G. T. VON VEGESACK. U. S. 1,644,097, Oct. 4. Steel is used contg. C 0.7–1.1, Cr 10–16, Mn 0.75–2.0% together with Fe and secondary elements in ordinary quantities.

Ferro-chrome alloys. W. B. D. PENNIMAN and E. J. SHACKELFORD. Brit. 262,795, Dec. 11, 1925. Ferro-chrome is decarburized in an arc furnace by melting, adding a reception slag which may comprise lime and fluorspar or may be a slag rich in Cr oxide and poor in Fe oxide, raising the temp., adding Cr ore, and continuing the heating until the C content is sufficiently reduced. Deoxidizing agents such as ferro-Si or the like may be afterwards added. Cf. C. A. 21, 221.

Nickel-manganese steel alloy. C. MCKNIGHT, JR., T. H. WICKENDEN and P. D. MERICA. Can. 274,453. Oct. 4, 1927. A steel contg. 0.50–3.50% Ni, 0.10–0.60% C and 0.70–2% Mn is specified.

Silicon-iron and aluminum-copper alloys. F. D. SHUMAKER. U. S. 1,644,000, Oct. 4. In forming alloys from materials such as bauxite, clay, alunitic or leucite, contg. oxides of Al, Si, Fe and Ti, the aluminous material is electrothermically smelted in the presence of Fe and a flux such as MgO to produce a ferro-Si alloy contg. more or less of the Fe and Ti of the aluminous material treated and a highly aluminous material or slag of low Fe and Ti content but contg. fluxing agent; the flux-bearing slag is then electrothermically smelted in the presence of Cu to produce an Al-Cu alloy low in Fe and Ti.

Silver-silicon alloy. M. G. KORSUNSKY. U. S. 1,643,304, Sept. 27. An alloy which is suitable for making silverware which is resistant to tarnishing contains a preponderating proportion of Ag together with Si 1.5–6.0% and other metals such as Cd, Al, Zn, Sn and Sb which form solid solns. with Ag.

Magnetic alloys. STANDARD TELEPHONES & CABLES, LTD. Brit. 263,059, Aug. 18, 1925. A magnetic material having high permeability and low hysteresis loss with low magnetizing forces comprises Ni (preferably 78.5%), Co (preferably at least 5%) and Fe. Heat-treatment of the product may comprise heating to 1100° and slowly cooling, or heating to 1100°, slowly cooling to near the magnetic transition temp. and then cooling rapidly, or, heating to 1100°, slowly cooling, reheating to the magnetic transition temp. and then cooling rapidly, *e. g.*, at the rate of about 9.5° per sec.

Low-carbon alloys. V. B. BROWN. U. S. 1,645,128, Oct. 11. Heat is supplied by a C arc to a metal bath such as ferrous metal and alloying components such as Cr

or Mn oxides are introduced into the bath while preventing absorption of C by use of an oxidizing slag. An elec. arc furnace with C electrodes is used.

Lead-cadmium alloys. WALTER FRIEDRICH. U. S. 1,645,098, Oct. 11. Cable casings are formed of alloys contg. Pb 99-99.8 and Cd 0.2-1%.

Resistance alloys. T. S. FULLER. U. S. 1,645,099, Oct. 11. Al is alloyed with Mn 4-10 and Zn 2-8%.

Lead alloy. C. T. J. VAUTIN and C. V. STEPHENS. Can. 274,632, Oct. 11, 1927. A lead alloy contg. 1.2% of Cd has an approx. tensile strength of 4700 lbs.

Alloy steel for impact-tools. P. A. E. ARMSTRONG. U. S. 1,645,213, Oct. 11. A tough hard steel contains W 1-2.5, Cr 0.75-1.75, Si 0.05-0.60, Mn 0.05-0.60, C 0.35-0.60, Ta 0.05-0.95%, the remainder being mainly Fe.

Alloy for brake band linings, etc. C. A. GEATY. U. S. 1,644,425, Oct. 4. Pb 95, Sb 3 and Cu 2%

Lined metal pipe. B. TALBOT. U. S. 1,644,361, Oct. 4. A metal pipe which may be formed of Fe or steel is lined with a mixt. of hydrocarbon material such as bitumen, S, pitch and anthracene oil, and a powdery reinforcing material such as ground granite, the proportion of which in the lining increases from the inner or exposed surface of the lining towards the surface in contact with the pipe.

Chill castings. E. KÖTTERITZSCH. Brit. 263,123, Dec. 15, 1925. Mech. features of a process in which molds are filled in stages.

Centrifugal apparatus for casting metals. J. BROWN & CO., LTD. AND M. E. UNWIN. Brit. 262,966, Jan. 8, 1926.

Molds for casting chambered metal bodies. H. KLOUMAN. U. S. 1,643,777, Sept. 27.

Apparatus for casting metals under pressure. O. ECKERT. U. S. 1,644,054, Oct. 4.

Apparatus for casting ingot molds. J. E. PERRY. U. S. 1,643,419, Sept. 27.

Carburizing box. W. B. SULLIVAN. U. S. 1,643,756, Sept. 27. Sheet metal panels are used with a cast metal frame.

Filtering apparatus for galvanization baths. E. HARBECK. Swed. 61,923, Nov. 9, 1926.

Apparatus for igniting the charge in sintering pans. H. G. THORULF. Swed. 62,593, March 15, 1927.

Uniting copper with ferrous metal by an intervening sheet of brass coated with zinc. H. C. MOUGEY. U. S. 1,644,741, Oct. 11.

Counteracting corrosive effects of alcohol and its mixtures on metals. W. OSTWALD. U. S. 1,644,267, Oct. 4. A small proportion of Na benzoate or other suitable benzoate is added to prevent corrosion of metals such as Zn, Fe and Cu with which alc. or fuels or other mixts. contg. alc. may come into contact. Cf. C. A. 21, 2355.

Aluminum solder. V. WHITE. Can. 274,197, Sept. 27, 1927. An Al solder includes Al and Zn as a base and Hg as a flux.

Welding metals by the combined action of electric current and flame. J. F. LAWSON. U. S. 1,643,307, Sept. 27.

10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

Recent advances in science: organic chemistry. J. N. E. DAY. *Science Progress* 22, 201-6 (1927).—A review of recent work on the synthesis and structure of thyroxine, and on large straight-chain and ring compds. JOSEPH S. HEPBURN

The relation of the classical stereochemistry to the recent work of K. Weissenberg. M. v. STACKELBERG. *Z. angew. Chem.* 40, 1023-7 (1927).—The new theory of stereochemistry by Weissenberg (see C. A. 20, 3104) is explained by means of simple examples, and discussed with reference to its relation to the older theories of stereochemistry. FREDERICK C. HAHN

Structure of the methane molecule. VICTOR HENRI. *Chem. Reviews* 4, 189-201 (1927).—Application of the modern methods of mol. physics to the study of the structure of the CH₄ mol., and the use of 5 completely independent methods have shown that the 4 valencies of C are not equiv. but consist of 2 different types. The structure of the mol. of CH₄ is pyramidal in form and not tetrahedral as previously assumed. The mol. of CH₄ is a labile system of atoms and is capable of change to other structures in its derivs. 21 references. C. J. WEST

The structure of some methane derivatives. H. MARK AND W. NÖTHLING. *Z.*

Krist. 65, 435-54(1927).— $C(NO_2)_4$, which is cubic at its f. p. $+13^\circ$, has the space group T^4 or T_d^1 . There are 4 mols. in the unit cell and $a = 9.2$ A. U. The trigonal symmetry supports the formula $(NO_2)_3C-O-NO$ proposed by Schmidt. CMe_4 has 8 mols. in the unit cell, with $a = 12.48$. The symmetry does not definitely establish a CH_3 group. Ph_3COH is rhombohedral. The edge of the unit cell is 11.1 A. U., and $a = 17.9$ and $c = 12.5$, with 3 mols. Ph_3CBr is also rhombohedral, with the length of the edge 10.8. There are 3 mols. and $a = 14.05$ and $c = 22.0$. These last 2 compds. belong to space group D_{3d}^5 if they are not polymerized.

L. S. RAMSDELL

Rearrangement of isopropylethylene to trimethylethylene and the pyrogenic decomposition of 2-pentene and trimethylethylene. J. F. NORRIS AND RAYMOND REUTER. *J. Am. Chem. Soc.* 49, 2624-40(1927).—The rearrangement of $Me_2CHCH:CH_2$ to $Me_2C:CHMe$ produced by heat is markedly affected by catalysts; the efficiency increased in the order Al_2O_3 , H_3PO_4 , $Al_2(SO_4)_3$. The rearrangement of $Me_2CHCH:CH_2$ to $Me_2C:CHMe$ which takes place when $Me_2CHCH_2CH_2OH$ is dehydrated by heat is slightly greater than when the hydrocarbon is heated; the efficiency of the catalysts in causing rearrangement is in the same order as above. Under the conditions used $Me_2C:CHMe$ did not rearrange to $Me_2CHCH:CH_2$. When $EtCH:CHMe$ was heated the results showed that no branched-chain hydrocarbons were formed. The pyrogenic decompn. of $EtCH:CHMe$ and $Me_2C:CHMe$ yields gaseous and liquid hydrocarbons, which were analyzed quant. for CH_4 , $MeCH:CHMe$, $(CH_2:CH)_2$, $MeCH:CH_2$, $CH_2:CH_2$ and higher hydrocarbons. From these results the mechanism of the reaction is developed. $Me_2CHCH:CH_2$ is stable toward dil. H_2SO_4 but can be made to rearrange to $Me_2C:CHMe$ to a slight extent by the action of acid of such concn. that polymerization does not take place appreciably. Sp. methods are given for the prepn. of the compds. involved in this study and the following carefully detd. phys. properties are reported: $EtCH:CHMe$, b_{760} $36.39 \pm 0.04^\circ$, m. $-138 \pm 2^\circ$, d_4^{20} 0.65551, d_4^{20} 0.65054, d_4^{20} 0.64537 ± 0.00003 , d_4^{30} 0.64021, n_D 1.3899, 1.3868, 1.3839, 1.3808 and 1.3744 at 5.3, 10, 15, 20 and 30° , resp. $Me_2CHCH:CH_2$, b_{760} $20.10 \pm 0.05^\circ$, becomes a thick sirup at -180° , d_4^{25} 0.63197 ± 0.00002 , n_D 1.3762, 1.3707 and 1.3675 at 0° , 10° and 15° , resp. $Me_2C:CHMe$, b_{760} $38.42 \pm 0.04^\circ$, m. $-123 \pm 2^\circ$, d_4^{25} 0.66708, d_4^{25} 0.65694 (both ± 0.00002), n_D 1.3939, 1.3908, 1.3878, 1.3814, 1.3781 at 10° , 15° , 20° , 30° and 35° , resp. $Me_2CHCH_2CH_2OH$, b_{760} $101.76 \pm 0.04^\circ$, m. $-11.9 \pm 0.5^\circ$, d_4^{25} 0.81382, d_4^{25} 0.80475 (both ± 0.00002), n_D 1.4104, 1.4078, 1.4052 at 10° , 15° and 20° , resp.

C. J. WEST

2-Pentene. J. F. NORRIS. *Org. Syntheses* 7, 76-7(1927).— $PrMeCHOH$ (176 g.), 200 cc. concd. H_2SO_4 and 200 cc. H_2O , heated on a boiling H_2O bath 2-3 hrs., give 65-80% of $EtCH:CHMe$.

C. J. WEST

Preparation of tetramethylethylene. J. C. EARL. *J. Proc. Roy. Soc. N. S. Wales* 61, 68-72(1927).— $EtMe_2COH$ (100 g.) is dehydrated with oxalic acid, giving $Me_2C:CHMe$ (II) (66 g.). II with $HOCl$ gives II-chlorohydrin (38 g.), which by the action of $MeMgI$ (Henry, *Compt. rend.* 144, 311) gives Me_2CHCM_2OH (III) (18 g.). Dehydration of III with dil. H_2SO_4 or concd. aq. soln. of oxalic acid gives $(CMe_2)_2$ (11 g.). The foregoing procedure is simpler, and requires less time than the method given by Thiele.

FREDERICK C. HAHN
